WARDING Off Vibration.—The rear spring suspension and the stiffly cushioning radius rod and driving-strut which form features of the Büssing motor truck, which is among those of best repute in Germany, are shown in Fig. 3, reproduced from *Der Motorwagen*. The construction exemplifies the tendency to produce constructively the necessary flexibility between running-gear and frame, in heavy trucks, while eliminating it from the frame proper.

—

Memorandum of Articles Unadapted for Abbreviation

Among compendious treatises on highly specialized subjects which have recently appeared in continental publications, and copies of which, in the original language in each case, may be procured for those interested, are the following:

Bevel-gear Milling Machines. Serial, illustrated.—By Prof. Alfredo Galassini of Turin in *Werkstattstechnik*, Feb. 15, March 1 and to be continued.

The Use of Cast Steel Balls in the Shaping of Sheet Metal Parts, illustrated, 3 pages.—By E. Gay in *La Technique Moderne*, March 1.

Graphodynamic Investigation of a Gill & Aveling Four-Cylinder Automobile Motor with Variable Stroke. Serial, illustrated.—By A. Nerreter in *Der Motorwagen*, January 20 and 31, February 10 and to be continued.

Recent Lubricators—Illustrated descriptions of lubricating devices; completing the subject as previously presented in same journal: 30 pages. *Revue de Mécanique*, Jan. 31.

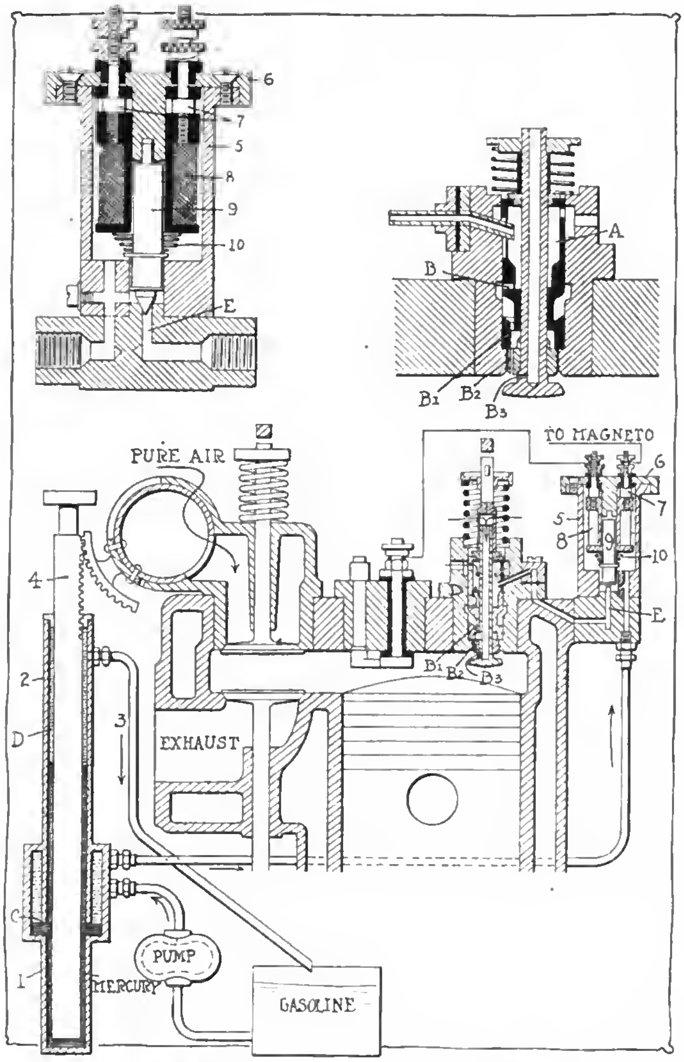

Fig. 1—General drawing of motor, showing the detail of the distributer with its magnetic coils, the pulverizer and the pressure-controlling device with its column of mercury. The fuel is carried from the tank to the pressure regulator by means of a pump placed in the position shown in the illustration

The New Bellem Oil Motor

¶ *This new motor runs on kerosene oil or crude and can be started directly on either one of these fuels while the motor is cold. This test was made upon the demonstration motor.*

¶ *It operates at the same speed as the ordinary gasoline automobile motor and being of the same size it can be substituted in the chassis for a motor of that type.*

¶ *The secret of the invention is the complete pulverization of the fuel which is effected by injecting it into the vacuum formed by allowing the intake valve to open only after the piston has gone some distance on its downward stroke.*

¶ *The valve mechanism consists of two principal parts; a pressure regulator and a distributer. The pressure is controlled through varying the height of a column of mercury and the amount of pressure used does not in any way affect the quantity of the fuel.*

¶ *A magnetic coil controls the distributer, whose opening is independent of the motor speed. A magnetic control is used which renders the opening dependent on the weight of a needle valve and the strength of a spring.*

French Kerosene Motor for Automobiles

Bellem Engine Starts Cold on Kerosene and Runs on Any Kind of Crude Oil—Uses No Carbureter nor Compressed Air

A FOUR-CYCLE motor capable of starting up cold on kerosene, of running on any kind of crude oil, weighing no more than a car motor, having a normal compression, having no carbureter and using no compressed air, has been produced by M. Bellem, a French engineer. This motor has passed beyond the experimental stage, for, it is claimed, licenses to construct have been secured by Delaunay-Belleville and by Messrs. Sautter & Harle, a French firm employed largely on army and navy work.

The similarity between the standard type of car motor running on gasoline and the Bellem, consuming kerosene or crude oils, is found in the fact that the former can readily be converted to the latter. Most of the experimental work has been done on motors so converted.

On the Bellem there are the conventional mechanically-operated intake and exhaust valves, but the intake, instead of admitting gas, allows pure air to pass through and does not open until 30 degrees before lower dead center. It closes about 30 degrees after lower dead center. The exhaust valve has the usual timing.

Automatic Intake Valve

In the head of the cylinder is fitted a combined automatic intake valve and pulverizer. With the main valves closed, there is a considerable depression in the cylinder during the first portion of the intake stroke. The suction of the piston opens the automatic valve illustrated in detail in Fig. 1. A charge of fuel having been brought up to this valve under pressure, the liquid and at the same time a certain quantity of air are brought in from A to B, through the holes B1 and then through B2. Finally, pure air is drawn through the hollow stem of the valve and the holes B3, completely pulverizing the fuel. Strong claims are made for this type of pulverizer working in a partial vacuum. In a recent test, a stone-cold, single-cylinder demonstration model was cranked by hand with the ignition cut off. At each exhaust stroke a puff of vapor came through the port, and on a mirror being held before it not a trace of condensation was to be seen. The inventor claims that he obtains cold vapors. A demonstration of this is to place a metal tube near the exhaust, heat it by a soldering lamp and drop kerosene onto the hot tube. At the same time the cold motor is cranked by hand, when the vapors coming out of the exhaust port are indistinguishable from those obtained by burning kerosene on the hot tube. *The demonstration motor, after standing all night, had cold water from the city mains run into its jacket and was started on the first pull of the handle against compression. This was repeated several times after the cylinder walls had been allowed to cool by a constant circulation of water from the mains.*

After running for 5 minutes on kerosene, this fuel was shut off and crude oil allowed to flow. No difference could be detected in the running of the motor and the exhaust was perfectly clear. Speed variations were obtained from 200 revolutions per minute running light to 1,200 revolutions per minute under load. Varying the speed as quickly as possible by use of the throttle and ignition cut-out, it was impossible to get anything more than a slight puff at the exhaust; this puff lasted but

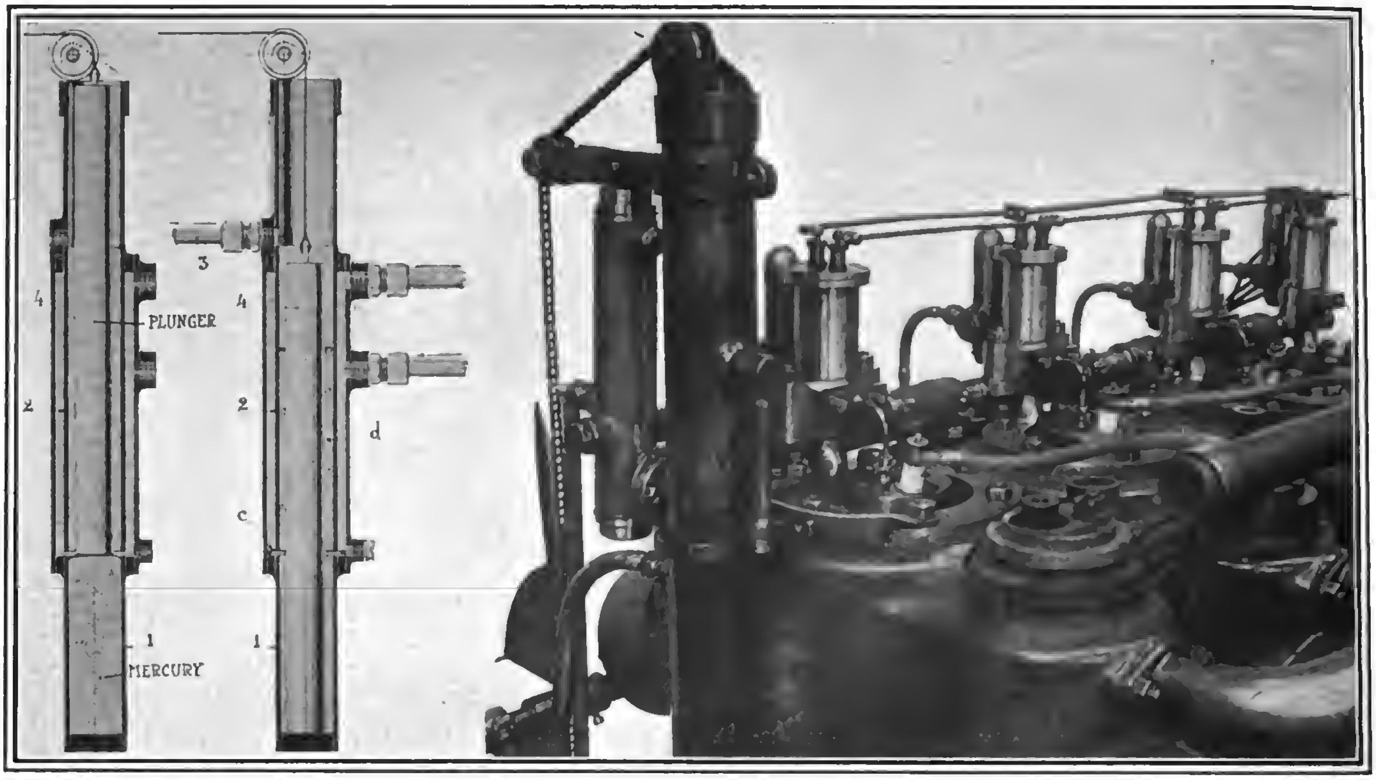

Fig. 2—Left, details of fuel-pressure device in Bellem motor. Right, top appearance of motor when fitted with the fuel pulverizing apparatus employed by Bellem

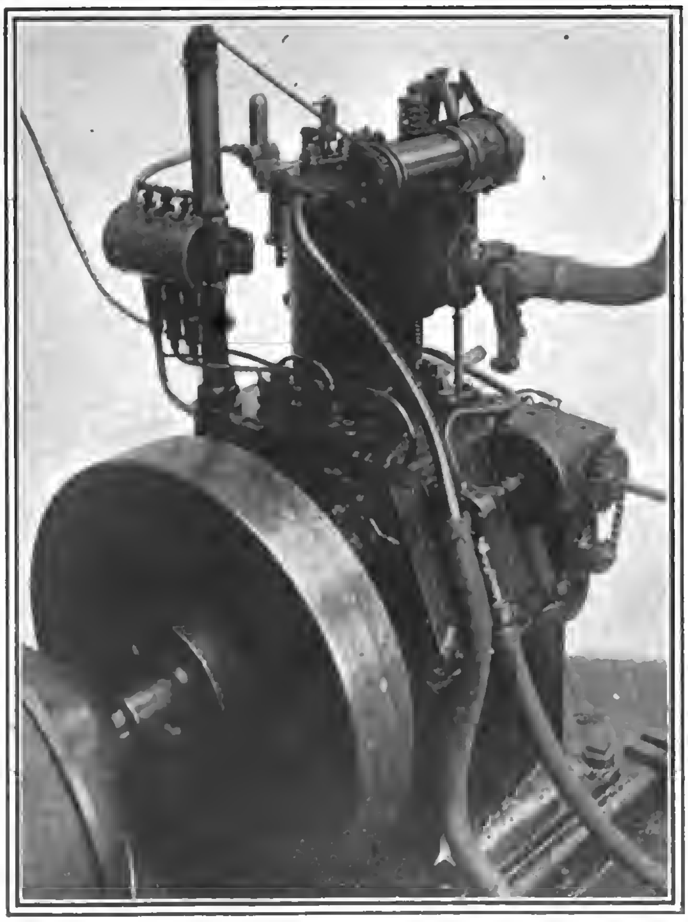

Fig. 3—Single-cylinder motor using the Bellem method of fuel pulverization. The spring of the auxiliary intake valve may be noted, projecting above the top of the cylinder, while the fuel pump is operated by silent chain from the extremity of the crank-shaft opposite the flywheel

a fraction of a second and had nothing that indicated incorrect mixture.

The secret of the invention lies in the complete pulverization of the fuel in a partial vacuum. Experiments have shown that if the same pulverizer is used in a chamber at atmospheric pressure and with compressed air passing through the valve, the results are not the same, there being a certain amount of condensation. It is claimed that the late opening of the main air valve does not prevent a complete filling of the cylinder.

The fuel, as already explained, is delivered under pressure to the vaporizer. This necessitates the use of two distinct organs, a pressure regulator and a distributer. The pressure regulator is shown separately in Fig. 2. It is fed from a kerosene tank by means of any suitable type of pump, and consists of a metal vessel, 1, containing mercury, and welded to it, a metal tube the lower end of which is level with the top of the mercury. In the tube is a plunger, 4, capable of being raised and lowered in any convenient manner, and, according to its position, varying the height of the column of mercury, D, in the tube 2. The height of the column of mercury determines the pressure of kerosene in the chamber, C. The excess of fuel passes through the mercury column and down the overflow pipe, 3, to the tank. The feed pump has a capacity slightly greater than that of the motor under full power. The amount of fuel flowing through the return pipe with the motor under power is insignificant and there is no danger of the mercury being carried through with the fuel. The plunger is connected to the air valve, thus a single operation, controlled either by governor or by hand, determines the pressure of fuel to the distributer and the amount of air admitted to the motor.

Distributer Does Not Regulate Fuel

It will be noted that the feed pipe connects the pressure chamber with the distributer placed to the right of the automatic valve. This distributer is shown separately in Fig. 4. The pressure being variable at will the distributer is not called upon to regulate the quantity of fuel in any way. Its opening has to be constant and independent of the motor speed. It will be readily understood that an opening which allowed the correct amount

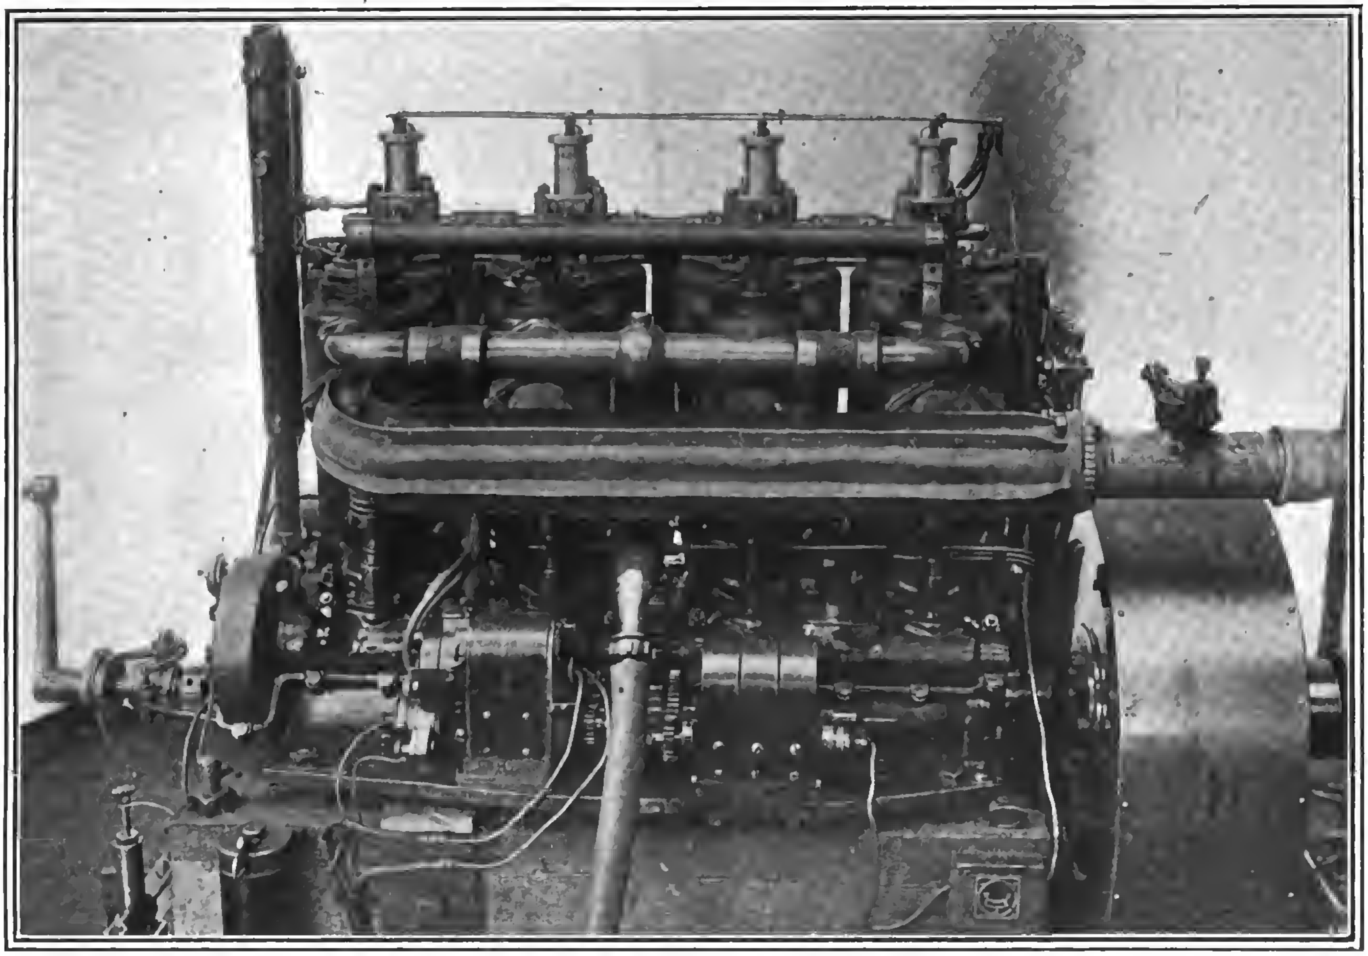

Fig. 4—Exterior appearance of Bellem motor adapted for automobile use. The magnetic control is governed by the wires running through the tubes along the top of the cylindrical distributers

of fuel to pass at 1,000 revolutions would be too great at 500 revolutions if a mechanical control was employed. With a mechanically-operated valve, also, there would be a possibility of the motor stopping with the valve open when the fuel would continue to flow until pressure had fallen off. The control is therefore magnetic, the apparatus comprising a soft iron core, 5, with a cover, 6, to which is attached the coil, 8, by means of the insulated terminals 7. In the center of the coil is a needle valve, 9, maintained on its seat by the coil spring, 10. At the moment of breaking contact on a low-tension magneto, the needle valve is raised from its seat and the fuel under pressure in the feed pipe passes through E to the pulverizer. The opening of the valve is practically instantaneous and its length of opening depends on the weight of the needle valve and the strength of the spring. The length of opening is obviously constant, whatever the speed of the motor.

In Fig. 1 the motor is shown with low-tension ignition. All the experimental models however, have been fitted with an ordinary type of high-tension magneto for the ignition and a low-tension magneto for supplying the current to the magnetic distributer. The compressions of the charge, firing and exhaust are carried out as on a normal type of four-cycle motor. When motors have been converted the compression has not been varied and has generally been between 60 and 70 pounds per square inch.

A test of one of these motors carried out at the laboratory of the Automobile Club of France is given herewith. The motor was a single-cylinder vertical of 100 by 150 millimeters, 3.9 by 5.9 inches, bore and stroke. The compression was 71 pounds per square inch.

The motor is adapted to marine, stationary or automobile use. As may be seen in the accompanying table, the crude fuel gave the greatest economy over a test running for an hour. It may be noticed that a higher rotative speed was used with the kerosene than with the other fuels and that the kerosene tests extended over a longer period.

SOME RESULTS OF TEST MADE ON BELLEM MOTOR IN LABORATORY OF THE AUTOMOBILE CLUB OF FRANCE

Module	Size of Blades in Mm.	Number of Hole	Temperature in Degrees Centigrade	Atmospheric Pressure in Mm. Mercury	Revolutions per Minute	H.P.	Corrections in Hundredths	Effective H.P.	Consumption Gallons per Hour	Specific Consumption Gallons per H.P. Hour	Observations
4	240x240	6.5	13	756	820	5.2	−2	5.1			Fuel: kerosene
4	240x240	6.5	14	756	813	5.1	−2	5.0	1.42	0.142	Test lasted 2 hours
4	240x240	6.5	14	756	811.5	5	−2	4.9			
4	240x240	6.5	15	756	811.7	5	−2	4.9			
4	240x240	7	10.5	771.5	773	5.1	−1	5.15	1.2	0.214	Fuel: Alcohol: Test, 1 hour
4	240x240	6.5	12	764.5	760	4.3	−1	4.25	0.396	0.920	Fuel, crude oil. Test, 1 hour

Motor, single-cylinder model of 100 by 150-millimeter bore and stroke. The motor was started cold with the use of kerosene only. The first test lasted 2 hours, the second test 1 hour, and the third also 1 hour. Acceleration from 183 revolutions to maximum speed under load was particularly easy.

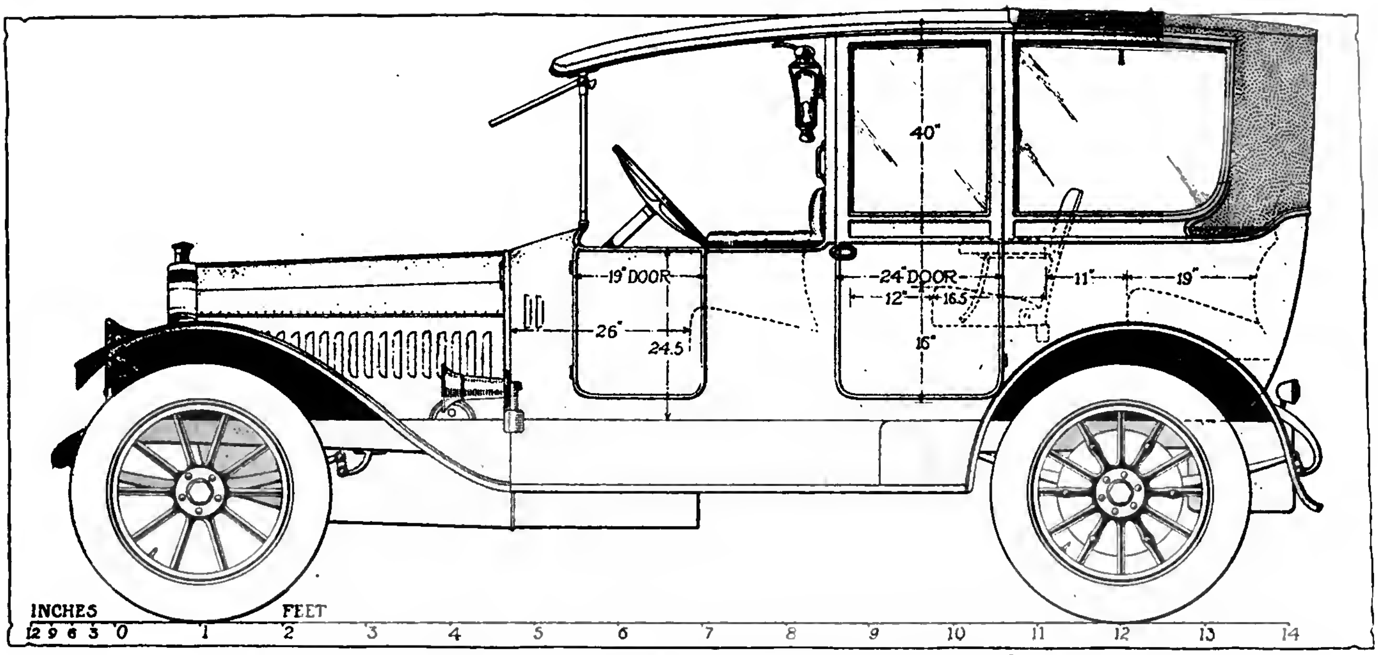

Fig. 1—Design to scale of limousine-landaulet body applied to White six-cylinder chassis

Limousine and Landaulet Types Combined

New Type of All-Season Body Meeting Increasing Favor—Notable Features Are Large Quarter Windows and New Curved Roof Line

ONE of the facts brought out at recent shows, and in particular at the last Importer's Salon in New York, was the increasing popularity of a new type of automobile body called, for want of a more comprehensive term, the limousine landaulet. As the name indicates, it combines the features of both. It has the large rear quarter windows of the limousine and the rear part of the top folds down in similar manner to the landaulet.

The ordinary landaulet has always the disadvantage of having the side quarters closed, thus preventing a clear outlook, whereas the limousine with its large spacious side and rear windows, has the distinct advantage of unobstructed view. On the other hand, the limousine is not capable of being opened up entirely, a serious limitation that suggested the need of combining the two types. This has been happily accomplished in the newer design. The limousine-landaulet has had a tryout for about two seasons in this country and for a much longer time in Europe where it originated. It is in no sense a freak design, but is a logical development in body types and it shows the public demand for an all-seasons car.

A suggested design of limousine-landaulet is given in the accompanying scale drawings. The body has flush side panels and its appearance is characterized by the straight line effect. The fore part of the body has low doors and cowl hood with storm visor windshield. The driver is free from hindrances that prevent his hearing all sounds and seeing clearly. For rain protection, drop curtains are used and when not required these are folded under the rear of the front seat.

Fig. 1 shows the complete side view of the car. The chassis is a White, Model G.F., 132-inch wheelbase, six cylinders, the hood of which has been changed slightly by sloping the top line up toward the dash and by bringing the sides outward toward the same point. This car is left drive with change and brake levers in the center. The length of the body space is ample to accommodate a seven-passenger body. The distance of the rear wheel center from the dash is 87 inches, which permits of a 24 inch door for entrance to the rear compartment.

No chassis changes are necessary. Standard front mudguards are used; the gasoline tank is under the front seat; the horn and headlights are standard and the dash lamps, which form part of the body equipment, are electric and let in flush in the dash. Provision for ventilating is also made in the dash below the lamps.

Fig. 2 shows the top folded down and the windows of the doors and quarters lowered. The windows are of the frameless type. It will be noted that the quarter window does not lower out of sight, due to the width of the body and the necessary clearance for the wheel.

The lowering of the top to effect the change illustrated in Fig. 2 is accomplished in practically the same manner as with the ordinary landaulet. The inside fasteners are released and the top lowered until the rear pillar or upright assumes a horizontal

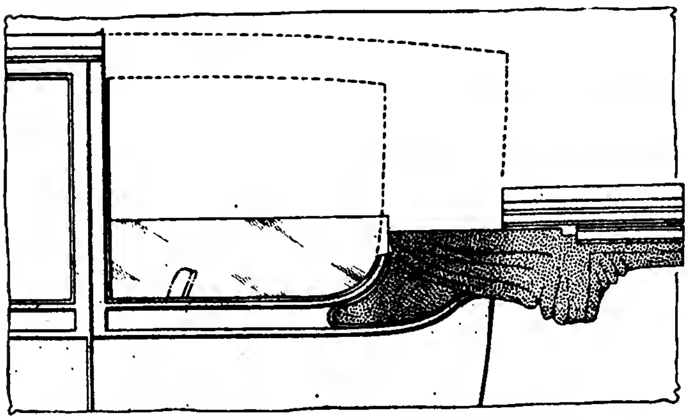

Fig. 2—Showing disposition of top when lowered

position. The toprail section, rear of the first joint, is thrown out till it lines with the pillar, and the front section of the toprail is folded back onto the line formed by the pillar and the rear section of the toprail. When down the supports of the top are concealed inside the leather. The hinges require to be very heavy as the overhang of the top in its lowered position is about 26 inches beyond the bearing point.

The roof line has a generous sweep from back to front, the drop from a horizontal at the rear across the highest part being 3 inches, while at the front windshield the drop is twice that amount, or 6 inches. The best quality landau top leather is used to cover the top, back and sides as far forward as the glass opening and there are two joints on the top covered with iron plates to keep out the water. The fixed forward part of the roof is sometimes covered with leather to match the rear part or it can be finished in the customary manner and painted. This latter plan seems to be the one most in use.

Closed Compartment Seats Five

The rear compartment is large enough to provide comfortable seating for five people, three on the rear seat and two on small seats facing forward, the width of the cushions, space between the seats and head room is indicated by figures on the various views. The auxiliary seats are of the arm chair pattern, made to fold up.

The construction of the body is wood framing, 16 gauge aluminum sheet for the panels and metal mouldings. Concealed hinges are used on the rear doors and concealed handles on the fore doors. Grab handles and pillar lamps are fitted to the front pillar and a megaphone speaking tube is located at the right of the driver on the post in the center of the front glass division.

Hand buffed leather, black and dull finished, is used for trimming the front compartment, the seat and back being tufted. The distance between the steering wheel and the seat back is 15 inches without compressing the leather, and a space of 9 inches is allowed under the wheel to the cushion.

A very suitable trimming for the interior of the rear compartment is a light Bedford cord, with lace to match, leaving a suggestion of brown in the design. The carpet should be similarly marked and the curtains striped silk to harmonize in color with the lace and cloth. A suggested interior appointment is a large size toilet case, complete with watch, mirror, etc., covered with drab Morocco with the tops silver mounted. This is placed in the middle of the front division. In the front part of the permanent roof is placed a silver mounted dome light and cord hatrack, and an electric cigar lighter could be placed on the side opposite to the mouthpiece of the speaking tube. The door pull to handles are light colored celluloid. All metal parts are silvered and the interior woodwork is natural finished mahogany.

Large pockets are located on the doors and in trimming the body, the carpet line should come far enough up on the sides, doors and front to protect the material from being damaged by the feet of the occupants. The thickness of the rear seat cushion should not be less than 10 inches nor more than 12 inches, the slant from back to front 3.5 inches and the back to be properly shaped and thick.

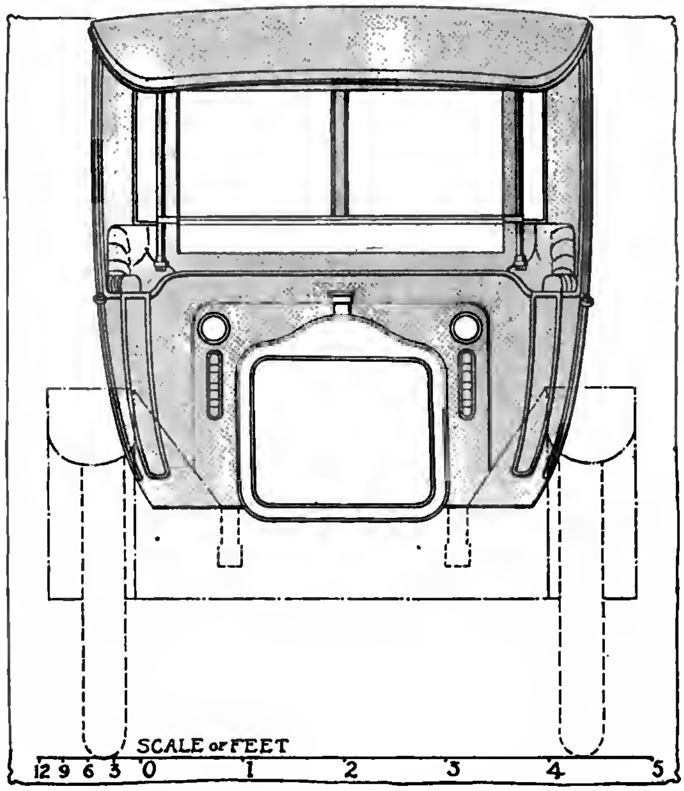

Fig. 3—Front view of limousine-landaulet design

For touring the trimming should be fitted with slip covers, so that the interior can always be made clean and free from dust. When selecting the trimming of a closed body it is becoming more the custom to consider the material and fitting from a sanitary standpoint. Many bodies are now finished inside entirely with wood except the seat cushions and the backs and sides of same. Charming effects are produced with these wood interior decorations and some combinations with wood panels and cloth borders form artistic and beautiful contrasts.

The tendency for beautiful dark colors is the prevailing idea in painting this year, and for the design illustrated, a rich dark blue for the body panels with the upper part black and black mouldings would be very suitable. The chassis could be painted blue, like the panels, with lighter blue and black striping.

The detail construction of the top will form the subject of the article to follow, in which a description of three methods of folding tops of these vehicles will be included.

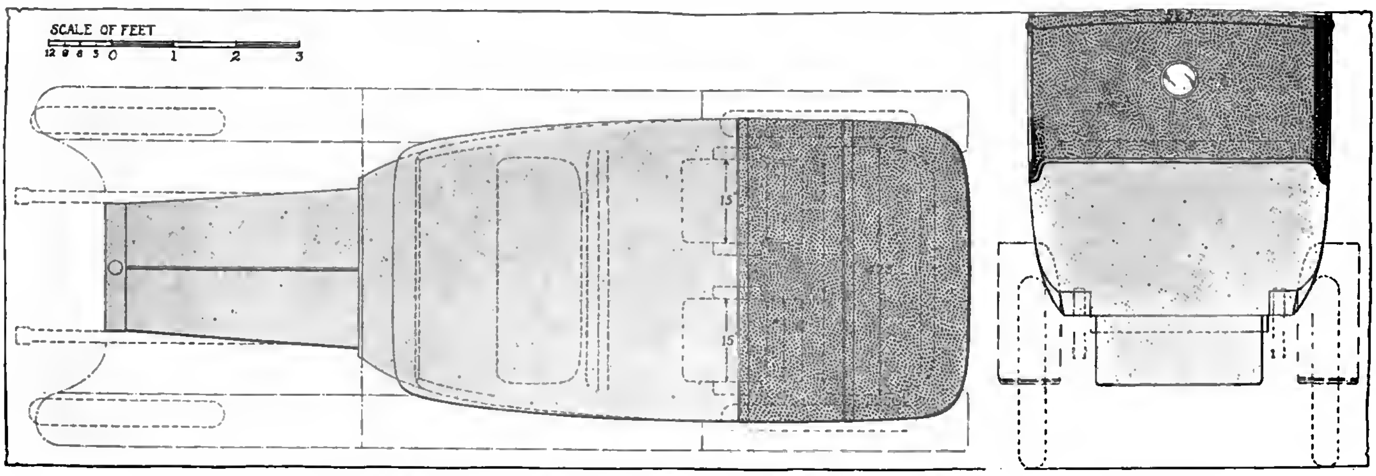

Fig. 4—Plan and rear elevation to scale of suggested limousine-landaulet body

Salesmen's System Used by Pierce-Arrow Distributing Agent

Complete Scheme for Recording Prospects, Follow-up Work, Sales and Their Exact Money Value Make Foss-Hughes Co.'s Selling Organization Strong —Nine Blanks Handled by Salesmen and Office Are Used

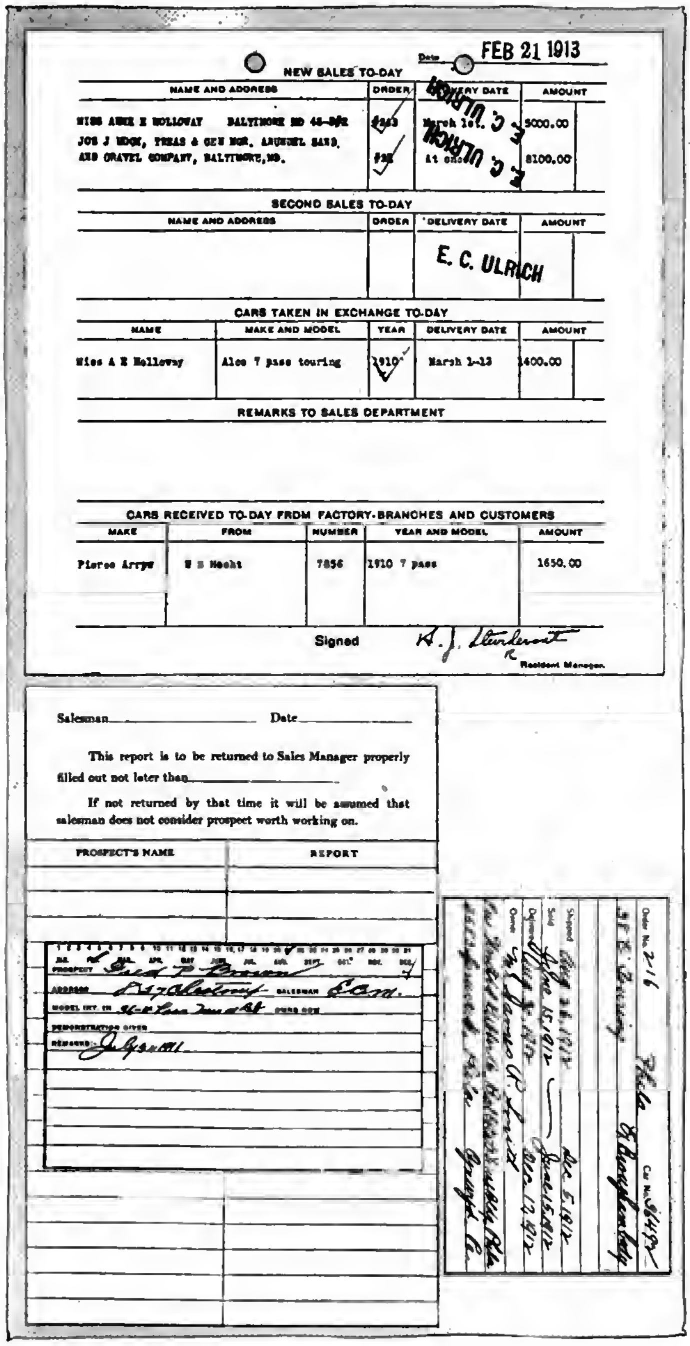

Fig. 1—Daily rocord sent from Foss-Hughes branches to Philadelphia main office
Fig. 2—Monthly salesman's follow-up report
Fig. 3—Prospective customer's filing card
Fig. 4—Card used by the Foss-Hughes Co. for making file records of car sales

SALESROOMS are no exceptions to the rule that a good system—which, it stands to reason, is the only kind worth using—tends in every case of its application to reduce loss and waste and to augment profits. A good salesroom system has the purpose, not to enslave the salesmen, but to make them freer in their application to their work and to prevent losses of sales by neglect on the part of individuals. Incidentally, it affords a possibility for the sales manager to gauge the men of his staff and to supply them with opportunities for increasing the business of the company and their own income. In short, a salesroom system enables a manager with brains to bring all his executive abilities into play.

Coming down to specific instances, it is a striking fact that the companies selling the highest-priced cars in important cities are almost unexceptionally using sales systems. One excellent system is in use by the Foss-Hughes Co., who has the Philadelphia agency of the Pierce-Arrow company and it is described below in detail, together with a complete set of illustrations of all the forms used in connection with it. The company has branches in Philadelphia, Baltimore, Providence, Wilmington and Washington. The Philadelphia office employs four salesmen for city work and a traveling man working on the road throughout the year. There are nine forms, as follows:

1. **Salesman's daily report.**
2. **Prospect's file card.**
3. **Salesman's monthly report.**
4. **Contract sales blank.**
5. **Sales file record card.**
6. **Sales force monthly record.**
7. **Second-hand car stock record.**
8. **Daily business report to main office.**
9. **Traveling salesman's weekly report.**

The order in which these forms are mentioned indicates the order of their application in case of a transaction beginning from the first visit to the final sale, including the trading in of a used car, if such is the case. The best way of forming a conception of the workings of the system is by considering each form in the order of use.

1. **Salesman's Daily Report**—Whenever a salesman comes in the store at evening, he fills out the daily report, using for this purpose a copy of the blank, Fig. 7, and making out a carbon copy. He enters the date of the day on the top of the sheet and then enumerates his various visits and their results. The sheet used for this purpose is printed on rather thin white paper, which is lined and printed black and 8.5 by 5.5 inches. Having done this, he signs the report, turns over the original to the office of the company and keeps the carbon for himself, storing it in a suitable place in his desk. Of course, he has his own pocket records in addition to the large daily reports, so that at any place and time he can inform himself on the condition of any pending or possible deal by referring to a notebook. All the salesmen's reports of this kind are kept together in one file in order of the dates, being ready for reference at any time.

2. **Prospect's File Card**—When the salesman's report is re-

¶ The system, while using nine different forms, is not cumbersome and imposes upon neither the energy of the salesmen, whose business it is to sell automobiles, nor upon that of too great a part of the office staff. ¶ The management sees to it that the system works out to the advantage of both the business and the salesmen. System is considered by it a helpful brownie and not a specter haunting the men when they are at work. This causes the men to adhere to the system. ¶ By promptly living up to the requirements of the system, the salesmen's work is made easier, as a number of detail operations otherwise weighing on their shoulders is removed, enabling them to devote all their energies to the work which is worthy of their efforts and to always operate at high efficiency.

ceived by the office, it is turned over to a clerk, whose business it is to put the information in a more handy form. For this end, a prospect's card file is used, in which there is a card for every person called upon by any one salesman of the force. This card is shown in Fig. 3; it is 5 by 3 inches, printed on thin white cardboard with blue lines and black letters. In filling out this blank the clerk first records the date, as he transfers the information from form, Fig. 7, to form, Fig. 3, in the same order as they appear on Fig. 7. The date of the first call is recorded by checking off the name of the month and the day of the month, as seen in the illustration. Then follow the name and address of the prospective customer. Spaces are provided for recording the dates of later calls and of a demonstration, if such is given, as well as the result of the same. The name of the salesman or rather his initials, the model of car in which the person visited by him is interested and the make of car owned by him at the time of the visit are also recorded in spaces provided for these records.

3. **Salesman's Monthly Report**—In order to keep prospects properly followed up, the sales management of the Foss-Hughes Co. makes use of monthly report orders, Fig. 2, a white blank, 5.25 by 8.5 inches in size, and lined and printed in black. About once in 4 weeks the sales office goes over the files of prospective customers which contain the cards, Fig. 3, and makes out one or more report orders for each salesman, on which the names of his prospects, so-called, and space for a report on the status of each case are given. After 10 days the report must be returned to the sales manager with an intelligent statement of each prospect's case. Whatever cases are not reported on satisfactorily become lost to the salesman; assuming that he is not pushing the prospect properly, the card is removed from the salesmen's prospects' file and placed on the open file, which is ready for any salesman's reference. Whoever follows up a prospect filed in this file is credited with the sale. This scheme naturally stimulates every man on the staff to close his sales as rapidly as possible.

4. **Contract Sales Blank**—When a sale is closed the salesman dictates the sales contract which is made out in the office, using a form, Fig. 5, the reverse of which is shown in Fig. 6. The contract blank is 9.5 by 11 inches and is made out with a carbon copy on green paper. Reference to the illustrations shows that the contract is a fine example of this type of form, providing for all necessary points of information and leaving no room for any doubt as to its contents. When the deal is closed, the salesman signs for the company and the purchaser opposite to the space for the salesman's signature.

5. **Sales File Record**—Sales are recorded on cards which are kept in a file; a sample card is illustrated in Fig. 4. This card is 5 by 3 inches and on the front side, Fig. 4, the name of the purchaser and his address, the model of car sold to him and

REPORT FOR WEEK ENDING ____________________

	Place.	Hotel.	Owners Seen.	Prospects Seen.	Sales.
MONDAY:					
TUESDAY:					
WEDNESDAY:					
THURSDAY:					
FRIDAY:					
SATURDAY:					

Expense For Week:

REMARKS:

Fig. 9—Weekly report blank used by the Foss-Hughes Co.'s travelling salesman

the dates of sale, shipment from factory and delivery to owner are recorded. The orders are numbered consecutively every season but are filed alphabetically according to the owners' names. The same card shows that a car was sold to James R. Smith on June 15, 1912, this being a 38 C touring model; it was shipped from the factory on August 26 and received by the owner on August 30. At the same time with the car the salesman sold to Smith an extra brougham body, to be delivered on December 17. Consequently, this body was shipped from the factory on December 5. The reverse side of this card gives the analysis of the sale, the amount paid for the car and the allowance made for a used car, if one was traded in. The same applies to the body, so that by a glance at the card the entire transaction may be overseen from the viewpoint of profit.

6. **Sales Force Monthly Record**—As soon as a sale is made it is also registered on a monthly sales sum-up sheet, Fig. 10, on which all the salesmen's names are entered. The date, model and price of each transaction is thus recorded, and at the end of the month it is easy to total the work of each man and to make out a comparative statement showing the business of each member of the sales force. Such a statement is considered an effective stimulus to slow salesmen.

7. **Second-Hand Car Stock Record**—As indicated above, the Foss-Hughes Co. accepts used cars when selling new ones and makes an allowance for their value when turned over. It is the consensus of general opinion that with sufficient capital on hand and with a correct valuation of the used car, an individual company can make good on the used-car proposition, although this does not solve the problem of the second-hand automobile so far as the industry as a whole is concerned. In order to be able to push the sale of used cars in cases where a new car cannot be placed, the company supplies small booklets to its salesmen and in these booklets fit thin, loose leaves, 4.5 by 2.5 inches, Fig. 8. When a used car is taken over by the company the sales department office fills out a loose leaf, for each salesman, which is given to the latter so as to keep him informed of what the second-hand department affords. Of course, when a used car is sold, the salesmen are informed to that extent so that they can remove the respective leaves from their books. The leaves are kept in the books, segregated into departments which differ between Pierce-Arrow cars ready for sale, such in the shop and likewise such coming to the company at a near date; and other than Pierce cars coming to the company and ready cars. Each slip, as Fig. 8 shows, gives model, description, equipment and price of the used car.

8. **Daily Branch Report to Main Office**—As the Foss-Hughes Co. operates in five cities, it is necessary for the four branches outside of Philadelphia to send regular reports to the main office at that town. The form, Fig. 1, is used for this purpose. It is 8.5 inches square and printed black on green paper. The report enumerates and details on the sales of new and used cars made during the day, the car receipts from the factory and has a space for remarks to the Philadelphia sales department. A carbon copy of this report is filed in the branch office, while the original goes to Philadelphia.

9. **Traveling Salesman's Weekly Report**—The traveling salesman mentioned at the beginning of this article not only sends in a daily report, Fig. 7, but also a week-end statement. The Saturday report, Fig. 9, is made out on thin, white paper, 8.5 by 5.25 inches, which is typewritten as seen in the illustration. The statement gives his stopping places for all days in the week, the number of owners and prospects whom he visited, and the amounts of the sales he closed from day to day. The bottom line of the report sums up all items for all 6 days of the week.

The only shortcoming of this system is the lack of a blank for reminding the salesmen of appointments. This could be done by having salesmen include on their daily reports the next appointment with each respective prospect. The clerk who handles the prospective customers' file would also have to work a card file containing appointment memoranda as follows:

March 17, 1913. (Prospect)
Oliver P. Smith. (Salesman)
Benj. McK. Snodgrass, 1507 N. 47th St.
38 C Touring. (Model int.)

All these cards would be kept in the order of their dates, and every day the clerk would take out all the day's appointment cards and hand them to the respective salesmen.

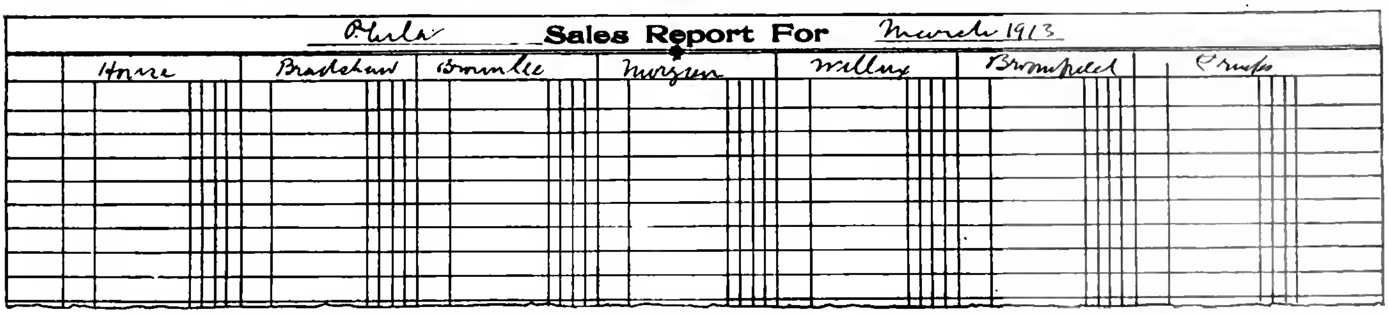

Fig. 10—Monthly comparative record sheet, on which the sales of all the salesmen of the company are entered

The Engineers' Forum

Economy in Motor Fuel

Testing Various Combinations of Kerosene, Gasoline and Ether as Fuel for Motor Vehicles

¶ C. W. Prochaska thinks that the adoption of kerosene as a motor fuel would result in an increase in price, due to the stimulated demand.
¶ W. O. Dixon gives information on the use and abuse of Motor Spirit, the new fuel for automobiles and motor trucks.

NEW YORK CITY—Editor THE AUTOMOBILE:—In our experimenting we have followed lines somewhat different from those usually taken. We have aimed to strike a happy medium and to go to the extreme on a Simplex car rated at 50 horsepower. Since last August we have used 70 per cent. kerosene, 29 per cent, 72-test gasoline and 1 per cent. ether. The cost averaged $13.80 per hundred gallons.

On several trucks we used straight 70 per cent. kerosene and 30 per cent. 70-test gasoline. In each case we supplied a small 1-gallon tank placed between the cylinders of the motors or else on the dash. Ordinary gasoline was used for starting the motor. We recommended that the motors be treated with an ample charge of denatured alcohol about twice a week, after the vehicles were turned in at night.

Our objects for making these tests were several. Kerosene alone will always give more or less trouble because of the extreme necessity to vaporize it under all conditions, especially on cold days, the number of connections and the fact that for starting the motor a fuel of higher test than kerosene is required.

From our experience, the use of kerosene alone is bound to create carbon. Without carbon, no explosion will take place. The odor is very offensive. We have used kerosene without the addition of water but the necessary fittings are so costly as to render this prohibitive for use in commercial vehicles. After careful investigation, we have come to the conclusion that, should kerosene come to be used as fuel for automobiles or commercial vehicles, the price would not remain the same because the increased demand would unquestionably cause the producer to raise the price. Also the adoption of kerosene in place of gasoline would necessitate radical changes in the motors themselves as well as in carbureters.—C. W. PROCHASKA, Gallagher-Tompkins Co.

On the Use and Abuse of Motor Spirit

CHICAGO, ILL.—Editor THE AUTOMOBILE:—The new power fuel Motor Spirit, while being designated chiefly for heavy duty gasoline engines in automobile trucks, tractors, etc., will undoubtedly find its way into the tanks of many pleasure cars, on account of its greater range of mileage and its lower cost.

Motor Spirit, while it belongs to the same group as naphtha and gasoline, differs in some respects, and must be used according to its peculiarities. For purposes of power, in the production of which it ranks well up with the so-called high-grade gasoline, Motor Spirit yields an increase of over 10 per cent., and is adaptable to all styles of motors now using gasoline.

The pungent odor noticeable from the liquid Motor Spirit, which is in some cases disagreeable, is almost entirely absorbed in the process of combustion, and leaves the exhaust almost odorless.

The bluish-white or gray smoke noticeable in the exhaust is not continuous, but is due to a sudden opening of the throttle, which throws an abnormal load on the carbureter and intake manifold, causing unusual friction of air along the inner surface of the manifold, which friction absorbing suddenly all liquid drops caused by condensation along the walls of the cold piping, carries into the combustion chamber a charge of raw spirits too rich to be entirely consumed, so is exhausted in the form of smoke, or incomplete combustion.

This fault is noticeable only in the colder weather and in a cold motor, and can be entirely, or nearly, overcome by jacketing the intake manifold above the carbureter, either for warm water or the hot blast from exhaust. If jacket is attached it should cover as much of the manifold as is practicable, and by all means should cover the parts which lay horizontal, and in which are possible pockets for lodgment of any fluid condensation.

If warm air is to be taken through the carbureter, it should be taken at both the initial, or primary, air intake, and the auxiliary or high-speed part, so that sudden opening of throttle will not cause the motor to load or back-fire when cool. The carbureter should be adjusted to a warm motor, as this is its running condition, generally allowing more air in proportion for the spirits than for gasoline, keeping the volume of mixture as thin as possible, that is feeding as little fuel as possible.

The thinner the mixture, the less the condensation. The less the condensation, the less the smoke. The less the smoke, the more the mileage.

The walls of lubricant built up in the cylinders and on the piston are not affected by Motor Spirit as quickly as by gasoline, which indicates that the amount of oil being used with gasoline can be materially decreased with perfect safety in using the Spirit. In brief, the best results, both in power and mileage economy, from the use of Motor Spirit, are obtained with just as small amount of both lubricant and fuel as is possible, using kerosene as a cleanser frequently—about a pint through primer, or through carbureter directly into air intake, once a week, and keeping the ignition system in tune.

Again—do not use an over-rich mixture.—W. O. DIXON, Standard Oil Co. of Indiana.

SYRACUSE, N. Y.—Editor THE AUTOMOBILE:—One big source of gasoline loss is in small leaks. Very frequently the gasoline valve or some of the unions leak just a drop now and then, but inasmuch as this drop is going on for 24 hours a day, it amounts to a great deal. For this reason all such places should be examined at regular intervals.

Touring in the country gives the best possible chance for economical operation, as it allows the motor to be used at a more economical point in its power. Probably 20 miles per hour represents the best speed for economical operation.—ARTHUR HOLMES, H. H. Franklin Mfg. Co.

Replacing Dry Cells with Storage Battery—Transmitting Power Through Spring—Cleaning Mohair—Long Stroke Advantages—Removing Carbon Deposit Pressures in Different Parts of Motor—Friction Drive—Strange Spark Plug

Using 6-Volt Storage Battery

EDITOR THE AUTOMOBILE:—In your department of Letters Answered and Discussed in THE AUTOMOBILE for March 6, you discussed the use of a storage battery to replace dry cells in the Delco ignition system for a 1911 Cadillac. Your subscriber asked whether he could replace the dry cells with a 6-volt battery and generator. I have been considering the same change with the exception of installing only the battery, but was dissuaded from doing so by the Cadillac people, who said, if I understood them correctly, that the system was made for dry cells and that it would not operate with a storage battery. Did I get this right? If I can replace the dry cells with a 6-volt battery I should like to do so. Perhaps I misinterpreted the discussion of the matter in THE AUTOMOBILE, as perhaps the additional unit of which you spoke was necessary because a generator was to be used. Could a 60-ampere-hour 6-volt battery be used in this case, or would it require an 80-ampere-hour 6-volt?

I might state that my principal object in changing from dry cells to a storage battery is to secure a trouble light for use in inspecting the engine and for tire troubles at night.

New York City. J. D. MARTIN.

—It would not be a feasible plan to use the storage battery for ignition unless you were installing a complete generator set, as mentioned in THE AUTOMOBILE for March 6 under the head of Letters Answered and Discussed. The reason for this is that the amperage of the storage battery of ordinary size would not be high enough. The best way to handle the situation would be to use your dry batteries for ignition and to purchase a small storage battery, say of 40 ampere-hours capacity, for exclusive use in your trouble-finding light. You could purchase the battery and lamp complete from any of the automobile supply houses for about $10. This could be recharged when necessary at a cost of about 25 cents. With one of these sets the lights would burn for more than 10 hours when used intermittently.

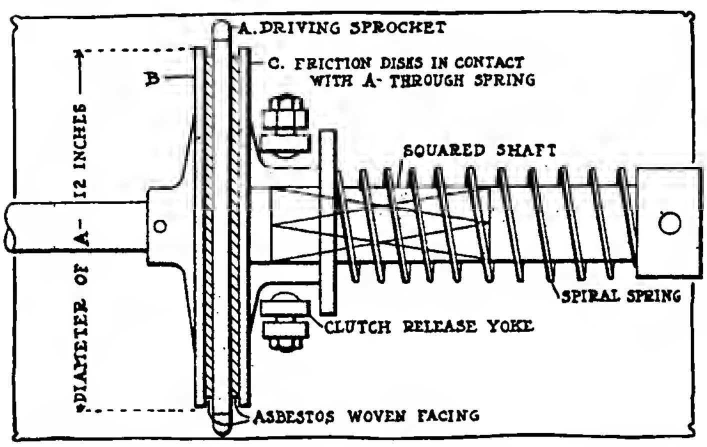

Fig. 1—Drive suggested for cycle-car type of vehicle with 10-horsepower motor

Spring Pressure to Transmit 10 Horsepower

Editor THE AUTOMOBILE:—I am building a light four-wheeled vehicle on the lines of the cyclecar now so popular in Europe, and would like to know how big and how much spring pressure is needed for the clutch in the accompanying drawing, Fig. 1, to transmit 10 horsepower for a car weighing, with two passengers, 800 pounds complete.

A is the driving sprocket held in contact with B and C disks by spiral spring, diameter D is 12 inches faced with Raybestos or similar material. Kindly let me know how much spring pressure is needed to transmit 10 horsepower to such an 800-pound car with a four-to-one gear ratio and 28-inch wheels?

New York City. WILLIAM SCHULZE.

—You would require 200 pounds for an absolutely sure drive. This is not an abnormal spring pressure for even a light car and could be readily controlled by a good linkage. The diameter of the spring is determined by the amount of space you can leave for it. The bigger the diameter, the more resilient the spring.

Cleaning Mohair Top

Editor THE AUTOMOBILE:—I have a mohair top on my automobile that is lined with a blue cloth. The cloth is badly stained and I would like to clean it. Is there anything that you know of with which it can be cleaned?

Ravena, N. Y. L. T. BURNS.

There is only one way to clean mohair. That is by the use of castile soap and warm water. If you attempt to use gasoline or any of the other volatile cleaners you will destroy the rubber interlining in the top and render it leaky. The method of procedure in cleaning is as follows:

Secure a fairly soft nail brush from any drug store and a cake of pure castile soap. Bring a pail of water to the boiling point so that by the time you get the water to the scene of operations it will be at about the temperature at which you can dip your hand in it without fear of scalding yourself. Dip the brush in the water and then rub it over the surface of the castile. This will coat the bristles of the brush with soap. The spots on the cloth are rubbed thoroughly with the soap until the white lather which will appear when first rubbing has nearly vanished. With a sponge wipe off the soap and allow the top to dry. If the spot reappears on drying, the process should be again repeated.

Buying Second-Hand Car

Editor THE AUTOMOBILE:—I should like to ask a few questions regarding second-hand automobiles. Could one buy a second-hand Hupmobile for $250?

2—What is the cheapest four-cylinder runabout manufactured?

3—How long has the Ford company been building the model T?

4—What should a second-hand 1911 Ford model T sell for?

5—Who makes parts for the Dragon car?

Washington, D. C. G. E. S.

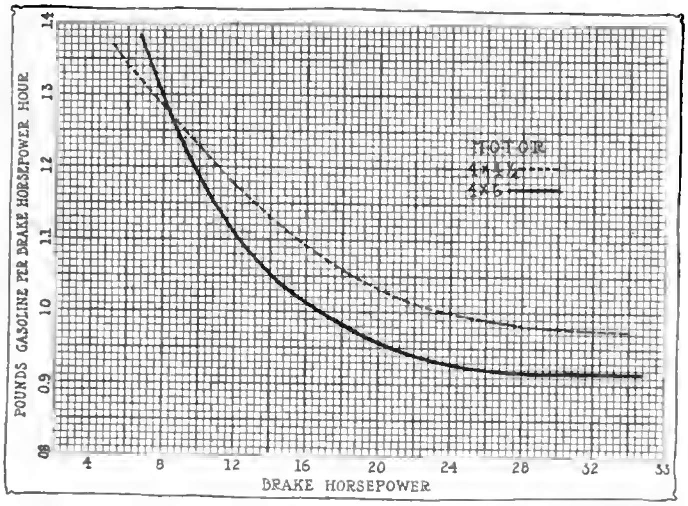

Fig. 2—Relative economy of two motors tested by the Moline company to show comparison between long and short stroke

—1—The price of the car when in the second-hand market depends on its condition in the first place and in the second place upon how anxious the owner is to change it for cash. There have no doubt been second-hand Hupmobiles sold for $250, even in the 1912 models, but the price, as a rule, is above this. This is natural when it is considered that the price of the new car is $750.

2—The cheapest runabout with four cylinders is the Metz. This is a water-cooled car of 22 horsepower with friction drive and sells for $445.

3—This is the fourth year that the Ford model T has been on the market.

4—The price depends altogether on the condition of the car and may range anywhere between $50 for a car which has seen nearly the last of its useful service, and the regular retail price of the car.

5—These parts may be secured from the Auto Parts Co., Detroit, Mich.

Advantages of Long Stroke

Editor The Automobile:—1—What main advantages has a long-stroke motor over the short-stroke type? What advantages has a short stroke over a long?

2—Is the efficiency of an underslung frame greater than that of an overslung? If so, how much and why?

3—How much more brake horsepower will a Knight motor develop than a poppet-valve motor?

4—Is there any difference in the quality and workmanship of a high-priced machine and that of a medium-priced car?

5—Will a six-cylinder motor of the same piston displacement as a four have more power and speed?

6—What is the bore, stroke, clearance and wheelbase of the big six-cylinder American underslung?

Lakewood, O. C. S.

—1—The long-stroke motor is more economical than the short-stroke type. The number of reversals of direction of the piston is less than with the short-stroke motor for a given piston displacement per minute. The motor is more flexible and has a greater reserve power. On the other hand, the short-stroke motor is lighter for the same horsepower, does not require such a high piston speed for a given number of revolutions per minute and gives the snappiness which is desirable in a high-speed motor.

2—There is no difference in efficiency in the drive of the two types of car. The center of gravity of the underslung model is lower than that of the overslung model and hence it is not so easily overturned.

3—This question cannot be answered definitely because it depends too much on the condition of the motor. For the same piston displacement per minute, however, the power developed will be about the same. The big advantage of the Knight motor lies in its silence which is equalled only by the most carefully-designed poppet types.

4—It would not be fair to state that there is better workmanship on the higher priced cars than on the medium. It is a fact, though, that there is more workmanship in parts which are not so essential except for appearance sake. This is in the line of finishing the exterior and castings, etc. It is but natural that when a man pays more for a car he gets his money's worth in time spent in manufacture, material and finish.

5—The six-cylinder motor will have less vibration and a more even torque output. The vibration of the six will be less. Otherwise there will be very little choice. The main advantages of the six-cylinder motor are its sweetness and smoothness of operation.

6—The particulars of the 6-66 American underslung are as follows: Bore, 4.5 inches; stroke, 6 inches; clearance, 12.5 inches; wheelbase, 140 inches, and wheels, 39 inches in diameter.

Removing Carbon Deposits

Editor The Automobile:—Is there any good way in which carbon deposits can positively be removed from the motor without taking it down and scraping? Are carbon removers what they are claimed to be and are the Six Little Yankees as good as the fluid removers?

Woodland, Pa. G. B. Shivery.

—There is only one way of positively removing all the carbon from your cylinders. That is by taking down the motor and manually scraping it out. Solvents of liquid nature do not do this any more than do solid solvents of the nature of the Six Little Yankees carbon remover, which you mention. Both of these solvents act in the same way. They are first gasified and the gas dissolves the projections of carbon. A smooth, flat layer of carbon on the top of the piston will not noticeably affect the motor. When a carbon deposit is built up in the form of a cone, however, the point or apex will eventually start to glow and this will result in pre-ignition and a knock in the motor.

Regarding Clement-Talbot Motor

Editor The Automobile:—Kindly answer the following questions regarding the Clement-Talbot racer:

1—How can this car have a compression of (according to your chart) approximately 145 pounds per square inch without causing pre-ignition?

2—Would this high compression be practical for commercial or pleasure cars?

Brooklyn, N. Y. Edgar Youngdahl.

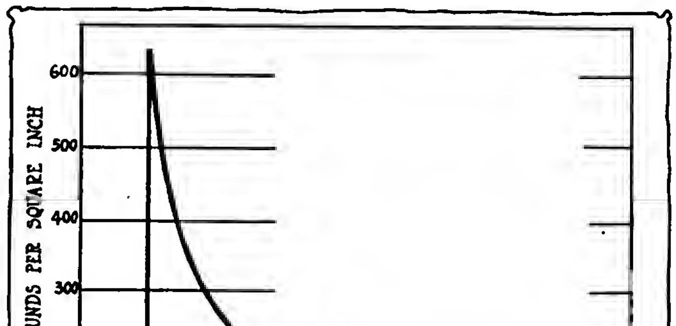

Fig. 3—Indicator card taken from Clement-Talbot motor. Compression pressure is about 120 pounds

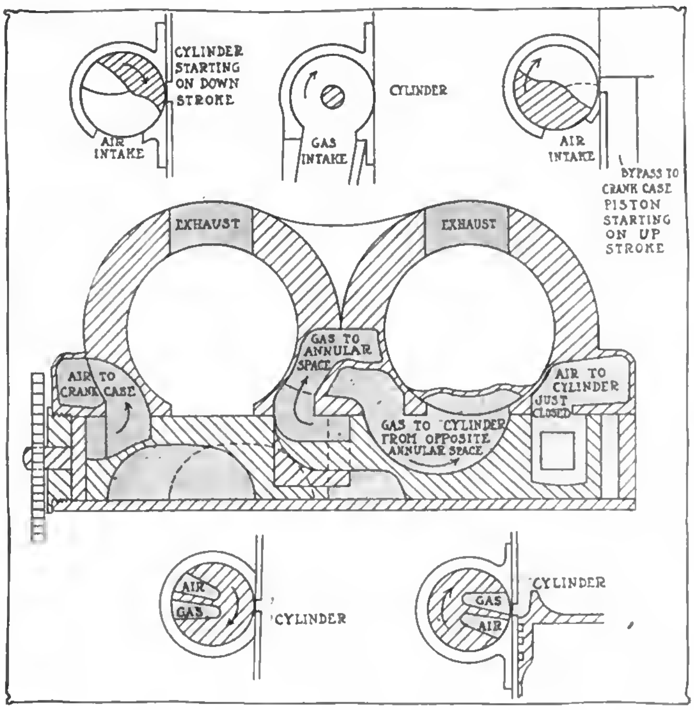

Fig. 4—Two-cylinder scavenging motor in which the gas is compressed in the annular space surrounding the cylinder and the scavenging air is taken from the crank case of the motor

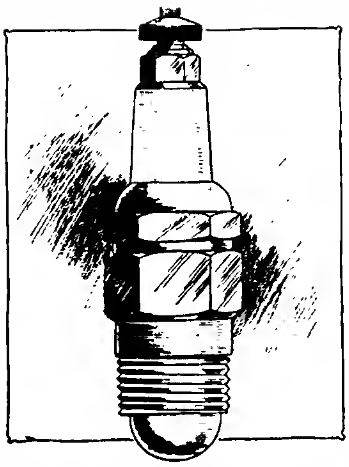

Fig. 5—Spark plug with globular base for which a reader is searching. The electrodes are evidently within the globe or the spark jumps from the rim to the globe

—1—If you will note the indicator card, Fig. 3, taken from the Clement-Talbot motor you will notice that compression pressure is about 120 pounds per square inch. The first part of the upward line being due to ignition or the beginning of the explosion stroke. It is possible to get this compression pressure without pre-ignition.

2—This compression pressure would not be practical for motors used in passenger cars or trucks as it has been found from practice that the efficiency drops off when the compression becomes too high. According to theory, the efficiency would be higher but difficulties in cooling and in getting proper combustion make the theoretical condition hard to obtain in practice.

Questions of Motor Pressure

Editor THE AUTOMOBILE:—What is the highest vacuum in the intake pipe of the average automobile motor?

2—What is the highest pressure of gas compression in the cylinder of the average automobile motor?

3—What is the highest pressure of gas after ignition in the cylinder of the average automobile motor?

4—What relation exists between these pressures? In other words, does a high-compression engine have a pressure after ignition correspondingly higher than usual, and a low-compression engine, etc., and to what degree?

5—What is the usual Diesel practice regarding pressure before ignition and after?

Philadelphia, Pa. J. H. B.

—1—The pressure in the intake pipe of the average motor is generally about 12.7 pounds absolute at average motor speeds or 2 pounds vacuum.

2—The average new automobile motor has a compression of 60 pounds to the square inch.

3—The pressure of the gas after ignition runs up to about 300 pounds to the square inch.

4—The relation between these two pressures is that which would be concluded in a formula which takes in the initial volume of the gas. That is to say, such a formula as $PV^n = a$ constant. In this formula P equals pressure and V the volume. Where the volume remains constant and the pressure rises the total pressure at the end of explosion will not bear a direct ratio to the volume except in that the higher the compression the higher the initial pressure and therefore the higher the mean effective pressure.

5—The Diesel compression pressure is 525 pounds per square inch. The fuel is injected at about 800 pounds and explosion pressure is the same as the compression pressure owing to the fact that this motor expands the gas for a short time under constant pressure.

Suggested Two-Cycle Motor Design

Editor THE AUTOMOBILE:—I have a design for a scavenging two-cycle engine, and would be pleased to have your readers express an opinion as to whether the same is practical or not.

Gas is compressed in the annular space surrounding cylinder, as in the Elmore engine, and supplied to the companion cylinder as the sketch, Fig. 4, indicates, while the scavenging air is supplied from the crankcase, as is also indicated in the sketch.

The distributing valve rotates at the same speed as the crankshaft, and is intended to control the air intake to both crankcase and gas intake to annular space surrounding the cylinder.

This cylinder should be arranged so as to be capable of retarding or advancing its rotation so as to supply more or less of the scavenging air, retarded for light loads and when running fast, and advanced when starting or running slowly to supply a rich mixture.

The question with me is, whether there would be a sufficient time for the transfer of both scavenging charge and mixture to the cylinder. I think it would be necessary under any circumstances to so construct the motor as to develop considerable compression of the gas mixture in the annular space surrounding the cylinder so that it would be transferred to the cylinder with great rapidity, and the volume of this gas should not exceed 80 per cent. of volume of the cylinder.

I have made the suggestion to an engineer of some prominence and he seems to think it is entirely practical, but would require some experimental work and considerable expense before its practicability could be demonstrated. As I have not the means to carry out the necessary experimental work I would like some further opinion regarding the matter.

I am aware that the arrangement of the crank is not conventional in this motor, but could be easily arranged for a crank of the usual type in order to avoid unnecessary vibration. With this type of engine it might be of advantage to control the admission of air from the crankcase by means of a governor so that the air passages would be closed on starting the engine and opened gradually as the speed of the engine increased, in this way performing practically the same function as the auxiliary air intake usually found in most of the carbureters of latest construction.

Grafton, W. Va. R. H. POWELL.

Looking for Strange Plug

Editor THE AUTOMOBILE:—Last summer I saw a spark-plug which I never saw used before and have inquired of about a thousand users and sellers of spark-plugs, but as yet have not found out the maker or anyone that sells or knows anything about one like it. The strange part of the plug is the part marked A, Fig. 5, a half sphere with no holes to let out the spark and apparently made of mica and neither positive or negative electrodes can be seen from without. There was no name or patent mark anywhere on the plug.

The plug was picked up on the floor of a repairshop and none of the owners of cars that were in the shop at the time knows anything about this freak and I understand the plug has now been stolen so it is impossible to send you the original for identification.

Can The Automobile assist me to find out the name of the maker or where they may be bought?

Trenton, N. J. Frank C. Wright.

—The plug which you describe, and which is illustrated in Fig. 5, does not correspond to any of the well-known makes on the market. Perhaps one of our readers, seeing this, may be able to help you find it.

Managing Friction Drive

Editor The Automobile:—In driving a car with a friction transmission how is it possible to tell whether same is slipping or not? I understand that to get the best results with this form of transmission there should always be just sufficient pressure between the disk and friction wheel to carry the load without slippage, but do not see how the driver can maintain this pressure which must constantly vary.

2—In the Cartercar the shifting lever cannot be moved until the pressure between disk and wheel is released. Why? I can see no good reason why the wheel conld not be moved along the disk without releasing the pressure. If this could be done it would greatly simplify the handling of the car.

3—Is there any advantage of placing a screen or other device in the inlet pipe for the purpose of better carburetion? If there is anything gained by the use of these devices why are they not more generally used by manufacturers?

4—What size wheels and tires are used on the majority of racing cars?

East Canaan, Conn. D. C. Canfield.

—It is possible to tell whether the drive is slipping or not by observing if the motor appears to be running faster than the load, that is to say, when climbing a hill if the motor appears to be running just as rapidly as it did on level road while the car moves forward at a greatly reduced rate of speed, owing to the load. It is true that there should be always just sufficient pressure between the disks to just carry the load, but this is out of the control of the driver and is merely up to the designer. If the drive is not slipping there is no need for you to worry about the pressure between the disks as this has been worked out at the factory before the car was delivered to you. In case the drive is slipping, however, you should write the factory and consult them as to replacing the friction band on the driving disk.

2—It is not reasonable to suppose that where the friction between the driving and the driven member is great enough to propel the weight of a motor vehicle and its occupants at a high rate of speed along level ground and up hills that the operator can readily shift these members in relation to one another. This is especially the case where they are both in motion and where the irregularity of surface of one fits into the corresponding irregularity of another.

3—Tests have been held with these screens and other devices which show better results than without them at certain speeds. This is due to the fact that they break up the gasoline. They are comparatively new and makers have not as yet become convinced of their usefulness. This is perhaps due to the fact that some of these devices were not a success.

4—The size of tires on racing cars depends altogether upon the weight of the car. The 36 by 5 size is very popular.

Explains Ford Magneto Trouble

Editor The Automobile:—In your issue of February 29 a subscriber complains that he had no spark with a Ford model T when the engine was hot. Your answer is that a hot engine is easier to start. The Ford has a flywheel magneto that will get so hot on long climbs in low gear that the magnets are temporarily weakened and the current is too weak to give a good spark.

I have more than once encountered this condition in severe mountain work, but the car will fire as well as ever if given a rest of 15 or 20 minutes. Subscriher's trouble was probably a piece of dirt under the spring at the magnets' terminal.

Denver, Col. J. A. Valentine.

To Join Protective Association

Editor The Automobile:—Please inform me how I can join the Gasoline Engineers' Protective Association of New York?

Brooklyn, N. Y. E. H. G.

—Address the secretary at 210 West One Hundred and First street, New York City.

Utilizing a Profit

AN automobile dealer in a large American city recently made the astounding confession that, although purchasing gasoline wholesale at 10 cents a gallon and retailing it at 20 cents, he was not breaking even. It is nearly impossible to conceive of such a condition, remembering as we must that the gasoline was delivered into his storage tank underneath his garage, so that all he was compelled to do with it to make his profit was one handling, namely, from the storage tank into the tank of the automobile.

Where did the profit go? There are divers answers. Cheap help, susceptible to favoritism from buyers, accounts for part of the profit. Over-measure was given to many, and under-measure to a few. The system of handling was poor. The pump on the storage tank was not locked. Every time a little gasoline was needed for any purpose a small pail or can was taken to the pump. It was half filled, perhaps filled, and often little over a cupful used. The ramifications of such waste are many. It was waste in one place and waste in every place.

All he lacked was business training. He thought that enthusiasm was all that was needed. He had this, but had little else. This is a business generation, and only the dealer who conducts his business on legitimate, up-to-date lines can continue in the field.

Raising a Revenue?

A FEW New York State legislators are endeavoring to double the annual registration tax on automobiles and to make the tax on commercial vehicles as much for each ton of useful load carried as it is to-day for the entire truck. These same legislators advance as their only argument the solitary fact that automobiles and motor trucks destroy the road surface and as such they should pay the bills. In the same breath they say that taxation on vehicles should be in proportion to the amount of road destruction, and yet they let all horse vehicles go without any taxation, and while endeavoring to double the motor vehicle fees continue to keep away from taxing horse vehicles as consistently as ever.

This condition of affairs is not a new one, it is well understood by all. It was well understood three years ago when the present Callan law was accepted by the motorists, who, when accepting a state registration tax, realized that such a tax was illegal except insofar as it was needed to cover cost of identification. It was accepted by the motorists three years ago because of their desire to co-operate with the legislators in obtaining a rational working law. The motorists were willing that excess registration fees should go to the road improvement work. The legislators accepted the matter in this spirit. In a word, it was a gentleman's agreement and as such it would naturally be expected that its conditions would be observed.

Today, what is becoming of this gentleman's agreement?

Doubling present taxes on passenger vehicles and multiplying them on commercial vehicles is not the treatment that the automobilist of the state deserves and treatment that the automobilists of the state will not accept. The facts convincingly indicate that more revenue is needed, and taxing the automobilist seems an easy avenue of attainment.

Every automobilist in New York State should resist such a course—class taxation. Levying on one class of vehicles because it wears out the highway and letting all other go free.

No better evidence of the new spirit of this generation could be given than the unanimity with which the entire automobile ranks of the state united to counteract such unjust taxation a week ago at Albany. From every corner of the state came the motorists, the farmer-driver sitting side by side with the banker, the lawyer and the merchant and all agreed on the injustice of such taxation. Not only did these motorists come hand-in-hand and fight side-by-side, but they are prepared to combat to the bitter end. They are prepared to take up the only proper course, determine the constitutionality of such a law in the courts. New York automobilists have set an example for the motorists of other states, an example that should be spread country-wide. The motorist does not wish to avoid taxation, but he objects to unfair treatment. He objects to paying it all. Tax every vehicle for the use of the highway in just proportion to the damage done and all will be satisfied. Compel all classes of vehicles to carry lights and to obey the regulations and there will be no dissatisfaction.

S. A. E. Hears Rim Manufacturers in Cleveland

Makers Answer Questions Relating to the Adaptability of Their Rims to Wire Wheels, Etc.—Indiana Section Meets

CLEVELAND, O., March 12—The hearing of rim manufacturers before the pneumatic rim division of the standards committee of the Society of Automobile Engineers was completed here this evening, and owing to the dispatch of the business by Chairman Henry Souther it was possible to complete the collection of data on each type of rim submitted. The meeting was in the nature of a hearing conducted by the special committee to which fifty pneumatic tire, wheel rim, steel band and motorcycle companies were invited to attend and explain their products. About thirty-five rim makers and others interested were in attendance, while ten manufacturers availed themselves of the opportunity to present samples of their rims. Of course, there are many more well-known rims which will have to be seen by the committee, but a very good start was made.

There were three types of rims which were never before exhibited anywhere, these being the new No. 60 Stanweld, which is a light demountable of the split-ring type; the Midgley rim, which is fathered by the United States Tire Co., and a new Goodyear quick-detachable design.

Valuable Data Collected

Each maker was questioned as to the weight of his rim, whether it could be sold in competition, how it withstood service, method of operation, number of loose parts, its adaptability to wire wheels, whether the standard dimensions of the clincher tire association has been adhered to and whether it could be manufactured in any mill without special machinery. Other special questions were put in order to bring out as far as possible every point and feature of every type considered.

Following the explanation of the Standard-Welding quick detachable, which was the last of this type submitted, the afternoon session confined itself to the demountables, which are the biggest consideration of the committee, there being such a wide divergence of meritorious designs.

In addition to the questions asked of the quick-detachable exhibitors those who showed demountables—of which there were ten—were also asked as to the distance between the supports of the outer rim, whether these had any relation to the position of the spokes, as to the waterproof qualities, whether the rim would squeak in extended service, etc.

Much valuable data were collected on each type, and the quizzing of the committee members was assisted by that of the other experts in attendance but not on the committee. Criticisms offered by the latter as to contemporaries' offerings were often edifying to the division.

Nothing whatever was decided at this hearing, it being entirely for the purposes already brought out. The minutes will be gone over carefully in the Society's offices in New York and the data relative to each make will be digested and put in uniform style for the ready reference of the committee.

In closing the hearing, Mr. Souther stated that great amount of information obtained made it very evident that more time was needed by the committee and each rim concern was requested to send its samples to the Society offices in New York in time for the next meeting. In the event of any companies not being able to furnish its exhibits to the committee there, it was requested to at least send blueprints or sketches. The exhibits can be sent at any time.

Mr. Souther assured all that prompt and intelligent action would be taken by the committee and its findings reported as soon as possible.

Following the hearing the committee held a short session to determine just what method of procedure to follow in rounding up the rest of the necessary information and taking care of that already obtained. It was decided to hold the next meeting on April 2 at the New York headquarters.

The concerns having exhibits of demountable rims at the meeting were: American Rim Co. (Lambert), Anglada Co. (Parker No-Felloe), Detroit Demountable Rim Co., Firestone Tire & Rubber Co., R. W. Funk, Goodyear Tire & Rubber Co., Standard Welding Co., Universal Rim Co. (Baker), United States Tire Co. (Midgley). The Mott Wheel Works did not have a sample to exhibit, but by means of blackboard sketches O. W. Mott explained it to the committee. Several other representatives were on hand, but when called upon stated that they had nothing to say or to show at this time.

As reported briefly in THE AUTOMOBILE last week, this rim committee, which was formed at the last semi-annual meeting of the Society, is made up of men who are the recognized authorities on the subject of automobile rims, as well as several prominent engineers. There has been some criticism of the appointment of several of the rim makers on the committee, but it was shown to be desirable to have such experts, for their specialized knowledge of this particular part of the automobile's makeup is invaluable. It would have been a rather noticeable feature if none of these men had been included in the personnel of the division. The number of rim makers is in the minority, however.

The committee is made up as follows: Henry Souther, consulting engineer, chairman; H. L. Barton, assistant director of production, General Motors Co.; G. G. Behn, executive engineer, Hudson Motor Car Co.; T. W. Guthrie, secretary, Standard Welding Co.; F. H. Moyer, experimental engineer, Firestone Tire & Rubber Co.; C. E. Reddig, engineer, Timken-Detroit Axle Co.; W. C. State, mechanical engineer, Goodyear Tire & Rubber Co.; J. G. Vincent, chief engineer, Packard Motor Car Co.; C. B. Whittelsey, factory manager, Hartford Rubber Works Co.; C. B. Williams, treasurer, Mott Wheel Works. Of this committee three members were not in attendance at yesterday's meeting. These were J. G. Vincent, H. L. Barton and W. C. State, who were unable to appear due to other business matters. E. R. Hall, manager experimental department, Goodyear Tire & Rubber Co., substituted, however, for Mr. State.

Indianapolis Section Talks Fuel

INDIANAPOLIS, IND., March 14—The March meeting of the Indiana branch of the S. A. E. was held Monday evening, March 11, in a joint session with the Hoosier Motor Club. The question discussed was Motor Fuels. A paper by A. M. Potter was read by Mr. Tipper, chief chemist of the Texas Coil Company. One of the points brought out in the discussion was that the fuel value of the gasoline cannot be determined by the gravity of the liquid. It was also stated that the increasing demand for gasoline must be met by using some of the kerosene distillates, and that in using kerosene as a fuel it is simply a question of getting the correct temperature to prevent condensation.

Pneumatic Suspension for Varying Load

ONE of the difficulties associated with the use of leaf springs as a means of suspension for automobiles has been the necessity of providing for a varying load. If a car always contained its full complement of passengers the problem of the correct proportioning of the springs would be much simplified. As it is, the variation of load, necessitating a design of spring that is supposed to meet all requirements, means that at no time is the suspension of the strictly correct strength.

Attempted solutions of this problem, in the form of shock-absorbers and auxiliary springs, are numerous, more or less satisfactory results accruing to several of them. But even in the case of the best it is generally felt that there is still room for considerable development before the ideal suspension is realized.

In this connection the pneumatic principle seems to offer possibilities to which, apparently, insufficient attention has been given. There are, however, several experimenters in the field. One of these, the Cowey Engineering Co., London, England, has, after trials extending over 2 years, brought its product to a state of practicability.

The Cowey device is not so much an auxiliary fitting as it is a complete suspension system. It consists of four air cushions applied to the rear ends of all four leaf springs, as shown in Fig. 2, and supplied with compressed air from a small reservoir conveniently located on the chassis. The feature of the system is that the pressure in each of these cushions or cylinders is made to vary exactly with the load borne by that particular corner of the car at any time.

A section through one of the air cylinders, Fig. 1, shows the method of attaching to the chassis and also the connection existing between the device and the end of the spring. Each unit consists essentially of a plain cylinder vertically arranged on a bracket fixed to the frame and opening at its upper end into a compression space having the appearance of an ordinary water-jacket. The lower end is open to the air. A piston provided with a well-oiled leather cup on its upper surface, constituting an absolutely air-tight joint, is free to slide within the cylinder. The piston rod or compression member between the piston and the spring is shackled only at its lower end, the other end simply resting in the recessed under surface of the piston.

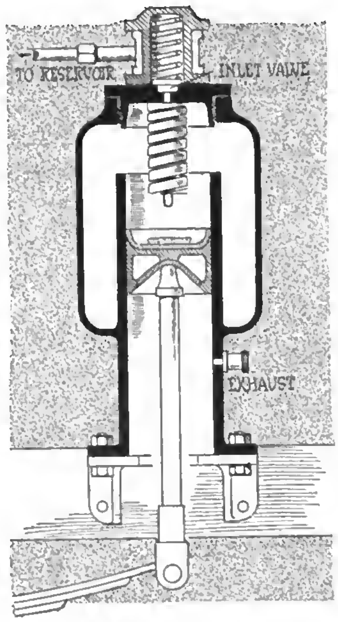

Fig. 1—Section through one of the air cylinders which are bracketed to the side members of the chassis

At the top of the cylinder casting a spring-loaded inlet valve is in direct communication through small copper piping with the air reservoir, as shown in Fig. 2. The plunger rod of this valve extends downwards toward the piston and is surrounded by a buffer spring, the lower end of which meets the piston when the latter is in its highest position. A small hole drilled in the cylinder wall, and forming an exhaust port, determines the lower limit of the piston stroke.

The air reservoir is supplied direct from a simple non-return valve fitted to one of the valve caps of the engine. By this means the pressure of air in the tank is maintained so long as the engine is running. This pressure is such that the automobile is supported on the four air cushions with the pistons occupying a normal position, as shown in Fig. 1.

Assuming this to be the case, and the car traveling over the road, the following action takes place: When an inequality of the road surface is met the piston is caused to move up or down and if the bump is severe enough the upper surface of the piston either strikes the plunger rod of the inlet valve, or, on the other hand, drops low enough to uncover the exhaust port. In running the car with the rear seat empty, then, immediately a person enters, that side of the car on which he is seated sinks a little over the piston. This action brings the upper surface of the piston near to the valve rod so that with each ensuing lump in the road surface a small quantity of air enters until the piston is again occupying its normal mid-stroke position. When the passenger gets out, the pressure in that particular cylinder, being too great, raises that corner of the car so that the piston approaches its lowest position in the cylinder. The first inequality then encountered frees a portion of the air through the exhaust port, and so allows the piston to return to its normal position.

For information respecting this system of suspension we are indebted to our contemporary, *The Motor*, England.

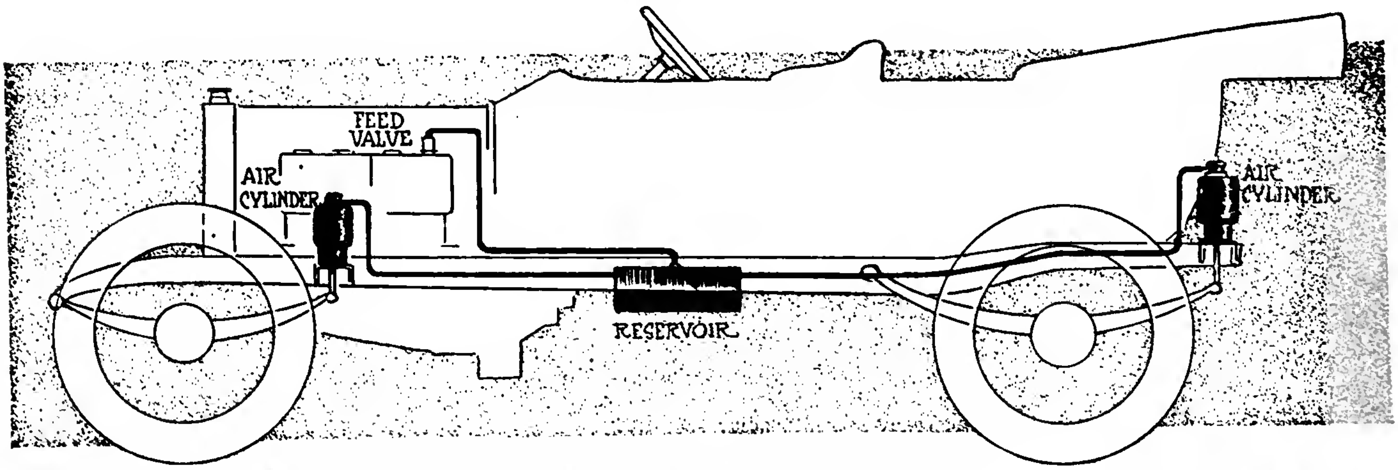

Fig. 2—Outline of the Cowey pneumatic suspension for automobiles in which the load is supported on four air cushions attached to rear ends of the leaf springs

Garage Men Protest Against Separators

Regulations of the Municipal Explosives Commission

Article XI

¶ *Sec. 376. No garage permit authorizing the storage of volatile inflammable oil shall be issued for any premises which are not provided with an oil separator, trap or other similar apparatus attached to the house drain for the purpose of preventing volatile inflammable oil from flowing into the sewer; provided, however, that the Fire Commissioner, may, upon recommendation, exempt from these requirements a garage drainage into a short sewer line.*

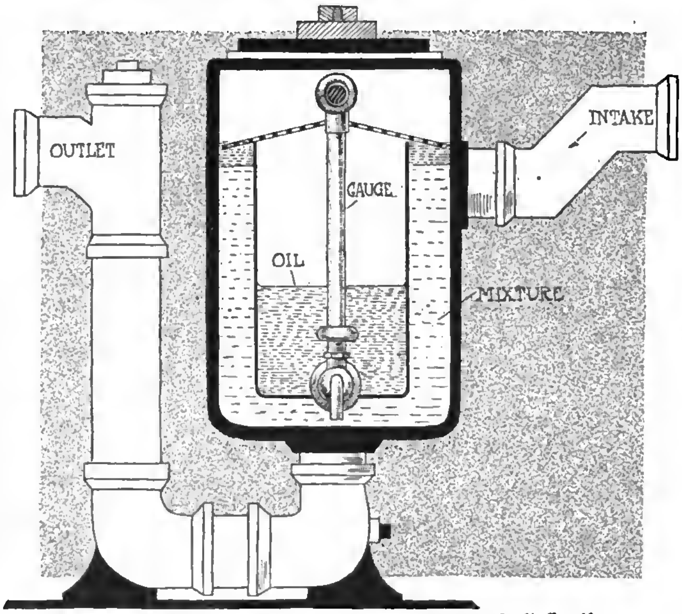
¶ *Sec. 396. Each oil separator installed in a garage shall be connected to the house drain, and shall be so arranged as to separate all oils from the drainage of the garage.*

¶ *Sec. 397. The oil receptacle of an oil separator shall not exceed 50 gallons capacity, and shall be emptied as often as may be necessary to prevent the oil from overflowing; and such oils as are recovered from the separator shall be removed from the garage within 24 hours after being taken from the separator.*

¶ *Sec. 398. All oils spilled on the floor of a garage shall be removed by sponging or swabbing, and poured into the drain leading to the oil separator.*

NEW YORK CITY, March 18—There are three sides to the garage separator situation as it now stands in New York City. First, there is the law which is printed on this page; second, there is the garage man who protests against the expense; third, there is the separator manufacturer who has to make a separator good enough to comply with the wishes of the fire department and cheap enough to suit the pocketbook of the garage man.

The presence of inflammable gas in the sewers of a city is a menace to its population. If it is possible to have an explosion in the sewers of the city, powerful enough to hurl manhole covers high into the air with a reasonable chance of falling on the heads of passing pedestrians or playing children there is something wrong. The fire department is responsible for street explosions. It is the business of the Municipal Explosives Commission to minimize the dangers of these explosions by doing everything possible to prevent them. For this reason they have passed the law requiring the garage to be provided with a separator.



Diagrammatic view of separator; note layer of oil floating on top of water. Separation takes place in large tank

The average garage man is no plutocrat. The sum of $300 extracted from his receipts strikes him a blow in a spot which affects him most seriously. The law must be obeyed or the fines amount to more than it would cost to install a separator. There is only one course to take in a matter of this kind. That is to combat the law and this is now being done.

The garage owners of New York City have combined and have an attorney who represents the entire organization. A test case has been carried into the courts and it is upon this that the matter now rests. There can be no doubt that the decision of the court in this case will decide the future of many of the small garage men who have great difficulty in making their business pay. If the device were cheaper, there can be no doubt that the garage keepers would have installed them without protest. Most of the larger garage owners have done so now.

The separator manufacturer is between two fires. He must meet the severe requirements of the Municipal Explosives Commission and he must meet the pocketbook of the garage man.

The fire department tests each installation separately. There are in New York four concerns which manufacture separators for garages. Each of these has a number of installations in reputable garages in the city and each has passed the individual test which consists of stirring together about 10 gallons of gasoline, lubricating oil, grease and dirt with about 50 gallons of water and pouring it down the drain pipe. Several samples are then taken at the separator outlet and tested for inflammable volatile matter. The principal test given the sample is the flash test. If it is possible to get a flash from the sample, the separator is condemned and a license refused until the separator meets the requirements.

These tests are made in the presence of an official from the Municipal Explosives Commission and are absolutely individual. There is no such thing as an accepted type of separator which stands alone on the merits of the manufacturer. It has to be tested while actually in place and has to meet requirements that are far more severe than found in ordinary service.

When the separator has passed the test a letter of the following form notifies the garage owner to that effect:

FIRE DEPARTMENT OF THE CITY OF NEW YORK
Office of the Commissioner

New York, March 4th, 1913.

American Locomotive Works,
630 Jackson Ave.,
Long Island City, N. Y.

Sirs:—You are hereby notified that the oil separator of the .... type installed at premises 630 Jackson Avenue, Long Island City, and known as the American Locomotive Works Garage, has been approved, as upon examination and test of sewage it was found not to contain volatile inflammable oil.

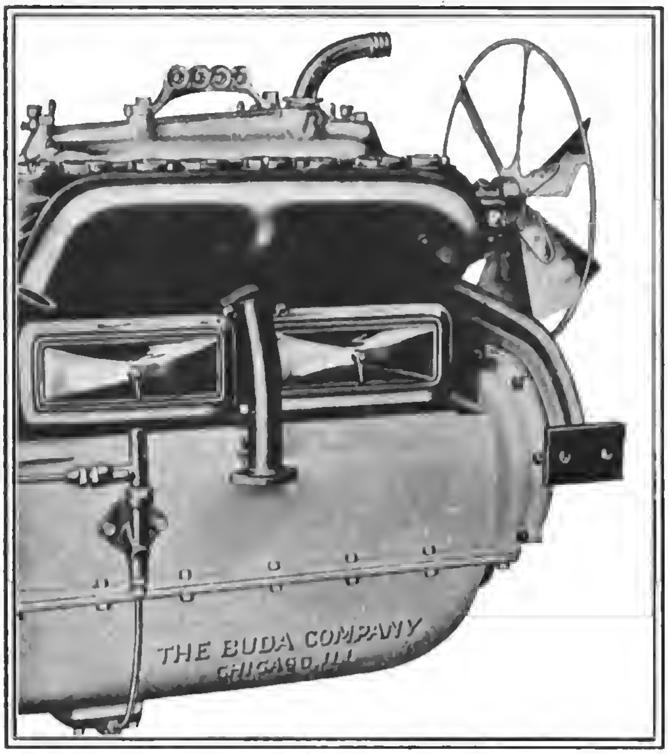
Respectfully,
WILLIAM GUERIN,
Acting Chief, Bureau of Fire Prevention.

The separators all operate on the principle shown in the accompanying sketch. The water passes through the outlet, leaving the layer of oil floating on the water to drop into the separating tank.

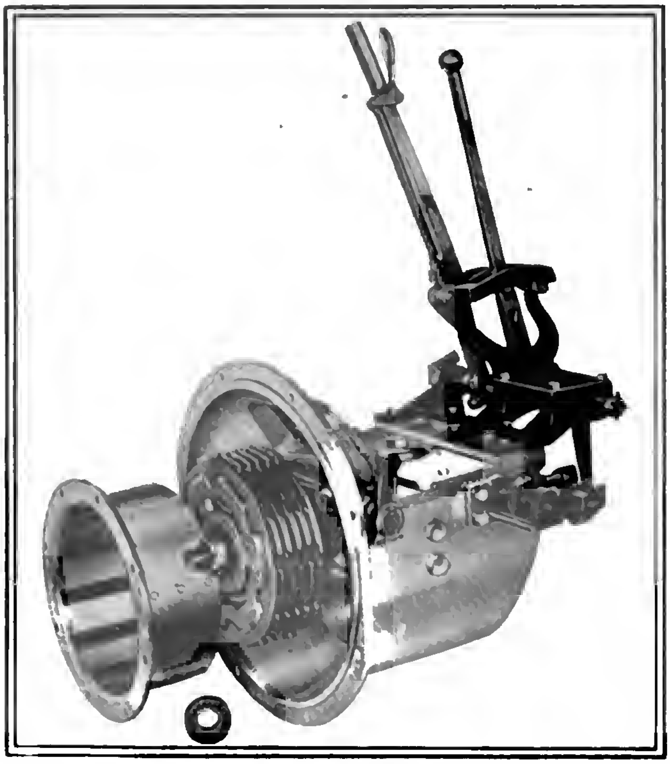
Before installing a separator the garage man must furnish the fire department with complete detailed information regarding the separator and his plans for installation.

New Tribune Car To Have Left Drive

Center Control Will Also Be a Feature—Four-Cylinder Block Motor of 35 Horsepower—Car Will Be Assembled



View of the right side of the Buda motor used in the new Tribune car, showing valve cover plates and manifolds



Multiple-disk clutch disassembled, showing the method of inclosing the parts as well as the shifting levers

DETROIT, MICH., March 17—A little over a week ago several Detroit business men, headed by L. G. Hupp, organized a new concern in the passenger car field, known as the Tribune Motor Co. This week THE AUTOMOBILE furnishes a description of the Tribune car, which is to be entirely an assembled proposition.

The principal features will include left drive, center control and a 35-horsepower block motor, having a bore of 3.75 inches and a stroke of 5.5 inches. This motor will be used in connection with a unit power plant. It is of Buda make, of L-head construction, the valves being all located on the right side and inclosed by two easily-removable cover plates. It has a three-bearing crankshaft with long, light pistons and long connecting-rods of I-beam section. Each piston is provided with three compression rings, while the connecting-rods are fastened to the crankshaft by four-bolt straps. The camshaft is integrally constructed and mounted on three bearings. The tappets are of the mushroom type and provided with adjustments.

The principal bearing sizes are as follows:

Crankshaft bearings	Length, Inches	Diameter, Inches
Front	3.125	1.75
Center	2.5	2.
Rear	4.	2.125
Connecting-rod bearings	2.375	1.875
Camshaft bearings:		
Front	2.9375	0.875
Center	1.5	2.
Rear	2.25	2.
Valve Diam	1.875	.....

Both the crankcase and the oil pan are made of aluminum, the flange for the clutch housing connection being cast one-half integral with each half of the crankcase.

Grease Cups in Bolts on Rods

Lubrication is by force feed, the constant-splash level system being employed. All spring bolts, radius-rod bolts and torque-arm bolts have a grease cup at the head which forces grease through a hollow core in the bolt to the wearing surface.

Magneto and water pump are located at the left on brackets provided for them, which are cast as parts of the upper half of the crankcase. This part also has cast integrally with it the four arms which attach to the frame and support the motor. Timing gears and magneto and pumpshaft gears are conventionally inclosed by an aluminum cover plate at the forward end of the motor. Due to the block construction, the various manifold connections to the castings are short, one inlet gas connection and one inlet water connection sufficing. There are three openings into the exhaust manifold, however.

The ignition is by means of a high-tension magneto of the dual type, employing the Bosch style of spark-plug. The make of carbureter has not yet been decided upon.

The gearset, which is to bolt to the rear of the crankcase through a flange, is of the Brown-Lipe make. It has three forward speeds and reverse and center control levers. The gears are all mounted on Timken bearings, the sliding gear-shaft being splined. This is in every way a standard Brown-Lipe construction and includes a multiple-disk clutch, alternate plates of which are lined with Raybestos, which can be run either in oil or dry. The gears are of chrome-nickel steel. The gear ratios provided in this gearset are given: High—1 to 1. Medium—1.76 to 1. Low—3.35 to 1. Reverse—4.32 to 1.

Standard Timken front and rear axles are used, the former being of the floating type with five-pitch bevel gear and pinion.

The driving gear is riveted on the differential case, following the usual Timken practice, while the housing is of pressed steel. A grease retainer is provided in the shape of a tube extending from the brakes to a point close to the differential. The usual removable cap at the rear of the housing is provided for accessibility to the transmission gearing.

The steering gear is a Gemmer type S unit, having a worm and gear with ball bearings. The wheel is 17 inches in diameter.

There are two sets of brakes, external contracting, operated by pedals, and internal expanding, operated by a ratchet hand lever. There are 320 inches of braking surface, the brakes being 14 inches in diameter and 2 inches wide. Pedals are adjustable to the leg reach of the driver. A large register is placed in the toe board for heating the car in cold weather.

The frame is of the usual channel section with a single drop and braced by three cross-members, having integral reinforcing gussets at the corners. The springs are half elliptic in front and elliptic in the rear. The sizes are as follows:

Wheels are of second-growth hickory, having 1.5-inch spokes. Twelve spokes are used and six holes in the hub flanges on both front and rear wheels. Wire Wheels will be supplied, if the purchaser desires them, for an additional charge.

Front—37 inches by 2 inches. Rear—42 inches by 2 inches. The rear springs are hung directly under the rear frame cross member and underslung to the axle by means of two-piece swivel seats. The tire size is 32 by 3.5 inches.

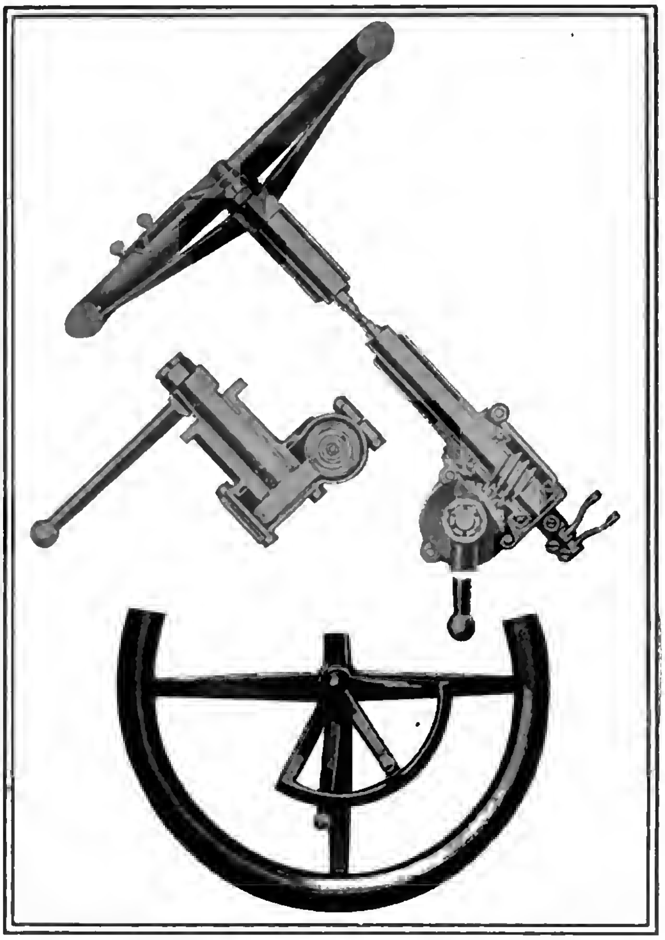
Touring Body Is Very Roomy

Looking at the touring body, which is the only style to be fitted at present, we find a very roomy design. The front seat is 41 inches wide, while the space between the front of the cushion and the dash is 30 inches. The rear seat is 47 inches wide and the distance from the front edge of the cushion to the back of the front seat is 28 inches. The gasoline tank is located under the front seat and has a capacity of 10 gallons. An 8-gallon emergency tank is placed under the cowl. The road weight of the car with the full equipment is given as 2300 pounds. The wheelbase is 116 inches.

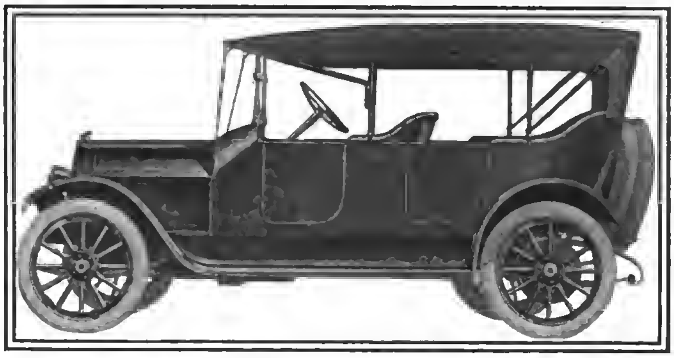
The idea in having the fenders follow the contour of the front wheels, as shown in the illustration, to the running boards is to provide ready access to the motor and other parts under the hood.

Perusal of the body shown herewith will reveal the fact that there are no side lights, which is a rather unusual feature. The head lights are so constructed as to make side lights unnecessary. In each lamp are placed electric bulbs of two sizes, the smaller to be used for city driving, and the larger being used for road work. Current to either of these two sets of lights is controlled from the driver's seat.

The equipment includes top, windshield, curtains, speedometer, electric horn and demountable rims, in addition to the usual complement of tools, robe and foot rails, and so on.



Details of the steering gear used on the Tribune car



The Tribune is made only in the touring type at present

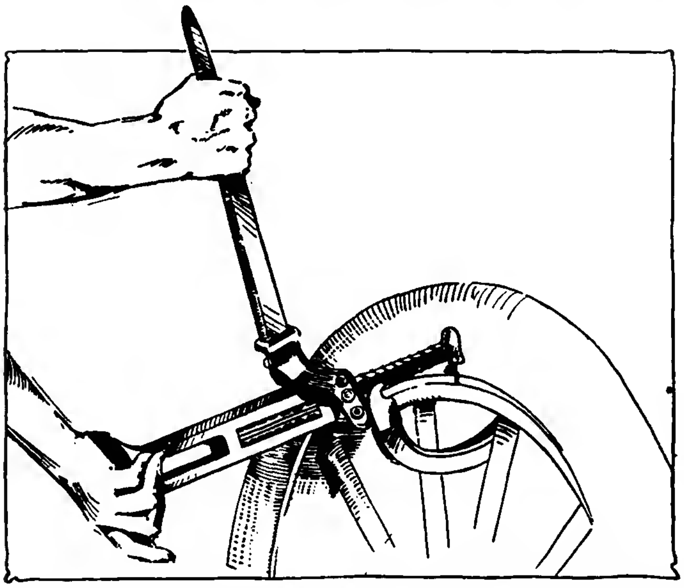
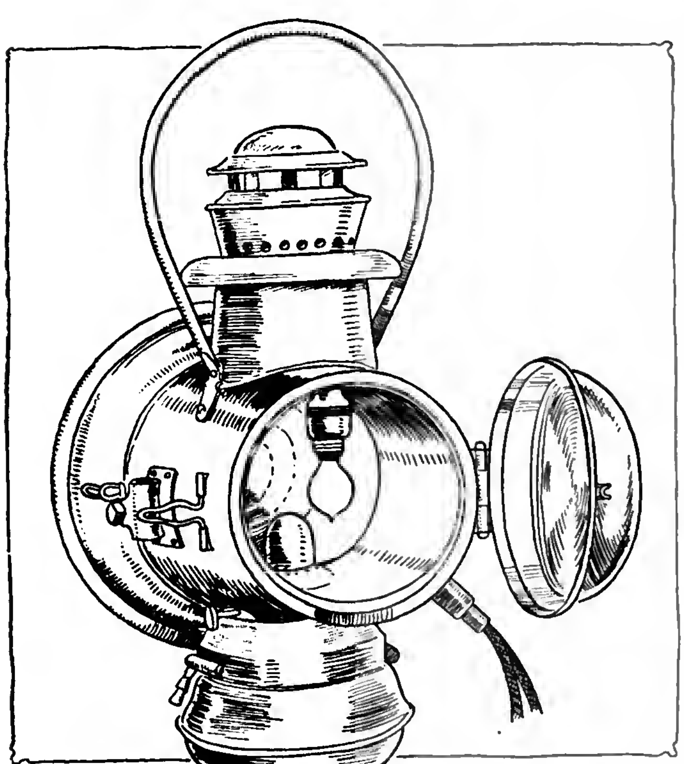
Sketches of the Driver lamp, the Tremo horn and the New Era tire which were represented at the recent shows



Peerless jacks, besides elevating automobiles, may be applied for removing tires



The line of Ham lamps is adaptable for the use of either oil or electricity

Show Accessories

Part. II

THERE were so many accessories shown at the recent big exhibitions at New York, Chicago and Boston that it was impossible to describe them in the show issues of THE AUTOMOBILE. A number of them, each of which is illustrated, are taken up herewith:

Driver Lamp—These lamps are made in such manner that the bulbs cannot be stolen, cannot rattle and do not require polishing. They may be used for side or tail lights and operate on a 6-volt cell. The tail lights are so designed that they are operated from the rear of the car to comply with the Illinois state law and similar laws pending in other states whereby it is required to control the tail light from the rear. They are sold by the Standard Auto Supply Co., Boston, Mass.

Tremo Horn is designed for Ford cars and is operated by the exhaust. It is fitted to the exhaust pipe of the car by clamping the horn-shank directly to the pipe. It can be attached in a few moments. The horn is operated by a pedal which opens a flapper and allows the exhaust to be blown across the mouth of the whistle. A feature of the horn is that it can be blown when the motor is throttled down as well as when it is operating at higher motor speed. It is made by the D. Henry Bonner Company, Cambridge, Mass.

New Era Springs are made to fit standard makes of cars, and can be furnished in any desired color. They replace the original spring in case of breakage. They are made of high-carbon steel and of such quality that it would be more satisfactory to buy the complete spring than to risk the type generally made by local blacksmiths who use as a rule a low-grade carbon steel. A large assortment is carried in stock and springs may be secured at short notice. They are made by the New Era Mfg. Co., Waterbury, Conn.

Peerless Automobile Jacks—The Oliver Mfg. Company, Chicago, Ill., manufactures jacks for automobiles. The Peerless jack is very practical in that it may be used in tire removing as well as jacking. It consists of a jack support, a curved base which digs into the ground preventing tipping of the jack, a hollow-swivel top and a handle. One of the most important features is the attachment for loosening and removing tires. This attachment is a bracket, which is hooked onto the jack, when the latter is to be used for the work of removing tires, and placed between the spokes to push the tire off, or over the tire to pull it off.

Ham Adaptor Lamps—The C. T. Ham Mfg. Co., Rochester, N. Y., manufactures automobile lamps. They are so constructed that oil or electricity may be used. The bodies are made of heavy brass, riveted throughout and reinforced with steel plates on the sides to take the strain on the brackets. The electrical device is suspended inside the lamp in such a manner that it clears the oil burner completely. By this system of adjustment, the electric light is in full focus of the reflector without interfering with the oil burner. It is wired between the cylinders of the lamp and connected to a permanent plug fastened to the outside of the lamp. All the other lamps are built on the same principle, with the same construction.

Peerless Tire Pumps—The Peerless four-cylinder pump, which may be driven by hand, engine and an electric motor, is manufactured by the Peerless Accessories Manufacturers, Chicago, Ill. It is built as a four-cylinder pump. It is finished in black enamel, with nickel trimmings. The pump is equipped with a dial-pressure gauge which shows the steadily increasing pressure in the tire as the pump is operated, either by hand or power. There is no danger of over-inflating as the gauge shows the exact air pressure in the tire at all times. The hose connection automatically opens and closes the valve in the tire. The pump is mounted under the hood or footboard and is driven by gears or chain from some exposed shafting on the engine or transmission. It is operated by a knob which together with the gauge is mounted on the dash. The Peerless four-cylinder hand pump turns with a crank and is clamped to the running board in a few seconds. The portable electric pump for garage purposes is very light. It is of the same construction as the engine-driven type. There is a gauge on the top of the pump which shows the air pressure in the tire. It can be moved to any part of the garage and attached to ordinary light sockets.

Wallmann Fuel Tanks—The Wallmann Mfg. Co., Milwaukee, Wis., manufactures oil-storage systems for factories, garages and stores. The Wallmann system No. 12 is made for the private garage. It is made of heavy galvanized steel, riveted and soldered to make it absolutely airtight. It is painted with rustproof paint and tested by air pressure before it is shipped. The filling pipe is 2 inches in diameter and has a vented double valve-cap with a hinged hasp which can be locked. The lubricating outfit, No. 14, is of the same construction as No. 12, but its use is for lubricating oils, paints and other non-explosive oils; it may be placed on the floor of a room with a gauge showing the quantity of oil in the tank at any time. A combination storage outfit is also made, containing five separate tanks and pumps, with an arrangement for raising barrels for the purpose of filling the tanks. The company also specializes in accessories pertaining to the storage of gasoline, such as pumps, buckets and funnels.

Barco Exhaust Signals—The Barco Brass & Joint Co., Chicago, Ill., manufactures the Barco chimes and valves. The chimes are attached to the exhaust pipe and operated by the valve attachment manufactured by the company, by means of a pedal at the footboard. The mechanical features of the exhaust valve are that it gives an unobstructed passage when the valve is open, and does not cause back pressure. It closes the horn outlet tightly and throttles the tone perfectly. The valve is self-cleaning. It consists of only three parts. The chimes are made of brass with an aluminum core. The method of installation is by sawing a section out of the exhaust pipe between the engine and the muffler and slipping the valve on with the proper end toward the engine.

Universal Tire Sundries—A tire tread and a few types of repair boots are being manufactured by the Universal Tire Protector Co., Angola, Ind. The Universal tread is made from a heavy quality of chrome tire leather, extending from rim to rim, averaging approximately 7 gauge, and upon this body are mounted a traction armor and reinforcement. This armor attachment is built up separately of two and three-ply leather specially prepared. This in turn is mounted upon the main body with four rows of heavy flat-head rivets, which are the only rivets passing through the main body. This construction leaves the inside surface of the tread perfectly smooth and free from rivet shoulders. The tread is locked on the rim by a pair of double-end locks on each side of the tread, providing four points of adjustment on each side. The connection and adjustment of the tension bands is accomplished by a separate, self-retaining connecting lug for each point of adjustment. The tension is made with a strong tool for the purpose. The Junior adjustable inflation boot is a new product. The new repair boot consists of specially designed double-loop, double-studded felloe grip. It is made with two pairs of 1.5-inch anchor straps riveted to the edge of the boot, under the side plates. The boot is placed over the deflated tire, the anchor straps are adjusted in the felloe grip and then the tire is inflated. There are two other repair boots manufactured by this company, a plain clincher and an armored-clincher type. These, like all the others, are made with the rigid, curved side plate, conforming the boot to the shape of the tire and furnishing the rigid support along the rim line.

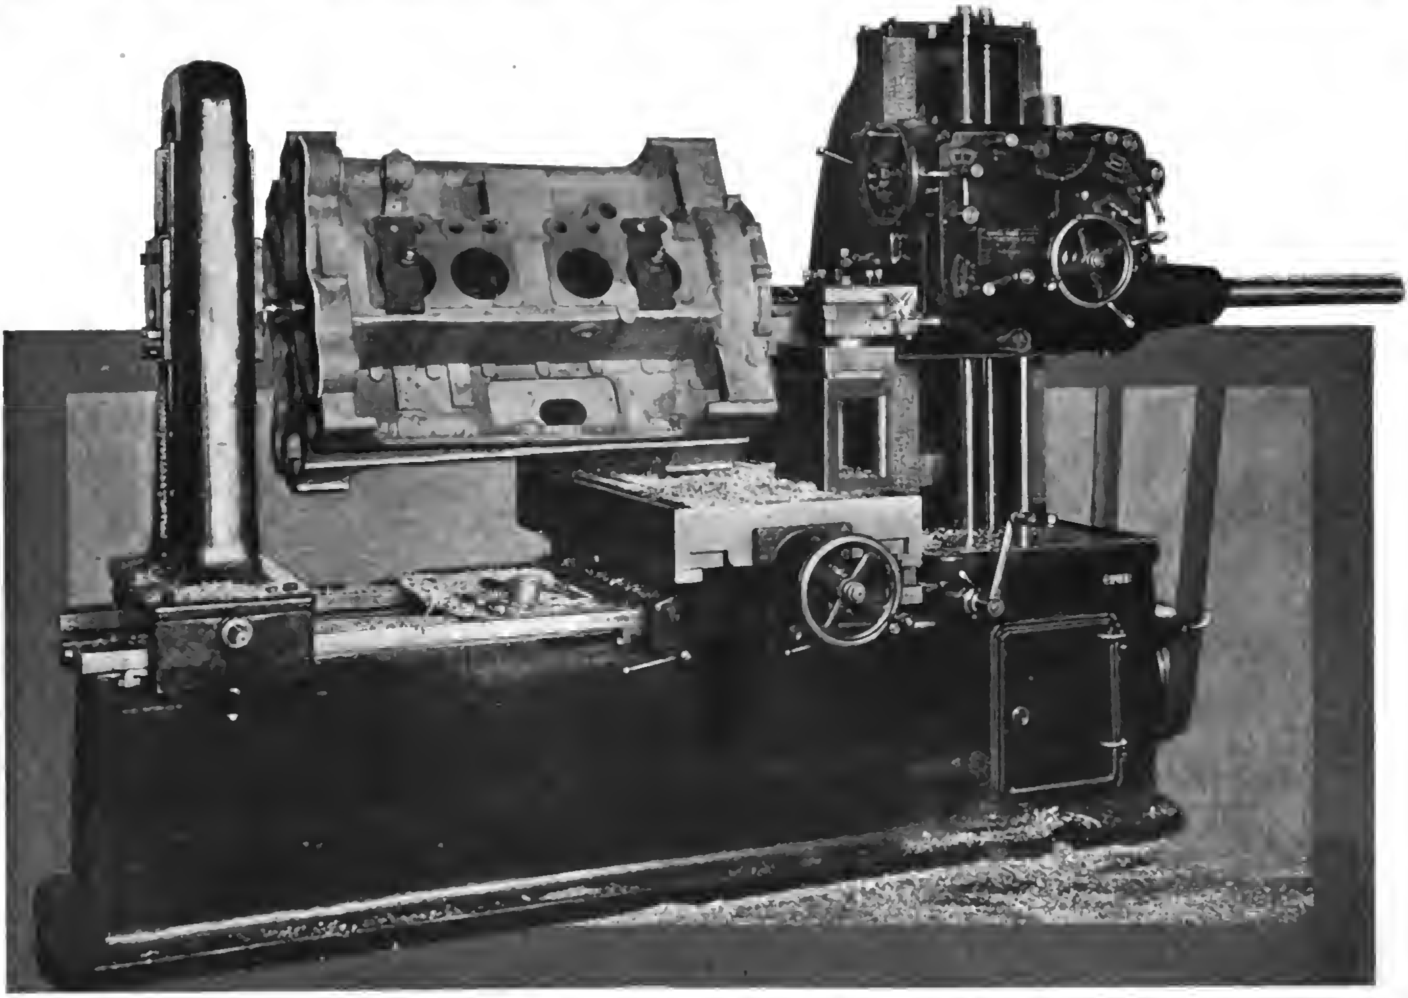
Factory Miscellany



Horizontal boring mill which is used in the boring and milling of crankcases in Jas. Cunningham's Sons Co. factory, Rochester, N. Y.

THIS horizontal boring mill can bore and machine two crankcases in 50 minutes. It dispenses with the use of a very heavy swing lathe and can take care of two of the cases at the same time. The illustration shows the machine with two crankcases which are having the rear ends faced off. Before facing off the ends the holes for the shaft have been bored and scraped to perfect alignment and the cases have then been mounted on a single arbor and placed in the machine. A complete circle is used to caliper the ends for the sake of accuracy. One man can operate the entire machine as the parts which are worked upon are not too heavy for him to handle economically and it requires the setting-up work but once an hour. With the heavy swing lathes previously used in this work the time required was approximately double and two men would have been working on the two crankcases instead of one. The machine described is used in the Cunningham factory at Rochester, N. Y.

LORD BALTIMORE'S Plant—The Lord Baltimore Motor Car Co., Baltimore, Md., has closed negotiations with the Board of Trade in Washington, Pa., to build a factory 255 feet square, occupying 2½ acres. Work on the construction of the new factory will be pushed with all possible haste. The building will be of steel and concrete, one story in height, and will be thoroughly equipped for the making of motor trucks. The company in its new factory will be prepared to turn out 4,000 trucks annually. It will only aim the first year, however, to manufacture 2,000 cars, increasing its output later. It will employ in the neighborhood of 100 men.

Shaffer Adds to Keeton Plant—C. B. Shaffer, president of the Keeton Motor Co., Detroit, Mich., has ordered several additions constructed to the new factory.

Hoover Plant Doubled—The Hoover Steel Ball Co., Ann Arbor, Mich., will double its plant. The present factory is entirely of brick and concrete construction and fireproof.

Maxwell's Machine Shop—The Maxwell Motor Co., Dayton, O., has awarded contracts for an addition to its machine shop. This structure will be 27 feet by 168 feet, built of brick or frame.

Swinehart's New Factory—The announcement is made by the Swinehart Tire & Rubber Co., Akron, O., that a new factory building will be erected which will almost treble its output during the coming year.

Factory for Saginaw—The Wilcox & McKim Mfg. Co., St. Louis, Mo., capitalized at $125,000, and making automobile parts, has decided to locate in Saginaw, Mich. One hundred and twenty-five men will be employed at the start.

New Hudson Factory—The Hudson Motor Car Co., Detroit, Mich., contemplates the building of a third factory building within the next year. The new structure is 578 feet in length by 90 feet in width and supplants the section of the factory grounds which resembled a tented city. By the spring of 1923 the size of the Hudson plant, if it grows as is planned by the company, will consist of fully fifteen individual factory buildings averaging 600 by 80 feet.

To Build in Stockton—J. E. Goodman, who recently organized a company capitalized for $100,000 in Stockton, Cal., to build puncture-proof tires, will shortly erect a plant.

Canton Rubber Company Enlarges—The Canton Rubber Co., Canton, Ohio, is planning to enlarge its plant and has petitioned the city council to acquire a small tract of city property located near its present plant.

Dreadnought Tire Builds—The Dreadnought Tire & Rubber Co., Baltimore, Md., recently incorporated with a capital of $1,000,000, contemplates the erection of buildings and installation of machinery to manufacture automobile tires and miscellaneous rubber goods.

Shotwell-Harris Plant—The Shotwell-Harris Co., Minneapolis, Minn., has approved plans and will ask for bids soon on the construction of a plant in the automobile district at Sixteenth street and Hennepin avenue, for the manufacture of tools and dies.

Alliance Purchases Site—The Alliance Motor Car Co., Alliance, Ohio, has purchased a site upon which will be erected a two-story factory building which will be used for the manufacture of automobiles. It is expected to have the plant completed soon after April 1.

Halley Extensions—Halley's Industrial Motors, Ltd., has been making large extensions to its works at Yoker, Glasgow, which are expected to be completed by the middle of March. As a result the company expects shortly to be able to double the output of the factory and thus to overtake its orders and to ensure prompt delivery. The new works cover about 1 1-2 acres of ground.

Rapp Holds Meeting—A special meeting of the Rapp Mfg. Co., Toledo, Ohio, was recently held for the purpose of authorizing a change of the firm name to the Toledo Spark Plug Mfg. Co. An increase in the capital stock from $15,000 to $25,000 was also voted at this meeting. Additional space in the Toledo factories building has been acquired and the plant will occupy three times its present floor space, while $10,000 will be expended in new machinery to facilitate working conditions and provide means for a greater output. It is said that when the plant is enlarged and the new machinery installed it will have an output of 4,000 spark plugs a day.

Four Wheel Drive's Plant—The Four Wheel Drive Automobile Co., Clintonville, Wis., organized 3 years ago to manufacture commercial and passenger cars utilizing the Zachow-Besserdick patents for drive to both front and rear axles, is about to realize its long cherished plan of establishing a new plant. Several months ago the capital stock was increased from $50,000 to $250,000, and on March 1 the additional stock was reported sold. The board of directors in special session immediately voted in favor of starting at once upon the construction of a new plant, to consist of three buildings, two of them to be 100 feet by 120, and the other, a power plant, 60 feet by 80. The buildings will be erected adjoining the present plant, the former Zachow-Besserdick machine shops, which will be used for patterns and warehouse. The company will thus be enabled to more than quadruple its output and will employ 500 men.

The Automobile Calendar

Shows, Conventions, Etc.

March............Indianapolis, Ind., Spring Automobile Show, State Fair Gronnds, Indianapolis Automobile Trade Association.

March............Nashville, Tenn., Annual Show, Nashville Automobile Dealers' Association.

March 17-22.......Norfolk, Va., Annual Show, Armory Bnilding, Norfolk Automobile Trade Association, Inc.

March 19-22......Springfield, Ill., Annual Show, Springfield Commercial Association, W. L. Chapin, Mgr.

March 19-26.......Boston, Mass., Annnal Truck Show.

March 20-24.......New Orleans, La., Annual Show, N. O. A. D. A.

March 24-29.......Indianapolis, Ind., Annual Automobile Show.

Mar. 27-April 3....Quincy, Ill., Mississippi Valley Automobile Show, H. F. Hofer, Director.

March 31-April 5..Manchester, N. H., Automobile Show, Dealers' Association, J. H. Graham, Manager.

April 1-6..........San Francisco, Cal., Motor Truck Show, Coliseum Hall. *Motor Field.*

April 5-19.........Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.

June 5, 6, 7........Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.

Race Meets, Runs, Hill Climbs, Etc.

May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.

July 1.............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.

July 1-16..........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.

July 8-16..........Winnipeg, Man., Midsummer exhibition, A. C. Emmett, Manager.

July 27-28.........Tacoma, Wash., Tacoma Road Races.

Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.

Nov. 26...........Savannah, Ga., Grand Prize Race, Automobile Clnb of America.

Foreign

March 31.........Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.

April.............Barcelona, Spain, International Exhibition.

May..............St. Petersbnrg, Russia, International Automobile Exposition, building of Michael Maneze, Imperial Automobile Club of Russia.

July 12...........Amiens, France, Grand Prix Race.

Sept. 25..........Isle of Man, International Stock Car Race.

Waverley electric delivery wagon in service of the United States parcel post, Indianapolis, Ind.

Exterior of the service station and salesrooms of the Foster Motor Car Co., Virginia and North Carolina, distributors for the KlineKar in Richmond, Va.

MOTOR Ambulance Wanted.—Tenders for the supply of a motor ambulance and two motor hose tenders required by the Johannesburg municipal council will be received up to March 28 by the Town Clerk, Municipal Offices, Plein Square, Johannesburg, South Africa, from whom copies of the contract form may be obtained. As the time for receipt of tenders is limited, only firms having agents in South Africa who can be instructed by cable will be able to avail themselves of this opportunity. All inquiries will be answered at the Bureau of Foreign and Domestic Commerce, Washington, D. C., File No. 10559.

Briggs Lord Baltimore Engineer.—H. M. Briggs has succeeded O. R. Bisler as engineer of the Lord Baltimore Motor Car Co., Baltimore, Md.

Motz Washington Branch—The Motz Tire & Rubber Co., Akron, O., has opened a branch at 1012 Fourteenth street, N. W., with F. G. Fickling as manager.

English Company Moves.—Trier & Martin, Ltd., has changed its offices from Great Portland street, W., to Trinity Works, New Church Road, Camberwell, S. E.

Organizes Vulcanizing Company—G. W. Smith of Beloit, Wis., has organized the Beloit Vulcanizing Co. and established a tire and repair shop at 415 Broad street.

Twyman Pennsylvania Tire Agency—The Twyman Motor Car, Columbus, O., has taken the agency for the Pennsylvania line of tires. J. A. Johnson is the manager.

Purchases Beloit Garage—W. H. Gragg has purchased the Allen Garage and business in Beloit, Wis. It is the first garage to be established in Beloit, having been built by Harry Vail in 1908.

St. Onge Leaves Detroit Electric.—W. J. St. Onge has resigned his position as advertising manager of the Anderson Electric Car Co., Detroit, Mich., maker of the Detroit electric. He is succeeded by W. P. Haines.

Fire Truck for Wilmington—A motor fire truck is to replace a horse-drawn extension truck now in use by the Wilmington, Del., Fire Department. A committee appointed to consider the matter visited the Webb factory at Allentown, Pa., recently.

Tracy Opens New Branch.—R. B. Tracy, western manager of the Michelin Tire Co., Milltown, N. J., has opened a new branch at 1106 Hennepin street, Minneapolis, Minn. This branch takes care of the territory of North and South Dakota, Minneapolis and Northern Wisconsin.

Mayer Carbureters for Coast.—The Maydwell Co., of Los Angeles, Cal., has taken the distributing agency for Mayer carbureters on the Pacific Coast. The Los Angeles company has branches in San Francisco and in Seattle, Wash., and will establish service stations in connection with each of the branches.

Reedy Invents Carbureter.—I. R. Reedy, of 1136 W. Third street, Dayton, Ohio, has invented a new carbureter which it is claimed will run an automobile at an angle of 60 degrees with its own supply. It is claimed to be adaptable for aeroplane use and is claimed to be of superior character because the angle of its use does not affect mixture.

Thompson Keeton Sales Representative.—C. W. Thompson, Rochester, N. Y., has become identified with the Keeton Motor Co., Detroit, Mich., as sales representative for the State of New York, covering territory east of Batavia, N. Y., and northern counties of Pensylvania, with the exception of four counties in the northwestern section of the state. He will tour in a Keeton Six and thus cover territory.

Drawback on Axles.—A ruling has been made by the Treasury Department, Washington, D. C., that drawback shall be allowed under section 25 of the tariff act of 1909, on motor car axles manufactured by the McCue Co., Buffalo, N. Y., with the use of imported annular bearings. The drawback allowance shall not exceed the number of bearings appearing in the exported axles as shown by the sworn statement of the manufacturers filed with the collector of customs at Buffalo.

Bassett Heads Case Branch—F. E. Bassett will be manager of the new Milwaukee, Wis., branch of the J. I. Case T. M. Co., Racine, Wis.

Miller Brothers' New Salesroom—Miller Brothers, automobile dealers in Glens Falls, N. Y., have opened up a new salesroom in that city.

Gray Goodyear Manager—C. H. Gray has been appointed manager of the Milwaukee, Wis., branch of the Goodyear Tire & Rubber Co., Milwaukee, Wis.

Johnson, Manager Ford—F. T. Johnson has joined the forces of the Ford Motor Co., Detroit, Mich., and has been made manager of the Omaha, Neb., branch.

Adding to Garage—The Haney-Pistor Co., Kewannee, Wis., is building a large addition to its garage and salesrooms. It will be of concrete construction and will have room for fifty cars.

College Station Wants Apparatus—The State Fire Marshal has recommended the expenditure of $21,713 at the Agricultural and Mechanical College, College Station, Tex., for better fire protection.

Goodhart Goes to Lippard-Stewart.—H. H. Goodhart has been made advertising manager of the Lippard-Stewart Motor Car Co., of Buffalo, N. Y. He was formerly with the Franklin Automobile Co., Syracuse, N. Y.

Wants Fire Apparatus.—A committee headed by City Judge Daniel Crowley has requested the fire commissioners of Ithaca, N. Y., to recommend to the common council of that city the purchase of a combination hose and chemical automobile.

Express Company in Kutztown—Kutztown, Pa., citizens have organized the Kutztown and Reading Automobile Express Co. to carry freight between the two places, stopping en route at Fleetwood, Blandon, Temple and Hyde Park on several trips daily.

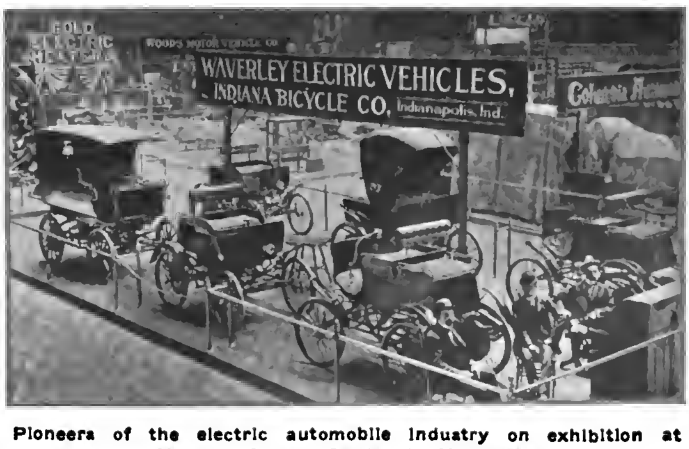
Lowry Promoted—S. W. Lowry will shortly take over the control of the Southern territory of the Pacific Coast for the Pennsylvania Rubber Co., Jeannette, Pa., with headquarters at Los Angeles, Cal. Mr. Lowry is now manager of the company's Pittsburgh, Pa., branch.

American Cars in Trinidad—American cars are used almost entirely on the British island of Trinidad, off the coast of South America. During 1912 forty-four cars were imported during the year. The popular preference is for a light car that does not cost over $1,000, but some market exists for better cars.

Washington Club Business Proposition—A paid membership of 293 has been reached by the newly organized Washington, D. C., Motorists' Association. This organization is purely a business proposition entirely devoid of the social end of the automobile. The new association desires to place in membership all persons within the District of Columbia interested in the adoption, use and maintenance of the motor-driven vehicle.

Clubs Join in Tire Test—Means for comparing in a measure road condition in the United States and England will be afforded by the results of a series of certified tire tests that are about to be undertaken with the same make of tire by the Automobile Club of America and the Royal Automobile Club. The local test will be conducted by the technical laboratory of the A. C. A., and like the English trial, will be of 10,000 miles' duration.

Wants Electric Automobile Agency—An American consular officer reports that a resident of his district, who has been engaged in the automobile trade for many years, desires to secure the local representation of American manufacturers of electric automobiles, including touring cars and commercial vehicles. These manufacturers are requested to send him their catalogues and price lists, together with a statement showing their annual output of the various classes of cars referred to. If it appears that satisfactory arrangements are likely to be made, the inquirer will probably visit the United States in order to get in touch with the manufacturers. All information may be had by addressing all inquiries to the Bureau of Foreign and Domestic Commerce, File No. 10,584, Washington, D. C.



Pioneers of the electric automobile industry on exhibition at Madison Square Garden in May, 1899

The naw Baker electric roadater, a product of the Baker Motor Vehicle Co., Clevaland, O.

Newton with White—M. R. Newton has become director of publicity for the White Co., Cleveland, O.

Swinehart's Buffalo Agency—The Swinehart Tire & Rubber Co., Akron, Ohio, recently opened an agency in Buffalo, N. Y.

Kulas Peerless Sales Manager—E. J. Kulas has become the general sales manager of the Peerless Motor Car Co., Cleveland, O.

Six-story Supply House—W. S. P. Oskamp has plans for a six-story fireproof automobile supply house in Cincinnati, O.

Cross Holly Sales Manager—The Holly Bros. Co., Detroit, Mich., announces the appointment of C. W. Cross as sales manager.

Newark Franklin Dealer Moves—E. D. Carlough, Franklin dealer in Newark, N. J., has just moved into new quarters at 35 Halsey street.

Ridler Pope Sales Manager—F. M. Ridler has been promoted to the position of sales manager of the Pope Mfg. Co., Hartford, Conn.

New Supply House Opened—The Post & Lester Co. has opened an automobile supply store at Waterbury, Conn. W. H. Lewis is manager.

Babcock Firestone Advertising Manager—E. S. Babcock has been appointed advertising manager of the Firestone Tire & Rubber Co., Akron, Ohio.

Case Company's New Salesrooms—The J. I. Case T. M. Co., Inc., Racine, Wis., announces the opening of a new automobile salesroom in Milwaukee, Wis.

Becker Establishes Baltimore Agency—Howard Becker has taken the agency in Baltimore, Md., for the Michigan and Wizard igniting and lighting storage batteries.

Miner President Hartford Association—S. A. Miner was elected president of the Hartford Automobile Dealers' Association, Hartford, Conn., at a recent meeting.

Williams Franklin Advertising Manager—W. H. Williams has been promoted to the position of advertising manager of the Franklin Automobile Co., Syracuse, N. Y.

Rochester Planning Apparatus Additions—Rochester, N. Y., plans to add two motor-driven hose carts to its fire-fighting equipment within the next few months.

Offer City an Automobile—The Hansen Automobile Co., Wilmington, Del., has offered to give the city a runabout for the use of the chief of the fire department.

New Brazilian Tariff Schedule—Publication has just been made of the new tariff schedule in Brazil and no increases were made on automobiles or on automobile sundries.

Best Promoted—Leigh Best, one of the vice-presidents of the American Locomotive Co., Providence, R. I., has become head of the automobile department of that company.

Mackemer-Pinkerton's Salesrooms—The Macemer-Pinkerton Automobile Co., Galesburg, Ill., recently opened a new salesroom at 256 East Simmons street. It handles the Ford car.

Doherty Henderson Manager—The Henderson Motor Car Co., Indianapolis, Ind., has appointed H. W. Doherty as Northwest district manager, with headquarters in Tacoma, Wash.

Hainea Anderson Advertising Manager—W. P. Haines has been appointed advertising manager of the Anderson Electric Car Co., Detroit, Mich., succeeding W. J. St. Onge, resigned.

Moskovics with W., C. & P.—F. E. Moskovics has become associated with the Wyckoff, Church & Partridge Guy Vaughan interests, which are to produce a new light six-cylinder car.

Automobiles in Bar Harbor—The bill repealing the law which excludes automobiles from Bar Harbor, Me., will become effective as soon as Governor Haines of Maine affixes his signature to it.

New Geneva Garage—Plans have been completed for the construction in Geneva, N. Y., of a large garage of reinforced concrete. The garage will be constructed in Exchange street by F. Madia.

Phelps with Moline—R. W. Phelps, sales manager of the Great Western Automobile Co., Peru, Ind., has been appointed assistant sales manager and publicity man for the Moline Auto Co., East Moline, Ill.

Baltimore Companys New Quarters—The Chesapeake Motor Co., Baltimore, Md., Hupmobile agent, has acquired 1018 Morton street as its salesrooms and garage and will also conduct a storage business there.

Automobile Incorporations

AUTOMOBILES AND PARTS

Akaon, O.—Summit Automobile Co.; capital, $10,000; to manufacture and deal in pleasure and commercial motor vebicles. Incorporators: E. J. Eblen, J. M. Sauder, F. L. Metz, Racbel Sauder, Almira Elben.

Boston, Mass.—Westcott Motors Co.; capital, $8,000. Incorporators: Orris W. Nelson, Harvey L. Kemp, Geo. H. Learned.

Baooklyn, N. Y.—Montauk Motor Co., Inc.; capital, $10,000; to do a general auto business. Incorporators: Louis F. Obse, James K. B. Webber, Morton Foster.

Charleston, S. C.—Arby Automobile Co.; capital, $200,000. Incorporators: Santo Sottile, M. R. Rivers, L. M. Pinckney.

Cincinnati, O.—Armstrong Motors Co.; capital, $10,000; to manufacture and deal in automobiles and all parts thereof. Incorporators: James H. Armstrong, Luella S. Armstrong, Clara M. Eggers, S. S. Stewart, Harry Bronworth.

Cleveland, O.—Gustav Schaefer Wagon Co.; capital, $55,000; to manufacture wagons, vebicles and automobile bodies. Incorporators: Gustav Scbaefer, Henry G. Scbaefer, Charles E. Mortiz, Artbur Kruse, Anna M. Schaefer.

Decatur, O.—Dawson Automobile Co.; capital, $10,000. Incorporators: Earle M. Dawson, Cbas. E. Dawson, Florence L. Dawson.

Detaoit, Mich.—Detroit Antomobile Exchange; to deal exclusively in used cars. Incorporators: G. C. Farnsworth, R. M. Drysdale, E. W. Pingree.

Detroit, Mich.—King Motor Car Co.; capital, $200,000. Incorporators: J. G. Bayerline, Arteman Ward, Jr., F. A. Vollbrecbt.

Datroit, Mich.—Moore Truck & Mfg. Co.; capital, $20,000; to manufacture motor trucks. Incorporators: F. A. Moore, H. A. Peters, C. W. McColl.

Indianapolis, Ind.—Ray Harronn Co.; capital, $50,000; to manufacture and sell motor cars. Incorporators: Ray Harroun, E. G. Baker, E. C. Sonrbier.

Mt. Vernon, N. Y.—Motor Trnck Mfg. Corp; capital, $150,000; to manufacture and deal in motors, engines, etc. Incorporators: H. Hitchenbacb, L. Bertscb, A. J. Albert.

New York City.—Associated Anto Mechanics Inc.; capital, $100,000; to deal in autos and auto parts. Incorporators: Charles Tichenor, Harry Barnes, William J. Hoover.

Naw York, N. Y.—Brady Murray Motors Corp; capital, $55,000; to deal in motor trucks, cars, autos, etc. Incorporators: Artbur T. Murray, Samuel T. Marcus, Cbarles Wein.

New Yoak, N. Y.—Commercial Truck Co. of America; capital, $3,000,000. Incorporators: J. F. Curtin, H. O. Dougblan, J. M. Satterfield.

New York, N. Y.—Henry Tobin Co., Inc.; capital, $50,000; to deal in automobiles. Incorporators: Henry Tobin, Ricbard F. Tobin, Jos. B. McDonough.

New Yoak City.—The Albert E. Eldredge Corp.; capital, $7,000; to manufacture motors, machinery, etc. Incorporators: A. E. Eldredge, John J. H. Poillon, Julia M. Wilkinson.

Patchocue, N. Y.—John R. Swezey Antomobile Co., Inc.; capital, $5,000. Incorporators: John R. Swezey, Nathaniel N. Swezey, Ella B. Swezey.

Pineville, Ky.—Cumberland Motor Co.; capital, $50,000. Incorporators: N. J. Weller, A. W. Bryant, M. J. Moss, John A. Pitman.

Pittsauach, Pa.—Gibson Motor Car Co.; capital, $3,000,000; to manufacture and deal in engines, motors and all equipments thereto. Incorporators: J. H. Maboney, E. D. Johnson, C. E. Gibson.

Rochestea, N. Y.—Rochester Automobile Exchange; capital, $500. Incorporators: Bertram E. Wilson, W. Hayes, Mitchell Dewitt, Owen D. Dewitt.

Salt Lake City, Utah.—Deseret Motor Truck Co.; capital, $50,000. Incorporators: Ira Cole, Domine Burns, J. E. Fleige.

Wyandotte, O.—Moore Truck & Mfg. Co.; capital, $20,000; to manufacture trucks.

GARAGES AND ACCESSORIES

Alliance, O.—Alliance Rubber Co.; capital, $100,000; to manufacture and deal in rubber goods of all kinds including automobile tires. Incorporators: Geo. C. Russell, Milton Bejach, W. H. Purcell, M. S. Melbourne, Robert Auld, Sr., F. E. Dussell, H. F. Bobecker.

Baltimore, Md.—Dreadnaught Tire & Rubber Co.; capital, $1,000,000. Incorporators: E. D. Buck, G. W. Dillman, B. M. Crawl.

Baooklyn, N. Y.—F. & P. Auto Transportation Co., Inc.; capital, $70,-

Carpenter's Indianapolis Office—W. W. Carpenter, western representative of the Jones Speedometer Co., New York City, will be located in Indianapolis, Ind. He has taken an office at 1201 State Life Building.

Bosch Magneto Appointments—The Bosch Magneto Co., New York City, has appointed the following firms as distributors of its various products: Ballou & Wright, Seattle, Wash., and E. A. Featherstone, Los Angeles, Cal.

Civic Garage in Rochester—The Board of Contract and Supply, Rochester, N. Y., recently awarded contracts for the immediate construction of the new civic garage which has been advocated for that city for the past year. It will cost $22,411.

Large Garage in Birmingham—The Cumberland Motor Car Co., Birmingham, Ala., recently moved into one of the largest garages in the South. Two show rooms each 100 feet long are provided. Several standard cars are carried by the company.

Stoll Assistant Sales Manager—O. E. Stoll has been appointed assistant sales manager of the General Motor Truck Co., Detroit, Mich., to fill the vacancy occasioned by the transfer of E. J. Kilborn to Chicago, Ill., as manager of the branch there.

Great Western car designed as a combination limousine and ambulance in Peru, Ind.

Gray & Davis Baltimore Agency—The exclusive agency in Baltimore, Md., for the Gray & Davis lighting and starting system is held by the Auto Electric Co., which is also conducting a service station to care for automobiles equipped with this system.

Colleges Interested in Automobiles—To encourage visits by the engineering classes of the large universities, the sales department of the Lozier Motor Co., Detroit, Mich., has issued invitations to the more important colleges throughout the country for a visit of inspection to the factory in Detroit.

Highway Engineering Course Success—The winter course in highway engineering at the Ohio State University, Columbus, O., is realizing the hopes of those who started the movement. The enrollment is sixty, not including the senior engineers who are regularly attending and the juniors who attend part of the time.

Ricker Opens Indianapolis Office—C. S. Ricker, formerly chief engineer of the Henderson Motor Car Co., Indianapolis, Ind., has opened an office at 1201 State Life Building, that city. Mr. Ricker will do consulting engineering work for several automobile companies and a considerable amount of publicity work also.

Hoover Purchases Flanders Department—The Hoover Steel Ball Co., Ann Arbor, Mich., has purchased the steel ball department of the Flanders Mfg. Co., Chelsea, Mich., which has been in the hands of a receiver since December 6, 1912. It is the intention of the Hoover company to move this department to its new factory at Ann Arbor.

Milwaukee Buys Five Cars—The commissioner of public works, Milwaukee, Wis., has contracted with the Mitchell Automobile Co., Milwaukee, Wis., for five passenger cars for the use of its various officials. The contract for two 1 1-2-ton trucks for the waterworks department was awarded to the Kissel Motor Car Co., Hartford, Wis.

Gemmer's Air Starting Device—It is reported that G. A. Gemmer, formerly of the Gemmer Mfg Co., Detroit, Mich., maker of steering gears, is organizing a company to manufacture an air starting device which he has invented. It is said to be built upon the principle of the electric starter, having a combination pump and motor, the entire outfit weighing about 50 pounds.

Ajax Offers Prizes—Five thousand dollars in prizes are offered in an annual service competition for Ajax tires, beginning April 1 next and terminating on March 31, 1914, by the Ajax-Grieb Rubber Co., Trenton, N. J. For the chauffeurs who in that space of time make the best mileage records out of their Ajax tires there are altogether 208 prizes to be distributed among the winners.

Automobile Polo in London—Richard Klegin, an American promoter, recently arrived in London, Eng., and commenced negotiations for automobile polo games in that city during the coming season. He purposes to bring over the eight participants from the games held in Madison Square Garden, New York City. The contests will occur either in the Olympia or at the Shepherd's Bush Stadium probably in May.

Automobiles in Lansing Schools—Lansing, Mich., has adopted a plan whereby the pupils will receive an automobile education. They spend the first year in school and after that they divide their time equally between school and shop, either in the automobile or gas-engine shop. After a short vacation they will alternate between school and some Lansing plant, where they will get the practical experience and also will be paid for their work.

Automobile Incorporations

000. Incorporators: William O. Goddard, Frank K. Fairchild, Geo. A. Logan.

BUFFALO, N. Y.—V. W. Bonham Mfg. Co., Inc.; capital, $20,000; to manufacture auto pumps, other pumps and machinery of all kinds. Incorporators: Edward C. Schwingel, E. S. McCready, James R. Pratt.

CINCINNATI, O.—F. M. Rose, Springfield Co.; capital, $100,000; to manufacture a patented automobile wheel.

DETROIT, MICH.—Superior Fonndries Co.; capital, $30,000; to do foundry work. Incorporators: Jos. Sturges, W. L. Willard, H. T. Peters, R. T. Holte, J. G. Williams.

INDIANAPOLIS, IND.—Motor Starter Mfg. Co.; capital, $40,000; to manufacture motor starters. Incorporators: S. M. Brundage, W. J. Sylvester, H. J. Herff.

KINGSTON, N. Y.—Brown Auto Supply Co.; capital, $7,000. Incorporators: Emerson Brown, Lewis Brown, Rodney B. Osterhoudt.

MILWAUKEE, WIS.—Escott's Auto Livery & Garage Co.; capital, $15,000. Incorporators: F. A. Escott, Clara A. Escott, Richard S. Witte.

MINNEAPOLIS, MINN.—O. Fenstermacher; capital, $300,000; to handle accessories.

MUNCIE, IND.—Derrickson Mfg. Co.; capital, $125,000; to manufacture automobile accessories. Incorporators: Harry S. Osborn, H. L. Kesselman, B. C. White.

NEW YORK, N. Y.—Auto Signalite Co., Inc.; capital, $2,000; to deal in automobile supplies. Incorporators: Robert C. Norton, Anna D. Chersan, Lelema E. Koblish.

NEW YORK CITY.—Charles E. Hottnm, Inc.; capital, $20,000. Incorporators: Charles E. Hottum, Maud J. Hottum, William H. Coffey.

NEW YORK, N. Y.—Continental Rubber Works Selling Agent, Inc.; capital, $3,000; to deal in rubber goods, tires, etc. Incorporators: Clarence E. Thornall, Willis A. Darling, Walter S. Tullis.

NEW YORK, N. Y.—Dayton Automobile Repairing Co., Inc.; capital, $5,000. Incorporators: Chas. E. Holst, Victor Drummond, Valentine E. Mott.

NEW YORK CITY.—New York Oil & Grease Co.; capital, $60,000; to manufacture and deal in lubricating oils, greases, etc. Incorporators: George T. Roberts, Garfield Carson, George G. Francis.

NAW YORK, N. Y.—Peteler Shock Absorber Corp.; capital, $50,000. Incorporators: James L. Allen, Charles L. Moreau, Frederick O. Lyon.

NEW YORK CITY.—Seeing New York Automobiles, Inc.; capital, $10,000; to operate sight seeing automobiles. Incorporators: Geo. H. Mulligan, Thomas Frost, Joseph V. Fallon.

NEW YORK CITY.—Universal Shock Eliminator, Inc.; capital, $15,000; to manufacture devices for eliminating road jars and shock to autos. Incorporators: Richmond Weed, Emile Dreyfns, Leslie S. High.

RACINE, WIS.—Wisconsin Electric Co.; capital, $50,000; to manufacture electrical appliances and devices. Incorporators: Louis Hamilton, C. H. Beach, W. W. Storms.

RHINELANDER, WIS.—Oneida Garage & Machine Co.; to open a garage and repair shop. Incorporators: Will Gilligan, Edwin Priebe.

ROCHESTER, N. Y.—Durno Mfg. Co.; capital, $100,000; to manufacture mechanical appliances for automobiles. Incorporators: John H. Durno, John F. Turk, Milton Noyes.

THOMASVILLE, GA.—Clark's Resilient Tire Filler Co.; capital, $100,000; to manufacture tire fillers. Incorporators: J. T. Clark, A. B. Clark, J. E. Golden.

UTICA, N. Y.—Divine Tire Co., Inc.; capital, $225,000. Incorporators: Charles W. Wicks, A. James Eckert, Bradford H. Devine.

VICTORIA, TEX.—Park Garage; capital, $10,000. Incorporators: John Fraser, J. T. Linehaugh, W. H. Crain.

WASHINGTON, PA.—International Combustion Loco Co.; capital, $1,000,000; to manufacture, buy, sell and deal in locomotives and internal combustion machines of all kinds. Incorporators: Thomas H. McKay, James W. McKay, John G. Gray.

WHITESTONE, N. Y.—Whitestone Garage, Inc.; capital, $5,000. Incorporators: Herhert A. Tretman, John A. O'Fee, Mary E. O'Fee.

CHANGES OF CAPITAL AND NAME

COLUMBUS, O.—Rogers Supply & Tire Co.; capital increased from $10,000 to $25,000.

DETROIT, MICH.—Gies Gear Co.; capital decrease from $50,000 to $25,000.

MIDDLETOWN, O.—Miami Cycle & Mfg. Co.; capital increased from $1,100,000 to $2,064,500.

AUTOMATIC Carbureter Design—In which the increasing suction of the motor enlarges the air intake port and widens the cross area of the venturi tube surrounding the nozzle.

This carbureter, Fig. 1, consists of a casing, the upper portion of which contains a passage I communicating with the intake manifold, while the lower portion includes an air-inlet port. The latter surrounds the lower portion of the gasoline nozzle N and is normally almost entirely closed by the cylindrical mantle of a sleeve S. The lower portion of the sleeve is tapered to fit the similarly shaped portion of the carbureter body. This sleeve is slidable in the main, vertical passage concentrically in which the nozzle N is in place. At low motor speeds the sleeve closes the air passage around the nozzle almost entirely. If, however, the throttle is opened farther, the increased motor suction tends to increase capacity of the contracted passage and in the effort to do so lifts the sleeve until a wider portion of it surrounds the opening of the nozzle. Incidentally the intake surrounding the lower, tapered end of the sleeve is raised and the air passage capacity of this opening increased as well.

No. 1,055,352—to Charles J. Pembroke, Rochester, N. Y. Granted March 11, 1912; filed August 9, 1911.

Resilient Wheel Construction—In which a solid spoke is held in place by springs at both ends and two sides.

The wheel described in this patent includes a rigid central portion forming a hub H as well as a number of spoke-holding chambers S which are radially disposed around the hub. The rim R of the wheel surrounds the hub as a center, being held in relation thereto by means of spokes S1. The solid spokes are held in approximately constant distance with regard to H by means of coiled cushion springs C disposed at both ends of the spokes. The spokes are encased and the casings connected by parallel plates forming a wheel frame, solid portions of which project into the space between the two plates. There are guides G, a number of which is used on two sides of the spoke adjacent to the neighboring spokes, and between each guide and the frame portions adjacent to it cushioning springs are provided. The total compression of these springs is in excess of the torque of the wheel, so that the drive may be taken from the hub to the rim through the spokes, while the cushion springs at both ends of every spoke allow for the percussions caused by driving the wheel over the road inequalities.

No. 1,055,835—to Frederick F. Tighe, New York City. Granted March 11, 1913; filed August 24, 1911.

Shock Absorber—Embodying friction members and a toggle joint between the absorber and the car frame.

The shock absorber, Fig. 3, consists of an annular shell S, a centrally chambered, radially slotted core element C and floating shoes which engage the shell frictionally. In the chamber of the core there is a longitudinally grooved member, the grooves having convergent floors; wedge-like gibs work in the grooves and slots. A resilient toggle joint T connects the gibs and the shoes, one end of which joint is secured to the chassis frame. Means connected to the axle cause relative engagement of the grooved member and the gibs so as to wedge the toggle joint means, if the axle is moved relatively to the car chassis.

No. 1,053,417—to George Cushing Martin, Los Angeles, Cal. Granted February 18, 1913; filed March 19, 1910.

Pneumatic Tire Casing—In which a coating of vulcanized rubber holds the threads of the fabric at their elastic limit.

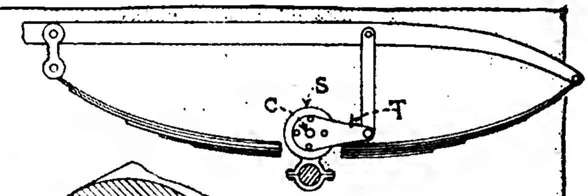
This patent deals with a tire casing, Fig. 4, having separated edges and comprising a body of fabric and a coating of vulcanized rubber. The fabric body has its threads uniformly tensioned in the casing structure to approximately the elastic limit of the material and the threads are held in this condition by the vulcanized rubber.

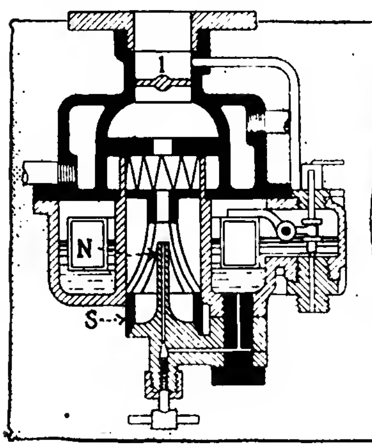
No. 1,055,744—to Nelson W. McLeod, St. Louis, Mo. Granted March 11, 1913; filed May 10, 1912.

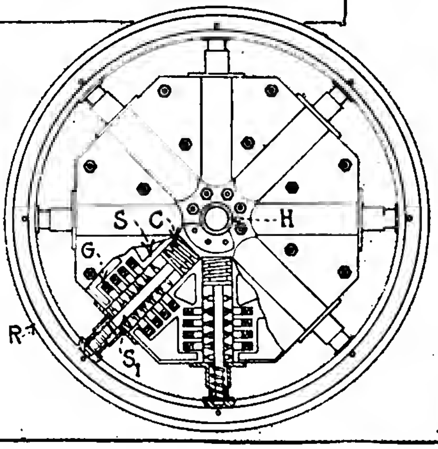
Illuminated Number Plate—In which non-transparent numeral signs are secured to a glass plate, behind which a light is in position.

This patent describes a combination number plate and light, Fig. 5. The same comprises a box which has a reflector and a lamp; the front end of the box is open and a number of lugs are disposed along the inner edge of the box front. These lugs are threaded internally. A rectangular frame member formed of L bars is so shaped as to fit for receiving a glass and lips on the edges of the rectangular member are adapted to be bent against the back of the glass after it is in place in the frame of that member. Lugs on the L-shaped bars are threaded internally to register with the threaded operations of the lugs on the box, and screws project into both of each pair of registering lugs, number members being secured to the bars lying over the glass.

No. 1,055,813—to Warren H. Seaser, Fresno, Cal. Granted March 11, 1913; filed February 2, 1912.







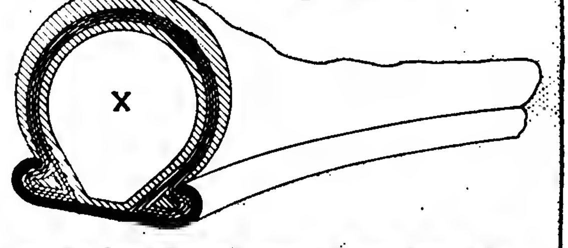


Fig. 1—Pembroke carbureter. Fig. 2—Tighe spring wheel. Fig. 3—Martin shock absorber. Fig. 4—McLeod tire. Fig. 5—Seaser number plate

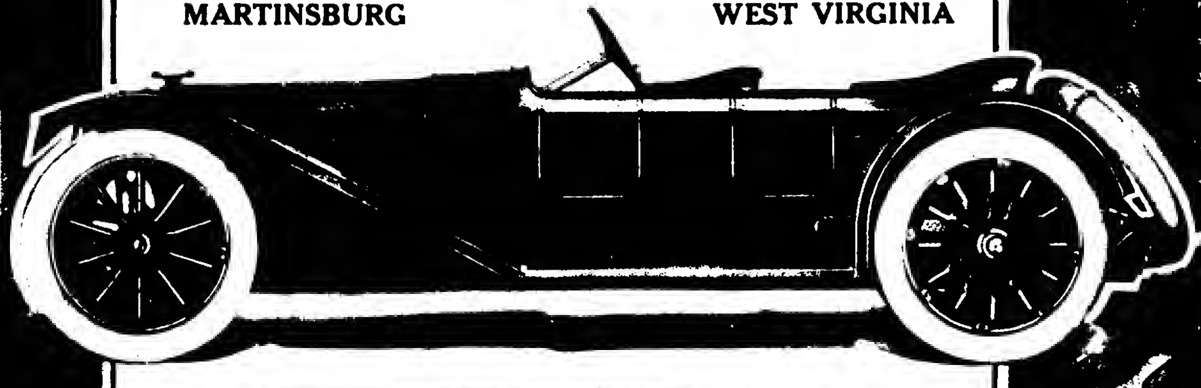
NEW YORK, MARCH 27, 1913.



Vol. XXVIII New York—Thursday, March 27, 1913—Chicago No. 13

The Automobile

Cars Taxed on Unused Horsepower

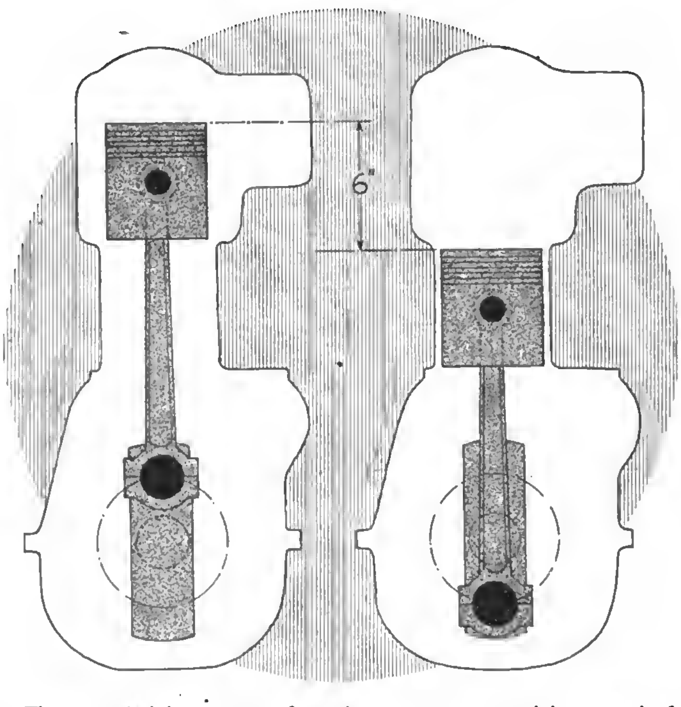
Motor Never Develops Rated Power When Traveling At Speed Permitted By Law

¶ *To be taxed by the state upon a certain piece of property and then to be forbidden to use that article would be impossible. Today in seventeen states the automobile owner is taxed according to the horsepower of his car and is then virtually forbidden to use it because the speed laws of the state will not permit the motor to be driven fast enough to develop the rated horsepower. A piston speed of* 1,000 *feet per minute is assumed in the formula used by the secretaries of state in calculating the horsepower. The average car when traveling fast enough to have* 1,000 *feet per minute of piston speed, would be going* 35 *miles an hour. The driver of that car would be fined.*

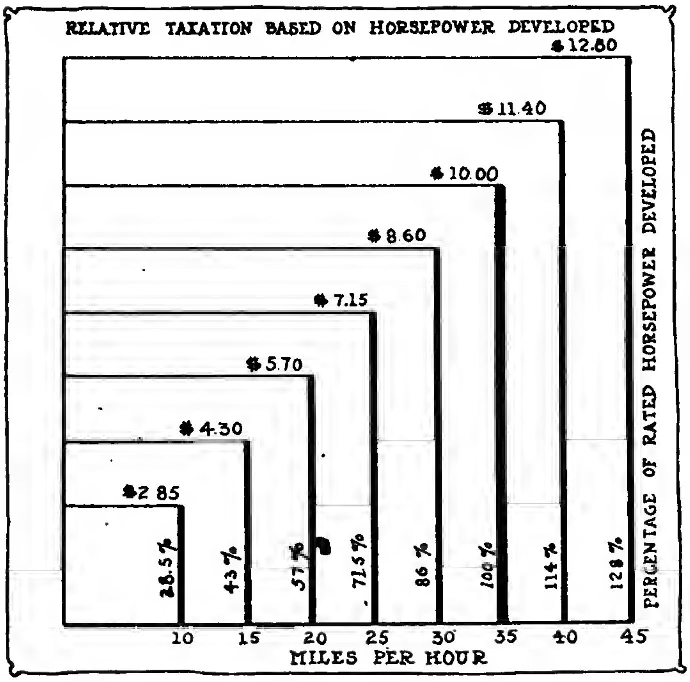
IF automobiles are to pay an annual registration tax based on their rated horsepower, then the horsepower formula used at present in establishing a car's power gives too high a rating, because with our present speed laws it is impossible to make use of the total horsepower given in the rating. This state of affairs is manifestly unfair to the automobilist.

Our speed laws will not permit you to drive fast enough to use it. If you observe the speed limits of the state in which you live you will rarely, if ever, utilize more than 57 per cent. of the horsepower you pay your annual registration upon. In other words, you are paying 43 per cent. too much registration tax. You are paying a tax on horsepower that the laws of the state will not permit you to make use of in average traveling.

Legislators have proceeded on the assumption that road destruction by an automobile is directly in proportion to the horsepower of the machine, but they forget that an automobile motor is capable of generating widely varying amounts of power and that the power generated is in direct proportion to the speed at which the engine works. If the speed of an engine, and by speed we mean the number of revolutions the crankshaft makes per minute, is 100 revolutions per minute, a certain horsepower is generated; double the speed and you will double the horsepower; treble the speed and your horsepower is increased three-fold. This ratio of increase continues until engine speeds of 1,500 revolutions per minute or more are reached, when, with not a few motors, the power fails to keep step with the increase in crankshaft revolutions. Then, in the language of the layman, the horsepower that an automobile consumes in traveling



The accepted horsepower formula presupposes a piston speed of 1,000 feet per minute. A motor with a 6-inch stroke as above, would travel a foot at each revolution—a thousand feet in a minute at 1,000 revolutions per minute



The tax for a 30-horsepower car in New York is $10. The above chart shows the maximum horsepower developed by such a motor at different speeds and what the tax should be if really based on the horsepower at definite speeds. A summons is often served in Greater New York for a speed of 15 miles an hour

along a highway always bears a direct relationship to the engine speed, and when you limit the speed of a vehicle on the highway you place a limit on the engine speed and curtail the amount of horsepower that the engine requires to generate.

In calculating official horsepower in the different states for computing the annual registration tax that an automobilist must pay, a formula familiarly known as the S. A. E. or A. L. A. M. formula is used. This formula has been used for years and has been official in Great Britain for many seasons. That it provides a satisfactory and just means of calculation is vouched for by the fact that several years ago in England a commission of the leading engineers was appointed to re-draft it to meet what were described as modern conditions. This committee, after making official tests of many hundreds of motors and delving generally into the subject, reported that no other method of calculation could be brought out that would meet the requirements and give general satisfaction to all better than the existing one.

This horsepower formula, given in a footnote, is based on two

Speeds at which important cars attain the A.L.A.M. rating based on a piston speed of 1,000 feet per minute. Note how few develop this at the generally illegal rate of 30 miles an hour

Car	Stroke	A.L.A.M. Horse-power	Gear Ratio	Wheel Diam-eter	Feet per Minute, Piston Speed 30 Miles per Hour	Miles per Hour at 1000 Feet Piston Speed
Packard 48	5.5	48.2	3-1	36	770	38.9
Pierce 66	7	60	2.7-1	38	836	35.85
Alco 11-60	5.5	54.1	2.63-1	37	660	45.5
Buick 40	4.5	28.9	3.75-1	36	788	38.1
Cadillac	5.75	32.4	3.5-1	36	940	31.9
Chalmers 18	5.25	43.8	3.75-1	36	920	32.6
Cole 50	5.25	32.4	3.94-1	36	964	31.2
Fiat 56	6	45.95	3.5-1	37	898	33.4
Ford T	4	22.5	3.64-1	30	815	36.8
Hudson 54	5.5	40.9	3.43-1	36	882	34
Hupmobile 32	5.5	16.9	3.86-1	32	1111	27
Locomobile M	5.5	48.6	3.21-1	37	801	37.5
Metz 22	4	22.5	3-1	30	672	44.7
Peerless 37	7	60	2.6-1	38	805	37.3
R.C.H.	5	16.9	4.25-1	32	1108	27.1
Stutz 4	5.5	36.10	3-1	34	816	36.8
White	5.13	22.5	3-1	34	761	39.5
Overland 69	4.5	25.6	3-1	32	708	42.4

motor functions, first, the piston speed in feet per minute, and, second, the diameter of the cylinder. Piston speed must be appreciated to understand the horsepower rating. The diagram on the opening page explains it. It means the lineal distance in feet that each piston travels in a minute of time. With a motor with 6-inch stroke, the piston travels 6 inches plus 6 inches, or 1 foot, in each crankshaft revolution. If the motor is working at 100 revolutions per minute the piston speed is 100 feet per minute; if at 1,000 revolutions per minute then the piston speed is 1,000 feet per minute. If the motor stroke is 5 inches, the lineal piston travel is 10 inches per revolution and 833 feet per minute. In the formula in question the piston speed is assumed to be 1,000 feet per minute and the assumption is that the motor is working at such speed when it generates the horsepower given by the formula.

In seventeen states the rate of taxation is based on the S. A. E. or A. L. A. M. rated horsepower of the motor. According to careful measurements the actual horsepower required for average travel under level road conditions is 25 per cent. of this.

The S. A. E. horsepower is based upon a piston speed of 1,000 feet per minute. At this piston speed the average car would be covering ground at the rate of 35 miles an hour, a rate far in excess of that allowed by law, but nevertheless assumed as a basis of taxation. When traveling at the legal rate of speed, which in the majority of states is 25 miles an hour, the horsepower developed by the motor with wide-open throttle is a little over 70 per cent. of that rated, and the condition of wide-open throttle at this speed is only possible with antiquated cars or in hilly country.

For every revolution of the crankshaft, the piston makes a trip down the length of the stroke and then up the same distance. If the stroke of the motor is 6 inches, the piston travels a foot in each revolution. At a piston speed of 1,000 feet per minute the motor is making 1,000 revolutions per minute.

Tax Based on 30 Miles an Hour

A common practice in touring work is to have the gear reduction between the motor and the rear wheels at a ratio of 3 to 1. While the motor is making 1,000 revolutions the wheels are revolving 333 times. The circumference of a 34-inch wheel measures 8.9 feet. In 333 revolutions it covers a distance of 2,963 feet, or .57 mile—more than a half-mile a minute. This is the speed that the motor tax is based upon—much greater than the speed permitted by law.

The Fiat car has a stroke of 6 inches. At a piston speed of 1,000 feet per minute it travels at the rate of 33 miles an hour. The rated horsepower of the Fiat car is 45.95. In New York state the tax is $15. In Greater New York the owner of the car is liable to be summoned for driving over 15 miles an hour. The greatest horsepower that the motor could develop under any road condition, at this speed, using the S. A. E. rating, is 21. The tax on a 21-horsepower car in New York is $5.

In Vermont this same Fiat car would be taxed to the extent of $45. The legal speed limit on the roads of this state is 25 miles an hour. The maximum horsepower that the Fiat motor could develop at this speed would be 35. This is 10 horsepower less than that rated and is the maximum which could be used by a law-abiding citizen upon the roads of this state. This 10 horsepower, however, is taxed as much as the 35 he may use.

It has frequently been argued that the weight of the car should be taken into consideration in taxing the car. At the automobile races run at Dieppe, France, June 25 and 26, 1912, close observations were made upon the road to note the effect of weight and speed as destructive agents. The road circuit covered 48 miles and was traversed 564 times by cars of various weights. The speed at which these cars traveled averaged close to 60 miles an hour. The following points were noted:

1—The road was left in perfect condition on the straight lengths.

2—Where skidding in axial or lateral direction took place the surface was broken.

3—In cases of wheel slippage due to the use of excess power not absorbed in propulsion owing to insufficient traction, the road surface was cut.

These trials furnished conclusive proof, according to the report of M. Lumet, "That on a perfectly smooth road, the speed, the weight or the power have no destructive effect on the road. On the other hand, however, the ratio of the adhesive weight of the car to the available power of the driving shaft must be such that the car cannot skid. . . . . One should note, however, that the road surface was frayed at the bottom of inclines, just where the speed was changed for the upgrade."

If horsepower does not affect the road, it seems unfair to use it as a basis of taxation. The tax on motor vehicles has for its sole object the recompense of the state for the use of the roads and for the necessary clerical work attached to identification. If horsepower is used as a basis on account of its indirect bearing on road destroying factors, then that actually utilized by the different cars should be studied. In the accompanying table on this page is a list of typical cars and the speeds at which the piston velocity is 1,000 feet per minute. Note how the gear ratio affects this problem, the size of the wheel and the stroke of the motor. For purposes of illustration a column is devoted to the piston speed reached by these motors at a rate of 30 miles an hour. This is the speed permitted by the state of New York in the sparsely populated sections of the state. There are but two cars that attain 1,000 feet per minute piston speed at this rate. It is impossible within the law to make use of the horsepower used as a basis of taxation by the state with a high-powered car.

Present Tax Favors Small Cars

The small cars, like the Hupmobile and R. C. H., are taxed $5 in New York state. They approach the nearest to utilizing the full power at which they are registered. In certain sections of the state where they are permitted to travel at the rate of 30 miles an hour they do attain the high piston speed of 1,000 feet per minute, but what tourist races about the roads through these sections of the state at an average rate of 30 miles an hour? With these small cars, as in the larger models, the motor only reaches the speed used as a tax basis when in low gear.

It has been found from experience that the average speed made by touring parties on fair roads is very close to 18 miles an hour, regardless of the size or weight of the car. This includes the necessary slowing down for bad stretches in the road and for passing through villages. If this were used as the basis, the owner of a six-cylinder Pierce-Arrow car rated by the S. A. E. formula at 60 horsepower would be charged for 24 horsepower instead. The owner of a Ford car would be charged for 9 horsepower.

A situation has recently arisen which has rendered the horsepower basis for taxation a matter which is uppermost in the minds of automobilists as a class. For the past few years the ratio of the stroke of a motor to its bore has steadily been increasing. This year the average stroke-bore ratio for American motors was 1.22 against 1.17 of last year and this advance has been typical of the history of the past 5 years. The increase in the length of the stroke with the bore remaining the same has given an increase in horsepower.

Derivation of A. L. A. M. Formula

The indicated horsepower of a motor is equal to the mean effective pressure, times the piston area, times the piston speed, divided by 33,000 and also divided, in the case of a four-cycle motor by 4. In equation form this is expressed:

$$\text{I.H.P.} = \tfrac{1}{4}\,\frac{P\,A\,S}{33{,}000}$$

In the A.L.A.M. or S.A.E. formula the piston speed is assumed to be 1,000 feet per minute, for area A, we substitute its equivalent .7854 D^2, the pressure P is assumed to be 90 pounds and the mechanical efficiency 75 per cent. bringing in N, the number of cylinders we have

$$\text{B.H.P.} = \frac{90 \times .7854\,D^2 \times 1{,}000 \times N \times .75}{33{,}000 \times 4} = \frac{D^2 N}{2.489}$$

$$\text{or: B.H.P.} = \frac{D^2 N}{2.5}$$

States which tax on horsepower basis and the amounts for different horsepowers. These are based on the A.L.A.M. formula and in many instances the Secretaries of State are thinking of adopting a formula which will give a higher rating

STATE	TAX ON HORSEPOWER RATING				
	10	20	30	40	50
Alabama	7.50	12.50	17.50	20.00	20.00
Connecticut	5.00	10.00	15.00	20.00	25.00
Idaho	5.15	7.50	12.50	20.00	20.00
Illinois	4.00	4.00	6.00	8.00	10.00
Indiana	5.00	7.50	7.50	15.00	15.00
Kentucky	5.00	5.00	10.00	10.00	20.00
Maine	5.00	5.00	10.00	15.00	20.00
Massachusetts	5.20	5.20	10.00	15.00	15.00
Missouri	2.00	3.00	5.00	7.00	8.00
New Hampshire	10.00	15.00	15.00	20.00	25.00
New Jersey	3.00	5.00	5.00	10.00	10.00
New York	5.00	5.00	10.00	15.00	25.00
Oregon	3.00	3.00	5.00	7.50	10.00
Pennsylvania	5.00	10.00	10.00	10.00	15.00
Rhode Island	5.00	5.00	10.00	15.00	25.00
Vermont	10.00	20.00	30.00	40.00	50.00
Virginia	5.00	5.00	10.00	10.00	20.00

The makers of automobile engines have realized the gains made in the horsepower of which the motor is capable and some have come to the conclusion that the A. L. A. M. or S. A. E. formula no longer gives a just rating of their motors since it no longer approximates the maximum power it is possible to get from the motor on the block of the testing laboratory. They have not infrequently expressed themselves as dissatisfied with the formula and have offered tentative suggestions for new ones.

The secretaries of state have noted these remarks and have come to the conclusion in some instances that since the formula seemed to be too low for the maker it must be also too low for taxation purposes.

It must be remembered that the motor upon the block is a different proposition from the motor in the car. Few owners can keep the motor in the condition that it is in when on the blocks of the testing room at the home plant. Little changes of carbureter adjustment, valve timing, tappet clearance, etc., not to mention carbon accumulations, and the numberless other items which enter into the efficiency of the motor, cut down the power output. The S. A. E. formula may fall short of the motor on the blocks, but it is without exception in excess of what the motor is doing on the road.

A car driven over a level road at a rate of 20 miles an hour requires from 5 to 8 horsepower to maintain that speed. Why should the owner of that car be taxed for 30 or more horsepower?

What the automobile user has to contend with in Vermont. Under the most adverse conditions, traveling at the legal rate of speed he falls far short of the rated horsepower which is used as a basis of his taxation

Car	A.L.A.M. Horsepower	Horsepower at Legal Rate of 25 Miles per Hour	Present Tax $1 per A.L.A.M. Horsepower	Tax if Based on Horsepower Developed on Road at Legal Rate
Packard 48	48.2	30.9	$48	$30
Pierce 66	60	41.8	60	41
Alco 11-60	54.1	29.7	54	29
Buick 40	28.9	19.3	28	19
Cadillac	32.4	25.4	32	25
Chalmers 18	43.8	33.6	43	33
Cole 50	32.4	26.1	32	26

Overland 69	25.6	13.4	25	13

Who Defends New York Tire-Dating Bill?

No One Claims Responsibility at Hearing—Illinois Also Afflicted with Similar Bill—Much Automobile Legislation in Other States

NEW YORK CITY, March 25—A hearing was given on the tire dating bill at Albany last Thursday before the Senate Committee on Miscellaneous Corporations. Several of the large tire companies sent their representatives and the others were represented by Sidney S. Meyers, Jr., who is acting as counsel for all the large tire companies in the country in fighting this objectionable measure.

In the course of the hearing the tire manufacturers vainly endeavored to ascertain who wanted the bill passed, in what way the bill would better existing conditions in the tire industry and, in a word, why this bill, which was supposedly peacefully laid to rest last March, has been resurrected.

The members of the committee seemed to be absolutely ignorant of the bill on which they were supposed to pass. As to the state of mind of some of the members of the committee, only three out of seven of whom were present, by the way, the following conversation is illuminating:

Mr. Meyers: May I ask, Senator Stilwell, what the real object of this bill is?

Mr. Stilwell: I know nothing about the bill.

Mr. Meyers: May I ask you, Senator Sullivan, what the real object of this bill is?

Mr. Sullivan: You will have to ask the introducer, Mr. Oxford. (Mr. Oxford, it was stated, was then in New York.)

The bill in question was introduced in the Senate on January 20, 1913, by Senator Sullivan, chairman of the above committee, who afterwards gave the bill to Mr. Oxford, to introduce in the Assembly, which was done on February 17, 1913. Thus the statement made by Mr. Sullivan, "You will have to ask the introducer, Mr. Oxford," is an example of the old game "button, button, who has the button?"

Mr. Meyers brought up the point that the bill is unconstitutional because it is class legislation, stating that:

"It provides for the dating of tires for use on motor-propelled vehicles and thus excludes tires for use on buggies, baby carriages and bicycles.

Senator Stilwell distinguished himself by replying as follows:

"You say it takes out a class and puts it on motor vehicles only. Are they not the only dangerous class of vehicles? Baby carriages are not as dangerous as motor vehicles, are they? Let's be sensible men."

Among the numerous remarkable statements made by the members of the committee the following passage, taken from the official record, is exceedingly illuminating in regard to the status of the men who represent the people of the Empire State at Albany:

Mr. Meyers: In order to be fair, you must keep in mind your specific powers.

Mr. Stilwell: We make the law.

Mr. Meyers: But you are not above the Constitution.

Mr. Stilwell: Yes, sir, we make the law.

If the authorities at Albany permit this uncalled-for measure, which will work so much harm to the legitimate tire manufacturers, to be enacted into law it will conclusively prove that something is wrong. The tire companies are putting up a manly, straightforward fight against the passage of the bill, although it seems practically impossible to find anyone who is in favor of the passage of such a measure.

The makers are determined to fight the passage of the bill to the limit and if it is passed over their opposition, they will carry the matter to the courts.

CHICAGO, ILL., March 22—A bill fashioned along the lines of the one that is before the New York solons, which will require that all tires made or offered for sale in the State of Illinois be stamped with the date of manufacture and also dated when repaired, etc., has been offered at Springfield by Senator Manny and referred to the committee on parks and boulevards. The bill is a short one and the interesting part of it says:

> It shall be unlawful, within this state, for any person, firm or corporation to sell, resell, or otherwise dispose of, any tire to be used on any motor vehicle unless the same shall have been properly stamped, clearly and legibly, and in the English language, with a die, and in such manner, designated thereon, the date when such tire was originally manufactured or made, and when, if such be the condition, such tire was repaired, with the date of such repair, and whether the same is a new or second-hand tire, and when or not the same had previously been used, and such tire, when new, shall have a tag pasted thereon, showing the ingredient, composite and component parts thereof.
>
> A fine of not less than $50 and not more than $200 shall be imposed for each offense.

Minnesota has a tire-stamping law, which, however, is not enforced, it being claimed that the authorities recognize that it is unconstitutional. The tire manufacturers, it is understood, have long wanted to make a test case in the Gopher State, but have had no opportunity.

Colorado Gets Highway Commission

DENVER, COL., March 21—Motorists and good roads promoters throughout Colorado are elated over the enactment of a law creating a highway commission and setting aside a fund of $750,000 for the construction and improvement of roads. The bill has been passed by the legislature and signed by Governor Ammons, and contains a clause putting it into effect immediately.

Iowa Insurance Bill Passes One House

DES MOINES, IA., March 22—A bill providing insurance against losses sustained by owners of automobiles in accidents passed the Iowa house of representatives this week. As originally introduced, the bill provided for insurance to indemnify the automobile owner driving his own car against damages he might incur as results of an accident. Before passed, however, the bill was amended so that the person or property injured may have the first right to bring suit against the insurance company, and receive his claim, if just, before the insured shares in the benefits of the policy.

Lippincott for Interstate Licensing

TRENTON, N. J., March 25—Job H. Lippincott, State Motor Vehicle Commissioner of New Jersey, dissatisfied with the results of the reciprocity licensing system as now used in that state, is proposing a system differing very much from all in use at present. At present, while New York and New Jersey have full reciprocity, the number of New York cars touring in New Jersey is very large and Jersey's roads are depreciated without anyone paying for them.

The proposed system of Commissioner Lippincott is claimed to be automatic in regulation and revenue, including as it does but one registration and making interstate travel possible without annoyance or delay.

The foundation of the scheme is an interstate license issued by the state in which the automobilist resides. The license tag is so designed as to denote the state in which the car is owned, and the license is to be charged for proportionately to the horsepower of the machine. The fee is to be assigned to the state in which the car is owned and if the license is to be extended for travel in any other state or states, an additional fee representing a percentage of the home license fee is to be charged for each additional state. It would then be necessary for the motor vehicle office of the home state to notify the state or states, for which extensions have been granted, of the licensing of the car, giving the number, color, etc., of the tag and forwarding to the foreign state a check for the amount paid for the license extension. It would, of course, remain for the state where the extension holds good to suspend or revoke the license. Each state should use all the money received from automobile licensing for road improvements.

Family Licenses for Delaware

WILMINGTON, DEL., March 20—Under a bill passed a few days ago and which went into effect yesterday, when it was signed by Governor Miller, family operators' licenses are now obtainable, at a cost of $8 per annum. Heretofore each operator, no matter how many there were in a family, had to have a separate license at $5 a year.

Ohio Representatives Pass Bills

COLUMBUS, O., March 24—The Hite bill is the most important of a number of bills passed in the Ohio house of representatives last week. It provides for a yearly levy of .5 mill for a period of 10 years for the improvement of the highways. The bill, if enacted into a law, will produce $36,000,000 in 10 years. Of the amount raised by the levy, 25 per cent. is to be used in building the market road system and 75 per cent. in building the system of inter-county roads.

Another bill was passed establishing the Portage plan in Ohio. This provides that any association, concern or individual may subscribe 10 per cent. and the county 90 per cent. toward the improvement of any road.

A bill was passed compelling township trustees to drag every road at least two times yearly with a split-log drag.

Still another bill was passed to take the place of the Garrett law, which had been invalidated by the Supreme Court; the new measure provides that in the improvement of roads abutting property owners may pay 10 per cent., the township 15 per cent., the county 25 per cent. and the state 50 per cent.

Detroit Cars Facing Taxation Scheme

DETROIT, MICH., March 25—Detroiters are fighting the proposed motor car tax law, which seeks to impose a specific state tax on motor cars, rather than a local tax. Mayor Marx and several of the city assessors have recently appeared at Lansing to speak against the bill and have offered facts to show that for the coming year the city will lose about $200,000 in taxes if the bill becomes a law. There are about 8,000 privately owned automobiles in the city and the tax derived therefrom last year amounted to $188,640, based on an average valuation of $1,050 per car.

Only $2 Fee for Federal Officials

WASHINGTON, D. C., March 24—*Special Telegram*—Under the ruling of corporation counsel, members of Congress and executive officers of the federal government who are legal residents of other states, will not be compelled to conform to the new automobile regulation imposing upon non-residents the same fee as is assessed by their home state against district automobilists.

The question arose in connection with the application of Senator Gallinger, of New Hampshire, for a district automobile license. Corporation Counsel Thomas informed H. M. Woodward, secretary of automobile board, that, for the purpose of obtaining a license to use his automobile here, it has been decided that Senator Gallinger is a resident of the District.

In view of this decision the commissioners today approved the recommendation that members of Congress and executive officers of the government, who are required by law to conduct their official business in Washington, be considered resident of the District for the purpose of this regulation. The cost to them for a license will be $2.

The regulation was aimed principally at the Maryland authorities, who have refused to enter into reciprocal arrangements with the District for the use of the roads by automobilists. Under it non-resident applicants for an automobile license are required to pay the same fee as is charged by their state against residents of the District.

Illinois Government Favors Good Roads

CHICAGO, ILL., March 24—That the men at the head of governmental affairs in the State of Illinois are in favor of legislation looking toward a permanent system of good roads in the commonwealth was made plain by William McKinley, speaker of the state legislature, at the good roads dinner held Saturday night under the auspices of the good roads committee of the Chicago Association of Commerce at the Hotel Sherman.

Speaking for Governor Dunne, Speaker McKinley said that while not committing himself as to the relative merits of any of the four or five bills under consideration in the legislature, he was heartily in favor of road improvement in the state. But he was not prepared to say what method to pursue to obtain them. He suggested a campaign of letters to the legislature when the favorite bill came up.

Thirty different organizations of business men throughout the state were represented at the dinner. In addition, the 40,000 clubwomen of the state had their hearing in the person of Mrs. F. W. Blocki, of Chicago. Henry Paulman spoke for the automobilists and Edwin R. Wright, president of the State Federation of Labor, spoke for organized labor in the interest of the use of convicts on road work. The pleas of the rural letter carriers, farmers and truck gardeners and the school teachers in favor of state highway improvement were presented by representatives of their organizations. A plan as outlined in a good roads bill was presented by Richard Finnegan, secretary of the Illinois State Highway Improvement Association and received the indorsement of the meeting.

Truck Club Against McAneny Scheme

NEW YORK CITY, March 20—At the monthly meeting of the Motor Truck Club last night the proposed vehicle taxation measure conceived by Borough President McAneny of Manhattan was discussed. This scheme proposed to tax vehicles according to the load carried by its wheels, the reason given being the destruction of city pavement by automobiles. According to the proposed fee schedule some big trucks would have to pay as much as $1,000 a year. The truck club members recognized that the enactment of the measure would greatly handicap the truck business and the use of trucks in New York, while the conclusion was reached that by specifying a minimum tire width the pavement could be sufficiently protected.

GRAND RAPIDS, MICH., March 25—The Supreme Court of Michigan has held unconstitutional the clause in the state automobile law of 1909, which makes the owner of a motor vehicle liable for any injury occasioned by the negligent operation, by any person, of the owner's automobile. This is a distinct victory for the motorists of the state. This does not affect chauffeurs, who are held to be paid servants of the car owner, who is strictly responsible for such employee's actions while the vehicle is under his control.

Price-Cutting on Patented Article Is Infringement

Decision to That Effect Handed Down in United States Supreme Court of Great Importance

CHICAGO, ILL., March 25—Word was received here from Washington today of a decision, to the effect that a dealer selling patented articles at cut prices anywhere within the jurisdiction of the Circuit Court of Appeals at Chicago is liable for infringement of patent, had been handed down in the United States Supreme Court. This will undoubtedly have a bearing on the future sale of automobile accessories.

Whether the construction of the law now in force in Chicago is to be the law of the entire country hangs on the decision in another case now pending before the supreme court involving a broader question than that in the case decided. This case, which has been advanced for argument April 7, is a suit for infringement of patent brought by a patent medicine manufacturer against a Washington druggist for ignoring the stipulation on the label which states that the nostrum could not be sold for less than a given price. In the lower courts the claims were not allowed and the court of appeals of the District of Columbia has now asked the supreme court for instructions.

The Fair Department Store was made a defendant in the old Circuit Court of Chicago by the Kobler Die & Specialty Co. in a suit for damages because of the sale by The Fair of a gas-beating device which the Kobler company controlled under a patent. The question tried was whether The Fair had violated any law in selling the devices for $1.25 each, whereas the Kohler company manufactured them for sale at $1.50 and attached a notice to each device imposing the condition that the device shall not be sold at less than $1.50.

According to Walter Chamberlin, who took the appeal to the supreme court for the defendant the supreme court has affirmed the decision of the circuit court of appeals that patentees could include in their patent notice a fixed sale of price. Attorney Chamberlin argued that the circuit court went without its jurisdiction in making such a decision, which he held was against public policy, established a monopoly, and was a violation of the Federal Constitution.

The decision of the supreme court in this case is at variance with a decision handed down in the United States district of New York in February when the judge held that patented articles may not be sold at a fixed price.

DETROIT, MICH., March 26—F. R. Bump, assistant general manager of the R-C-H Corporation, has resigned. J. F. Hartz, president of the corporation, will take charge of Mr. Bump's duties for the present.

$450,000 Company to Make Hearses

GRAND RAPIDS, MICH., March 20—The Michigan Hearse & Automobile Co., capitalized at $450,000, was organized here today for the manufacture of motor trucks, with motor hearses a special line, and horse drawn hearses.

The new firm, which is among the first to specialize in the building of motor hearses, is a merger of interests of the Michigan Hearse & Carriage Co., which has been in business here for the past 10 years, and the Grand Rapids Motor Truck Co., manufacturers of 1.5 ton commercial vehicles, which removed to Grand Rapids from Decatur, Ind., about 1 year ago.

The present working forces of forty men at the hearse factory and fifty-five at the truck plant will be at once augmented to 160 men.

INDIANAPOLIS, IND., March 14—At their regular annual meeting, held at the plant in this city, recently, the stockholders of the American Motors Co. re-elected the entire board of directors and the following officials: J. I. Handley, president; D. S. Menasco, vice-president; J. D. Bright, treasurer; V. A. Longaker, chairman of board and general manager.

Automobile Securities Quotations

NO definite trend can be said to have prevailed through the past week, and the number of advances were about equal to that of losses. The principal influence of recent weeks, namely, the Akron strike, having been practically eliminated, the tire stocks regained much of their former strength, Goodyear common advancing 15 points, Goodrich common 4, Fisk common 3 1-2, Miller 5, U. S. Rubber 2 and Swinehart 7. Firestone common, however, dropped 5 points. Among automobile manufacturing securities Chalmers was notable for its advance of 5 points, while Pope dropped 3, Willys-Overland 6, U. S. Motor first preferred 23 and second preferred 35. The comparative tabulation for 1912 and 1913 follows:

	1912		1913

McLaughlin Wins from Grand

WASHINGTON, D. C., March 24—The Interstate Commerce Commission has handed down an opinion in the complaint of the McLaughlin Motor Car Co., Ltd., vs. the Grand Trunk Railway Co., of Canada, *et al.*, in which it is alleged that unjust and unreasonable charges were made for the transportation of automobile parts from Flint, Mich., to Oshawa. The commission found that the rates charged were unreasonable and ordered reparation paid to the complainant. In its opinion the commission said it did not believe that automobile chassis knocked down should be charged as high a rate as that provided for chassis set up or for complete automobiles.

Yale & Towne Company Sues Dealers

NEW YORK CITY, March 25—The Yale & Towne Mfg. Co., of this city, has filed suit against the General Automobile Supply Co. and Smith-Haines, both of this city, for alleged violation of the Yale & Towne trademark. The bill of complaint charges that the defendants in both suits sold locks, stating them to be of the Yale type. Inasmuch as the name Yale is protected legally, the complainant holds that this alleged practice on the part of the defendants is illegal and the Yale company prays for injunctions preventing the defendants from continuing the sale of such locks, as well as an accounting of the business done in these products.

Market Changes of the Week

Tin proved to be the most important change in the markets this week, gaining $.63 per hundred pounds. Under the influence of the better London cables the market here was firm and higher yesterday, but without any great show of activity on the part of operators to either buy or sell, and at the close the market was inactive though firm. A steady business was reported in lead here yesterday on the basis of $4.35 per hundred pounds. Both electrolytic and Lake coppers suffered losses of $.00 1-8 per pound. Beyond a moderately good demand from consumers, there is but little change to note in the copper situation here. Leading sellers claim a steady run of good buying orders, and buying may be viewed as of very fair proportions. Domestic scrap rubber remains in a firm position. A moderate demand continues to be received from reclaimers and fair-sized clearances are still noted to various foreign countries. Collections are reported to be light and stocks are comparatively rather light. Automobile tire scrap rubber is calling at $.09 7-8 per pound. Cottonseed oil rose $.05. The oil market has shown so much firmness of late that some of the traders thought it about time for a moderate reaction and were afraid to pursue the buying side any further.

Trunk and Fisk from Thropp

CHICOPEE FALLS, MASS., March 26—Justice Hale in the U. S. Court of Appeals, First District, a few days ago affirmed the decision of the district court declaring the patent No. 822,561 issued June 6, 1906 to P. D. Thropp, void and invalid, on the grounds of anticipation. The De Laski & Thropp Circular Woven Tire Co. thus lost to the Fisk Rubber Co., of this city, whom they had sued for infringement of the above-mentioned patent during the past 4 years.

The patent covers the form of mold used in the making of Fisk one-cure, wrapped-tread tire casings.

Buick Sues Père Marquette on Rates

WASHINGTON, D. C., March 24—The Buick Motor Car Co., Flint, Mich., has filed complaint with the Interstate Commerce Commission against the Père Marquette Railroad Co., charging the imposition of unjust and unreasonable rates from Flint, Mich., to Richwood, O. The complaint charges that rates fixed by defendant company on automobile shipments from Flint to Richwood are in excess of those charged to Dayton from Flint on the same road and further by 70 miles than to Richwood. It is alleged that competing lines charge 40 cents less on the hundred on automobiles for similar distances. Reparation to the sum of $53.30 is asked.

Merger of Flanders and Maxwell Completed

Detroit, Dayton and Tarrytown Plants of the Organization Rapidly Resuming Capacity Production

DETROIT, MICH., March 25—As a final action in the merger of the Flanders Motor Co. of this city, with the Maxwell Motor Co., Inc., the holders of stock in the former were last week given shares in the parent concern on the basis of about half a share of Maxwell preferred stock, and one each of second preferred and of common stock for each share of Flanders stock.

Following the usual procedure in such negotiations, the books of the Flanders company were completely gone over and audited and the plant and stock inventoried before the formal transfer was made, which accounts for the delay. All Flanders liabilities are assumed by the Maxwell Motor Co., and all its indebtedness squared away.

The plants here, namely the Flanders, Brush and Alden Sampson plants, are not operating to capacity yet but men are being taken on as rapidly as possible and before long some 9,000 men will be employed. The Dayton, O., plant where Stoddard-Daytons were formerly made and the Tarrytown, N. Y., factory, old home of the original Maxwells, are also taking on many employees and settling down to serious business.

Chandler Buys Factory Site

CLEVELAND, O., March 25—The Chandler Motor Co., of this city, closed a deal yesterday with the Belt & Terminal Realty Co., for 6 acres of land on the Belt line of railroad for a factory site. The ground is located at St. Clair and 131st streets. The company is already pushing plans ahead to erect a concrete and steel fireproof factory which will be completed by July 1. This factory will be 120 by 420 feet. The company is making rapid progress with its Chandler light six on which shipments will begin July 1. Already distributors have contracted for a large portion of the first year's output and indications are favorable for an encouraging reception of the new car by the country at large.

Dunlop Company to Double Capital

TORONTO, ONT., March 22—The Dunlop Tire & Rubber Goods Co. is to double its preferred capital, and with this object in view they will issue $300,000 worth of preferred shares. In addition to the $293,000 preferred stock now paid up (7,000 shares of the original issue authorized having been cancelled) there are outstanding $700,000 and $500,000 in bonds. It is the intention to apply later to the Montreal and Toronto Exchanges to have the entire preferred listed. The operations of the company embrace the whole of Canada, branches having been establishd in no less than eleven of the leading cities. Since 1905 the sales have increased from $369,362 until last year they reached an aggregate of $2,310,585. For 14 years a dividend of 7 per cent. per annum has been paid semi-annually on the preferred stock, the total distribution in this way reaching $285,520.86.

Batavia Issues $100,000 in Stock

NEW YORK CITY, March 24—The Batavia Rubber Co., Batavia, N. Y., capitalized at $500,000, is issuing $100,000 worth of 6 per cent. preferred stock, the total stock of that class amounting to $250,000. The company has a surplus of $62,754. The added capital is needed for expansion purposes.

Finnegan Buys Bulk of Thomas Company Property

Total Realized at Auction from Thomas Assets Was $256,400—Finnegan May Manufacture Cars

A. A. A. Opens Washington Branch—New York Stoddard Dealers Bankrupt—Grand Palais Dilapidated

BUFFALO, N. Y., March 22—This afternoon at 5 o'clock auctioneer Conant disposed of the last article in the auction of the property and stock-in-trade of the E. R. Thomas Motor Car Co., 1192 Niagara street. The sale opened Monday, March 17. About 400 bidders were in attendance on each day but the bidding on the articles was not exceptionally heavy, although the entire sale brought good returns.

Fifteen of the Thomas cars went at $1,900 each. These and most of the other articles were bought by Mr. Finnegan of Depew. Although the price officially bid and paid for lot one of the Thomas stock by Mr. Finnegan, was $51,000, he paid $5,360 additional for other machinery, working tools, lathes and other material not included in the first lot.

Immediately after the sale, Mr. Finnegan, who is president of the Empire Smelting Co., and who previously had purchased the patents, patterns and stock-in-trade of the Thomas factory including machinery, tools, lathes and other articles, stated to THE AUTOMOBILE representative that he would carry along the Thomas product in much the same manner as did the Thomas officials. This led to the belief that Mr. Finnegan, who formerly headed a motor car company in Louisville, Ky., is about to make a second incorporation in the automobile field but for the present Mr. Finnegan prefers not to discuss his plans for the immediate future. However, he hinted that he was about to manufacture automobiles but where he would not say.

Mr. Finnegan also bought the famous New York to Paris racer for $200. The famous New York-Paris trophy, also bought by Mr. Finnegan, brought $300, or $100 more than the racer that won it.

Lot No. 2 of the assets of the Thomas Motor Car Co. was disposed of for $6,000 to the Shiffman Iron & Metal Co., Detroit, Mich.

The entire receipts from the sale of the Thomas assets aggregated $256,400, divided as follows: Monday, $84,500; Tuesday, $17,400; Wednesday, $72,200; Thursday, $49,300; Friday, $11,300; Saturday, $21,767. About 2,000 persons attended the sale during the 6 days. Registered for the sale from the various states were the following number of men: New York State (outside of Buffalo), thirty-six; Michigan, seven; Pennsylvania, twenty-nine; Indiana, six; Missouri, four; Rhode Island, three; Illinois, eleven; Maryland, one; Montana, one; Delaware, one; Minnesota, four; England, six; New Jersey, four; Kansas, one; Ohio, eighteen; Maine, one; Connecticut, four; Massachusetts, nine.

Post Office Bids to Open Next Week

WASHINGTON, D. C., March 24—(*Special Telegram*)—About April 1 the officials of the post office department will call for bids for furnishing the service for carrying mails in various Eastern cities. Regarding the use of motor vehicles the call for bids will say:

Proposals to perform service in any of the routes named in automobiles, of such style and construction as may be acceptable to the second assistant postmaster general, instead of in wagons drawn by horses, will be received. Each proposal must be accompanied with statement giving description of motor vehicle it is proposed to use, with horsepower of engine and speed per hour that will be made.

In the event of a proposal for automobile service being accepted, the department reserves the rigbt to rearrange the schedules shown in the advertisement for route, and to change the running time, so as to provide schedules better adapted to the more expeditious mode of transportation.

The department reserves the right to reject any or all of such proposals.

In New York the call will be for eighty motor [illegible] capable of carrying 6,000 pounds and twenty motor vehicles [illegible] each 3,000 pounds. The post office department will answer all inquiries about the proposed service.

A. A. A. to Open Washington Branch

NEW YORK CITY, March 25—The American Automobile Association will open branch headquarters in the Riggs Building, Washington, D. C., April 1. This move has been contemplated by the executive board for several months, in fact, since the movement for national construction and maintenance of highways took definite form. It is the intention of A. G. Batchelder, chairman of the executive board, to spend approximately one-half of each week at this branch.

Next Week Busy One for S. A. E.

NEW YORK CITY, March 26—During the coming week the Society Automobile Engineers will conduct a considerable amount of business. On April 1, during the morning the council meeting of the society will be held at the headquarters of the Metropolitan section, 1784 Broadway, while in the afternoon the fuel committee will hold a meeting to outline its work which is to be done in co-operation with the Automobile Chamber of Commerce. On the following day the wheel standardization committee will meet in New York to take up the work that was begun at Cleveland this month.

NEW YORK CITY, March 21—The Stoddard Motor Co., of this city, which formerly handled Stoddard-Dayton products for the old U. S. Motor Co., has been declared a voluntary bankrupt. The liabilities, aggregating $253,338, are all due to the Maxwell Motor Co., Inc., and the assets are $66,988. The Maxwell company has decided to take the distribution of its products in its own hands.

PARIS, FRANCE, March 19—The Grand Palais, where the salon of motor cars is held annually, is said to be in a very shaky condition. The various floors creak and the weakness of the construction became more pronounced by the flood several years ago. Since then $160,000 was estimated by a commission to be needed to put the building in shape, but nothing has been done.

English Motor Experts Organize

NEW YORK CITY, March 25—According to a London, Eng., dispatch, there has been organized in that city, the London Chamber of Motor Experts, an organization of automobile specialists formed for the purpose of inspecting and passing on many inventions intended for the automobile field. It is the purpose of the organization to charge a nominal fee for the examination of patents and the conducting of tests with various apparatus, etc.

LONDON, March 14—In July, under the presidency of Prince Arthur of Connaught, an Imperial motor transport conference

Detroit To Pay Higher Freight for Better Service

will take place in this city. All the recognized bodies connected with the manufacture and use of motor vehicles as well as other engineering experts connected with the Dominions and Colonies are represented on the executive committee. Not only will the conference devote its attention to the business of touring motor cars, but also to the whole problem of the transport of motor vehicles whether for pleasure or industrial purposes. As far as arrangements have gone, it is anticipated that Prince Arthur of Connaught will receive the delegates on Friday, July 18, and that on the following day, the Industrial Motor Vehicle Exhibition which will be opened at Olympia will be visited. On the following Monday and Wednesday further meetings of the conference will take place and the final meeting will be held on Saturday, July 26.

Canada Get 468 Cars in January

WASHINGTON, D. C., March 24—During January, 1913, of the 2,157 automobiles which were exported to foreign countries from the United States, Canada got 468, the total value of which was $593,700. British Oceania came next witht 403 machines imported of a total value of $386,833, and the United Kingdom next with a total of 374 to the value of $258,463. Then came South America, importing 351 machines of a total value of $393,079, Asia and other Oceania, 193 of a total value of $182,600 and the rest following in this order:

France, West Indies and Bermuda, Europe, other than the countries listed; Mexico, Germany, Italy. All other countries took a total of ninety-three machines of a value of $103,118.

During January the United States imported seventy-one machines of a total value of $174,689, as against January, 1912, when it imported eighty-four machines of a total value of $199,197. Of the machines imported, twenty-four came from France, twenty-one from Germany, ten from Italy, eight from the United Kingdom and eight from all other countries.

Wants Cole Stock Returned to Him

INDIANAPOLIS, IND., March 24—Lee Watson, of Texas, has hrought suit in the local courts against J. J. Cole, S. J. Kuqua and J. Frank Morrison asking that a transfer of 165 shares of stock in the Cole Motor Car Co. made to them in September, 1910, be set aside. He also asks that he be allowed hack dividends and that the court fix the price he shall pay for the stock he sold.

In his complaint, Watson alleges he sold the stock for $17,500 as the result of misrepresentations of conditions.

Columbus Buggy Still Tied Up

COLUMBUS, O., March 24—A proposition made by F. R. Huntington, a hanker of this city, to pay 35 cents on the dollar for the elaims against the Columbus Buggy Co., now in the hands of the receiver, has been refused.

Another plan to pay the creditors 66.6 cents on the dollar is being worked out hy the creditors' committee and will prohahly be announced within a short time. In the meantime the large plant of the concern on Duhlin avenue is practically idle.

YORK, PA., March 22—All records for attendance were broken during the first week of Harrisburg's fourth annual automobile show last week. The exhihition is the most complete ever held by the Harrisburg Automobile Dealers' Association and exhibitors report having done much business during the first week of the show.

City's Shipping Facilities Inadequate—Railroad Men To Confer with Detroit Manufacturers

Canada Ranks First in Importing American-Made Cars During January—Columbus Buggy Plan Fails

DETROIT, MICH., March 22—Freight traffic managers and other railroad officials who are in convention in this city this week made it clear to Detroit manufacturers and other shippers that in order to accede to the demands for increased railway terminal facilities and quicker and better service in the transportation of package freight and carload lots the only possible means was hy the increasing of the existing freight rates. The present charges are so low in view of the large increase in cost of transportation that Detroit cannot expect any hetter service until they are put on a proportionate hasis. Before long a proposal will be made to Detroit manufacturers by those railroads which have been investigating the conditions here.

Paul Wadsworth, general traffic manager of the Delaware & Hudson, in his talk before those gathered at a banquet tendered the visiting railroad officials by the Board of Commerce admitted the inadequacy of the city's shipping facilities, and showed that while the railroads are able to cope with the situation of certain periods of the year, they are unahle to meet the vastly greater requirements of other seasons. This is largely due to the plan of the many automobile factories of bringing out new models for spring delivery and being less active during the early fall and winter months. Terminals to handle the enormous business of these busy seasons would mean a large investment, and at the same time they would not be used at the slack times.

Co-Operation with Railroads Urged

Railroads are operating at a very close margin of profit, according to the Delaware & Hudson official. During the last 5 years, money has not heen very easy to ohtain for improvements of equipment and in further touching upon the financial side of the railroads' problem stated that most loans had to be on short time paper, that of long terms meaning a high rate of interest and a permanent tax upon the property. Many of the roads have reduced their dividends and thus damaged their credit in the borrowing market. Detroit shippers were urged to cooperate in every way possihle with the roads, who are no less interested in efficient and quick service than are the former.

Another speaker showed that the roads are further harassed by their employees on all sides demanding higher pay.

Last summer, automobile manufacturers were compelled to store their finished cars in tents and other temporary quarters owing to the freight car famine. Detroiters contend that the least the railroads can do is to take as good care of this city's shippers as they do of those in other cities. The lack of foresight in the rapid growth of Detroit in the past few years was given as the chief reason for the present inadequacies of shipping.

The contemplated increases mean only one thing—that the car buyer will have to pay the piper. Automobile makers do not pay the freight on the cars which are sold by their agents and therein lies the time-worn reversion to the pocket of the ultimate consumer. Increased freight rates will also mean an increased cost to the buyer of parts in other cities—this will favor Detroit in that it will cause makers in other localities who depend upon Detroit-made parts to think of getting closer to their supplies.

General view in Grand Hall, showing the uniform stand decoration, which was also a feature of the passenger vehicle show

Six New Types at Boston Truck Show

BOSTON, MASS., March 24—The annual exhibition of commercial motor vehicles which opened in this city a week ago and closed here tonight has proved to be one of the best yet held by the Boston dealers because of the amount of retail sales made and the general interest engendered in motor trucks by the exhibition. The attendance was not large but the amount of business done was large in proportion to the numbers attending. The entire New England territory was well represented and many of the sales made were to outside Boston purchasers.

With a total of fifty-four exhibitors, the show numerically takes third place in comparison to the Chicago and New York truck shows as Chicago had seventy-six exhibitors and New York sixty-six. The Boston list of exhibitors included practically all of the big concerns with the exception of two or three which were left out because of lack of room to suit them or for other reasons. The list shows forty-eight makers of gasoline machines, six electric machine representatives and one maker of steam cars, this being the first truck show at which the Stanley steam trucks have been displayed.

The Boston show had its quota of new trucks not seen at either New York or Chicago, this list including the front-wheel drive Eldridge electrics made in various load capacities; the new Edison electric made in Lawrence, Mass.; the Sowers gasoline truck built in Boston, and the Victor built in Buffalo. The Eldridge vehicles all use the Couple-Gear wheels which incorporate an electric motor in each. These wheels are mounted in front and permit of the use of large diameter artillery wood wheels with metal tires in the rear. The rear wheels vary in size, depending on the load carried but approach 72 inches in diameter and carry steel tires 4 inches wide and 1 inch thick.

Little can be said of the trucks exhibited so far as chassis details are concerned. Each show, however, has its own peculiar styles of bodies and so important are these becoming that the more interesting types will be reviewed herewith. One novel body was that of a large Tarvia spreader on a 6.5-ton Alco chassis. The body is a tank wagon style and has provision for heating the tarvia inside the tank from a steam road roller.

A type of body local to Boston is that of the furniture-moving companies which is not of the inclosed van type but of the open express style. These bodies approximate 13.5 feet in length, are 5 feet wide and the sides are 2 feet high.

Among the concerns exhibiting bodies of this type were Packard. Kelly, Knox, Atterbury, Lauth-Juergens and others.

The Packard company exhibited an interesting ice-cream body for a Boston house. The body is made with a front compartment and a rear compartment separated by an aisle extending crosswise between them. The front compartment measures 4 feet, 2 inches long, and 4 feet, 4 inches wide; the rear compartment is 3 feet, 6 inches long and 4 feet, 4 inches wide; between the two is the aisle, 25 inches wide, reached by a step.

The Peerless exhibit contained a sight-seeing car with capacity for forty people. It has been built for use in Porto Rico, where it will operate on schedule over a route 120 miles across the island, making the trip in one direction each day. It resembles open trolley-car construction rather than the conventional sight-seeing style. There are five cross-seats, which should accommodate six persons each. At the rear are two short longitudinal seats with baggage space between them. Entrance is by means of two steps at each side, these extending the entire length of the seating portion of the vehicle. These steps fold in when the vehicle is traveling. The total weight is 8,500 pounds, and the speed 12 miles per hour. The body is built on a 3-ton chassis which has a motor with four cylinders each 4.5 by 6.5 inches bore and stroke. There are four of these vehicles at present operating in Porto Rico and two more are being shipped.

Unconventional delivery wagon of General Vehicle Co.

The various exhibit spaces showed bodies intended for a variety of uses. Naturally dumping types for coal and building construction trades were in great numbers. They were shown by White, Packard, Peerless, Pierce, Locomobile, Velie and some others. Peerless shows two types, one in which a rack-and-pinion method of dumping is used and the other in which the front end of the body is elevated by means of two vertical chains passing over upper and lower sprockets. There are many examples of special bodies for such concerns as bakers, furriers, confectionery houses and other concerns using vehicles of 1,500 pounds capacity and over. The White company showed one body for a confectionery house in which a metal interior is used. Provisions are included for a series of adjustable shelves, there being three of these, extending from end to end of the body, thereby increasing its useful floorspace four-fold. Other concerns exhibited bodies showing a variety of good decorative designs. One of these was an Autocar sold to a Boston furrier. Practically three-quarters of each side is given over to a drawing of a polar bear, very suggestive of the trade in which the vehicle operates.

Of the new vehicles, the largest exhibit was that of the Eldridge Mfg. Co., Boston Mass., building front-wheel-drive electrics, and electric tractors with three and four wheels. One of the vehicles exhibited was a 5-ton Watson stone wagon in which the floor is hinged at each side and opens downward to unload. This wagon is fitted to take removable batteries so that two batteries can be used in the same day. The vehicle has a speed of 6 miles per hour. The rear wheels are 56 inches in diameter and are shod with 4-inch steel tires. On the 5-ton coal wagon the rear tires are 68 by 4-inch steel bands 1.25 inches thick. Another vehicle is the cart especially designed for alley use in Boston. It is a three-wheeled vehicle with a driving wheel in front, and a metal dumping body mounted between the two large steel-tired rear wheels. The vehicle has a 2-ton capacity and is especially intended for maneuvering in cramped quarters where it is impossible to use a standard vehicle. It has a mileage radius of 25 per charge of battery and is set to operate at 6 miles to the hour.

The Eldridge tractor was shown connected to a trailer for the lumber trade. It is a four-wheel design carrying its own battery and has a fifth wheel for supporting the forward end of the trailer. Its load is 5 to 7 tons and its speed is 8 miles per hour.

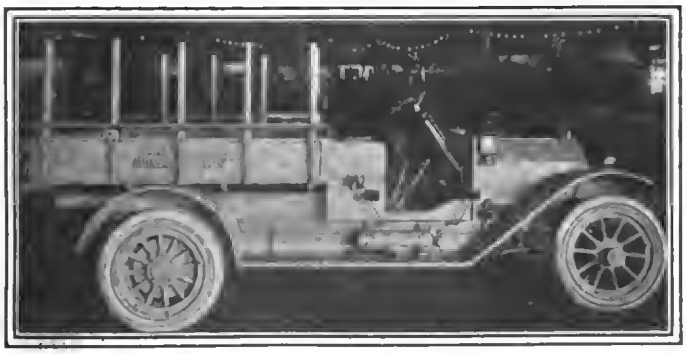
The Edison electric truck is built by the Edison Electric Vehicle Co. of America, Lawrence, Mass., and is made in 1,000 2,000 and 3,000 pound sizes. All of these are built with side chain or shaft and worm-gear drive. They carry Edison batteries and use General Electric or Westinghouse motors. The 1,000-pound vehicle has a speed of 12 miles per hour, and a mileage radius of 55. It uses 34 by 2.5-inch solid rubber tires all around. The load-carrying space measures 3 feet 6 inches wide and is 6 feet long. This delivery vehicle is designed for such trades as grocers, butchers, bakers, laundries and department stores. The 2,000-pound wagon has a mileage of 60 per battery charge, and a speed of 4 to 12 miles per hour. It has four forward speeds and three reverse. The 3,000-pound vehicle is suitable for express work and industries needing this capacity.

Dumping gear of coal wagon on Velie chassis

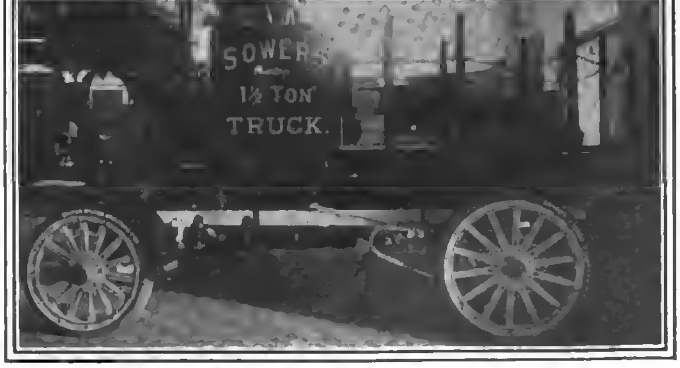
It has a speed of 10 to 12 miles per hour, and a battery range of 50 miles. The chassis measures overall 154 inches and the loading space is 44 by 105 inches. Axles are either Timken or Standard. The David Brown worm and wheel are used when shaft drive is fitted.

The 3,000-pound Sowers truck is manufactured by the Sowers Motor Truck, of Boston. It is a conventional motor-under-the-seat type with three-speed gearset, combined jackshaft and differential and side-chain drive. The vehicle has a loading space 10 feet 6 inches long and 5 feet wide. The wheelbase measures 110 inches and its maximum speed is 16 miles per hour. The front and rear tires are 36 by 3.5 and 40 by 4. The motor is a four-cylinder Wisconsin type with 3.75-inch bore and 5-inch stroke. The cylinders are cast in block and have inclosed valve parts Other motor features are Bosch magneto, Schebler carbureter the thermo-syphon cooling. The gearset is selective. Steering wheel and control levers are on the right side. The company expects to market soon a 2-ton vehicle with the motor under the hood, with the steering wheel on the left side, with levers in the center, and a wheelbase of 136 inches.

A truck not seen at New York or Chicago shows, but one which was placed on the market last fall and which was exhibited is the Marmon. This is a 1,500-2,000-pound delivery wagon set to operate at 20 miles per hour. It is largely fashioned after the four-cylinder Marmon passenger car chassis and has the motor under a forward hood and uses shaft drive. The rear tires are double pneumatics. The wagon is fitted with a self-starter and has right side steeling and control.



Marmon truck has double pneumatics on rear wheels



Boston built Sowers truck of 1.5 ton capacity

French Press, No Longer Indifferent to American Design, Dissects a Small Mechanical Detail—The Fag End of Mechanical Efficiency—Experimental Iron-Tired Wheels—Mission of the Worm Drive—Memorandum of Recent Technical Treatises

CRITICISM of American Drive-Shaft Construction.—Disquieted by the ability of American manufacturers to sell automobiles which please the public at a lower price than European makers are compelled to ask, members of the technical press in the three principal industrial countries of the old world are at pains to point out flaws in those details of design where a cost reduction has been effected through a simplification of the current European practice. As this new attitude represents a great improvement upon the position previously taken, which consisted in a general denouncement of American workmanship and a sneer at mass-production methods—as if these methods were incapable of development in the direction of accuracy in the results—an example may be quoted of the more definite criticism now coming into vogue. The subject is a drive-shaft construction which was shown in an American car exhibited at the last Paris salon and which is not without a parallel in other American cars.

The construction is shown diagrammatically in Fig. 1, and its details are referred to as follows:

"The transmission has a single universal and the rear axle is oscillating. The drive-shaft is inclosed in a tube constituting both torsion rod and driving-strut. But this tube does not terminate either in a hinged fork stay or in a ball-and-socket joint—pieces which are expensive to produce. To its end there is secured a lever AD which is fixed at D and cannot turn around this point, with the result that the angle ADQ is invariable. This lever is journaled at A to a rod AB which at its front end is journaled to the side of the gearbox and transmits both push and reaction. It is placed at an angle which makes its prolongation pass through O, the point of contact of the vehicle wheel with the ground. In the mind of the designer, what should take place is this: The reaction due to the application of motor power gives rise to a force y which is applied at the point D, at the spot where the drive-shaft revolves in a ball-bearing mounted in the tube, and acts in a vertical upward direction. On the other hand, the driving-push, transmitted from the driving-wheels through the tube, may be represented as a horizontal force Z_1 and applied at A, and it can be resolved into the two forces m and t_1. If the dimensions of the parts AD and AB are suitably chosen, y and t_1 can be made equal and opposite, so that one offsets the other, and there remains then only the force m which works in the direction of the rod AB exerting a simple compression stress upon it. An expensive piece of machinery, a fork or socket joint, has thus been replaced by a simple rod of negligible cost and by a lever which is riveted to the tube and also inexpensive. The solution is seductive.

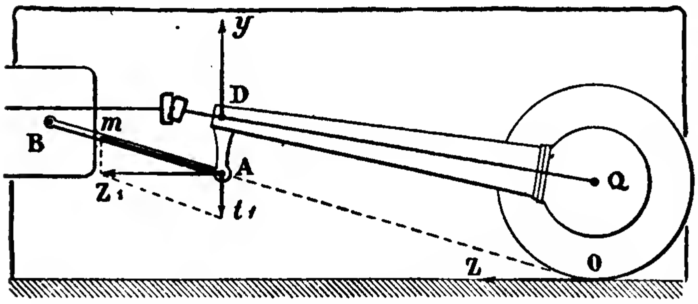


Fig. 1—Diagram of construction denounced by French critic

"If the force of the driving-push is changed through operation of the motor or the gears, the reactions vary in the same manner, and it may be expected that the forces m and t_1 will always offset one another. And, if the brakes are applied, the reaction y changes direction, acting now vertically downward, but at the same time the driving-push is changed into traction, so that its direction is similarly reversed, and one may still hope that the two forces will be mutually compensated."

Having thus represented the presumable reasoning of the designer, the critic proceeds to show by a mathematical development of the subject that m and t_1 cannot balance against one another unless the rod AB is infinitely short in comparison with DQ, and this would be the construction corresponding to a fork or socket joint; also that the resultant of these two reactions is an upward thrust which has to be absorbed in the universal and the rear bearing of the gearbox to the detriment of these parts, and that this thrust is greater, other things equal, the more the direction of the drive-shaft departs from the horizontal.

As might be expected, the critic is able to show that a still much greater discrepancy between the two reactions arises when the brakes are applied. Comparing with recent French construction [as in Peugeot racing and other cars] which also tends toward simplification, he suggests that the American construction which divides the stresses between the rod AB and the universal is certainly inferior to the method consisting in absorbing the driving-push in the vehicle springs and the motor torque partly in the torsion tube and partly in the universal. By the latter method the movements of the rear axle are at least not hindered, as the critic believes he has shown mathematically that they are in the American construction, and do not create unnecessary additional stresses upon the universal or the bearings and other organs.

The critic shows further that all one-sided movements of the rear axle and wheels tend to deform the drive-shaft, the rod AB or the lever AD, and that either these parts—particularly the rod AB and the shaft—will be deformed or else the one-sided movements will be effectually resisted, the running qualities and the durability of the vehicles being impaired in either case. The construction is therefore to be completely rejected, he concludes.—From *Technique Automobile et Aérienne*, February 15.

[The careful reader will not fail to notice that it is essentially a man of straw whom the critic has transfixed with his lance, partly because a construction exactly like the one described by him is not common among American automobiles and partly because its merits and demerits depend largely upon other features in the construction of the vehicle—the degree of flexibility of the frame and its cross-members, for example; also upon the nature of the spring suspension and the relative dimensions of the drive shaft, the rod AB, the torsion tube and the universal. The work of an automobile is such that without some compromise relating to the possible relative movements of its parts—based on an indeterminate flexibility here and there—there would not be any automobiles built today that the general public could afford to buy. If an objection can be taken to a compromise construction mainly dictated by a desire for reducing the cost of manufacture and the selling price, a stronger objection might with equal right be raised against the general tendency among French manufacturers to save a little expense for fuel by equipping cars with very small high-speed motors with high compression, whose average work in average service must be a good deal harder for the material put into them than similar work is for the larger motors used in the small American cars. In both cases there is a question of saving involved, and it seems to be a question of general judgment and experience whether in either case the saving is actually effected or is bought too dearly.—Ed.]

—

TWO Aspects of Efficiency.—Usually the efficiency percentage of a motor or of a mechanical movement is looked upon and estimated from the wrong end. If one mechanism is found by test to have an efficiency of 96 per cent., and another has 92 per cent., there is a tendency to consider the difference as unimportant. The latter is only one-twenty-fourth less efficient than the former, it is said. If the relations are as 80 and 90, the difference is considered greater than in the first case. Yet it is only with reference to the power requirements that this view holds good. When wear and durability are concerned, efficiency should be measured backward from the 100 per cent. An efficiency of 96 means 4 per cent. of waste, while one of 92 means 8 per cent. of waste in one form or another. The waste means generation of friction and usually a corresponding amount of wear and deterioration. To begin with, the first mechanism is then in operative perfectionment twice as efficient as the other, and, as wear advances in a geometric progression, as a rule, the difference in the degrees of efficiency of the two mechanisms under comparison will soon be still much greater under the same amount of work; that is, one will prove much less durable than the other. A case in point is the enormously enhanced serviceability that is obtained from ball-bearings by the minutest attention to accuracy and finish, although the nominal initial efficiency may be raised only 1 per cent. by the extra work and care.

On the same principle, an 80-per cent. efficiency is twice as good as a 70-per cent. efficiency, so far as any consideration of practical importance is concerned, excepting that relating to the required power, and in the case of a mechanical device, where thermal efficiency in the utilization of expanding gases is not in question and where the majority of the wasted power finds expression in wear, one of 70 per cent. efficiency will usually be found to be worth much less than one-half, from the standpoint of the investor who wants value for his money, than another mechanism serving the same purpose and reaching an efficiency of 80 per cent. Hydraulic transmissions may constitute an exception, in so far as some waste heat in them may be disposed of by radiation without causing wear of the working parts.

This important and neglected viewpoint has recently been justly emphasized in connection with tests of worm gears for automobiles made at the Lanchester works in England.

—

STATUS of the Worm-Gear Drive—Some variations in the current reports concerning the properties and peculiarities of worm-gear drives for automobiles are accounted for by F. Carlès in a review of automobile mechanics. With regard to silent operation, he says, the worm gives complete satisfaction. In a properly established worm-drive, silence is obtained at once and continues so long as the gear lasts. Wear of the parts does not affect it, and this is perfectly natural, since there is no interruption in the contact between driving and driven members; scarcely even at a reversal of the direction. There are cars in England which have run 60,000 miles and are as silent as at the start. But while the silence is not affected by the wear, the efficiency is.

On this subject of the efficiency of the worm drive a great deal has been printed during the past 2 or 3 years. From some tests made by the Oerlikon company of Switzerland it seemed reasonable to infer that the efficiency of the worm-drive was at least equal to that of the bevel-gear drive, and this inference was presented to the world, somewhat hastily. The tests gave an efficiency of 97.5 per cent. for a worm with five threads acting on a bronze wheel with 68 teeth. The motor used was operated at 780 revolutions per minute. In a Glaenzer worm-drive acting upon a wheel with roller teeth the average efficiency was found to be 93 per cent. With some optimism, it was then possible to suppose that the worm was slightly superior to the bevel-gear, which under the most favorable conditions gives an efficiency from 90 to 95 per cent. On the other hand, a table compiled from data furnished by manufacturers shows that the efficiency of the worm-drive in automobile practice is lower than that of the bevel gear except at high motor speeds, such as from 1200 to 1800 revolutions per minute. At the low speeds it even drops to an average of 70 per cent. This difference between a maximum of more than 97 per cent. at some tests to 70 per cent. under certain practical conditions may be reconciled by assuming that the efficiency is first of all a function of the gear-reduction in the drive, and this reduction can never be the most favorable in automobiles on account of the need of having the gear reversible, for which purpose the thread of the worm must have a pitch of about 45 degrees. This cannot be be varied materially, and it seems to be the upshot of the data that with this pitch the efficiency drops rapidly when the speed of the worm shaft is reduced.

The worm drive has however important advantages relating to lubrication and wear. Owing to the relatively large surfaces which are in contact, the driving pressure per square millimeter is much smaller than in a bevel-gear drive. Consequently the oil is not so readily driven out from between the working surfaces, and the wear is reduced to much less than it would be supposed to be from the amount of sliding friction involved in the action. The latter factor, on the other hand, makes the need of providing an unfailing lubrication imperative. The rate of wear is, on the whole, considerably slower than that of a bevel-gear, if the worm-drive is well made and carefully lubricated. The consumption of oil for this purpose is large.

The security against breakage of teeth is much greater than in a bevel-gear drive by reason of the reduced driving-pressures per unit of area, as referred to.

The data, in so far as they have been established, point thus to the worm drive as desirable for a high powered, luxurious and fast limousine, with which a reduced efficiency, meaning the loss of a few horsepowers, incurred when the vehicle is driven slowly, is a matter of no consequence. But for its application to slow-moving trucks and low-powered small cars the demonstration in favor of the worm-drive is still to be made.—From *La Vie Automobile*, Feb. 22 and March 1.

—

IRON-TIRED Truck Wheels.—While it is the universal experience that the apparently high cost of a solid-rubber tire equipment leads to a lower all-around upkeep cost than that obtainable with steel or iron tires in the case of motor trucks which travel normally at from 8 to 15 miles per hour over hard roads, it is widely believed that the situation may be different in the case of heavy motor vehicles which need not be driven faster than 8 miles per hour at any time, either loaded or empty, and whose work lies mainly over soft roads, or even over macadamized roads. In the United States considerable motor truck work of this nature may be contemplated in connection with mining enterprises, interurban freighting and for the transportation of garden and farm produce, in which lines any saving in tire upkeep and a simplification of the tire equipment would also be especially appreciated and would tend to open up a market for motor trucks which has barely been touched.

Captain Renaud, whose data upon truck wheels and tires in general were presented in part in these columns last week, also refers to some of the experiences and experiments made with iron-tired wheels in France, where however the prevalence of stone pavements in towns and villages accentuates the drawbacks of iron tires, while little transportation work is offered that must not be done at all seasons of the year if at all; so that also at this point a difficulty is experienced with iron tires in the poor traction and steering qualities on snow or ice which have so far been characteristic of them.

As iron or steel tires in all vehicles, except steam tractors and slow-moving agricultural implements and machinery, can be used with wood wheels only, if ruinous vibrations shall be avoided, one of the foremost problems in connection with them is to obviate the loosening of the wooden construction and the onerous re-tightening which such loosening necessitates. In the French artillery steel tires were tried because a thin steel tire, sufficiently hard to be elastic, holds the wood wheel together more strongly and more lastingly than a heavier iron tire, but it was found that the hard steel tire gives considerably poorer traction than a soft iron tire, especially on stony roads or pavements; and for driving wheels of a truck or other vehicle this disadvantage is of importance. In the end, the steel tire also succumbs to the same trouble which overtakes the iron tire in much shorter time. The hammering which the metal tire receives on the road—especially of course on rough stone pavements—lengthens it and thereby loosens it from the wood rim, and then it is that the wheel must be retightened, from the hub outwardly, in order to fill the enlarged tire. With heavy loads, hard roads and high speed this necessity arises very soon.

Mr. Renaud suggests that it should be possible to effect an improvement, in the way of combining the better traction of soft iron tires with the greater durability of hard steel tires, by providing a tire which is hardened next to the wood rim while the outer surface portion is kept soft, as might be done by spraying the inner surface of the tire with water when it is red-hot, [similar processes being in use in the manufacture of vehicle springs]; but no such method has yet been perfected.

Some iron-tired wheels have been developed in the French automobile industry which are designed especially to minimize the troubles arising from the stretching of the tires. A wheel used for the lighter models of Purrey steam trucks and also for the rear wheels of some Berliet gasoline trucks is shown in Fig. 2 and the machine used for tightening this style of wheel is represented in Fig. 3. The special feature is that the rim is made of as many pieces as there are spokes and that hardwood wedges C are employed at both ends of the spokes for tightening purposes, as shown in the drawing. The metallic hub is slightly conical. As soon as any looseness is noticed in the wooden structure, two semi-sleeves, N in Fig. 3, of suitable thickness are pressed in between the hub and the wooden wedges, and, if necessary, metal wedges may also be inserted at other points.

On the very heavy models or Purrey steam trucks which carry loads from 15 to 20 tons, the type shown in Fig. 4 is used. Here full sectors of wood are compressed very strongly within an assembling ring 30 millimeters thick, and upon the latter there is shrunk a tire 60 millimeters thick. The spoke sectors are aligned by radial tenon-pieces inserted in mortised spaces in the meeting-edges of the sectors. The hub is put in place by strong hydraulic pressure, and one such wheel weighs 700 kilograms. It remains tight for a long time, but it is necessary to renew the outer tire when it has been worn down to one-half of its original thickness. The same principle has been applied by Berliet in the type of wheel shown in Fig. 5, but the shape of the spokes has been made more sightly and the construction of the central portion has been modified so as to make the retightening method illustrated in Fig. 3 applicable. This demountable wheel thus consists only of spokes, wedge pieces abutting against the hub and the double iron tire, the wood rim being eliminated—From *Le Génie Civil,* March 1.

—

Compression Cocks and Burnt Fingers.—The pet cocks in most motors is so bored that the handle lies horizontal when the cock is closed. When opening it while the motor is running one is liable to get the fingers burned from the flame which shoots out. By boring it so that the handle hangs downward when the cock is closed this is not so likely to happen; neither will the cock turn open of its own accord.—From *Automobil-Welt,* January 31.

Time for Cleaning the Car

Old Oil and Mud Should Be Removed and the Surface of Body and Trimmings Given a New Finish

Accessories Such As Top, Lamps and Upholstery Need Special Attention in the Spring

THE time is fast approaching, indeed, is already here, when the car owner must consider the matter of putting the car in condition for the spring and summer campaign on the road. Nothing attracts more attention or excites more favorable comment than the neatly varnished car with lamps, fenders and other accessories shining fine and clean under a new garb of material, the top and upholstery cleaned and renovated and everything, in fact, conditoned to a nice point of harmony throughout.

A very large number of cars this spring will, upon examination, be found in a sufficiently good condition to need only a good rubbing down and a simple coat of varnish applied.

This work carries with it, naturally, some attention to lamps, fenders, top and other furnishings in order to get the car out in a well-balanced condition.

Cleaning Old Oils From the Car

It is usually quite a job to start the grease and smeary accumulations and get them thoroughly cleaned off the car, and particularly off the chassis or running parts. A combination of crude oil and turpentine—one part of oil and two parts of turpentinue being recommended—swabbed on quite generously and left to attach and soften up the grease is more certain and effective than other mediums for the preliminary process. Use a case knife or two, a couple of small hook scrapers and a common putty knife for scraping and cleaning parts which the oil and turpentine mixture fails to loosen. Finish off by saturating the greasy parts of the surface with a dressing of clear turpentine and then with strips of clean burlap scrub dry and clean It is important that the grease and oil be cleaned off thoroughly. This is not always attended to as it ought to be, which accounts for the great number of shabby, unkempt appearing cars yet in the prime of their usefulness.

The body surface of the car should now be rubbed with pumice stone flour and water sufficiently to lay down any surface roughness and to develop a clean, receptive surface. Any defects, or bruises, or chipped places need to be touched with color made to match as closely as possible the color of the car. Owing to the fact that, as a rule, it is almost impossible to match the old color which is usually more or less faded and not uniformly faded, this touch up color should be applied very carefully and sparingly with none of the color allowed to run over the edge of the blemish. In mixing the color always use enough rubbing varnish to cause the color, when applied to the surface, to dry with a gloss. In this state it is then prepared to retain in the drying process its original shade, as shown in the container after mixing. A color with a pronounced gloss reflects more light than it absorbs and therefore when exposed to the light upon the surface remains a "fast color."

It is a good plant to give the chassis, also, a light rub over with the pumice stone flour and water. Apply this and do the rubbing with a small fleece wool sponge, which is less likely to cut through the sharp edges of spokes, springs, etc. Give these parts the necessary touching up, practicing the same care in this work on the chassis as upon the body surface.

For the body of the car use a finishing varnish that dries, in proper surroundings, out of the way of dust in 6 hours and is fit to use in active service in three days. Such varnish should be bought for its capacity to resist the action of mud, water, grease, etc.

For the chassis a varnish is recommended that will resist to the utmost the destructive action of soap, mud, water, grease and oils. Such a varnish should dry free from dust in 3 hours and harden ready for use in 2 days.

In connection with these touch up and varnish jobs it not infrequently happens that after the body surface has been given the pumice stone flour and water rub surface checks appear to a depth and in such variety as to call for two coats of varnish instead of one, in which case the first coat should be a rubbing varnish made to dry in from 20 to 24 hours. This extra coat of varnish serves to penetrate the cracks and seals them. Give this coat a nice, uniform rubbing with pumice stone flour and water, clean up carefully and apply the finishing coat. Even the car with the body surface considerably slashed with checks, both fine and large, can be made with the two substantial coats of varnish to look almost like new.

In the case of a car showing the color faded and bleached out—its original shade and lustre quite gone, in fact, it is practically labor and material thrown away to try to touch up a surface of this kind. The better way—the only way, in a word—is to clean the surface of grease and foreign substances and then sandpaper down smooth and clean with No. 1 sandpaper, after which dust off clean and apply a solid coat of color. To get satisfactory results with one coat of color it will be necessary to use the same shade of color that was used in previously painting the car. In preparing this color, which should be a japan ground one, thin down with pure turpentine and to every six parts of color add one part raw linseed oil, this latter forming the binder to fasten the color to the surface. This color will dry over night, whereupon it may be striped in the morning and late in the afternoon given the rubbing coat of varnish.

Special attention should be given the guards, fenders and under parts. It often happens that these parts are in much worse condition than other parts of the car and when such is the case they require an extra coat of some hard drying varnish that dries out of the way of the dust in 2 hours and hardens over night.

In doing over the lamps in color it is the best practice if a baking oven can be secured to bake the pigment on. A color varnish baked on the lamps at 170 degrees for 6 hours will give an unsurpassed finish for such parts.

The Top Often Deserves Attention

The car top and the upholstery deserve attention. If rubber or leather, sponge off with tepid water. What the requirements are can then be judged. A good hand buffed leather top will hardly, if at all, need any further treating until the enamel of the leather wears thin. The rubber top after a season's wear, if not before, will need a thin application of some good reliable dressing, and the same treatment may be given the leather top when the enamel begins to look shabby. Although mohair top dressings are advertised and are doubtless good preparations, we should hesitate to use anything on mohair until the fabric begins to look the worse for wear. A good, thorough brushing with the whisk broom will do wonders for the mohair fabric, which has not the clean appearance it once possessed.

For the upholstery, if of cloth, the vacuum cleaner is a splendid device. Even in the case of leather it will take every atom of dirt or other accumulations from around buttons, binding, etc. Door jambs and interior parts of the car which are painted and varnished had best be given a dull finish or a polished finish. If finished in high gloss the parts show finger marks and hand blemishes readily. Just fetch these parts up in varnish and if they are to be polished use polishing varnish for the last coat. Rub the varnish in due time with pumice stone flour and water and then with some reliable polish rub until the generated friction brings out the high, sharp brilliancy that is proof against finger marks, etc.

Gear Changing and the Clutch Brake

Silent Changing Rendered Easier By Clutch Brake Which Permits Control of Gear Before Meshing

By E. P. Batzell

¶ *Good results in gear changing can only be secured when the pitch velocities of the meshing gears are practically alike. It is desirable that a partial connection between the motor and clutch be maintained during the operation of changing gear, but the clutch should always be released momentarily on actual contact of gears so that any existing difference in pitch speed between the two members will not transmit a shock to or against the mass of the clutch.*

¶ *If properly fitted and provided with a means of adjustment a clutch brake is of advantage in gear changing.*

¶ *When starting, the clutch should be entirely disengaged, so that the full braking action of the clutch-brake is applied, thereby bringing it to rest. When changing to a higher gear, the clutch should be only partially released so that the brake only slows down the driving member of gearset. When changing to a lower gear, the pedal should be operated so that the clutch-brake is not brought into action at all. The clutch member can then increase its speed with the engine, during the free period of changing.*

THE noiseless shifting of change-speed gears requires that the driving and driven gears, which are about to be meshed, rotate with equal pitch velocity. Unless this is so there will be some shock between the gear teeth when they come in contact. It is clear that the required change of pitch velocity when going from one gear combination to another should be in the rate of the respective ratios of these two combinations. Being extremely difficult to control the speed of the secondary or driven element of the gearbox, because it is rigidly interconnected with the driving wheels of the vehicle where the only available speed control medium is the brakes, it is common in driving practice to use the motor and the clutch for regulating the relative pitch velocity of the gears to be meshed. This regulation is exercised on the primary or driving part of the gearbox.

Motor Is the Chief Factor

The motor is the chief factor for proper gear meshing when it is necessary to change from a higher to a lower gear without stopping the vehicle. Most frequently the motor performs the desired function automatically. In this case of speed changing the secondary gear to be meshed has a higher pitch velocity with the initial gear ratio in use, than its respective primary gear has. Consequently the latter has to be speeded up in the rate of the new ratio to the initial one, if clashing is to be avoided, because the pitch velocity of the secondary gear would vary only with the vehicle speed. Necessity for use of a lower ratio without stopping, generally would appear after the motor becomes overloaded using the initial higher ratio. By easing off the clutch without materially decreasing the throttle opening when going from high to neutral, the motor gets a few moments for speeding up and carrying away with it also the clutch and the primary gear parts of the gearset, before the driver has time to pass from the neutral to the lower gear. It will be noticed, that during this gear change it is not desirable to interrupt entirely the driving connection between the motor and the primary part of the gearset. It depends on the nature of the clutch and on the driver's familiarity with its functioning whether or not the motor acceleration will produce the desired result in speeding up the primary gear to that extent, when the pitch velocities of both gears to be meshed are equal.

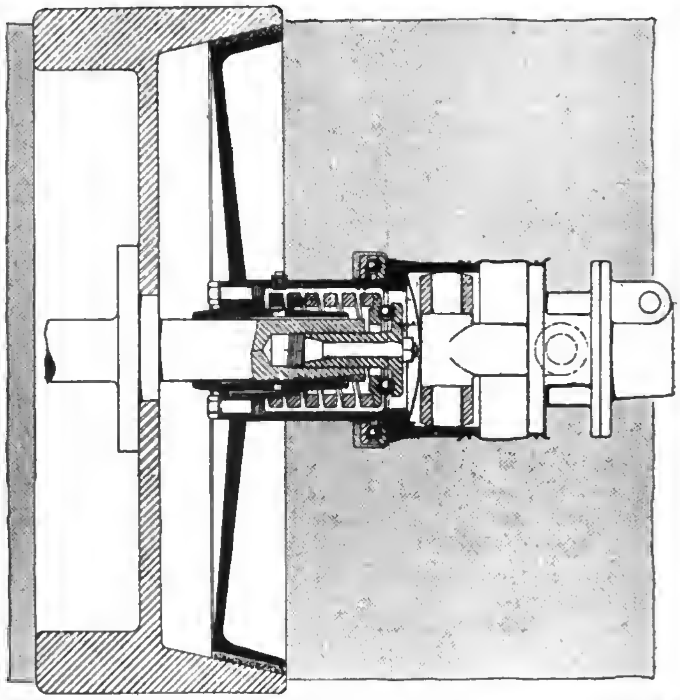

Fig. 1—Cone clutch to which brake was applied with advantage

Cone Clutches Disengage Readily

Cone clutches without springs for gradual engagement generally can be very readily disengaged from the motor. A slight motion on the clutch pedal might be sufficient to disconnect the motor and the primary gear and consequently, although the motor will accelerate as mentioned the velocity of this primary gear will not increase and therefore the lower ratio gears will be clashed. The result is still worse if the clutch is equipped with a powerful brake, inasmuch as the clutch-driven member together with the primary transmission gear might be stopped entirely instead of being speeded up. Cone clutches with springs for easy engagement, as well as multiple-disk and band clutches, especially those with a more or less elastic medium between the driving and driven parts, like lining, cork inserts, etc., are easier to handle during the described period of gear changing, even when they are provided with brakes. However, inasmuch as the clutch brake is not essential here, a slight releasing of the clutch serving the purpose, the clutch brake is preferably arranged so as to act only after the clutch is already more or less out. *When going into a lower gear grating of teeth invariably will occur, if the clutch brake is very strong and acts from the moment of slightest clutch releasing motion, unless the clutch friction surfaces continue in slight engagement, during a part of this releasing motion.* That forms the reason why the gradually engaging clutch types give better results in this connection. In practice certain clutches with a strong brake incorporated in their releasing construction are purposely made with a heavy secondary member. For instance a multiple-disk type with thick plates alternating with thin ones carries the thick ones on the driven member, the increased inertia of the latter permitting better shifting into lower gear as has been demonstrated by actual comparison of this construction with one which had thin disks on the same driven member.

The speed of the vehicle could have some influence on the unfavorable effect of the clutch brake when changing gears as explained; most often, however, this gear change will take place with the motor getting overloaded and consequently at about the same low revolutions per minute. It may be mentioned, though, that in general a quicker gear change is necessary when the motor runs slowly at the beginning, and the effects of the clutch brake are also more pronounced here than in the case of a higher initial speed.

The matter of the motor speed at the moment of engagement of the gears when making a change from one gear to another is a very important factor, especially to the novice in driving an automobile. One of the hardest things for the new driver to learn is the knack of changing gears. The main reason for this is that he has great difficulty in gauging the correct speed of the motor. It must always be remembered that the car speed at the moment of shifting is an important factor.

Motor Should Be Disconnected

The method of changing to lower gears without entirely disconnecting the motor from the transmission works perfectly in theory and also in the hands of skilled operators, but it could be rather harmful for the gears if an attempt were made to mesh a pair of them when their pitch velocities are not practically alike. In any event, to avoid possible trouble it is preferable to release the clutch entirely for a moment when the gears are coming together, whereby any shock between them will not be transmitted against a more or less considerable resistance as represented by the motor partially engaged through the clutch.

Being rather an interference when changing to lower gears with the vehicle in motion, on the contrary the clutch brake appears very essential for quiet meshing of gears from lower to higher ratio. In this case the secondary gear rotates with a lower pitch velocity, than the primary one to be meshed with it—assuming constant vehicle speed. The regulation of these two velocities can be accomplished more or less satisfactorily by the motor, disconnecting it from the gearbox and slowing it down. But it is not always feasible to slow the motor down to the exact desired revolutions per minute.

The clutch should be the principal functionary here, it serving for disconnecting the motor and also permitting to reduce in any desired rate the rotation of the primary gearbox member. This is so if the clutch-driven part has no force tending to carry it away after the driving motor parts even when it is completely released. The writer recalls a certain cone clutch Fig. 1, which had a ball thrust bearing in the releasing collar and also one between the crankshaft and the clutch spring, which acted on the driven member directly. It depended on the state of these two thrust bearings and on that of the clutch centering bearing which of the two efforts prevailed, the friction effort of the inner thrust and centering bearings toward dragging the clutch driven member after the motor, or the friction of the thrust bearing in the releasing collar tending to stop it from following the motor. This uncertainty of a complete clutch stop when it is released made a clutch brake indispensable for good gear shifting from a lower gear to a higher one. The shifting into any gear when the car is standing was particularly difficult with this clutch when without a brake, because often the rotating primary gearbox member caused grating of teeth with the stationary secondary member without meshing into it, until this grating had overpowered the tendency of the former to rotate. On the other hand this clutch permitted an easy meshing on the road from high into lower gear. The change to a higher gear with the vehicle in motion was better than when stationary, though the releasing of the clutch could not stop entirely the spinning of its driven member without application of the brake. On account of all the above this clutch had to be equipped with a brake, but this was made adjustable and it came in action only after the clutch was partially disengaged. Thus, when starting the vehicle one generally pushes out the clutch entirely, stopping its driven member by the brake. When changing to a higher gear with the vehicle in motion this operation automatically is done in a very short time, the driver releasing the clutch only for a moment and often merely partially. This slows the driven member without stopping it, thus giving again good gear meshing. The gear change on hills, from higher to lower gear remained easy, because the clutch had to be pushed out very little inasmuch as it had no springs under the leather. The brake, not coming into action here, could not prevent the driven clutch member from gaining some speed with the motor during the time when the gear changing passed through neutral. It took a little practice and the gears could be meshed quietly on any occasion.

It is of interest to give here the data of this clutch relative to the inertia of its driven parts and braking effort on the same, because these figures may be used for comparison with other clutches. The idling motor speed is about 250 revolutions per

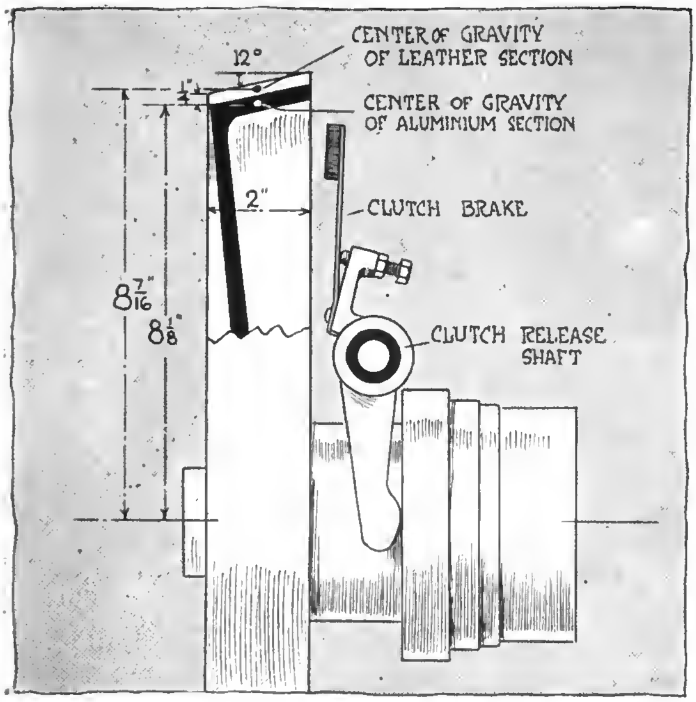

Fig. 2—Dimensions of clutch showing also adjustable clutch brake fitted to release shaft

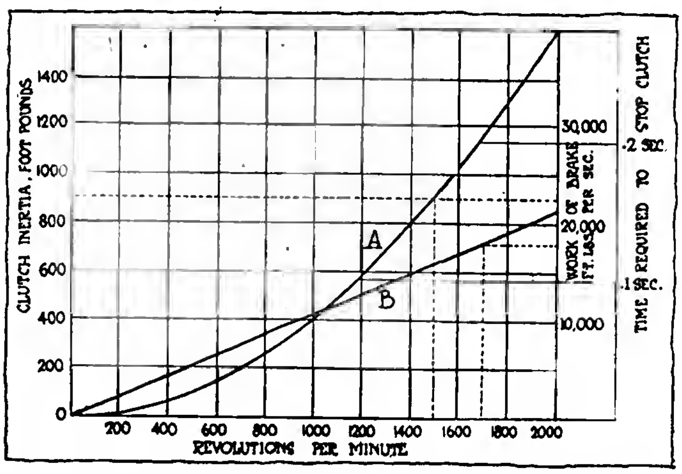

Fig. 3—Curves showing work absorbed by clutch brake at various speeds

minute. The clutch dimensions are shown in Fig. 2. The total inertia can be written as being composed of the inertia of the different clutch parts:

$$T = \Sigma \frac{Mv^2}{2}$$

The mass M_l of the leather band is

$$M_l = \frac{.036 \times 2\pi \times 8.437 \times .250 \times 2}{32.16} = .0297\text{—its inertia:}$$

$$I_l = \frac{.0297 \times \left(\frac{2\pi \times 8.437 \times 250}{12 \times 60}\right)^2}{2} = 5 \text{ foot-pounds.}$$

The mass M_r of the aluminum cone rim is:

$$M_r = \frac{.093 \times 2\pi \times 8.125 \times .375 \times 2}{32.16} = .111\text{—its inertia:}$$

$$I_r = \frac{.111 \times \left(\frac{2\pi \times 8.125 \times 250}{12 \times 60}\right)^2}{2} = 18.0 \text{ foot-pounds.}$$

Total inertia including clutch leather rivets, cone spokes, etc., can be estimated at $I = 25$ foot-pounds.

Assuming that the friction effort of the thrust release bearing equals the friction of the spring thrust and clutch centering bearings, the clutch brake should be considered as the only means serving to stop the cone from rotation. The clutch brake acts directly against the back of the clutch cone as in Fig. 2 and its spring presses the fiber pad with a force of about 12 pounds. The braking moment of this arrangement with a co-efficient of friction .20 between fiber and aluminum figures as:

$$T = \frac{12 \times .20 \times 8.5}{12} = 1.7 \text{ foot-pounds.}$$

Under assumed conditions this brake can stop the cone after it turns a number of times

$$R = \frac{I}{2\pi \times T} = \frac{25}{2 \times 1.7} = 2.33$$

This action is fast enough for any gear meshing when starting the car. Practical observation of the clutch brake action confirms the foregoing calculation and from this one can derive that the calculated figures for clutch inertia and the corresponding proper brake moment could be recommended for practice in similar cases. Of course the rate of action of the brake is different at different motor speeds when disengaging the clutch. Whereas the clutch inertia increases with the square of the motor speed, the work performed by the brake remains simply proportional to this speed. Illustrating graphically for the described clutch, curve A, Fig. 3, represents the clutch inertia and curve B the

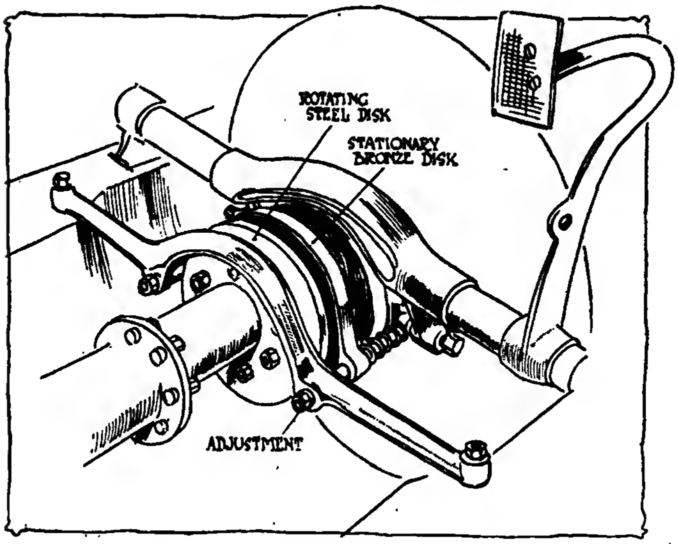

Fig. 4—Conical and flat types of clutch brakes

work of the brake during 1 second acting with the initial revolutions per minute. The desacceleration as caused by the brake action remains practically constant regardless of the motor speed. From the equation conecting acceleration j, velocity v, and time t which is, $v = jt$, it will be noticed that the time required to stop the clutch will increase in a rate equal to the initial speed, in other words, to the initial clutch speed, or. curve B, Fig. 3 could represent also this time in a proper scale, as indicated there.

The foregoing example dealing with a cone clutch without springs under its leather, afforded an opportunity to study the subject in figures, assuming that a very slight motion withdrawing the cone from the driving flywheel is sufficient to disengage them entirely. It is well to compare these obtained figures with those of clutches with provision for gradual engagement, and in which therefore the driving member continues to drag along the driven one during a great part of the clutch releasing movement, especially if the latter member rotates with little resistance as for instance when the gears are neutral and no clutch brake is provided.

It should be mentioned that a cone clutch of similar dimensions to the above, with the same style and strength of clutch brake but with spring plungers under the cone leather for gradual engagement, invariably caused tooth grating, unless the cone was pushed out to the extreme of its motion. It is proper to deduce, that in this case the available braking effort was not sufficient to overcome the tendency of the clutch cone to follow the flywheel during the beginning of the clutch releasing travel, because the range of friction between the flywheel and the cone became greater on account of the spring plungers under the leather.

Multiple-Disk Is Easy Engaging

A multiple-disk clutch with lining or with cork inserts is a fair example of the easy engaging type. The inertia of the disks will be figured in an approximate manner by assuming a mean velocity v for the whole mass of the disk, this velocity v being that of the mean radius of the disk. The mass of the disks in one example of a clutch with cork inserts equals $M_d = .34$.

The inertia of the disks at 250 revolutions per minute totals:

$$I_d = \frac{M_d \times v^2}{2} \quad \frac{.34 \times \left(\frac{2\pi \times 4.8125 \times 250}{12 \times 60}\right)^2}{2} = 19.5 \text{ foot-pounds.}$$

The clutch drum inertia similarly figured approximates 7 foot-pounds, which with the inertia of other parts can bring the total clutch inertia of its secondary or driven part to about 30 foot-pounds.

This clutch is provided with a brake incorporated directly in its release cover. The braking is done by the action of a 360-pound spring on a fiber collar 3.406 inches outside diameter by 2.219 inches inside diameter. The torque of this brake is to be figured from the equation

$$T = \frac{P \times f \times (Z_2^2 \times Z_1^2)}{2Z_2}$$

where are P — the total acting pressure on the collar = 360 pounds, f — the coefficient of friction of greasy fiber and metal = .10, Z_2 and Z_1 the outside and inside radii of the collar.

Therefore,

$$T = \frac{360 \times .10 \times (1.703^2 + 1.109^2)}{2 \times 1.703 \times 12} = 3.62 \text{ foot-pounds.}$$

Comparing these figures with those of the cone clutch in the foregoing, it will be noticed that although the inertia of the disks in this multiple-disk clutch is about 20 per cent. greater than in the cone clutch, the braking torque used is about 213 per cent. greater. This multiple-disk clutch gives a very satisfactory performance in practice. The clutch brake is of a type which acts immediately with the beginning of the clutch release, and therefore it necessitates the great mass of disks used for a good gear charge from high into low. A slight pressure on the pedal is enough to release the clutch so that gear changing can

Among the New Books

Many Technical Works of Interest to The Automobilist Are Announced By the Publishers

THE spring crop of technical books is now available for the manufacturer of automobiles as well as the student and interested owner. Many of exceptional merit have been recently sent to press and THE AUTOMOBILE will publish a short explanatory review of these as they appear. The following are offered for sale at the present time and should meet the popular demand.

MAGNETO AND ELECTRIC IGNITION. By W. Hibbert, A. M. I. E. E. Published by Whittaker & Company, New York City. 154 pages, 4 by 6 inches, with 90 illustrations. Cloth, $0.70.

Some time ago the same author brought out a work entitled "Electric Ignition for Motor Vehicles" and it is this which has furnished the basic idea for this later book. This work takes up the basic principles of the electric ignition system and by simple analogies carries them through so that they may be understood by a reader who is not trained in electrical terms. All types of ignition systems, both high and low tension, are discussed.

THE FREEZING POINT, BOILING POINT AND CONDUCTIVITY METHODS. By Harry C. Jones, Professor of Physical Chemistry in the Johns Hopkins University. Published by the Chemical Publishing Company, Easton, Pa. 75 5 by 7.5-inch pages; illustrated. Cloth, $0.75.

This work treats of three methods of chemical analysis. First, the application of the freezing-point method to the determination of molecular weights and to the measurement of electrolytic dissociation. Second, the application of the boiling-point method to the determination of molecular and electrolytic dissociation, and, third, the application of the conductivity method for the solution of the same problems.

GAS POWER. By C. F. Hirshfeld, M.M.E., and T. C. Ulbricht, Cornell University, published by John Wiley & Sons, New York. 209 pages, with sixty illustrations. Cloth, $1.25.

This book consists of eighteen chapters, of which the first three are devoted to a study of the theory of the gas engine and its fuel. The next two chapters are devoted to the historical development of the gas engine and its modification, while the remaining chapters take up the cooling, control, ignition, carburetion, classification, etc., of modern motors. Stationary, marine and automobile engines are taken up along with a short chapter on gas producers. Each chapter of the work, in treating of its subject, follows the development of that particular part of the gas engine from the early times up to modern practice. For instance, the chapter on ignition has one article devoted to a history of ignition, bringing in such devices as the open flame, etc. The earlier forms of electric ignition are then discussed and finally, examples of modern practice are given. In concluding the work the author dwells on the performance of different motors and the effect of different possible gas engine conditions.

DICTIONARY OF AUTOMOBILE TERMS. By Albert L. Clough, published by the Horseless Age Co. New York. 357 pages, with numerous zinc illustrations. Cloth, $4.00.

Everything from A to Z in the automobile line is defined in this work. It would no doubt be a handy book for the struggling layman in reading some of the technically involved automobile literature now extant. The work is arranged in alphabetical order and is, as the title suggests, a dictionary.

---

occur between any of the available combinations when the vehicle is in motion. On changing to low gear this slight release gives the partially engaged clutch a chance to follow the speeding up motor, overcoming the retarding effort of the brake, if the motor were loaded hard under the high gear and, retaining a fair throttle opening, quickly picks up during the moment when passing from one gear to another. When changing to a higher gear equally good results are obtained because the motor generally is more or less shut down during this operation and consequently it does not increase the speed of the disks so readily above the desired amount, nevertheless preventing them from being stopped entirely by the powerful brake action. It is only when in neutral with the vehicle at rest that the clutch must be pushed out to its limit, so that the disks disengage entirely and consequently can be stopped by the brake. It is a matter of construction which makes this clutch brake always act when releasing the clutch. That is the reason why this type of clutch has also proven less satisfactory with light disks on the driven drum instead of the heavy ones, the lighter disks making more difficult a proper change from high to low gear when the car is in motion.

The two cited examples give reliable figures for two extremes of clutch types as encountered in practice—one possessing sudden release and engagement, the other very gradual. It should represent little difficulty to estimate from figures of these examples the necessary data as to clutch inertia and corresponding clutch brake capacity for any ordinary case, for instance, when preparing an experimental design. The final dimensions, however, would have to be settled through trial, because individuality is apt to vary the results and also the requirements of what is to be considered satisfactory clutch and clutch brake action.

Referring to constructive features of clutch brakes it is well to indicate some of their peculiarities from a few actually used designs. The design shown at the left in Fig. 4 is unsatisfactory, because the metal cone brake acts very suddenly and strongly, it being strong enough to exert a very noticeable brake action on the motion of the vehicle proper when the gears are in mesh, as is the case when coasting down hill with a free engine. On the other hand, it acts at the extreme end of releasing motion, which does not cause much trouble for quiet gear meshing when the vehicle is in motion. This construction has given place to another one of the same make, shown to the right in Fig. 4, the flat brake being less sudden and powerful. Both types of brakes would show a very appreciable amount of wear, when used often, with gears in mesh. It is desirable to have the clutch brake act gradually, for instance through an elastic medium. Fig. 5 shows a brake backed up by springs, another variety having been given in Fig. 2. These two types should be the most satisfactory, because they permit adjustment of the clutch brake as to force of action and also as to the moment of action.

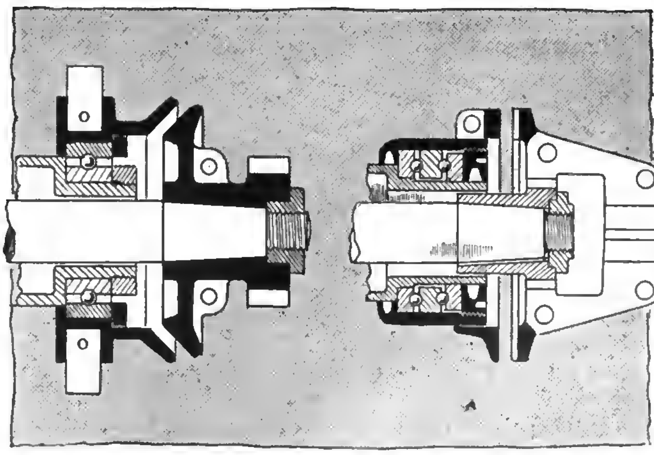

Fig. 5—Bronze to steel clutch brake used on the Lozier

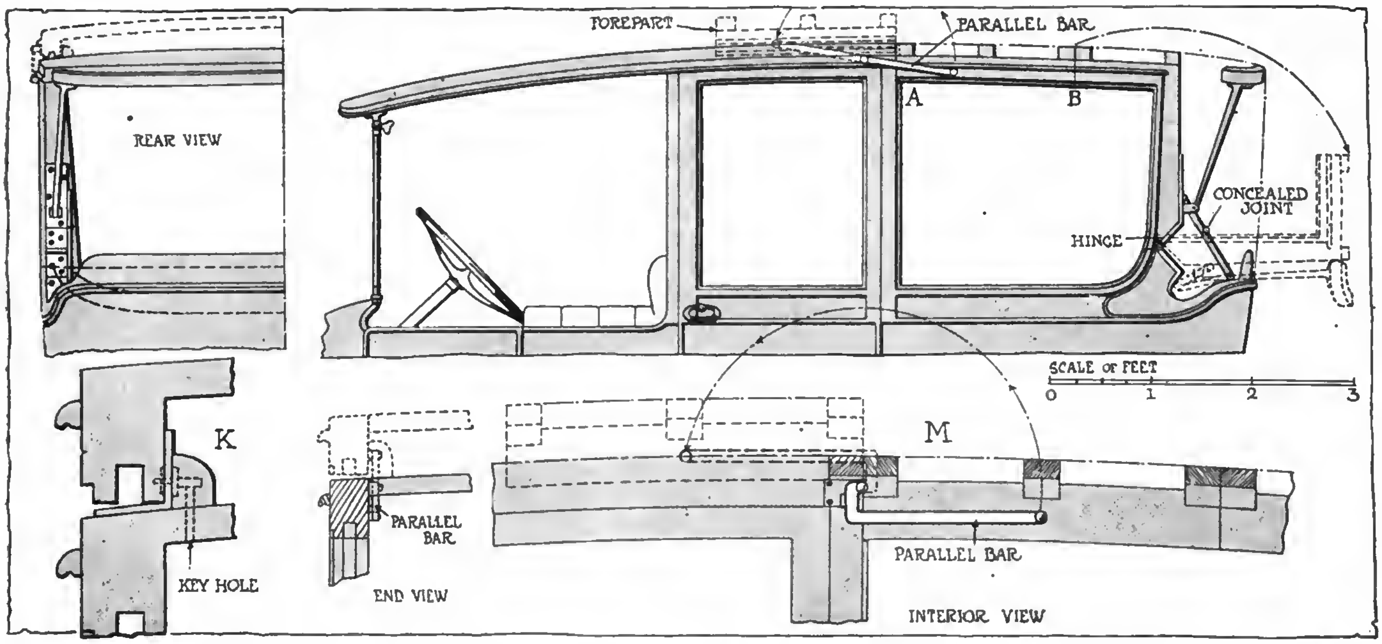

Fig. 1—Scale drawings of folding top for limousine-landaulet, showing also alternative method of fitting parallel bars to the top section

Folding Tops for Limousine-Landaulets

Three Alternative Methods of Construction Show Simplicity of Operation —Neat Appearance Obtained by the Use of Concealed Supporting Joints

IN this article constructive details are given of three hoods designed to fit the new Limousine-Landaulet type of body which was described more generally last week. It will be seen on referring to the accompanying scale drawings that all three designs of hood are identical as far as outside dimensions and points of division are concerned, differing only in the method of hinging and supporting the rear portion when lowered.

The older form or that used on the first cars brought to this country, is shown in Fig. 1, which comprises a side elevation and half rear view. The body is shown stripped of the leather covering so that the construction can be more clearly seen. The top in its folded position is indicated by dotted lines and the arc of travel by arrow marks.

The fore section, or that part of the top between the points marked A-B, is movable and is placed on top of the permanent roof, being controlled and guided by two parallel bars, that are placed one on each side. This top section rests on angle irons. the same length as the top section, which are fitted permanently to the roof.

To fasten the top section on the roof, there are two spring box locks of the regulation pattern, fastened to the inside of the vertical web of the angle iron as shown at K so that the lock bolt is horizontal. A wood block covers the exterior part of the lock completely, preventing the entry of water. On the lower side the key hole extends through the roof, and the lock is operated by inserting a key from the inside of the body and throwing the bolt until it engages with a slot on the inside of the toprail of the top section. This lock in conjunction with the side parallel bars form an effective means of holding the top section firmly in place without rattling.

The falling portion of the hood swings about a point situated a few inches from the base of the rear window pillar, where a particularly strong hand forged hinge is fitted. Great strength is necessary here as the entire strain of the lowered top is taken by the hinge.

The shape of the hinge opening is such, the cut of the pillar being at 45 degrees, that when down the hinge forms its own stop. This is clearly shown in Fig. 1.

A concealed jointed rod is used across the angle of movement to contribute to the support of the top when raised. A great deal of strain is thus taken off the top fasteners. In order to throw this joint, the upper end is fitted with a square nut, to which a key can be applied and the joint broken preparatory to falling the top. The opening in the trimming through which the key is fitted to the joint is covered with a flap of the trimming material. This concealed joint is short on account of the limited space for folding when the top is down, and also by the fact that the body is round at the rear corner. Consequently the lower end of the joint cannot be put very far back. This joint is shown both in its raised and lowered positions.

The toprail rear of the cut B is framed solid to the pillar and when lowered occupies the position indicated by the dotted lines. The sizes of the framing material of the bows and pillars are the same as used on the ordinary landaulet, with the exception of the rear pillar and the rear bow. This pillar is made wide on the side to allow stock for a generous bearing surface for the lower hinge. Below the hinge and above the moulding, the wood is also higher up than usual, on account of the tendency of the leather to fold or creep under at this point when lowered. The wood filling prevents this and holds the leather in place.

The rear bow is made of ample proportions and the corners are rounded to follow the shape of the body.

The fasteners used are the regulation landau top pattern, two being used at each cut. In addition dowel pins and plates are used at each end and in the center of the bows.

This design of top construction has a practical value in that part of the top is placed where weight does not count, over one-third of the total weight of the top, or rather that part of the top that falls, being supported overhead. It has the slight drawback, however, of being rather cumbersome to shift.

An alternative method of attaching the top section is shown at M, Fig. 1.

A partial end view shows the relation of cranked parallel bars, which are arranged inside the body, to the toprail. These bars operate in precisely the same manner as the outer bars in the first design, but being inside permit a much cleaner external appearance to that part of the body. They are plated, and their presence does not detract from the appearance of the interior.

Both positions of the top are shown in the drawing, which shows also how the bent part of the bar passes round the roof top rail, occupying a perfectly flat position on top and out of sight.

Fig. 3 is another method of construction that is very popular today, owing chiefly to its trim appearance, and despite the very serious weakness of having so much weight overhanging the bearing point when the top is down. Practically, the lower hinge is the medium of supporting the entire top. As in Fig. 1, this hinge is hand forged and very strong.

The movement of the parts when folding are indicated by the arrow marks, the cuts at C and D correspond to those of A and B of Fig. 1. The hinge I is the regulation landau three prong hinge, one member of which supports the bow. The hinge at the cut D is similar to a straight door hinge, only narrower, and it is fastened to the inner wall of the toprail only. Landau top fasteners are used, two being placed at each cut under the bows. In addition there are two more used at the cut D, one being placed at each side on the inside of the toprail. Further security is afforded by the use of dowels and plates at the ends and in the center. Grab handles are placed one at each side under the cut C to control the lowering and raising of the top.

The weight of the top when down will insure its staying reasonably steady. Between the members that touch, rubber blocks are fastened to insure silence and protection of the surfaces.

Point J on the side elevation of this figure represents the extreme rear point that bearing for the top when down can be established. There is an overhand of 26 inches from this point to the extreme rear edge, and a distance of 7 inches between it and the center line of the lower hinge pin. Taking into account the weight of the leather covering, this would seem, from the figures, to be a rather dangerous overhang, but as many are in use it can only be deduced that constructional strength of the hinge meets the situation. Its neat appearance evidently more than compensates for this apparent mechanical defect, for this type is the most popular of the methods employed.

In this, as in other features of automobile construction, care in the building as well as in the subsequent handling goes a great way towards producing satisfactory results.

A method that overcomes the slight mechanical weakness of the previous design is shown in Fig. 3. The construction is identical with the exception that an outside joint has been substituted for the concealed joint in Fig. 2. The lower joint Fig. 3 extends beyond the actual body length and the bearing point of the top when down, is 18.5 inches from the back end and 14.5 inches from the center of the hinge. These figures are certainly more conducive to stability than those previously noted, and the life of the top will be longer under equal usage. The bearing of the top on the lower joint prop is an iron support that extends downward from the upper joint prop. When the top is raised this support is concealed back of the joint, and when lowered it rests on the lower prop, thus making an ideal bearing.

Some Durable Color Combinations

The combination of gray body, with red striping and red running gears is durable provided first-class materials are employed. The work is performed in a thorough manner and the finish is made rich and strong with plenty of varnish.

The most durable colors, all things considered, are probably the browns, blues, greens and grays. There are so many shades of each of these colors that a very long list of colors is available from them. The present show season has shown that the above colors, including, possibly, maroon, are the favorite automobile colors today.

For a seven-passenger touring car paint the body dark Napier green and the chassis a light shade of the same color and stripe both body and chassis with double .0625-inch lines of black.

Many car owners prefer the dark shade of Napier green for the car entire with black lines of striping. This makes a finer looking car. Brunswick green, a little mellower green, dark shade for the body and light shade for the chassis, the car striped throughout with double lines of black, is another attractive combination.

Silk green, dark shade for the body and medium or light shade for the chassis, striped with two .5-inch lines of black .5 inch apart with two fine lines of gold running through the center of this space, gives a splendid effect on a big touring car. This is a very durable color and nothing in the line of greens is more attractive.

It is important for the car owner to bear in mind that any of the grays, with the exception of the very palest ones, show dust and dirt to the minimum extent, and are kept in repair at small expense as compared with some of the other colors.

Truck Inspection Reports

Two Original Systems Used by New York Branches of Truck Factories

If Properly Handled the Inspection System Is a Direct Asset to Dealer and User

SYSTEMATIC truck inspection and its advantages were taken up in THE AUTOMOBILE of March 6, and in that issue a number of inspection systems used by metropolitan branches of various truck factories were described. It was shown that inspection itself is undoubtedly a valuable practice to adopt which not only helps to sell a truck but also to keep the customer satisfied when the machine is in service and thereby acts to induce him to buy another truck of the same make if he requires one.

In the preceding article on this subject a number of inspection systems were described which, with a single exception, consisted in the company periodically sending inspectors to the truck owner's place. In the case of the exception the company fixes a day on which the truck of a certain owner runs over to the company's service plant to be looked over and have necessary minor repairs made. In all cases the inspectors instruct the drivers how to make small repairs and adjustments or they make them themselves.

A procedure differing slightly from the general rule is used by the New York branch of the Knox Automobile Co. The company does not feel satisfied by having its inspectors look over its products now and then, but a special scheme for getting at the weak sides of the drivers handling Knox trucks has been evolved. This scheme includes the use of a daily report made out by the truck driver for the first 60 days after the truck has been delivered to its owner. The report is made out on a specially designed record blank, Fig. 2, which is furnished by the Knox company to the truck owner's driver with instructions to make out one every day and to send it to the branch office. As Fig. 2 shows, the card, which is 4.25 by 7 inches and printed black on tan cardboard, is so designed as to afford space for recording the work of a car done on a certain day, the miles run, the gasoline and oil used, the loads carried and the weather. Besides this there is space for entering the various stops made by the truck, with such details as indicated by the headings of the spaces in Fig. 2. The card is marked with the date and the name of the driver as well as that of the owner. On the reverse side there is a space for reporting fully all work done on the truck, the cause of all delays, troubles or accidents, no matter whether they occurred in the garage or on the road. If there are no remarks on the reverse of the card designed for this purpose, the company assumes that the driver is either operating

the truck perfectly or neglects the preparation of full and correct records. An inspector is therefore sent to look over the truck and to watch the driver's work. Thus, in the course of 2 months, the driver is made acquainted with all the various parts of the mechanism. Thereafter an inspection is made every month, which is very similar to the inspections of other companies, including, as it does, a careful examination of the mechanism, watching for noises, squeaks and lost motion, etc. Small repairs are made by the inspector or by the driver under his supervision. After the inspection is over, the inspector returns to the service department of the company and fills out his report, Fig. 1, a blank printed black on white paper, 8.25 by 10.75 inches. This blank provides spaces for filling in the name of the inspector, the job number—all the jobs are numbered consecutively—the name of the truck owner and the number of the truck, as well as the date of the inspection. The inspector, as he goes over the various parts of the car, checks them on the report form, if they are O. K., while if this is not the case he states the trouble of each specific part on the form. If he makes a repair himself, he states so on the report. The same blank is used for testing trucks before putting them in the repair shop and in this case a final test is made after the work is completed to see whether or not the troubles have been eliminated. The inspector making the test signs the report, which is filed in the office of the service department, ready for reference at any time.

Autocar Prefers Night Inspection

Another original and apparently very efficacious system is used by the Autocar Co.'s New York branch. This company sends out its inspectors every 60 days, and, while most concerns try to have their inspectors work in daytime, the Autocar practice is to give nightly inspection service wherever possible, so as to interfere as little as possible with the business of the trucks. As a matter of fact, half the Autocars in New York are inspected at night. Here, too, an inspector makes his calls at intervals of approximately 60 days and when going to see a truck he inspects it in substantially the same manner as other company's inspectors do their trucks. If necessary he takes out the machine and gives it a road test to find out troubles which are not developed by an inside inspection and test. He makes his notes, instructs the driver as to what is necessary, makes slight repairs and adjustments or shows the driver how to make them and then return to the company's service department. At the office of the latter he fills out a report stating what parts of the truck are in need of repair, what repairs he himself has made, which seem to be the characteristic faults of the driver, and so forth. He turns over this report to the office of the service department. There the report is given a number—all inspections are consecutively numbered from the beginning until the end of the year—and every day the reports of the previous day are typewritten on several sheets with four carbon copies. One of these sheets is cut up and the reports are sent to the various truck owners, calling their attention to the troubles with the truck and the repairs required, if such are necessary. One set of sheets is filed in the office of the service department for future reference; the second is sent to the maintenance engineer's office, the third to the service department's shop and the fourth is used for the owner's reports mentioned above.

Inspection Records As Money Savers

This system has the advantage that if a truck owner comes in at some time or other, claiming that a certain part of his machine is not up to specifications, he can be shown that it was his driver who neglected to properly care for the part and that he, the owner, was advised of that once or repeatedly. In this way the inspection report is an actual money saver to the company and prevents abuse of the guarantee by truck users whose machines are not treated properly.

Of course, as the reports are filed numerically, a key for reference to the truck owners' names is necessary to make the system ready for reference at a minute's notice at any time. For this purpose a card file is used which contains records of all inspections made on all trucks in the Metropolitan territory. There is a car for each truck in the territory, filled out like the sample, Fig. 3. By reference to a record card it is easy to put before an owner, within less than half an hour, the records of all inspections made on one or all of his trucks and to show him what are the causes of inefficient operation, if such is in evidence. The cards are filed in order of the owners' names.

What Is Rubbing Brick?—Dimensions of Racing Motors—Sand Box for Automobiles—Different Piston Heads—Chamois for Straining Work—Adjustment of E. M. F. Carbureter—Economy of Fours and Sixes

Rubbing Brick a Composition

EDITOR THE AUTOMOBILE:—In your issue of September 12, 1912, there was an article on page 523 in regard to painting a roadster, in which you said to use a rubbing brick. Kindly advise me what this rubbing brick is.

St. Louis, Mo. G. N.

—Rubbing brick or stone is a composition stone used for rubbing down rough stuff or other coarse surfacing material applied to the body of the automobile in order to get a level and smooth surface.

This rubbing brick or stone is a composition material which during the last 20 years has superseded the natural blocks or pieces of pumice stone formerly used to rub a body of pigment to a level and smooth surface. It is superior to the natural lava or pumice stone in that, unlike the latter, it does not crumble and chip off during use thus alowing the coarse particles to get under the stone and cut and mar the surface. Probably the best known rubbing brick is made in Germany, large quantities of which are used by carriage and automobile painters in this country. Excellent rubbing stone is, however, made in this country. An American-made stone known and used in practically every corner of the country by carriage and automobile painters is known as Eureka rubbing stone. This stone is doubtless obtainable in the St. Louis paint supply stores.

Bore and Stroke of Big Motors

Editor THE AUTOMOBILE:—Kindly let me know the dimensions of the Jay Eye See and the Jumbo Benz racing cars.

Pittston, Pa. R. M. S.

—The bore of the Jay Eye See is 9.33 inches and the stroke 8.625 inches. The car is a four-cylinder Fiat.

The bore of the Jumbo Benz is 175 millimeters and the stroke 200 millimeters. It is a four-cylinder car of Benz manufacture. The features of design of these special racing cars is kept secret by the factories which produce them as the rules of racing do not require that the dimensions be made public.

Automobile Ejector Sand Box

Editor THE AUTOMOBILE:—The following is suggested as a device for preventing skidding on asphalt and other slippery surfaces:

In Fig. 2 is shown a device for shooting sand beneath the tires and checking thereby the tendency for a car to skid. The mud guards are made hollow and contain a supply of sand. They are filled through a filler opening on top. A lead is taken off the exhaust pipe and by pressing a pedal the valve is opened and sand flows by gravity from the box and is then shot by the exhaust beneath the tire.

Chicago, Ill. SUBSCRIBER.

Effect of Piston Head Shape

Editor THE AUTOMOBILE:—1—What are the advantages of a concave piston?

2—Does a concave piston draw in any more vapor than a flat-top piston, same bore and stroke?

3—Does a concave piston make a low-compression engine?

4—A says a long-stroke motor uses less gasoline than a short-stroke. B says a long-stroke uses more. Which is right?

Lawrence, Mass. W. R. MOORE.

—1—The advantage of a concave piston may be perceived by a study of the three types shown in Fig. 1. The concave piston helps to reduce the area through which heat is lost. It gives the hemispherical combustion chamber, which is ideal in a motor which is small enough to use a non-water-cooled piston. It has the disadvantage of being costly to construct and to be of such form as makes a bad casting. The difficulty in the latter respect is to have it cool without cracking, to leave the material internally unstrained and to avoid projections. The convex piston, on the other hand, does not give an ideal combustion chamber shape, but is used to some extent on account of the structural strength due to the arch effect of the piston. The flat top is cheaply made, avoids pockets, although not as good as far as shape is concerned as the concave combustion chamber.

2—The concave piston will draw in the same amount of charge as will any other piston having the same piston displacement and volume of clearance.

3—The compression space with a concave piston is limited because the walls of the piston are higher than the center of its head. This does not signify that the motor must be of the old compression type because the stroke of the motor may be long enough to cause the relative volume above the piston to be very small and hence give a high compression.

4—It is generally conceded that the long-stroke motor is as a class more economical in fuel than the short-stroke. THE AUTOMOBILE published curves in the issue of March 20 on page 689 showing a record of tests made by the Moline company on long and short-stroke motors.

Adjusting E. M. F. Carbureter

Editor THE AUTOMOBILE:—I have an E. M. F. 30, which I bought the latter part of 1911. It has been running comparatively little and is in good condition. I am quite sure the carbureter is out of adjustment. Until lately it ran very well, but now it won't run on high gear. Please give me detailed information as to adjusting carbureter on high gear. Do you think there could be anything else that would affect its running on high gear except adjustment of the carbureter?

Saluda, S. C. A. E.

—There is only one adjustment on the E. M. F. carbureter. It is located on the upper side of the carbureter, as shown in Fig. 4, at A. The function of this valve is to permit the proper amount of air to be drawn into the carbureter to meet the requirements of the motor under different atmospheric and temperature conditions. In extremely cold weather the carbureter requires less air than that provided by the factory adjustment and in hot weather more air may be admitted. To give the carbureter more air loosen the thumb lock nut B provided on the valve stem and turn valve stem to right. To give less air valve stem is turned to left. In setting the carbureter open the throttle valve on the steering wheel until it is about one-fifth open with the motor running. Turn auxiliary air valve stem to left for about five turns and then turn back slowly until the point is reached at which the motor seems to run best. The probabilities are that the carbureter on your motor is getting too much air and for this reason misses when the car is turning over slowly as when pulling on high gear. A turn or two to the left on the valve stem A will probably cure the trouble. It is best, however, to start the motor and turn the valve as stated until the best running is secured.

The trouble with your motor probably lies in the carbureter adjustment, as you state, although it may be one of the following: Too large gaps of the spark-plug, weak magneto, faulty wiring or carbon. The carbureter adjustment should be tried first. The spark gaps should be 1-32 inch or less.

Four Uses Less Gasoline

Editor THE AUTOMOBILE:—I would like to know how much more fuel will a six-cylinder motor use than a four-cylinder to the mile, both being of the same size motors. My friends tell me that a six-cylinder car uses as much as a four-cylinder car. I cannot see it that way.

Great Meadows, N. J. J. M. REED.

—Giving the same horsepower and the same degree of good workmanship, the four-cylinder motor is more economical than the six. It must be remembered that one-third of the power contained in the gasoline fed to the motor is lost through the cooling water. This proportion of power lost depends on the amount of wall surface exposed to the cooling water as compared to the piston displacement of the motor. Since the surface is greater in the six than the four proportionally when the same horsepower is considered for both motors, the heat lost through cooling is greater proportionally in the six, therefore more gasoline is thrown away through the walls in a correspondingly less amount available for driving the car. This makes the four more economical than the six, even leaving aside greater frictional resistance, weight, etc.

Where the six shines is in its even torque output. Since the power strokes overlap each other the power is delivered smoothly and at an almost constant rate. Vibration is practically eliminated.

Misfires When Running Idle

Editor THE AUTOMOBLE:—I have an Amplex motor car which will misfire even when running idle. How can I remedy this trouble?

Winthrop, Mass. R. D. P.

—The seat of trouble on your car may lie in either the ignition system or the carbureter. It is more probably in the former than in the latter. In the ignition system the principal causes for misfire when the motor is turning over slowly are the weakness of the magneto, too great a gap at the spark-plug points, partially short-circuited coil, bad connections or improperly adjusted coil. In the carbureter the causes are either mixture which is too rich or one that is too lean.

In order to get the ignition system firmly in mind a diagram is shown in Fig. 6. The troubles outlined for the ignition system may be taken up one by one and the cure for each shown.

The magneto generates its electric current by inducing a flow through the windings on the armature which cut the lines of magnetic force extending between the pole pieces. When the magnets become weak, the intensity of the magnetic force is diminished and as a result the amount of current induced at low speeds is insufficient to produce a good spark. The remedy for this is to take the magneto to the nearest branch of the manufacturer and have the magnets recharged.

When the gap between the electrodes is too wide the current required to jump it is greater than when the gap is small. Besides this, the spark which is produced in leaping the gap is thinner. At low speeds the current is often insufficient to jump the gap and as a result the cylinder misfires. The gap should be not less than 1-64 inch in width and not more than 1-32 inch.

A short circuit through a part of the windings of the coil generally results in a total inability of the ignition apparatus to produce a spark, rather than in its missing at low speeds. The

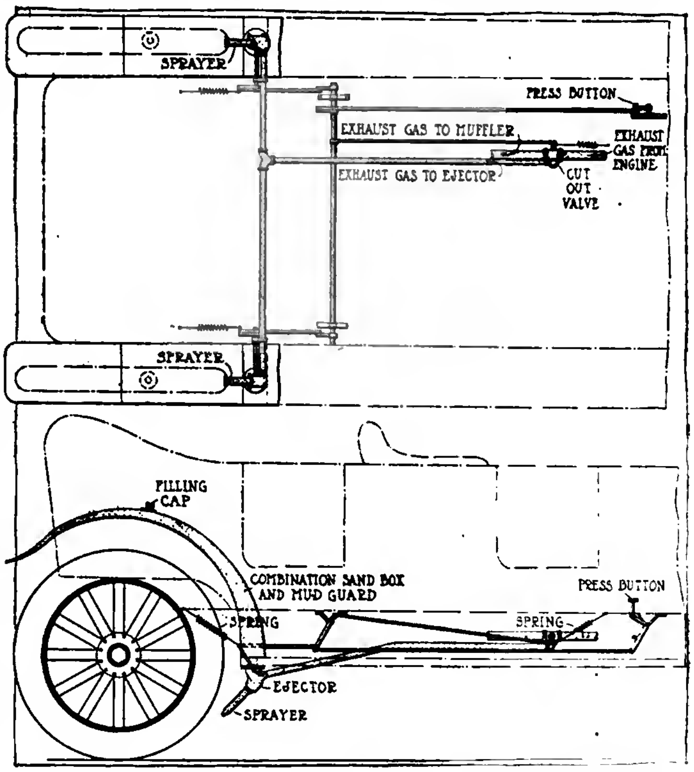

Fig. 2—Diagram showing operation of sand box on mud guards. Operated by exhaust pressure through ejector

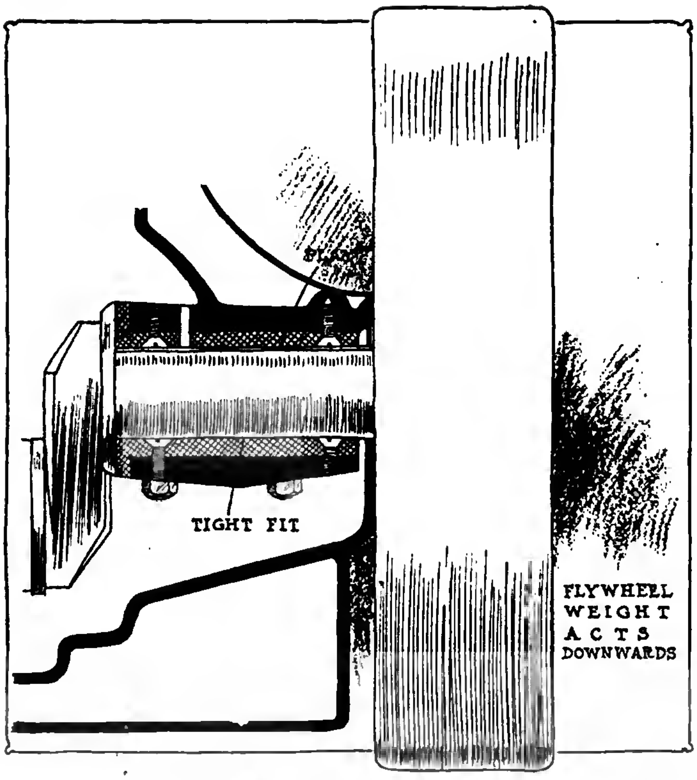

Fig. 3—How the flywheel conceals a loose bearing and thus makes it difficult to locate knock

result of such a coil condition is the same as if a coil of too small a capacity were used and the current is not boosted to a high enough voltage to jump.

Bad connections in the wiring increase the resistance to the circuit. The voltage drop in any circuit is proportional to the resistance in that circuit. It is very well possible that the current would be sufficient to produce a spark at high speeds and not enough at low speeds. It would therefore be wise to go over the wiring.

The vibrator adjustment is not apt to be at fault in this matter. It would be well though to look at the platinum points on the coil trembler and see if they are flat, and also to try a lighter and a heavier adjustment on the trembler spring. There is a possibility that this will make some improvement.

Too weak a mixture will cause a cylinder to misfire. Even with the best-designed manifolds, when the mixture is very weak, one or two cylinders will fire better than the others. To improve this condition, open the needle valve or give the carbureter less air. Too rich a mixture does not often cause misfiring, but it does occasionally happen. First try the effects of closing the air valve or opening the needle and then if this produces no good effect, try the other.

Chamois for Straining Purposes

Editor The Automobile:—I am the patentee of an automobile gasoline strainer which includes in operation a chamois skin. I propose to market the device myself through agents, having arranged for the manufacture of same. I would like very much to obtain some advice from you relative to the kind and quality of proper straining medium and other matter.

1—Are the so-called chamois skins, thousands of them, used for straining automobile gasoline, real genuine chamois skins or are they mostly sheep or goat?

2—Will goat skin suffice as well as chamois skin for the purpose?

3—Is it washable and is it not considerably cheaper than chamois?

4—What grade of chamois, goat or sheep do you advise? Is not chamois or sheep which can be washed best for the purpose—or can all grades of said skins be satisfactorily washed?

5—Will you kindly refer me to the best and cheapest source of supply for skins, chamois, sheep and goat?

6—Would not my nearness to original source of supply for skins make it possible for me to buy cheaply?

7—From what importers do you suppose I could get the best figures? It seems most skins used are imported.

8—Would domestic skins suffice as well, and what would be my nearest to original source of supply for them?

9—In what size quantities do you suppose I would have to order from foreign exporters in order for me to import skins, or would I have to be a recognized dealer?

Sedan, Kan. E. C. Courtwright.

—1—The majority of skins used for straining gasoline and which are called chamois skins are in reality sheep skins.

2—There are a small proportion of goat skins, but these are not manufactured to such a large extent, although satisfactory.

3—These sheep skins are washable, as are also the goat skins and the genuine chamois. The latter, however, are too expensive for extensive use.

4—The skin you require would be of a heavy medium grade

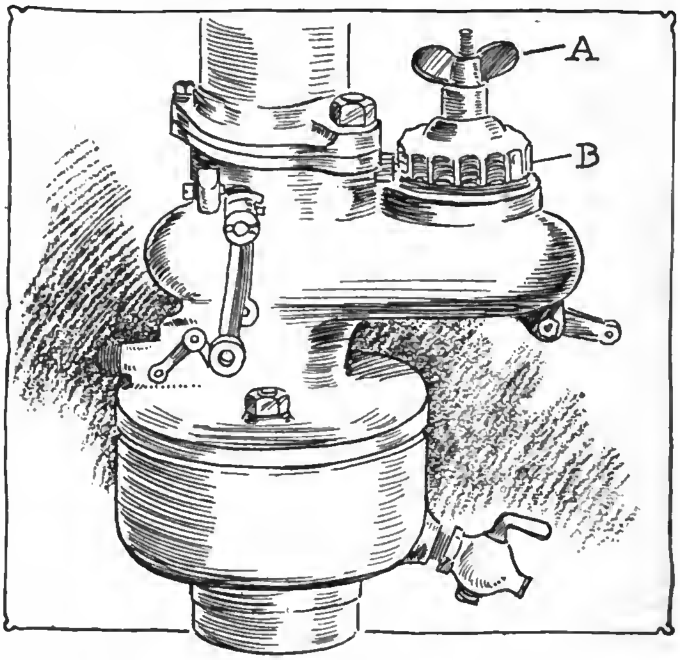

Fig. 4—Single adjustment on E. M. F. Carbureter. Wingnut A controls the air supply and mixture

oiled tanned. The domestic variety are just as satisfactory for straining purposes as are those which are imported, and besides they are cheaper.

5—Most of the skins manufactured into the so-called chamois are taken from Western sheep.

6—It would not be cheaper for you to live near the Western sheep markets, unless you were buying in extremely large quantities.

7—The Eastern markets, located in New York, Boston and Philadelphia. One of the largest manufacturers in this country is Drueding Bros., 429 Master street, Philadelphia, Pa. This concern will furnish you with any other information you desire.

8—Yes. See question 7.

9—It is sold in kips. There are thirty pieces to a kip, each piece being composed of the skin of the entire animal.

Dull Pound Given by Motor

Editor The Automobile:—I have a Carhart 1912, Falls motor, two-bearing cylinders 4 by 4.5 inches. When running on level and without too much gasoline car runs smoothly and with only slight vibration, but on picking up with more gasoline there is a distinct throb of dull character which comes with about every fourth explosion. I had motor overhauled to find cause, transmission and differential looked over and in fact every possible thing which might cause such a throb looked into. Wiring is good and perfect, timing O. K. Can you help me out? Do you think the carbureter is at fault? It is a Stromberg. I have tried every kind of mixture. This has been going on for about 6 months, but getting worse all the time. Nothing is loose.

New York City. J. C. R.

—The fact that the noise has been increasing gradually for a period of 6 months would indicate that the trouble is in the bearings of the motor. It often happens that the bearing nearest the flywheel is worn and the wear cannot be detected because the weight of the flywheel holds the shaft down tightly to the lower bearing liner. This is indicated in Fig. 3. If you will look at the bushings in the two main bearings it will be found that the trouble is in one of these.

Bent Axle Causes Tire Wear

Editor The Automobile:—One front tire shows considerable wear, but the left tire shows practically none. I have the wheels toed in .25 inch in front. Tell me, if possible, which spindle arm is bent or which wheel is out of line, or how to find out the trouble.

St. Louis, Mo. J. T.

—The condition of your front axle is evidently that which is shown in exaggerated form in Fig. 5. The wheel which is in an improper position and upon which the tire wear is greatest is nearest the bend in the axle in all probabilities. It is certain that the tire which wears quickest is on the wheel that is in such position that the contact with the ground is of the sliding rather than rolling nature. This combination of sliding and rolling motion may be readily detected by examining the surface of the tire. It will be noted that the tread has the same appearance as if it were filed or had been run over the surface of a grindstone. A series of parallel lines running diagonally across the tread will be perceived upon close examination. This is due to the fact that the wheel which is out of line is being practically pushed along the surface of the ground.

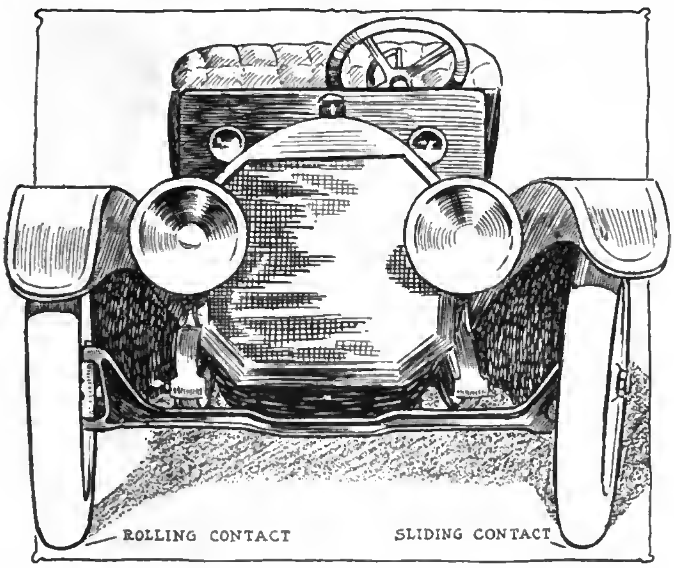

Fig. 5—Exaggerated effect of bent axle, showing how one wheel has a sliding contact with ground

The location of the bend in the axle may be found by running a straight edge along the I-beam flange. It is generally found that the bend is at the center of the axle since this is the portion which carries the greatest load. A bend in the steering knuckle is not infrequent, however, and these should be aligned also.

Another good method of procedure would be to place the car upon a floor and turn one of the wheels so that it is exactly parallel to the center line of the car. A line should be struck through the center of the wheel extending fore and aft. At the point where the wheel meets the ground a line at right angles to the fore and aft line is drawn, and extended toward the other wheel. Now from the other wheel draw a line parallel to its direction extending through the point at which the wheel touches the ground. Through the point of intersection of this wheel with the ground draw a line at right angles to the line and extend it in the direction of the first wheel. The point of intersection of these two right-angle lines will give the bend location. The bend will be found in the axle vertically above the point of intersection.

Effect of High Gas Speeds

Editor The Automobile: Is it true that better carburetion results from high gas velocities as compared to lower rates of flow with correspondingly high pressure? To what extent does this affect the atomization of the fuel?

Syracuse, N. Y. Reader.

—The fuel economy resulting from the use of air velocities higher than the average, and thus lower pressures, is quite marked. Of course, with high charge velocities, the maximum power is not realized above a certain piston speed; but the fuel economy and efficiency will be greater within the range which the high velocity device can supply without great loss per cylinder charge. This latter fact is easily demonstrated by making two series of runs with any multiple-cylinder automobile engine. One series should be made with carbureter and manifold passages of such areas that an average charge velocity of about 8,000 feet per minute is had at a velocity speed of 1,000 feet per minute, and the other series with passages which will give the above charge velocity at between 600 and 700 feet per minute piston speed.

A comparison of the two series of runs will show that up to that piston speed at which the volumetric efficiency of the engine pumping strokes falls off because of too high a charge velocity the power deliveries are approximately equal, the fuel consumption per brake horsepower hour and the thermal efficiency have each been improved. The passages giving the above charge velocity at the higher piston speeds will permit of the development of a greater power at those speeds, and are thus superior from the viewpoints of maximum economy and efficiency at maximum output, which is the condition desired.

The points which it is desired to bring out are: That the greater the pressure drop in the passages the more perfect will be the breaking up of the fuel, the more rapid will be the agitation and internal motion in the mixture column, the greater will be the vaporization due to pressure reduction; and, as a final result, the fuel will be more thoroughly vaporized, and the mixture more homogeneous. There are in present practice several examples of the above utilization of high air velocities and low pressure in the carbureter passages. In the best of these the maximum charge velocity in the manifold and past the valves is kept down to the value given above (8,000 feet per minute); and the high velocities and low pressures are both secured in the carbureter passages through several spraying nozzles, each located in a separate, small passage.

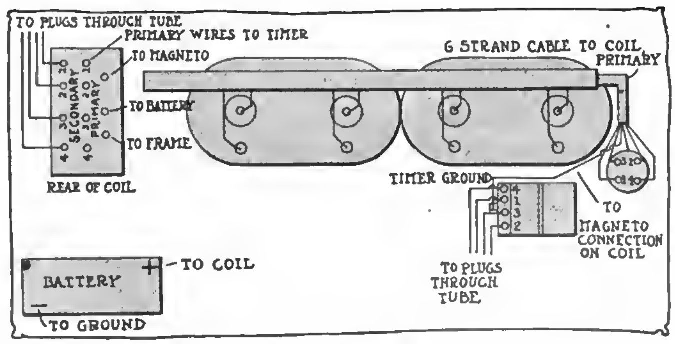

Fig. 6—Wiring diagram of the Amplex car, giving connections from battery and magneto to coil

Kerosene or Gasoline

NOT a few owners of automobiles and motor trucks are pondering today on the solution of the fuel problem, wondering if some fine morning they will not awaken to read the announcement that from that date forward they will have to use kerosene in their cars, due to a gasoline shortage. There is no fear of such a contingency. The process of gradually introducing heavier gasoline will continue as it has in the past. It is fresh in the memory of the majority when 74 fuel was general, then came 68, then 64, then 62, then 60 and now it is a little lower. This gradual use of heavier fuel will continue, because the supply of crude oil demands it. The amount of 60 gasoline that can be made from a given quantity of crude is exactly double the amount of 64 fuel that could be produced. This means that if we demanded 64 fuel today we would be bringing about an exigency and the only way to meet it would be an unprecedented advance in price.

All automobile owners must be prepared to accept the heavier weight fuels. It is not surprising that many should object to this, but the objections can largely be passed over when it is remembered that in these heavier fuels are enough low-boiling points to insure a quick ignition and relatively easy starting. The self-starter has come at a most opportune time to aid in this work.

The Cost of Poor Roads

FROM the last report of the Department of Agriculture, Washington, D. C., it is apparent that bad roads are today playing their part in the high cost of living, because at least a considerable fraction of the cost is due to the farmer not being able to convey his products to market as rapidly as he should. Instead of keeping up with previous years the farmer is dropping slightly behind in deliveries, due to increased crops with no corresponding improvement in facilities for transportation.

The report shows that with wheat, corn, oats and barley the crop percentage delivered from the farm is less than a year ago. Taking the negative aspect of it 41.3 per cent. of the 1912 wheat crop was on the farms, not delivered, on March 1, whereas a year ago but 34.9 per cent. of the 1911 crop remained on the farm at that date. Similar figures apply to corn, oats and barley. When the actual number of bushels of each is taken into consideration, the amount remaining undelivered on the farm this year is vastly in excess of that of a year ago.

With this condition confronting him the farmer is still loath to see in a dollar-and-cent atmosphere the doctrine of good roads. He still remains content to pay 23 cents over per ton-mile for delivery of products when Europe is paying less than 10 cents.

Better rural roads would affect directly the distribution of one-third of the nation's crop, a large proportion of which, it is claimed, is wasted because of the farmer not being able to deliver it at seasons when he has the time and when the market is suitable. This failure in delivery is a question that should be considered by every automobilist. To the maker of passenger cars it means lack of capital with many farmers to purchase cars and at other times a lack of desire to purchase because of the road conditions. To the maker of motor commercial vehicles the message is equally important. Better roads would mean the ability of the farmer to purchase motor trucks for delivery work, and it is a conservative statement that the use of motor trucks and good roads would mean marketing a large fraction of the crop, so large a proportion, in fact, that the additional money secured by the farmer would, in not a few cases, go far to paying for the original truck investment.

Selling and the Truck Show

A MOTOR truck show is only of value to the truck maker in proportion to what he puts into it. The truck maker who begins preparing in advance for the show generally is not disappointed with results; whereas that maker who waits for the show and goes to it anticipating a landslide to his product generally leaves the show a most dejected person.

Public interest must be worked up previous to a passenger or truck show, and particularly with the truck show. One of the best informed authorities on the principles of salesmanship recently stated that "the best policy is to begin the advertising and selling campaigns a long time before the product is ready for delivery."

Electric Vehicle Men Hear Truck Paper

NEW YORK CITY, March 26—In spite of inclement weather, the regular monthly meeting of the Electric Vehicle Association of America, held in the rooms of the association in the Engineering Societies building last night, was well attended and great interest was shown in the paper of the evening, "Observations on Horse and Motor Trucking," by Professor H. F. Thomson, of the Massachusetts Institute of Technology.

Before Mr. Thomson took the floor President Williams called on L. J. Gerson, of the Wanamaker organization, who outlined the plan to be followed by that firm in marketing electric vehicles. Mr. Gerson stated that the company intends to sell cars in three ways:

Plan A—To sell cars outright with the manufacturer's guarantee.

Plan B—To sell cars outright and include 1 year's service at the nearest garage.

Plan C—To sell cars outright and to establish for the purchaser a private garage with all necessary equipment.

Plan B includes the delivery of the car at the residence of the purchaser at any time ordered from the garage, repair and unkeep work, charging of batteries, etc. Naturally, the cost of this service will be added to the cost of the car.

New Garage Sign Being Prepared

After discussion of this plan President Williams announced that the association is preparing a new garage sign somewhat similar to that employed by the Blue Book in that it bears the stamp of approval of the association.

Mr. Thomson then proceeded with the paper of the evening, illustrated by lantern slides showing the tabulations and charts included in the paper. Before dealing with these details, Mr. Thomson took up the truck problem in general as follows:

"The amount of work which any truck can do in a working day depends, first, upon the number of miles it is driven in a day, and second, upon the standing time or time taken in loading and unloading. The first item depends primarily upon the speed of the truck, although in congested districts the speed may be largely determined by the average speed of all the traffic using the street. But the second item, which is equally important, depends primarily upon the loading and unloading conditions. The importance of the effect of standing time upon the cost of operation is frequently overlooked; yet this time item must be carefully considered, particularly when motor trucks are used.

"As an illustration, consider a horse-drawn wagon which travels 15 miles per day but which is actually moving about 3 out of 9 working hours; the average speed of the wagon therefore being 5 miles per hour. If this wagon is replaced by an electric truck of the same carrying capacity, whose average speed under the same traffic conditions would be 10 miles per hour, then the motor truck could cover this same distance of 15 miles in $15/10 = 1.5$ hours; but if the loading and unloading conditions remain the same, the time required to perform the same service would be $6 + 1.5 = 7.5$ hours. That is, in 9 hours the motor truck could do only $9/7.5 = 1.20$, or 20 per cent. more work, although its speed is twice that of the horse wagon. However, in many short haul services the superior ability of the motor truck, in comparison with the horse-drawn wagon, to get into position where considerable backing and other maneuvering is necessary may be of equal importance with the greater speed of the motor.

"On the other hand, the long haul character of work offers to the motor an opportunity to utilize its superiority over horses with regard to greater speed and mileage capacity.

"The routing of delivery wagons, especially in parcel work, is another feature of operation which requires special attention. Two factors limit the amount of load which a wagon can handle on a single trip, first, either the bulk or weight capacity of the body, and second, the number of trips which must be made per day. The former factor is taken care of by the use of a body of suitable capacity. The latter factor very often curtails the number of deliveries made on a trip, as a wagon which consumes 2 or 3 hours in traveling to and from its delivery territory can evidently handle fewer parcels than the motor car which spends only an hour in going and returning.

"The ratio of the actual number of miles per day which a truck is driven to the number of miles per day it is capable of running, under average conditions and without interference from other traffic, may be called the mileage factor of the truck in this particular service. The greater the mileage factor in any service, the less will be the cost per unit of the service. Therefore every effort should be made to maintain a high mileage factor. To accomplish this when motor trucks are substituted for horse wagons may require considerable change in the methods previously employed in the service using horse-drawn vehicles only.

"In addition to a good mileage factor, the load-factor, or the ratio of the maximum load per trip to the capacity rating of the wagon, should also be kept as high as possible. If the vehicle does not carry its rated load on each trip, it is not performing the work with the greatest economy. In some lines where the quantity of work varies considerably with the season of the year, this may be a difficult adjustment, but in any case the size of vehicle should be carefully selected to fit the service in hand.

"The service of the hauling of freight from railroad freight houses to dealer's warehouse, or vice versa, presents a particularly complicated problem. This is due to the diverse conditions which must be dealt with, such as the railroad's organization of its freight houses, the relative locations of the stable, freight yard, the wholesale areas of the city, the fact that teams and merchandise frequently are owned by different parties, etc. In addition to the time often lost by a wagon at warehouse or freight house in receiving its load, there is also poor economy in the usual practice whereby a wagon moves with full load a comparatively small percentage of the working day."

Mr. Thomson then proceeded to elaborate upon the tabulations of cost and efficiency and to elucidate the charts and diagrams illustrating his paper.

The Field of Traffic Engineering

Before opening the meeting for discussion President Williams called attention to the prominence which has been attained by the comparatively new profession of traffic engineering. He pointed out that a state committee detailed to investigate the subject found that the cost of food in New York City is increased 40 per cent. by inefficient distribution. This food, which costs $350,000,000 at the piers and terminals, represents a cost to the consumer of $500,000,000 delivered at the kitchens. President Williams suggested to Mr. Thomson that it might be possible to establish a course in traffic engineering at the Massachusetts Institute of Technology. He also drew attention to the increasing night traffic in the large cities, pointing out that this is the best way to utilize the immense investment in the way of pavement which is lying practically idle nearly 50 per cent. of the time.

An animated discussion of Mr. Thomson's paper following being opened by Mr. Cabot of Boston, followed by Messrs. Kennedy, Curtis, Lloyd, Bartlett, Howland and others. The meeting was brought to an end after Mr. Thomson had answered the inquiries made in detail.

Cars participating in the winter reliability run of the Swedish R. A. C. in the Olympic Stadium before the start

N. A. G. car, which won the Goteborg hill-climb, according to the official formula rating of the club

The German Horsch car which took third place in the reliability run, rated on the official formula

Another German car, the Opel No. 5, which ranked fourth in the reliability run as announced in the official score

Fourteen Perfect in Swedish Reliability

Five Others Perfect Mechanically But Were Penalized for Not Adhering to the Official Schedule—First American Car Ranks Sixth in Run—Another American Machine Takes Second Place in Goteborg Hill-Climb

STOCKHOLM, SWEDEN, March 6—Of the sixty-eight cars entered in the Swedish Royal Automobile Club's annual winter tour, according to the official scores which have just been made public, fourteen are credited with perfect scores. Four of these were American-made. Five other cars were perfect mechanically, that is, they were not penalized for repairs, but were given demerits for not keeping the official schedule. Two of these were American. The results of the run are given in the accompanying tabulation. The Hupmobile is the first American car, ranking sixth.

The Goteborg hill climb was won by the N. A. G., while the Overland took second place with a formula rating of 2,690. These cars were the only ones to make perfect scores, as may be seen from the tabulation.

The trip was to Goteborg and back to this city, a distance of 1,181 kilometers or 738 miles. The rigor of the climate usually renders the tour a trying test for both cars and drivers but this year the mild weather rendered it simply an enjoyable trip, the only hardship being the difficulty which the drivers experienced in keeping awake.

Stop of 12 Hours at Goteborg

A stop of 12 hours was allowed at Goteborg. There were control stations at convenient points along the route where stops could be made for fuel, oil and food without penalty. The time consumed, however, was added to the schedule time, and could not be made up en route. For example, if a car remained for an hour at a control it would not be allowed to enter the next control until an hour after its scheduled time of arrival. If for any reason the car was stopped en route, the time so consumed was added to the schedule. The car could not be stopped anywhere except within the boundaries of the control station without the time being added to the arriving schedule. As a result, every contestant endeavored to keep as closely to the specified pace as possible.

The roads in Sweden are generally better than the average road in the Middle West of the United States, and although several fairly steep and difficult hills were climbed on the route covered by the tour, they were not especially trying to either cars or drivers.

Tremendous enthusiasm was shown by the great crowd which witnessed the start of the tour from the Olympic Stadium in this city and all along the route people lined the roadways watching for the appearance of the cars.

The scenery was very fine and the participants in the tour thoroughly enjoyed themselves, although 28 hours of constant travel with meals consisting of sandwiches and the contents of vacuum bottles which could be consumed comfortably only by a juggler owing to the motion of the cars, made the arrival at Goteborg a great pleasure to some of the contestants.

After checking in at the Palace Hotel in Goteborg, the cars proceeded to a fuel station where they replenished the fuel and oil supplies. Then they were driven to a large garage where competent officials were at hand to see that the cars were arranged in an orderly maner so that departure would be facilitated.

Twelve hours after checking in at Goteborg, the cars were again required to start away on the return journey. Thus many of them were on their way back to Stockholm before daybreak.

Cars which left Goteborg shortly before daybreak were scheduled to arrive in Stockholm about midnight, and at a point about .5 hour journey from Stockholm, each car was stopped opposite two red lights, which marked the starting point of a long hill. The speed of the ascent of this was timed, and figured in determining the winner of the tour, the time being taken by the observer in the car, with a stop watch specially provided for the purpose. The start was a standing one, both the car and the observer's watch, being required to start at the word "Go" from an official. At the top of the hill, which also was marked by two red lights, one on either side, the observer's watch was stopped, and as the car proceeded on its way the time was read and noted in the observer's book.

On arrival at the Grand Hotel, which also was approached through masses of people, the observer made his final notations in his book, compared watches with that of the timers, notation of any difference between the watches was recorded, then the observer handed his book over to the official and the car was dismissed. No final examination of the car was necessary, it being simply required that the car arrive at the Grand Hotel, the finishing point, under its own power.

The formula used in determining the winners of the contest is as follows:

$$R = \frac{[P\,(k+i) + 0{,}06\,S\,V^2]\,V}{0{,}01,\ nD^{2'4} \times L^{0'6}}$$

P = Weight of car in tons (1000 Kg.) with equipment, passengers and full benzine tanks.
V = The average speed of the car during the tour, in meters per second. (This year = 37.53 cm per meter.)
i = The average rise of the hill in millimeters per meter.
D = Bore of cylinders in centimeters.
L = Stroke of motor in centimeters.
n = Number of cylinders.
k = Constant, varying from 12 to 30, according to the condition of the road during the tour. This is decided by the committee just before the hill climbing takes place. (In this test it was 18.) (1913.)
S = 0,8 for small racing cars.
S = 1.0 for large racing cars.
S = 1.25 for passenger cars with torpedo bodies.
S = 1.50 for touring cars with windshield and top.
S = 2.00 for closed cars.

This formula was used by Swedish R. A. C. for first time this year, and is claimed to favor small cars.

Tabulation of the Standing of Leading Cars in Swedish Run

No.	Car	Repairs	Schedule	Formula Rating	Time on Kilometer Hill
19	• Minerva	0	0	5714	1:31.0
34	Minerva	0	0	3649	1:37.0
8	Horch	0	0	3335	1:23.2
5	Opel	0	0	3224	1:27.4
10	Scania-Vabis	0	0	3135	1:30.4
1	Hupmobile	0	0	2791.	1:44.7
29	Pope-Hartford	0	0	2720	1:28.7
7	Fiat	0	0	2443	1:31.8
30	Overland	0	0	2429	1:24.3
35	Cadillac	0	0	2375	1:24.6
20	Fiat	0	0	2207	1:36.3
16	Mercedes	0	0	2081	1:49.4
14	Horch	0	0	2051	2:10.3
15	Rochet-Schneider	0	0	....	1:37.8
	Other Cars With Perfect Mechanical Scores				
12	Scania-Vabis	0	6	....	1:43.1
26	Overland	0	6	....	1:30.5
6	Opel	0	7	....	1:28.8
25	Horch	0	10	....	1:39.4
2	Cadillac	0	53	....	1:28.8

Standing of the Leading Cars in Goteborg Hill-Climb

No.	Car	Repairs	Schedule	Formula	Time on Hill
61	N. A. G.	0	0	3589	2:12.4
57	Overland	0	0	2690	1:22.7
63	Hupmobile	0	38	....	1:47.2
58	Presto	3	6	....	1:45.6
52	Hupmobile	4	7	....	1:42.9
51	Overland	14	6	....	1:32.6
45	Maxwell	14	17	....	1:43.5
54	Hupmobile	19	68	....	1:42.1
66	Krit	32	151	....	2:14.5
59	Krit	33	29	....	2:15.2

•Note—Attention is called to the time made by this car on the Kilometer Hill, being much better than that of any other of the 68 cars that competed. It was also one of the only two cars to have a perfect score.

Daimler No. 4 ready to start on the winter reliability run of the Swedish Royal Automobile Club

Overland No. 57, which took second place in the Goteborg hill-climb, making the best time of all the contestants

Cadillac No. 35, which finished the reliability run with a perfect score, ranking tenth in the list

No. 1 Hupmobile, which also had a perfect score in the run, was first of the American cars, ranking sixth

The Magic Motor on Test

Test at A. C. A. Laboratory Shows Good Performance for Sleeve Motor on Open and Closed Throttle

THE A. C. A. has run a test on the Magic motor, which was described in THE AUTOMOBILE of December 19. This motor, it will be remembered, has two crescent-shaped sliding valves in the cylinder wall, driven off the cranshaft by box cams and Coventry chains. The slides extend the whole length of the cylinder and about 2 inches below, terminating in slots for engagement with the actual driving mechanism. The motor is a four-cylinder monobloc casting with a bore of 3.3125 inches and a stroke of 4.75 inches.

On one test the motor ran continuously for a period of two hours at an average speed of 1293 revolutions per minute, developing an average of 23.4 brake horsepower. The total weight of fuel used during this run was 35.6 pounds, an average consumption of 0.76 pound ber brake horsepower hour. The total weight of oil consumed was 0.6 pound, equivalent to 0.66 pint in liquid measure.

Other tests with wide open throttle at various speeds ranging from 124 to 1990 revolutions per minute were made, the motor running for five minutes at each speed. The maximum brake horsepower recorded was 32.8 at 1990 revolutions per minute. The motor was allowed to idle for two or three minutes between most of the five-minute runs.

A second series of five runs were made with the throttle approximately half open.

A third series of runs was made with the electric dynamometer driving the engine (throttle wide) in order to determine the frictional losses. The approximate indicated horsepower was determined by adding to the brake horsepower at the several speeds, the power lost in friction at the same speeds.

The motor is of the four cycle type, having four cylinders of 85 millimeter, 3.346 inch bore. The cylinders are cast en bloc with a common water jacket. The stroke is 120 millimeter, 4.72 inch. The valves are of crescent shape and are placed between the piston and the cylinder wall, there being one inlet valve and one exhaust valve for each cylinder. They are operated by a box cam which imparts a positive motion both in opening and closing. The weight of the motor, including flywheel, carburetor, magneto, inlet, exhaust and water manifolds, is 520 pounds. The weight of pistons and three rings (no wrist pin), 2.2 pounds. Weight of connecting rod, 3.7 pounds. Length of connecting rod, 11.42 inches.

The clearance volume of the motor is 9.75 cubic inches and the piston displacement 41.5 cubic inches. Total piston displacement of four cylinder is 165.9 cubic inches.

A gear pump is employed to lift oil from the sump, whence it is pumped to the main bearings under pressure, and to troughs under the connecting rods in which a constant level is maintained. The big end bearings, valves and pistons are lubricated by splash.

Before any tests were made on the motor the heads of the cylinders were removed and all carbon in the combustion chamber cleaned out. Following these tests, which consumed about one week, the cylinder heads were again removed, and it was found that the cylinder walls below the junk ring and above the piston when the latter is at the top of its stroke, including that portion of the inner wall of the valves which does not at any time come into contact either with the piston or junk ring, were coated with carbon to a thickness of approximately 1-64 of an inch. The same was true of the lower edge of junk rings. The piston heads were clean in the center with some carbon deposit near the edges. The cylinder head was coated with only a very slight deposit, barely enough to completely cover the metal.

The gasoline used during the test was 63.2° degrees Beaumé, equivalent to 0.727 specific gravity. The heating value of the gasoline is taken at 20,490 British terminal units per pound in computing the thermal efficiency.

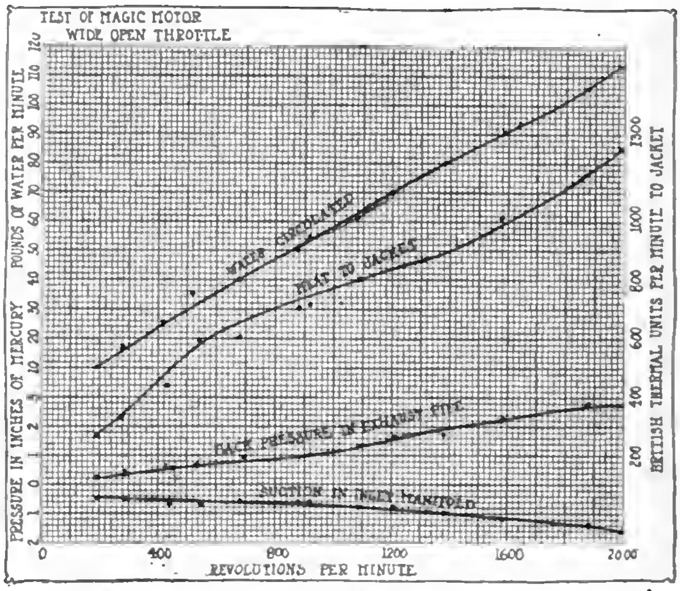

Fig. 2—Water, heat loss, back pressure and intake suction curves taken on Magic motor test

The motor was fitted with a 1 1-4 inch Newcomb carbureter which was set to give maximum power. This initial setting was not changed after starting the tests here recorded. Hot water was circulated through the carbureter jacket in all runs.

The source of ignition was a Berling magneto with spark timing lever set in each run to give maximum brake horsepower.

The motor is designed to use thermo-syphon cooling, but it was found impossible to get sufficient circulation through the long pipes and the Venturi meter used between motor and cooling tank in this test. Hence, a small gear pump was connected directly to the crankshaft and used to assist the circulation during the tests.

The exhaust from the motor was discharged into a short length of pipe to which it was connected by an 8-foot length of 1 1-2 inch flexible tubing to a 2 inch Mondex muffler. The back pressure in the exhaust pipe was measured by means of a mercury manometer connected at a point about 1 foot from the outlet of the exhaust manifold. No smoke was exhausted.

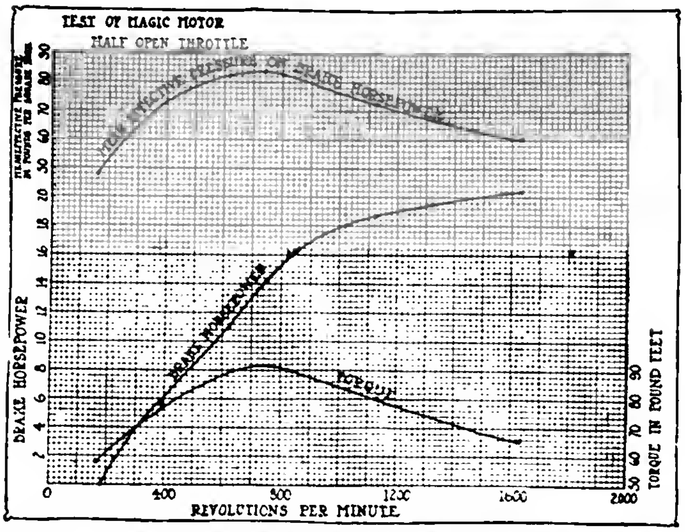

Fig. 1—Curves of mean effective pressure, brake horsepower and torque made from test on Magic motor

Some Methods of Testing Automobile Motors—Makers Are Coming to Realize Value of Scientific Testing

Communication From England on Accumulators As Necessary Evils Predicts Ideal Electric Lighting System

ELIZABETHPORT, N. J.—Editor THE AUTOMOBILE:—As the actual horsepower of an engine is affected by bore, stroke, number of cylinders, compression, form of compression chamber, valve timing, shape and length of gas passages, cooling facilities, location of ignition point and many other features it is very hard to form some empirical formula by which the horsepower can be accurately calculated. Possibly the formula most used is that of the A. L. A. M., namely, $\frac{Nd^2}{2.5}$ assuming a piston speed of 1,000 feet per minute.

While one regrets that there is no complete testing laboratories in the country, we feel sure that the makers are gradually realizing the value of a scientific test. A testing laboratory is to the average engineer very much like medicine, inasmuch as he knows he needs it, but hates very much to take it. The principal part of the laboratory is, of course, the dynamometer, and some of the uses of a reliable machine are carbureter adjustment, valve timing, ignition points and most economical speed of the engine, best lubricant to use and the effect of all various forms of mufflers.

There are two types of dynamometers, namely, transmission and absorption machines. The former is merely a device which registers the actual torque exerted in foot-pounds, but provides no means for creating a brake load, while the latter type not only provides a brake load, but also measures the same. Starting with the first type of braking device used, namely, the Prony brake, various advantages and disadvantages were shown on all makes and types, among them being the fan dynamometer by Franklin, Renard & Tracy, the Reilly hydraulic brake, the Garland electric dynamometer and the modern forms of electric cradle dynamometers.

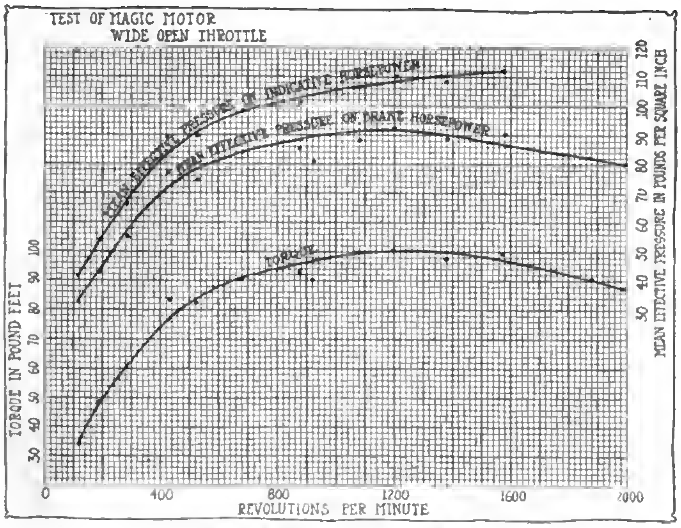

Fig. 3—Curves of mean effective pressure and torque with wide open throttle. Heat and frictional losses may be noted by subtracting brake from indicated horsepower curve.

One of the principal features in connection with the Diehl electric dynamometer system is the method of control. The company provides a control table of mahogany on which is mounted a large automobile steering wheel and three-point rotary switch. Through the steering wheel is supplied a spark and throttle control, the combination forming a standard automobile equipment. One operator can sit at this table and have every feature of the laboratory, that is, as far as horsepower measurements are concerned, under his direct control.

The methods various makers have adopted to test their engine are of interest, especially that of the German company whose factory is on the banks of a river. This concern mounts thirty or forty finished motors side by side on a scow and connects them through their own flexible joints to a line of shafts extending into the water, to each of which is keyed a propeller enabling the engine to be maintained at the most economical speed. Between the flexible shaft and propeller shaft is fixed a torsion transmission dynamometer.—P. P. DEAN.—Diehl Mfg. Co.

Motor Car Electric Lighting

LONDON, ENG.—Editor THE AUTOMOBILE:—The above matter is ever present with most motorists now, and this has been an exceedingly useful winter for testing the real driving light of electric lighting sets.

During my experiments I have found that most generators depend upon large accumulators to help them out when being used at night. Now, it seems to me that no form of electric light dynamo should be purchased by a motor car user unless the output from the dynamo is more than sufficient, when the head and other lamps are alight, to provide all the electricity required, without calling upon the accumulator.

If the accumulator is called upon, it means that if your journey is prolonged, the lights get feebler and feebler, whereas with a proper generator which gives 18 amperes one can have a whole collection of lamps alight and can use a small, and thus a light accumulator, and the accumulator, at the end of a night's run, has more electricity in than when you started.

It is well to remember that accumulators are only a necessary evil, they weigh a lot, they cost a lot. The ideal generator some day will light the lamps without any accumulator; at present our generator lights them through small, light ones—not ideal—but the best yet produced.—S. F. EDGE.—United Motor Industries, Ltd.

To Obtain Gasoline Economy

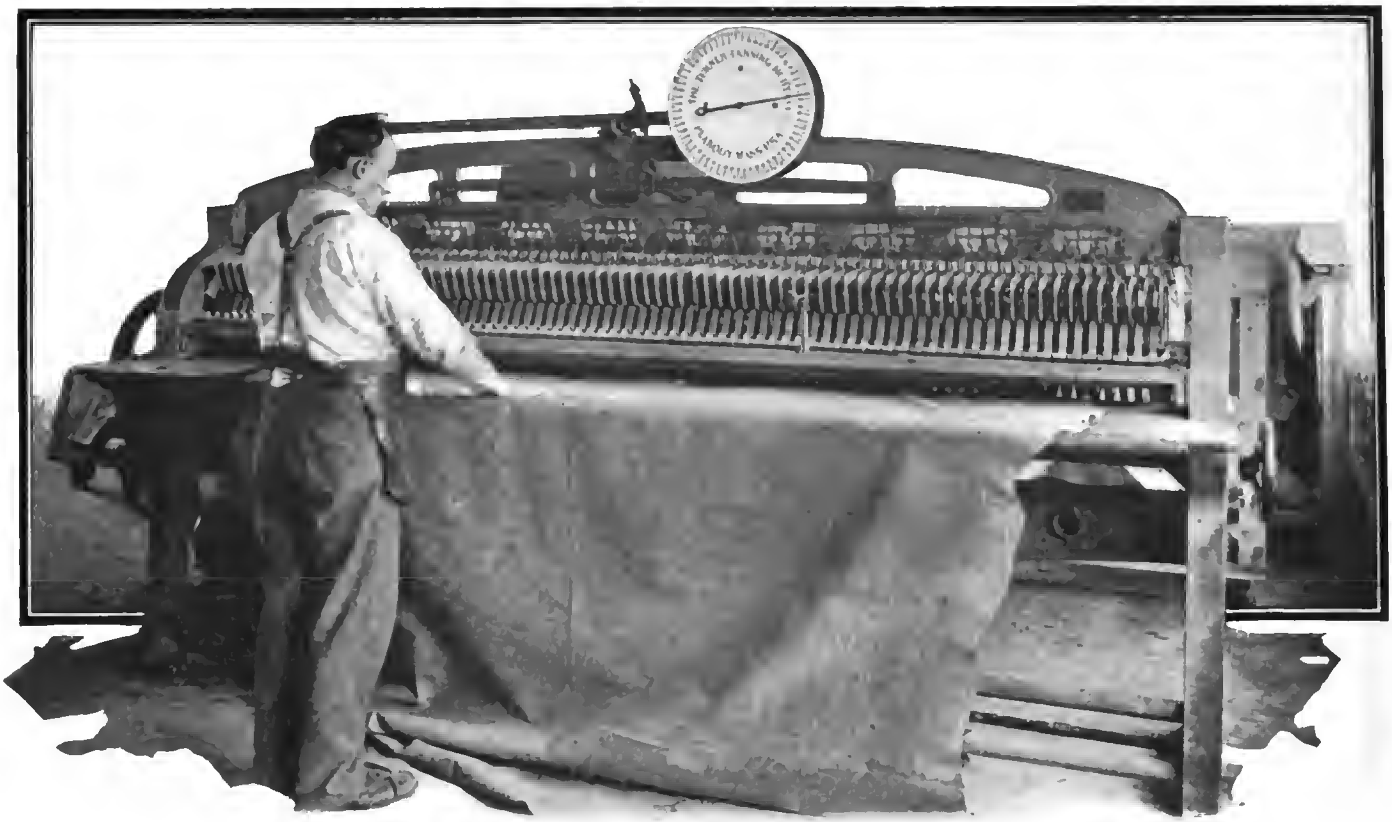
Economical operation with a six-cylinder car, or in fact any car, may be said to be attained when about 14 miles on 1 gallon of gasoline is the average over a fairly long period in the use of that car.

Gasoline economy is but one of the many economies that can and should be worked for on a car. This is one reason why it will never be possible commercially to get the maximum economy of gasoline, as to obtain that maximum, it is necessary to sacrifice a good many other details that lead to a satisfactory car.

We believe that every man selling cars should know the points that are necessary to be understood in their operation in order to obtain fuel economy.—A. HOLMES, H. H. Franklin Mfg. Co.

ROAD RESISTANCE—If a wheel rim with an axle pressure could roll on a surface without any deflection, such a condition would be rolling without resistance. A wheel rim under the pressure of the axle is deflected into the ground and leaves a path. The quantity of work required to make the path of interval length in an interval of time is the measure of work consumed by resistance.

Factory Miscellany



Special machine used for measuring the area of hides employed in upholstering cars in the Studebaker factory at Detroit, Mich.

THE above machine is used in the Studebaker factory at Detroit for measuring the area of the hides used in upholstery work. As the piece of hide passes between the rollers the fingers shown in the illustration rest upon it and are hence raised above the level at which they rest when there is no hide in the instrument. The more fingers that are raised by the hide in passing between the rollers the greater will be the area of the hide. This area is registered on the diaphragm of the recording device mounted above the fingers and directly before the operator. By knowing definitely the area of the hide the trimmers are able to base their calculations in such a way that there is very little of the hide wasted. The machine is large enough to accommodate the largest hides, and, as may be seen in the illustration, can be operated by one man who notes the readings on the dial of the area scale and marks the hide by this reading. The time required for each measurement is 100 per cent. shorter than that of measuring by manual means and the results are more accurate. This machine is made by the Turner Tanning Machinery Co., Peabody, Mass.

ENLARGE Klaxon Plant—The Lovel-McConnell Mfg. Co., Newark, N. J., maker of the Klaxon horn, recently completed extensive additions to its present factory equipment. A new building has been constructed which increases the floor space of the factory about 50 per cent., making an equal increase in the capacity. The new structure is of concrete, two stories in height, with basement, and it is connected with the main building by means of a bridge. It is used exclusively for storage and shipping. The space formerly occupied for these purposes in the main building is now devoted to manufacturing.

Chatham's $40,000 Plant—The Chatham Auto-Wheel Co., Chatham, Ont., is planning the erection of an auto-wheel plant, the estimated cost of which is $40,000.

Metz Builds Factory—The Metz Automobile Co., Waltham, Mass., plans to build a new factory, 200 feet by 200 feet, one story high, and of brick; also a boiler house, 100 feet by 60 feet.

Hendrie Buys Land—The W. C. Hendrie Rubber Co., Denver, Colo., has acquired 5 acres of land at Torrance, near Los Angeles, Cal., and will erect a large rubber manufacturing plant, estimated to cost $100,000.

Steel Wheel Company Building—The Steel Wheel Co., Bethlehem, Pa., is planning to erect a three-story factory on Broad street, that city, for the manufacture of a spring steel wheel for use on automobiles and motor trucks.

Ausman Factory in Chattanooga—The Manufacturers Assn., of Chattanooga, Tenn., is interested in the establishment of a factory to manufacture the Ausman motor truck. It is said that the plant will represent an investment of about $100,000.

Factory for Brazil—Although it was stated that the Goodyear Tire & Rubber Co., of South America, which was incorporated late last year, under the laws of Maine, with an authorized capital of $3,000,000, purposed acquiring or developing rubber plantations in Brazil, it now appears that the establishment of a factory in Rio de Janeiro was one of the objects in view.

Big Plant for Toledo—A new industrial plant, financed by the Perfection Spring Co., of Cleveland, O., but probably with a separate corporate title, and involving a building and equipment investment of many thousands of dollars, will be located in Toledo, O., in the near future. The new plant, like the parent plant at Cleveland, will manufacture automobile springs, and the product will be taken largely by the Willys-Overland Co. A site for the new spring company has been purchased and it will consist of 5 1-2 acres. The price paid for the land was $15,000.

Safe Storm Shield's Addition—The Safe Storm Shield Co., Fremont. O., is planning an addition to its plant in that city.

Weller-Thomas Builds—The Weller-Thomas Co., Zanesville, O., capitalized at $1,000,000, will build a plant to manufacture engines and automobile fire trucks.

Midland Making Alterations—The Midland Motor Co., Moline, Ill., has increased its capital stock from $100,000 to $300,000 and will make extensive improvements to its plant.

Kenyon Starts Addition—The R. L. Kenyon Co., Waukesha, Wis., manufacturing tops, curtains, cushions, etc., has commenced work on additions to cost $15,000 and increase its capacity one-third.

Want S. & M. Tire in Coshocton—A movement is on foot among the business men of Coshocton, O., to have the newly organized S. & M. Rubber Co., manufacturer of automobile tires locate its plant at that place. The promoters of the concern have visited that city and have viewed the old plant of the Premium Stamp Co., which could be easily remodeled into a rubber plant.

Eastern Rubber Secures Site—The Eastern Rubber Co., Toronto, Ont., which was recently organized to manufacture automobile tires, has secured a site of 4 acres and two manufacturing buildings will be erected. One of the buildings will be three stories high, about 250 feet by 72 feet, while the other will be one story, about 200 feet by 72 feet. In addition to these there will be suitable warehouses and a power plant.

Buys Big Factory—J. W. Murray has purchased the buildings and sites at Clay and the Michigan Central, near St. Aubin avenue, Detroit, Mich., and will begin the manufacture there of automobiles fenders and other articles in stamped steel. Machinery is being installed and operations will be begun shortly. The property is valued at $50,000. There are two brick buildings, two stories high and a frame structure on the property, giving a floor space of 22,000 square feet.

Traveler Purchases Building—The Traveler Motor Car Company, recently formed in Detroit, Mich., has purchased a two-story brick building at 1146 Grand River avenue and an adjoining lot with a 40-foot frontage. Plans have been prepared for the erection of a brick structure on the vacant lot and for the remodeling of the present building. The name of the car manufactured by this concern is the Traveler. Several Detroit business men are interested in the company as follows: J. P. Lavigne, W. K. McIntyre and F. W. Barstow.

Sanford in New Quarters—The Sanford Motor Truck Co., Syracuse, N. Y., has just completed a new factory in that city. It is 160 feet on St. Mark's Place, 138 feet on the Erie Canal, and 44 feet on West Fayette street, and is three stories high. The equipment is now practically complete and in a short time the factory will be running at full force. The ground floor will be used as a service station and as a final assembly, testing and shipping department. The second floor is devoted to the drafting room, superintendent's office, machine room and assembling. The third floor is given over to painting, body building and storage of completed trucks. The company has always made a specialty of 1-ton trucks, but now having the factory space necessary will build a 1 1-2-ton size, following the same lines as its 1-ton truck.

Shows, Conventions, Etc.

March 17-22	Norfolk, Va., Annual Show, Armory Building, Norfolk Automobile Trade Association, Inc.
March 19-22	Springfield, Ill., Annual Show, Springfield Commercial Association, W. L. Chapin, Mgr.
March 19-26	Boston, Mass., Annual Truck Show.
March 20-24	New Orleans, La., Annual Show, N. O. A. D. A.
March 24-29	Indianapolis, Ind., Annual Automobile Show.

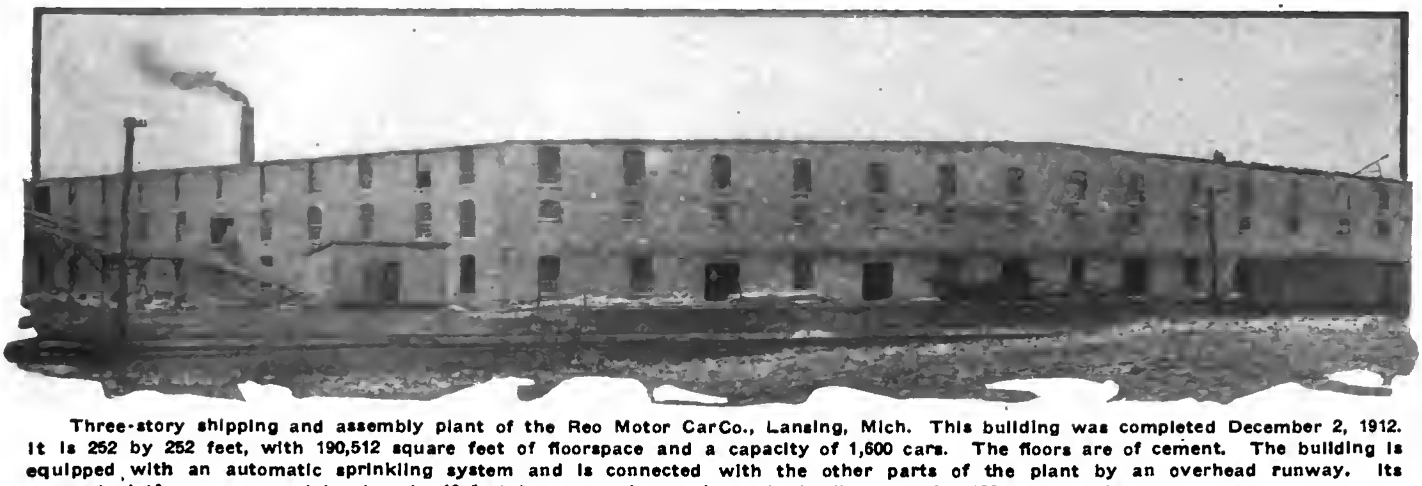
April 5-19	Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.
June 5, 6, 7	Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October	Paris, France, Automobile Show, Grand Palais; 10 days.
November	London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

April 28-30	Chicago, Ill., Commercial Vehicle Demonstration, Chicago Motor Club.
May 5-8	Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14	New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 30	Indianapolis, Ind., 500-Mile Race, Speedway.
July 1	Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16	Winnipeg, Man., Motor Plow Competition, Dr. A. W Bell, Manager.
July 8-16	Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 27-28	Tacoma, Wash., Tacoma Road Races.
Nov. 24	Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 26	Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

March 31	Montevideo, Uruguay, International Competition of Agricultural Motor Vehicles.
April	Barcelona, Spain, International Exhibition.
May	St. Petersburg, Russia, International Automobile Exposition, Building of Michael Maneze, Imperial Automobile Club of Russia.
July 12	Amiens, France, Grand Prix Race.
July 18-26	London, Eng., Imperial Motor Transport Conference.
Sept. 25	Isle of Man, International Stock Car Race.



Three-story shipping and assembly plant of the Reo Motor CarCo., Lansing, Mich. This building was completed December 2, 1912. It is 252 by 252 feet, with 190,512 square feet of floorspace and a capacity of 1,600 cars. The floors are of cement. The building is equipped with an automatic sprinkling system and is connected with the other parts of the plant by an overhead runway. Its covered platform accommodates twenty 40-foot box cars, thus making the loading capacity 120 cars per day.

News of the Week Condensed

American La-France truck equipped with hydraulic transmission hauling a 45-ton load consisting of a frame for the door of the new vaults of the Bank Clearing House in New York City. The frame was placed upon a four-wheel wagon which, empty, weighed 16,400 pounds. The door frame weighed 52,600 pounds. The truck was loaded with five steel plates for the vault which weighed 12,100 pounds. The truck itself weighed 9,000 pounds, so that the total load to be moved was 90,000 pounds

WHITE Buys Philadelphia Land—The White Co., Cleveland, O., has purchased a four-story concrete automobile sales building on North Broad street, Philadelphia, Pa., occupying a lot 53 feet by 200 feet, for $300,000. The structure was formerly occupied by the Packard Motor Car Co., and at present is the home of the United Motors Philadelphia Co. It is reported that the White company will have two additional stores constructed preparatory to removal from its present quarters.

Ohio Punctureless Moves—The Ohio Punctureless Tire Co., Columbus, O., has moved to 205 East Town street.

Tudhope in New Quarters—The Tudhope Motors, Ltd., Vancouver, B. C., is now located in new quarters on Granville street.

Opens New Washington Salesrooms—D. S. Hendrick & Co., Inc., has opened up new salesrooms at 1024 Connecticut avenue, Washington, D. C.

Harper Studebaker Inspector General—H. G. Harper has been made inspector general of the automobile division of the Studebaker Corp., Detroit, Mich.

Maloney Chairman Minnesota Board—J. A. Maloney has been elected chairman of the Minnesota state board of automobile examiners, Minneapolis, Minn.

Philadelphia Swinehart Agency Opened—The Swinehart Tire & Rubber Co., Akron, O., has opened an agency in Philadelphia, Pa., at 726 Main street.

Metallurgique Moves Salesrooms—The Metallurgique Motor Co., Inc., New York City, has removed its showrooms and shop to larger ones at 1876 Broadway.

Black Brothers Continental Distributors—Black Brothers have been appointed distributors for British Columbia, headquarters at Vancouver, B. C., for the Continental tires.

Sherman Elected President—J. M. Sherman has been elected president of the Safe Storm Shield Co., Fremont, O., to fill the vacancy caused by the death of J. F. Gottron.

Mars Erecting Pittsburgh Garage—G. C. Mars, Pittsburgh, Pa., is erecting a two-story brick garage at 4610 Center avenue. The building will be fireproof and is estimated to cost $12,000.

Franklin Agency Building Completed—Cramer and Bennett, recently appointed Franklin dealers, have completed the building of a new salesroom and garage at 220 Sixth street, Waterloo, Ia.

Pierce-Arrow's Brooklyn Building—The Pierce-Arrow Automobile Co. is erecting a four-story 200 feet by 205 feet building on Freeman street, Brooklyn, N. Y. It will cost approximately $300,000.

New Kelly Service Plan—The Kelly-Springfield Motor Truck Co., Springfield, O., recently announced a chain of fourteen factory branches and service stations in the principal centers of the country.

St. Louis Specialty House—A new automobile specialty house is to be opened in St. Louis, Mo. It will be known as the Daughters-King Auto Specialty Co., and will be located in the heart of the automobile row.

Rowan Velvet Shock Absorber Manager—F. J. Rowan, formerly district sales manager of the American underslung in the East, has been appointed sales manager of the Velvet shock-absorbing springs, Boston, Mass.

Form New Company—The United States Auto Lock Co., is to be the name of the new firm that is to begin operations in Findlay, O., soon. The product that is to be manufactured by the new company is a lock for automobiles.

Pacific Tire Company Transferred—The business of the Pacific Rubber Tire Co., Ltd., Vancouver, B. C., agent for Firestone tires, was taken over recently by the Pacific Rubber Tire & Repair Co., Ltd., under new management with A. L. Teetzel as president.

Larger Quarters—The Automobile Exchange, Ltd., London, Eng., has moved to 91 Great Portland street, in order to get larger quarters. With the additional room thus afforded the company is looking for more lines of automobile parts and supplies. It has the agency for several British cars and one of American make.

Motor Buses in Washington—The National Motor Transportation Co., Washington, D. C., has been given a franchise to operate a number of motor buses connecting the northwest section of Washington with the Capitol and the Union Station, via F street and Pennsylvania avenue. The cars to be used will be manufactured by the Commercial Truck Co., Philadelphia, Pa. H. H. Westcott is president.

Attempt Organization Washington Dealers—The organization of an automobile dealers' section of the Retail Merchants' Assn., is being attempted in Washington, D. C. Claude Miller has been made chairman of the automobile section. The prospectus of the association sets forth that the association will endeavor to eliminate friction and petty jealousies, encourage good business practices, cultivate a strong fraternal spirit among its members and protect them against credit losses.

Opens Garage in Sharon—A garage has been opened on Dook street, Sharon, Pa., by James Wilson.

Pressman and Meeley's Store—H. Pressman and G. G. Meeley have opened a tire store in New York City at 1659 Broadway. Mr. Fairman is manager.

Buys Syracuse Garage—J. W. Lee, of the Overland-Syracuse Co., Syracuse, N. Y., has bought the garage and salesroom formerly occupied by the United Motor Syracuse Co.

Railroad Adopts Motor Car—The Chicago, Milwaukee & St. Paul road will put in operation in the vicinity of the Twin Cities gasoline-electric cars covering 132 miles of road.

New Walpole Tire Manager—I. W. Penniman is now the New England sales manager for the Walpole Tire & Rubber Co., with sales offices at 757 Boyston street, Boston, Mass.

Sewell Cushion Opens Branch—The Sewell Cushion Wheel Co., Detroit, Mich., will shortly open a branch in New York City. W. E. Kretschmar from the factory will be manager.

Kilborn G. M. C. Branch Manager—E. J. Kilborn has been appointed general manager of the General Motor Truck Co.'s branch in Chicago, Ill., with headquarters at 2241 Wabash avenue.

Motordome to be Built—The Pittsburgh, Pa., Motordome Co., composed of local men is planning to build a motordome, the lumber for which is under contract. The site will be chosen in the near future and work begun by April.

Dustin Retail Sales Manager—The American-Marion Sales Co., 1896 Broadway, New York City, distributor of the American underslung and Marion cars has secured the services of L. N. Dustin, in the capacity of retail sales manager.

Large Chicago Garage Opened—What is said to be the largest garage on the west side of Chicago, Ill., was recently opened by the Jackson Boulevard Garage Co. The garage is of fireproof construction, with a storage capacity of forty cars.

Garabrant District Sales Manager—W. W. Garabrant has been appointed district sales manager by the Franklin Automobile Co., Syracuse, N. Y., for the states of Nebraska, Kansas, Missouri and Oklahoma. He will make his headquarters at Kansas City, Mo.

City's Largest Garage—Walter Haefeli has filed for A. R. E. Pinchot, owner, plans for one of the largest automobile garages in New York City. It will be located on the north side of Sixtieth street, east of Columbus avenue, running through the block to the south side of Sixty-first street. It will have a frontage of 18 feet on Sixtieth street and 100 feet on Sixty-first street, being fireproof. The cost has been estimated at $325,000.

Norway as Automobile Market—There is absolutely no demand in Norway for electric automobiles for either pleasure purposes or commercial uses. The market for gasoline automobiles is limited, but better in Christiania than in all the rest of Norway. The number of automobiles registered in Christiania is only about 600, and in all the rest of Norway about 300. Of the 550 or 600 gasoline cars used for pleasure purposes in Norway, it is estimated that about 300 are of American manufacture. There is a good opportunity for the sale of high-priced cars from America.

It is in emergencies that motor vehicles are at their best, and this fact has led many street railway companies to adopt the commercial vehicle for emergency wagons. The G. M. C. electric machine shown in the illustration is used in this capacity by the Nashville Railway & Light Co., Nashville, Tenn., and has shown much greater economy and efficiency than could be obtained with a horse-drawn wagon

Front View of the Mission Concepcion near San Antonio

Starter Company Opens—The Pennypacker Engine Starter Co., recently opened a service station at 2210 South Main street, Los Angeles, Cal.

Alco Ends Trip—The Alco motor truck of John Lucas & Co., Philadelphia, Pa., arrived at Pittsburgh, Pa., on March 22, finishing a 400-mile run.

Latham Manager Frisco Branch—Bert Latham has been appointed manager of the San Francisco, Cal., branch of the Simplex-Mercer Pacific Coast Co.

Baltimore Buys Apparatus—The Lord Baltimore Motor Car Co., Baltimore, Md., sold two trucks to Baltimore city for use in the city fire department.

Edmonton Adds Fire Apparatus—Twelve pieces of modern apparatus will be added to the fire-fighting equipment by the municipality of Edmonton, Alta.

Fleming Joins Studebaker—Treasurer A. R. Erskine of the Studebaker Corp., Detroit, Mich., announces the appointment of C. D. Fleming as assistant to the treasurer.

Alabama Invites All Governors—Alabama will invite every governor in the United States to attend the meeting of the National Good Roads Federation in Birmingham, Ala., April 24.

Michigan Service Station Established—A garage and service station has been established at 3435 Lullow street, West Philadelphia, Pa., by the local branch of the Michigan Motor Car Co.

Anthony Maxwell Comptroller—W. M. Anthony, who represented the receivers of the old U. S. Motors Co., Tarrytown, N. Y., has arrived in Detroit, Mich., where he will join the Maxwell Motor Co., as comptroller.

Phillips Promoted—F. R. Phillips has been promoted to the position of assistant to the vice-president of the International Motor Co., New York City, with headquarters at Broadway and Fifty-seventh street, that city.

Standard Bearing's Indianapolis Office—The Standard Roller Bearing Co., Philadelphia, Pa., has opened an office in Indianapolis, Ind., with L. M. Watkin, Jr., in charge. The office is located in room 1201 State Life Building.

Motometer in Atlanta—The Motometer Co., Inc., New York City, maker of radiator heat and indicators known as Motometers, has appointed the Johnson Gewinner Co., 124 Peach street, Atlanta, Ga., as distributor of its product.

Establishes Clintonville Garage—W. B. Stevens has formed a company with the backing of Clintonville, Wis., business men and has established a garage, repair shop and salesroom. The name of the firm will be the Star Garage Co.

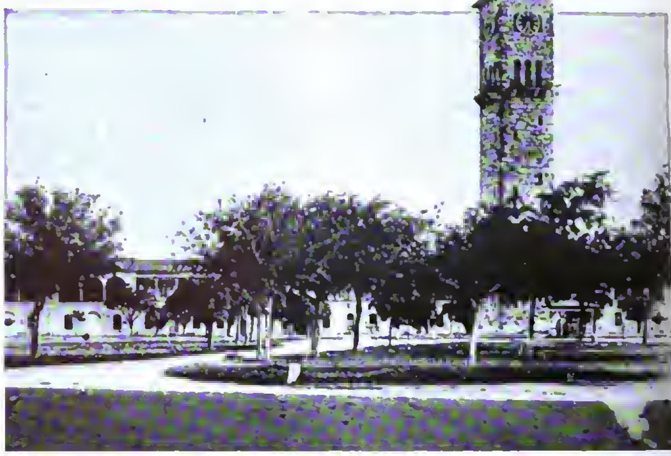
Open Second-Hand Store—R. A. Kloch and John Dietrich have formed the firm of Kloch & Dietrich and have opened a store at 1333 Fourteenth street, N. W., Washington, D. C., for the sale of second-hand cars, and a line of accessories.

Frisco Wrecking House Opened—Pioneering the way in a new industry, the Auto Exhibit and Supply House, an automobile wrecking house of Los Angeles, Cal., has opened its San Francisco quarters at 465 Golden Gate avenue, with J. C. Porter in charge. This firm handles all parts and accessories for every make of automobile.

McLaughlin Makes Appointments—J. W. McLaughlin, California distributor of Dayton trucks, has recently made the following appointments: H. L. Miller has charge of the Los Angeles branch and J. M. Lawrence of San Jose has to take care of the counties of Santa Clara, Monterey, San Mateo and San Cruz, with headquarters at San Jose.

San Antonio's Picturesque Old Missions

¶ One of the prime factors which has led to the construction of splendid automobile roads radiating in all directions from San Antonio and extending to the limits of the Bexar county line, and in some instances through adjoining counties, has been the recognized necessity on the part of the people of San Antonio to provide a means of affording pleasure for the great number of winter tourists who visit there each year. Since the erection of splendid hotels in the city and the creating of other essential requirements that go to make up an attractive resort for pleasure seekers, San Antonio's tourist business has increased enormously. It is rapidly becoming the equal of noted resorts in California and Florida. Many of the winter visitors from the North bring with them their automobiles and obtain keen enjoyment in their daily outings over the system of good roads that has been constructed throughout the



Quadrangle and old stone tower at Fort Houston

Automobile Incorporations

AUTOMOBILES AND PARTS

ASHEVILLE, N. C.—Lyerly Motor Co.; capital, $15,000. Incorporators: D. K. Lyerly, W. K. Lyerly, P. H. Lyerly.

BOSTON, MASS.—Androscoggin Motor Co.; capital, $10,000. Incorporators: Geo. A. Pulsifer, William G. Renwick, Gilbert Hodge, Jr.

BROOKLYN, N. Y.—John Hann Co.; capital, $25,000; to manufacture gasoline engines, machinery, etc., and to operate general machine shop. Incorporators: John Hann, Daniel Douglass, Francis J. Waters.

BROOKLYN, N. Y.—F. & P. Auto Transportation Co.; capital, $70,000; to manufacture and trade in vehicles propelled by gas, electricity, etc. Incorporators: W. O. Goddard, G. A. Logan, F. K. Fairchild.

ALEXANDRIA, VA.—Imperial Motor Tire Company; capital, $100,000. Incorporators: G. D. Gehaghtly, E. A. Garlock, M. T. Wiggins.

AUGUSTA, GA.—Harbak Auto Heater Company; capital, $300,000. In-

Appeal to Many Automobile Tourists

county and to adjacent towns. The automobile loop highway, as it is termed, which extends almost around the city, is the favorite route for pleasure seekers. There are a number of points of historic interest situated adjacent to the city and upon the routes of these automobile highways.

¶The chain of missions that extends from the city south along the San Antonio River for about 15 miles is an unfailing object of interest to many of the automobilists. Beginning with the Alamo, which is situated upon the beautiful plaza of that name and which is often referred to as the "cradle of Texas liberty," there are splendid streets and roads leading to the next historic edifice, Mission Concepcion, about 3 miles south of the town. A few miles below that is situated Mission San José, and a little further down the river is Mission San Juan. These ancient structures are in a remarkably fine state of preservation, considering that their foundations were laid nearly two centuries ago.

San José Mission, several miles south of San Antonio

The San Juan Mission has an aspect of antiquity

Automobile Incorporations

corporators: C. L. Andrews, L. J. Coleman, R. S. Buzzell, E. M. Hussey, E. M. Leavitt.

CHICAGO, ILL.—Auto Combination Manufacturing Company; capital, $50,000; to manufacture automobile supplies and equipment. Incorporators: H. M. Show, G. W. Nevine, W. J. Liddy.

CHICAGO, ILL.—Logan Square Auto Supply Company; capital, $10,000; to manufacture automobile supplies. Incorporators: Otto E. Schmidt, August J. Schmidt, Martha Perl.

CLEVELAND, O.—Standard Shock Absorber Company; capital, $100,000; to manufacture and deal in shock absorbers and various automobile accessories. Incorporators: C. D. Sward, William Leary, S. A. McGill.

FINDLAY, O.—United States Auto Lock Company; capital, $15,000; to manufacture and deal in combination and other locks and deal in novelties and accessories of all kinds. Incorporators: J. S. Van Tassell, E. B. Brokaw, J. H. Macklin, J. R. Harnahan, George F. Burnap.

NEW YORK CITY.—New York & New Jersey Seaton Wheel Company; capital, $350,000; to manufacture Seaton spring wheel for automobiles. Incorporators: John T. Landis, William C. Mack, William T. Rainey.

RACINE, WIS.—Wisconsin Electric Company; capital, $50,000; to manufacture a line of electrically operated labor saving devices and instruments. Incorporators: Louis H. Hamilton, Chester H. Beach.

STEUBENVILLE, O.—Ohio Valley Rubber Company; capital, $50,000; to manufacture and deal in rubber and mechanical goods of all kinds, including automobile supplies and accessories. Incorporators: C. L. Williams, Howard L. Wickersham, Roy D. Lloyd, Edward L. Parker, John C. Smythe.

SUFFOLK, VA.—Suffolk Garage & Machine Company; capital, $15,000. Incorporators: B. E. Parker, C. C. Clark, G. L. Bower.

UTICA, N. Y.—Divine Tire Company; capital, $225,000; to deal in tires. Incorporators: C. W. Wicks, A. J. Eckert, B. H. Divine.

CHANGES OF NAME AND CAPITAL

CLEVELAND, O.—Chandler Motor Car Company; capital increased from $1,000 to $425,000.

DETROIT, MICH.—Thompson Auto Company; capital increased from $10,000 to $20,000.

KENTON, O.—Kenton Drop Forge & Manufacturing Company; capital increased from $25,000 to $150,000.

LOUISVILLE, KY.—Transit Motor Car Company; change of name to Transit Motor Truck Company.

WABASH, IND.—Service Motor Car Company; capital increased from $125,000 to $250,000.

Garage in San Bernardino—F. T. Hendee has organized the Perkins-Hendee Garage Co., San Bernardino, Cal.

Merrill Manager Veerac—Frank Merrill, chief engineer for the Veerac Motor Co., Anoka, Minn., has been made general manager.

High School Studies Automobiles—The Manual Arts High School of Los Angeles, Cal., has taken up the study of motor cars and parts.

Borovitz Croxton Chief Engineer—Joseph Borovitz has been appointed chief engineer and factory manager of the Croxton Motor Car Co., Washington, Pa.

Gail Hamilton in Charge—Gail Hamilton has been placed in charge of the new department for used cars, opened by the Howard Automobile Co., Los Angeles, Cal.

Burlington Garage Enlarged—The Burlington Automobile Supply Co., of Burlington, Wis., is remodeling its garage and store and will gain considerable more floor space.

Used Car Department Established—The Hawley-King Co., Los Angeles, Cal., has decided to run a used car department in conjunction with the salesroom at 1027 South Olive street.

Federal Tire Agency Moves—The Federal Tire & Rubber Co., Detroit, Mich., has removed to 846 Woodward avenue, where a service station, salesroom and store rooms will be conducted.

Milwaukee County Wants Automobile—The county of Milwaukee, Wis., will soon be in the market for a touring car for the county coroner, to cost not more than $1,200. The purchase will be made in open market without call for bids.

By Way of Correction—Under the heading of New Agencies Established During the Week in the March 13 issue of THE AUTOMOBILE G. M. Redding was given as distributor of the Haynes cars in New York City, which should have read Utica, N. Y.

Fire Apparatus for Oshkosh—The piece of motor fire apparatus recently ordered by the common council of Oshkosh, Wis., and which inaugurates the use of motor equipment for the fire department of Oshkosh, is being built by the Kissell Motor Car Co., Hartford, Wis., at a cost of $3,500.

Mulkern Garage Company Organized—Frank Mulkern, Milwaukee, Wis., has organized the Mulkern Garage Co. The garage has a storage capacity of 100 gasoline and 150 electric cars. It has dimensions of 216 feet by 60 feet and is two stories high. Both floors are obstructed only by four columns.

Towson Installs Fire Trucks—Combination chemical fire engines and hose trucks have been put in service in Towson and Highlandtown, Md., making seven pieces of fire apparatus used by the county fire department. The new apparatus was bought from the American La France Co., Elmira, N. Y., and cost $9,500 each.

Drawback for Reo—The treasury department at Washington, D. C., has made a ruling to the effect that drawback will be allowed under section 25 of the tariff act of 1909, and the regulations promulgated thereunder, on automobiles manufactured by the Reo Motor Car Co., Lansing, Mich., with the use of imported tires. The drawback allowance shall not exceed four tires to each automobile exported. The maker's sworn statement has been filed with the collector of customs at Detroit, Mich.

SPRING WHEEL CONSTRUCTION—In which a special tire is mounted on flanges extending from the inner fixed rim, radially arranged springs between the spokes forming the resilient members.

In this design the outer rim O, having inwardly extending flanges, slides on flanges fitted to the inner rim or felloe I. The driving strain between the two components is taken by cross pins furnished with rollers which slide in radial slots in the flange of the tire. Plungers P pressed outwardly in a radial direction by helical springs are arranged between the spokes; these plungers have stems S and heads H, both bored with passages for the transfer of a lubricant which is supplied from a cylindrical receptacle C. Helical springs force the plungers P outwardly, their heads H bearing against O, around which a tread member is arranged.

No. 1,056,167—to Norman Gratz, Boise, Idaho. Granted March 18, 1913; filed February 6. 1912.

Automobile Wheel and Tire—The tire is a transversely contractible ring governed by pinions operable from outside the tire.

This patent refers to a wheel construction, Fig. 2, in which a rim R is equipped with a contractible, transversely divided ring R1 which encircles it. The opposite ends of the tire ring R1 are provided with inwardly extending brackets, each of which has a transversely threaded hole. A rod has oppositely threaded portions fitted into these holes. A pinion P is secured to the rod, being rotatable therewith; a yoke Y is equipped wih two arms arranged at opposite ends of P and formed with holes in which the rod is rotatably mounted. A second pinion Q meshes with the first-named pinion, being rotatable in the yoke Y.

No. 1,056,591—to William E. Schilling, Kansas City, Mo. Granted March 18, 1913; filed June 12, 1911.

Automobile Engine Starter—Including a flywheel mounted loosely on the crankshaft and capable of being clutched to the same.

Fig. 3 shows the subject-matter of this patent, consisting of a starter mechanism. The latter is composed of a flywheel W journaled on the crankshaft S so as to be rotatable independently of the same and carrying on its rim portion the rotary element R of an electric motor. The crankcase K supports the fixed polepieces F arranged inside the rotatable armature R which is carried by W. It is clear that by energizing the armature R the wheel E is rotated. By engaging the clutch C on the shaft S with the wheel W, the latter is connected to S and the shaft is rotated, starting the automobile engine.

No. 1,056,417—to Percy W. Hodgkinson, Rochester, N. Y. Granted March 18, 1913; filed February 3, 1912.

Automobile Jack Design—Consisting of arms which are operated through a toggle mechanism to lift the wheels.

The jack described in this patent consists of a pair of arms A, each pivoted at one end and so arranged that they engage the automobile axles just inside of its wheels. Links L are pivotally connected with the arms A at a point removed from their free ends, part of the links extending beyond the arms. The links are part of a toggle mechanism, and means M are provided for the purpose of operating the toggle.

No. 1,056,235—to Hosea S. Tuttle, Minneapolis, Minn. Granted March 18, 1913; filed April 3, 1912.

Automobile Horn—Being of the bulb-and-reed type but being operable by means of a pump driven from the flywheel of the motor.

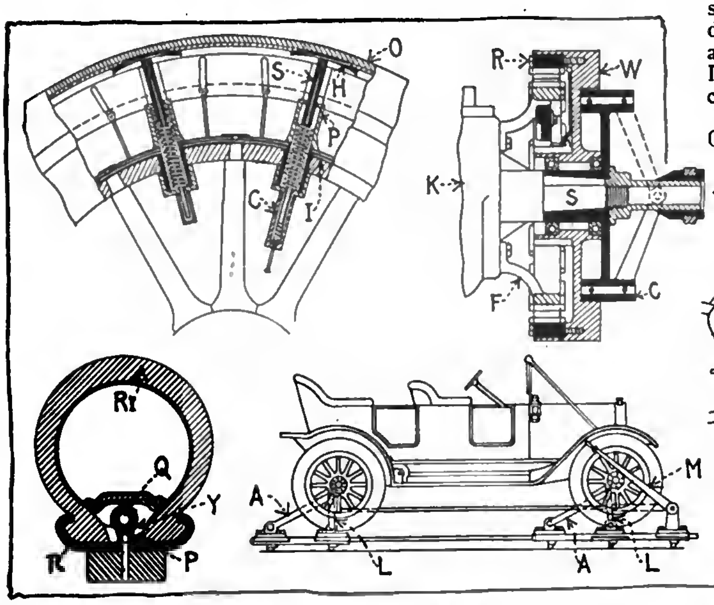
The horn H, Fig. 5, comprises an air bulb, a reed and a pipe connecting these two parts. A pump P is driven by the flywheel W, if brought into frictional engagement with it by suitable means operated by the driver. The pipe Q is so connected to the pump and the first-mentioned pipe, that it conveys air from the former to the latter, through which it is forced into the horn H, sounding the same.

No. 1,056,265—to Amedee Couesnon, Paris, France. Granted March 18, 1913; filed February 7, 1912.

Internal-Combustion Engine—Consisting of a cylinder having two sections of different widths, one of which serves as compression chamber.

This patent refers to an internal-combustion motor design, Fig. 6, which comprises a cylinder formed with a wider diameter at its lower end, to provide a compression chamber, and with a narrower above, to give an explosion space. An exhaust port E is formed in the explosion chamber and a gas inlet port A as well, A being located higher than E. An air passage A1 through which carbureted air is taken into the cylinder is formed in the wider section of the cylinder, which is connected to the upper portion by a passage controlled through a rotary valve V. A differential piston fitting the two cylinder sections is formed with an upper half U and a lower one L, and it is obvious that on each upstroke there is compression in the wider cylinder section and exhausting in the narrow section, while on the downstroke there is a power stroke in the explosion chamber and a suction stroke in the wide-diameter cylinder section. In this way a two-stroke cycle engine is obtained in which crankcase compression is avoided.

No. 1,056,690—To Frederick O. Kilgore, Somerville, Mass. Granted March 18, 1913; filed May 28, 1912.



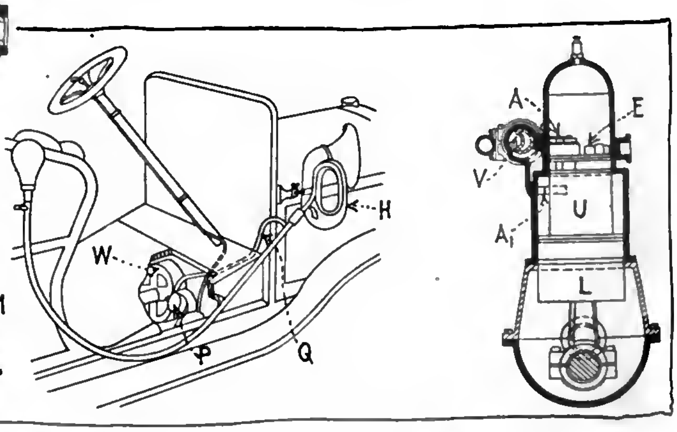


Fig. 1—Gratz cushion-tired wheel. Fig. 2—Schilling contractible-tire wheel. Fig. 3—Hodgkinson electro-mechanical starter. Fig. 4—Tuttle automobile jack. Fig. 5—Couesnon flywheel-operated reed-horn. Fig. 6—Kilgore internal-combustion engine

The AUTOMOBILE

Floods Damage Automobile Centers

Dayton and Indianapolis Bear a Large Portion of the Loss by Fire and Water

¶ *The floods through Ohio and Indiana and the Nebraska tornado have been the first great national disasters since the use of the automobile attained prominence. Besides actually affecting the industry through the submersion of factories making automobiles and accessories and by the great delay of freight passing through the Ohio and Indiana routes, interest has centered on the motor car as an instrument of rescue and a means of increasing the rapidity of repair work. It is still impossible to get reports from isolated districts but estimates have been made that the losses to individual factories are as high as $100,000. In Dayton the losses will come to many times this amount. As it is under martial law now reports from submerged districts are exceedingly difficult to obtain.*

THE big effects of the flood through Ohio and Indiana on the automobile industry are the delays in shipments and the shutting down of plants until repairs and railroads and factories are complete. The actual damage through contact with water is not so serious as the loss in time. Freight passing by way of Toledo has been held up indefinitely. It will probably be 3 weeks before traffic is straightened out.

Two big automobile states, Indiana and Ohio, have suffered severely from the flood which is now beginning to recede. Dayton, O., the home of many factories connected directly to the automobile industry, has suffered most heavily from the devastating flow of water. The Dayton Electrical Laboratories Co. has been reported temporarily crippled. In Akron the Firestone rim factory is partially submerged and the Goodyear company has suffered damages. Several concerns of Dayton making products necessary to the equipment of cars made in other centers, such as Detroit and Indianapolis. have been compelled to stop work until the waters have receded and until the damage caused has been repaired. Thousands of dollars loss will have to be covered by the industry, not only through the actual damage done by the contact of the goods with the water, but through the loss of time on contracts, etc.

Many of the car makers have been compelled to reroute their shipments owing to the fact that washouts have occurred along the railroad lines and entire banks supporting railroad tracks have been carried away. Bridges have been weakened to such an extent that it has been considered unsafe by the railroad engineers to operate trains over the lines affected.

Typical Ohio street scene—The above illustration shows how the water reached far up into the residence section of Columbus, rendering the streets impassable except to automobiles and other vehicles which were capable of traveling through the submerged areas. Many people living in this section of the town are automobile owners who keep their cars in small garages at the back of the house. They were able to get downtown in their cars and to assist their neighbors in getting supplies. The trolley car lines running through this city and in Dayton and other places affected by the water were so crippled that they could not operate and as it was impossible to get through the streets by walking many who could not avail themselves of automobiles were marooned

In Fort Wayne an Ideal motor truck was used to pump water out of a flooded building

Truck transporting a relief boat in Toledo

Car on rescue work. Indianapolis car makers put all available cars at the disposal of the police

It has been exceedingly difficult to secure any definite reports from Ohio. This is especially true of Dayton. In the latter city alone the loss will amount to many hundred thousand dollars. Since martial law has been declared through Dayton and the work of the rescuers engages the attention of every available citizen, no accurate accounts have been taken of detailed damages. The latest news from Dayton appears on page 752.

Unconfirmed reports have reached Toledo regarding Dayton. It is stated that the Maxwell concern was the most heavily hit of the automobile manufacturers. The Maxwell concern is fortunate in having recently made heavy shipments to dealers throughout the country and has therefore not been crippled as badly as would have been the case were this stock all left on hand. Production will be only slightly interrupted in the Maxwell plant. The Speedwell plant, contrary to reports was unharmed.

In Columbus, O., the plant which suffered the most is that of the Columbus Buggy Co., which has been in financial difficulties of late, and is now in the hands of receivers. The buildings connected with this plant are submerged to a depth of 10 feet and the water is receding but slowly. It is fortunate with this plant that the water did not attain a slightly greater depth as the battery and electrical departments would have been flooded and the resulting loss would have been much higher. The Republic Rubber plant, Youngstown, O., was not affected.

The John W. Brown Co., maker of automobile lamps, was another concern to suffer enormous losses. This company has an order on hand for 75,000 lamps for the Ford company.

Slight damage was sustained at the Garford plant, Elyria, O.

While Toledo itself escaped with comparatively small damage, many interests in neighboring towns in which Toledo capital is interested have been hit heavily. Perhaps the greatest instance of this is that of the Turnbull Wagon Works Co., at Defiance, O. This concern manufactures automobile wheels. The damage due to flooding amounted to about $75,000.

One of the biggest factors in the damage done to Toledo dealers is the fact that very few sales may be expected for some time. It is probable that business will be dull in the selling line with Ohio retail concerns dealing in cars and accessories. The value of the automobile in a disaster of this kind have been effectually demonstrated in Toledo. The repair work on the bridges and culverts affected or suspected of weakness has been rushed through quickly, owing to the rapidity with which workmen and supplies have been carried to the critical points. Other benefits have been reaped from the automobile trade in a charitable way. An instance of this is the automobile parade to be given in Toledo and performances in seven theaters made up of amateur actors who are employees of automobile concerns.

Indiana did not suffer as heavily as did Ohio, but the damage throughout this state is severe, nevertheless. Directly affected by the flood were twenty-six car manufacturers, 413 dealers and garages and eight branch salesrooms. In Ohio there are 719 dealers and garages, forty-two car manufacturers and twenty-four salesrooms affected. In Indianapolis three big plants, the Marion, Pathfinder and Marmon, had their lower floors submerged. Other concerns whose lower floors were covered by several feet of water are the H. J. Martin Forging Co., R. J. Irvin & Co., and the Showalter Mfg. Co. None of the garages or salesrooms were affected. The automobile show under the auspices of the Indianapolis Automobile Trade Association was abruptly stopped on Tuesday when 10 feet of water cut off communication. Sunday the show was reopened for the benefit of the flood victims. The factory of the National Motor Vehicle Co., which is on the north side of the city was not damaged in any way by the flood, which will not affect production in any way.

In Indianapolis the water did not reach the center of the town. The salesrooms did not suffer to the extent as did the shops through the factory district of the town. The principal cause of loss in this city is not the direct contact with the water, but the fact that railroad communcation has been paralyzed. The town is short of coal and many of the plants will have to shut down because it is impossible to keep the power houses going. The town coal supply has been reserved for use in residences. It is stated that freight communication between Indianapolis and Connersville will be resumed in the course of a week, and according to reports from the inundated districts it is said that the railroads are offering $1 an hour for labor in rushing the repair work. Connersville has not been affected by the water and all reports to the effect that actual damage has been done have been denied.

The Remy Electric Co., Anderson. Ind., was not seriously affected by the flood. The only damage being loss of time due to the disablement of the municipal power plant. An improvised power plant supplied the deficiency. The Nyberg plant was unscathed.

The waters did not reach the plant of the Warner Gear Co., Muncie, Ind., but the company was obliged to shut down because of lack of city water and power. It is now running shorthanded on account of non-delivery of necessary material, but expects to be running on schedule in a few days.

The Great Western plant at Peru escaped serious damage and the company is already commencing shipments. A small force started work Sunday which will be increased as soon as the men can get back. The Brown Commercial Car Co.'s plant was flooded but no great damage done. The Maxwell plant at Newcastle, Ind., was not damaged at all as was originally reported.

Kokomo, Ind., was cut off from all neighboring towns as far as railroad service is concerned for 2 days. The telegraph and telephone service was also so crippled during the first 2 or 3 days of the high water that they were absolutely unable to cope

Henderson car carrying boat and policeman to flooded district

with the situation. This cutting off of the city gave rise to many rumors which have since been proven unfounded. The biggest damage to the city was caused by the destruction of about 150 homes which have been so badly damaged as to require extensive repairs. The Apperson Automobile Co. was forced to suspend operations for a few days when its plant was flooded.

Fort Wayne, Ind., has one automobile factory, that of the Ideal Auto Co. This plant stood for a week under 4 feet of water. During this time about thirty complete machines on the lower floor were submerged. A great many small parts in the stockroom were also damaged as a result of contact with the water. Those parts which were not actually destroyed by the water are covered with a coating of slime which will require considerable labor to remove. The estimated damage to the Ideal plant is about $3,000.

South Bend and Mishawaka, two Indiana towns which are noted as automobile centers, the first as the home of the Studebaker Corp. and the second as the site of the Amplex factory, were fortunate enough to escape damage from the floods. Neither of these concerns expects the damage sustained through the inundated districts to affect its output or sales in any manner worthy of comment.

Influence of Disaster at Detroit

While it is still too early to make any specific statements as to the probable loss which the automobile industry in Detroit will suffer as the result of the floods, it is very evident that the vengeance of the elements on the stricken district will be felt to some extent at least, although the majority of the makers are very sanguine.

The suspension of railroad service south from Toledo offers a serious consideration at present, as it will serve to hold up shipments and in some cases will necessitate storing a large number of machines at the factories until traffic is resumed. In other cases the car lots which were to have been shipped through Toledo are being routed elsewhere.

The Ford company so far has not been crippled to any extent by the disaster, according to F. H. Diehl, purchasing agent. The recent tire workers' strike was taken advantage of for stocking up on pneumatics, the Ford supply of these now being very large, sometimes as many as fifteen to eighteen carloads a day having been shipped in at strike time. As for coal, the company has enough for two months of maximum running, while the supply of steel products, frames and so on is correspondingly large.

The Ford company buys from many divergent sources to protect itself against just such tie-ups as these great floods. However, no word has been received from many of the concerns the company buys from in the stricken territory.

N. A. Hawkins, general sales manager of the Ford company, echoes Mr. Diehl's sanguine views, and says that the sales and shipments of cars are not affected any. Those consignments which were to have gone to Ohio and Indiana have been redirected elsewhere. The contemplated schedule of 1,000 cars a

A portable garage and car in Omaha after the tornado

day will not be curtailed in the least. Of course, those shipments already in the Ohio region are not yet heard from, but the loss is up to the railroads, says Mr. Hawkins. The Ford concern could sell its entire output in the East and West and forget about the rest of the country, according to its sales manager.

C. C. Winningham, sales manager of the Hudson Motor Car Co., states that the Dayton Hudson dealer had about six machines, but no word has been received as to their fate. The Hudson company will probably loose some seventy-five sales of cars as a result of the floods. Two carloads of Hudson cars arrived in Dayton the day previous to the outbreak and no trace of them has yet been obtained.

Lee Counselman, Chalmers company, states that he cannot tell how his company is affected until it gets word through. Several sources of its supply are located at Dayton and many forgings are obtained from Fremont, O. Since no mail or other communication has been received, it is, of course, impossible to say what business was on the way.

D. T. Hastings, general manager of the Hupp Motor Car Co., is not so hopeful. He states that his company will be seriously affected by the floods, not only due to the holding up of supplies, but because outgoing shipments for the Southeast which were to have gone through Toledo are held up. The Hupp company has sent out three men to trace shipments. These men are looking up cars shipped from the factory and supplies in transit.

Kentucky automobile factories are not situated near enough to the banks of the Ohio River to feel the effects of the high water. Louisville is about the most important town located on the Kentucky side of the river and in that city none of the garages or salesrooms were damaged.

Tornado Cost Car Owners $300,000

Coming as a forerunner of the heavy floods, the tornado which swept through Nebraska must be connected with it in the minds of those who stop to consider this chain of disasters. A path was literally torn through the city of Omaha, leaving behind it 114 people dead, 1,169 homes wrecked, 6,000 of the residents homeless, and with a loss of $10,000,000 to homes, merchandise and personal property. It did not take in any of the business section of the city, being almost entirely confined to the residential part and but comparatively small damage was done to the automobile interests. The Electric Garage, local dealer for the Baker electric, R. & L. electric and Flanders electric, and the Orr Sales Co., agent for the Packard, both in the same building at Fortieth and Farnum streets, were the only automobile firms to loose anything by the big storm. It is estimated that with the building and the cars that were in the garage at the time, all of which were completely destroyed, the damage to these two firms will not exceed $150,000. Many private garages and cars were destroyed, but at this time no correct estimate can be made. It is safe, however, to say that, all told, automobile owners will have lost $300,000.

Cars and chassis in the debris of an Omaha garage after the tornado had passed (C. N. E.)

In Omaha an automobile was carried 500 feet away from its garage and deposited in a cellar

Dayton Plants Not Seriously Damaged

DAYTON, O., April 2, *Special Telegram.*—Early reports of the flood declared that the automobile industry in Dayton suffered severely from the inundation but a personal inspection of the plants affected by a representative of THE AUTOMOBILE proves this report to be much exaggerated. The Maxwell suffered the greatest loss in that its three buildings had their lower floors washed out. The two buildings at the Big Four tracks had the offices on the lower floor flooded, together with the finished stock room. There were few cars in the latter room and hence the loss was not very great. The plant on the north side had the lower floor damaged also, but not to an extent great enough to put the plant out of business for more than 2 days. A sign on the Maxwell buildings reads, "Men report to work Monday, March 31.

The plants next hardest hit are those of the Dayton Engineering Laboratories Co. and the Apple Electric Co. The lower floor of both these buildings was flooded almost to the ceiling, but the damage done was more in the nature of damage to the building than to material. In the former plant the Delco starting appliance is manufactured. The lower floor contained the shipping room, offices and part of the assembly department. Few of the big windows were broken and hence little material floated away. The same may be said of the plant of the Apple Electric Co., which is not far from the Delco plant.

Although the flooded area covered most of the city of Dayton, by a strange combination of circumstances the Speedwell Motor Car Co.'s plant was not affected. The water was within two squares of the one-story Speedwell buildings, but did not make its way to the plant. It afforded a place of refuge for hundreds of Daytonians.

The Dayton Mfg. Co., which supplies lamps to a number of makers, suffered little damage. The only definite estimate of damage done was given by A. W. Apple of the Apple Top Co., who gave $2,000 as the extent of the flood's pillage.

Together with manufacturing plants comes the motor car agencies, most of which were situated on Third street, the most affected portion of the city. Here the loss is great for not only were the buildings wiped out, but show cars and stock together with the office records went also.

It is expected that work in the various automobile shops and those connected with the industry will resume operations in a few days. The work of getting the buildings in shape is the least thought of. Work of this sort is going on rapidly. The chief cause for worry lies in the fact that Dayton is without power. However, at the Speedwell plant it is hoped that the gas engines on hand will be able to supply enough power to keep the plant running until the central station is in good shape. The other factories will obtain power from the plant of the National Cash Register Co. and a number of other unaffected shops.

Men are being rushed to Dayton from every part of the United States, so that the work of cleaning up the city will not fall upon the shoulders of those men living in Dayton, who are anxious to get back to work. The only thing that will hamper the industry at Dayton, is the present crippled shipping facilities. At this time the Pennsylvania is the only road operating. All the bridges are down except one concrete affair, so that it remains to be patient until these bridges are reconstructed before any factories supplies may be had or before any shipping can be done.

The Delco plant was in full operation before the flood and the Speedwell and other plants had a great number of orders on hand. Representatives of the factories said that the loss due to non-shipment of cars and parts, would be practically nil.

Much credit, indeed, is due the men in Dayton who are connected with the motor car industry. When the officials of the Speedwell plant heard of the flood they immediately put into service thirty-five finished cars. All that could be gotten from the Stoddard-Dayton plant were sent hurriedly to the stricken people. Even Springfield responded to the call. The work done by the six motor trucks sent by the Kelly-Springfield Company was nothing short of marvelous. These trucks reached Dayton under their own power in time to be of great assistance in carrying people from flooded hospitals to places of safety. Without motor cars the city of Dayton would be practically helpless, for the great majority of the horses were drowned. The 250 cars doing rescue work bore signs reading, "Pass this relief car." As much as 80 miles per day was traversed by each of these cars.

In all, about 200 motor cars were carried away by the flood, the estimated loss to owners being close to a quarter million dollars.

Ohio Loses $1,000,000 in Bridges

COLUMBUS, O., March 31—At the request of James Marker, state highway commissioner, Walter Braun, engineer of Franklin county, has furnished the state a list of bridges lost by the county with an estimate of how much it will take to replace or repair the same. The approximate loss of the county will aggregate $1,000,000 and the legislature expects to pass a law appropriating money for the reconstruction of bridges lost in the flood.

The bridges over the Olentangy destroyed by the flood and the approximate replacement values are: Wilson Bridge, $15,000; Worthington, $30,000; Weisheimer, $20,000; Dodridge, $2,000; Lane avenue, $20,000; King avenue, $20,000; Fifth avenue, $2,000, and waterworks, $5,000.

Those over the Scioto River and their building costs were: Williams, $50,000; Grand View avenue, $25,000; Sandusky street, $15,000; Broad street, $200,000; Mound street, $75,000; Greenlawn avenue, $2,000; Frank road, $30,000; Clickenger road, $30,000, and Shadeville, $15,000.

Those over Alum Creek were: Eberly road, $2,500; Matheny, $2,000; Fark Mills, $5,000; Westerville road, $5,000, and Westerville, $2,000.

Those over Big Darby Creek: Converse, $5,000; High, $3,000; National Road, $12,000; Georgesville, $5,000; Chenoweth Mills, $2,000; McKinley, $3,000, and Harrisburg, $25,000.

Those over Little Walnut: Winchester, $1,800; Burgstresser, $4,000; Harris, $2,000; Seymour, $2,000; Corbett, $4,000 and Hopewell, $10,000.

The total expense of replacing and repairing these bridges aggregate in sum total, $787,500, but with the $50,000 loss to the city through the washing away of the State street bridge and the $150,000 loss through the Town street bridge, this total is increased to $987,500.

Runabout swept 3 miles in current at Dayton, O. (C. A. P. A.)

February Exports Beat 1912 By 68 Cars

WASHINGTON, D. C., April 1—More automobiles were exported from America during February, 1913, than in February, 1912. Last year the number was 2,403, this year it was 2,471, an increase of sixty-eight machines. Last year the 2,403 machines were valued at $2,274,489 and this year the valuation was $2,630,097.

During the 8 months ended February last the number of cars exported was 14,488 valued at $14,852,628, as against 12,347 cars valued at $12,064,383 shipped abroad during the same period of 1912. Exports of parts, not inclinding engines and tires, increased in value from $345,965 in February, 1912, to $444,728 in February last and from $2,426,264 to $2,983,336 during the 8-month period.

Imports of cars decreased in number from seventy-three, valued at $166,048, in February, 1912, to thirty-three, valued at $82,119, in February last and from 717, valued at $1,575,376, to 569, valued at $1,329,345 during the 8-month period.

Exports of automobile engines increased from 954 valued at $113,871, in February, 1912, to 1,428, valued at $243,995, in February last and from 3,484, valued at $417,308, to 6,964, valued at $1,089,907, during the 8-month period.

Finnegan to Continue Thomas Name

BUFFALO, N. Y., April 1—*Special Telegram*—C. A. Finnegan, who recently purchased the entire stock and equipment of the E. R. Thomas Motor Car Co., of this city, has announced his intention of continuing the manufacture and sale of chassis for fire-department vehicles as well as the making of repairs on Thomas cars. This work will be carried on under the name of the E. R. Thomas Motor Car Co. at the plant on Niagara street, in this city. Mr. Finnegan is undecided at the present time as to whether or not he will continue building passenger cars.

50,000,000 Packages in Parcel Post

WASHINGTON, D. C., March 31—Reports submitted to Postmaster General Burleson show that approximately 50,000,000 parcel post packages were handled throughout the postal service during February, which is about 10,000,000 in excess of the number handled during the previous month. These figures are based on the amount of business done at the fifty largest post offices where about one-half of the postal business of the United States is handled. When it is considered that there were 3 more days in January than in February these figures are all the more remarkable. Actual figures for the calendar month, regardless of the number of days, show that the parcel post business at the fifty largest offices increased 25.98 per cent. during February over the previous month.

As in January Chicago exceeds all other cities in the number of parcels handled with a total of 5,167,540, and following in order are New York with 4,102,010; Boston, 1,326,228; Cleveland, 1,226,025; St. Louis, 1,069,305; Philadelphia, 1,046,045; Jersey City, 916,180; Brooklyn, 816,440; Detroit, 766,661, and Cincinnati, 569,285. Cleveland, which ranked sixth in the amount of business done during the month of January, jumps ahead of both St. Louis and Philadelphia in the amount of business done during February, Philadelphia dropping to sixth place. Jersey City, which ranked twelfth in January, is now only about 100,000 behind Philadelphia.

The express companies may protest to the Interstate Commerce Commission on the ground that the parcels post system already threatens decrease in their revenues to the extent of $5,000,000 for the present year. It is said that the operation of the new system has cost these companies 22 to 25 per cent. of their total business in packages during the first 60 days of the year.

Organize to Make Wire Wheels

COLUMBUS, O., March 31—The Frayer-Howard Co., of Columbus, O., has been organized by Lee Frayer, a well-known racing driver of Columbus, and H. S. Howard for the purpose of manufacturing wire wheels for all kinds of automobiles. Several cars in Columbus have been equipped with the wire wheels with good results. The Columbus concern is prepared to equip any car with wire wheels and the plan is to carry a fifth wheel with an inflated tire in order to avoid the delay and trouble in exchanging tires.

The Last of the London Taxicab Strike

After 11 weeks of idleness the London taxicab drivers have resumed work. The proprietors have yielded, and the men are to receive gasoline at the old price of 16 cents per gallon. The offer made by the British Motor Cab Co. to supply the men with gasoline or an equivalent mixture at the rate of 21 cents per gallon, with a guarantee of 23 miles to the gallon was rejected.

FLINT, MICH., April 1—The entire assets of the Randolph Motor Truck Co., Flint, Mich., bankrupt, were sold at auction on March 27 and 28, by order of the United States District Court for the Northern District of Michigan.

There were twelve purchasers in all, the principal buyer being the DeKalb Wagon Co., DeKalb, Ill., which purchased one-half of the assets, including truck parts, complete vehicles and other materials. This principal purchase also included two-thirds of the machinery. E. S. Hunt, manager of the Randolph concern, states that the DeKalb people intend to manufacture motor vehicles of the Randolph type under the trade name New Randolph. All of the DeKalb purchases will be moved to DeKalb, Ill., the present plant at Flint being abandoned, so far as the making of motor vehicles is concerned. The balance of the machinery, shop tools and parts was purchased by supply houses, second-hand dealers and others.

Wrecked fire department trucks, Columbus, O.

Cars in water rushing down Hight street, Hamilton, O. (C. N. E.)

Boston Favors Show

Lease for 1914 Exhibition Signed—Twenty-three Agree To Show—Rubber Strike Off

BOSTON, MASS., March 29—All doubts as to whether or not Boston would have a truck show next year was dispelled today when Manager Chester I. Campbell stated that he had already signed a lease for the building; and furthermore that 23 of the exhibitors this year had put in applications for space already, some of them for a greater area than they occupied this year. At a meeting of the Boston Commercial Vehicle Dealers' Association held yesterday, President J. S. Hathaway stated that plans had been made to open the truck show on Tuesday evening next year and finish it up on Saturday night instead of running it over into a second week with a Sunday intervening, as was done the past two years. It will be possible to open earlier because the owners of Mechanics' Building have arranged to build an additional runway on the rear of the building, that will be of steel and much wider than the present one. The old runway will be retained and the pleasure cars will be rushed out on one while the trucks are being received on the other and in this way an entire day at least will be saved. If it were possible to work on Sunday the show could open Monday night, but the 24 hours of the Sabbath are sacred here.

To get an expression of opinion from some of the big exhibitors the representative of THE AUTOMOBILE visited the spaces on the closing day of the show. He questioned the exhibitors as to whether the show had been successful enough to warrant their taking space next year in view of the fact that Chicago and New York had discarded truck shows. The sentiment in favor of exhibiting again was practically unanimous.

Views of the Boston Dealers

Norman Halliday, manager of the truck department for Alvin T. Fuller, Boston agent of the Packard, said: "We sold several trucks, but more than that, we got in touch with people that will keep our sales department busy for the next 4 months developing the business. From the Packard viewpoint. I consider the show a success."

The White was one of the biggest exhibitors, and J. S. Hathaway, Boston branch manager, said: "It was most successful from our sales standpoint. This was due to the fact that this was a real selling show and we had a variety somewhat larger than some of the other exhibitors. Next season, with the show held within a week, it will be much better. Walter White went back to the factory delighted with the results here."

Frank Crockett, truck manager of the Boston branch of the Locomobile, said: "In view of the fact that this was the first time we presented a complete truck the results were satisfactory. We had people come in and leave their names, requesting information relative to our product, so that we now have more than 60 people to work on. That represents many people whom we would have to search out and locate, and some of them we never would have found, perhaps. We shall exhibit again."

A. P. Underhill, the Knox representative, said: "We had eight men at the show constantly, and at times we had to secure three and four more to answer the inquiries and give the information asked about our line. We secured some sales that we were working on and some that were really new. It was successful for us. Next year we shall be in the show."

J. S. McKinney, of the Peerless truck department, said: "We sold at least one truck every day, and some days more. They were not all sales that resulted from the show alone, but by exhibiting our product we could give purchasers a chance to make comparisons. This resulted favorably for us and we have asked for space next year."

J. W. Maguire, of the Pierce-Arrow, said: "Our worm-gear drive has been in operation long enough to give prospective customers some real statistics, and when they saw what we exhibited and it was of the tonnage capacity wanted we were able to close up some sales. People are not buying big trucks like other things, but comparatively speaking, it was a satisfactory show for us."

George M. Hudson, of the Alco, said: "We sold some trucks, but I believe that if the show were held earlier in the year, say in January, right after the New York show, the results would be better. Perhaps a fall show might be considered a better proposition. However, we are satisfied with the results and shall exhibit next year. The new plan will be a great help."

L. E. Harmon, manager of the Myer Abrams Company, handling the Lauth Juergens line, said: "Our answer is that we have not only asked for space next year, but have requested the two additional spaces beside us to get almost an entire aisle. W. S. Diller, sales manager from the factory, left us last night with contracts carrying deposits for trucks, the deposits alone totaling $10,500. Eight trucks were sold to new people, and four others were practically closed with, all of whom came to us. Other sales were made to people we had worked up previously."

P. S. Altman, of the Kelly-Springfield, was not one of the enthusiasts. He said: "The show had a bad break going into a second week, with Sunday intervening and this lessened the interest. It ties up too many trucks at a time when they might be sold."

E. A. Gilmore, who has the Federal and Standard said: "We found that the show was a success. If some of the others had advertised their product, or used their advertising along concerted lines I think they would have done better. This is no criticism of their efforts. But we found people locating us as a result of knowing that our firm was the same one that handled the Chalmers product. We sold several Federal trucks and a few Standards, the latter being new with us."

C. P. Rockwell, the Rambler branch manager, exhibiting the Jeffrey said: "I was surprised at the attention the Jeffrey attracted. It was inspected by lots of people and it received favorable comment on its construction. We expect to sell a lot of them."

The Mercury from Chicago was so well thought of that agencies were closed up the first day. W. A. Zimmerman from the factory said: "We got in touch with a number of individuals and now we are working on some of the corporations. We can trace a number of our sales this year to the fact that we exhibited a year ago, and so we shall be here again, but with much more room. This was a very successful show."

L. B. Johns, of the G. M. C., was satisfied with the show from his point of view: "Producing both electrics and gasoline vehicles we are in a position to give a purchaser what he wants without having to knock another product, which sometimes happens in the trade. We had no trouble in interesting a number of people."

Fred H. Lucas, of the Pope Hartford, said: "Many people do not realize that within a few miles of Boston there are fifty-four cities and towns with a population running above 10,000 people; that good roads connect all these places; that the per capita wealth is greater in this section than elsewhere, and that ours is a manufacturing community built up by natural water power, so that the factories are not going to move away and leave behind such valuable assets for competitors. So in the life of trade they need trucks and it is up to us dealers to sell them. We have no complaint to make about our success."

These comments tell the story of the future of the truck show in Boston. And being the only one of National importance it will attract more exhibitors undoubtedly.

Rubber Strike Declared Off

AKRON, O., March 30—*Special Telegram*—At a meeting of Industrial Workers of the World leaders here tonight attended by 200, the strike in the rubber factories was declared off. No concessions were gained by the strikers and the I. W. W.

Automobile Securities Quotations

As a consequence of the disaster in Ohio and Indiana, a number of securities declined during the week, so that the general tone of the market was not clear. Conditions in the tire industry are normal, so far as the strike is concerned, but the flood naturally had some influence on this industry, too. Nevertheless, Firestone jumped 20 points, while Goodrich advanced but 1; Goodyear common dropped 25 and Swinehart 5 points. Rubber Goods Mfg. likewise fell 4. and Fisk 5. U. S. Rubber advanced slightly.

retired defeated in every way. All Akron rubber factories are now in full operation. The stories sent out by I. W. W. correspondents that Akron's rubber factories had been wiped out by floods are without foundation. Only one factory suffered any damage by flood, and that was the Goodyear. The loss of this company will be trifling, the only damage done being the flooding of basement and drowning of fires in the engine rooms. The plant is now doing business as usual. No damage to accessory plants, garages, tire plants or salesrooms occurred, although water from the bursting of a dam at a reservoir south of the city swept through the canal leading down through the city.

DETROIT, MICH., April 2—*Special Telegram*—The Kelsey Wheel Co. is now getting its factory in readiness for the production of wire wheels. The actual turning out of these types will not be possible before July 1, however. These wheels will be constructed under the concern's own designs and will be made to use Booth demountable rims exclusively.

Triumvirate to Manage Olds

LANSING, MICH., April 1—A committee of three will in the future direct the affairs of the Olds Motor Works, due to the recent resignation of general manager O. C. Hutchinson. This advisory body will consist of Sales Manager J. V. Hall, Factory Manager E. B. Linden and Comptroller D. F. Edwards. The Olds plant is located in this city and is one of the General Motors group.

Market Changes of the Week

Few changes took place in last week's markets. In the metal market, steel was again the most important change. A rise of $1.18 occurred due to an increase of deliveries. Bessemer and open-hearth steels remained constant at $29.00 a ton. Electrolytic refined copper and Lake were held slightly higher. The market yesterday ruled firm on the basis of $.15 1-4 for electrolytic and $.15 1-4 for Lake, due to an increase of sales, and there is every indication that the consumption for March will be large. This, coupled with the very heavy exports and the better foreign markets, sounds good for continued firmness and perhaps higher prices. Lead remained unchanged at $4.35 per 100 pounds. There was an absence of new developments in the linseed oil situation, so far as the local market was concerned, prices ranging from $.47 to $.48. In the petroleum markets both the oils from the Kansas and Pennsylvania wells remained constant at $.88 and $2.50 respectively. Lard oil rose $.01 on Thursday, closing at $.94.

Goodrich Cuts Prices

Cheap Rubber and Automatic Production Means Are Reasons —Other Companies May Follow

NEW YORK CITY, April 1—More or less consternation was precipitated in tire circles throughout the country when the Goodrich-Diamond organization announced a cut of approximately 5 per cent. on casings and inner tubes for the entire country. This cut to the consumer is best indicated on a 34 by 4-inch Goodrich tire which heretofore has listed to the consumer at $31.80, but under the new list will retail at $29.80.

Already several of the other companies have met this reduction. No official statement has been issued by the United States Tire Co., but several of its metropolitan dealers have been informed that they have met the cut, so that with this company the dealers' list in force until April 1 now becomes the list price to the consumer.

The Goodyear company has announced that it has also revised its prices to meet the new schedule.

No official announcement has been made by the Fisk company further than that a revision of its prices is promised.

No statements have been issued by the Firestone, Michelin, Republic, Ajax, and other concerns, although many of the dealers are of the opinion that practically all of the companies will revise their prices to meet the new schedule set by the Diamond-Goodrich organization. Where cuts have been made they have taken effect April 1.

The Kelly-Springfield Tire Co. will maintain its old price schedule.

The Michelin Tire Co. has not decided as yet what action it will take with respect to the price question, as Mr. Michelin, the head of the firm, is abroad.

The Empire Tire Co. on April 1 made a 5 per cent. reduction in the prices of its standard tubes and its round casings while the Red and Peerless tubes as well as the gray non-skid and red casings remain at their old prices. The Pennsylvania Rubber Co. has so far made no change in price and no definite plans have been formulated.

It is difficult to discover just why this price reduction has occurred. Several reasons are advanced. One is the cheap price of rubber, which is now quoted at 88 cents. Another reason is the more general use of automatic machines for manufacturing tire casings, whereby all of the fabric is laid and stretched by machinery. The Goodrich-Diamond Company has had one complete plant equipped with such machinery in operation for several months. It is stated in tire circles that a reduction in cost of manufacture of approximately 25 cents per casing is obtained by the use of these machines.

The new scale of prices will not affect the tire dealer, who, in many cases will receive standard commissions, which, to the preferred dealer, are 10 per cent. plus 7 1-2 per cent. with an additional 5 per cent. for cash. The regular dealer will continue to receive his 10 per cent. with an additional 5 per cent. for cash.

Maxwell Sells Factories Not To Be Operated

Five Plants Being Disposed of—Ford Enjoins International League—Argyll Wins From Knight

DETROIT, MICH., April 1—Walter E. Flanders, president and general manager of the Maxwell Motor Co., has made it definitely known to the trade that the Maxwell company does not intend to operate all of the eleven plants which were acquired by the purchase of the United States Motor Co.'s assets. The factories total 2,684,648 square feet of floor space and consist of the following: Flanders Motor Co., Brush Runabout Co., Alden-Sampson Co., Briscoe Mfg. Co., all of Detroit; the Providence Engineering Works, Providence, R. I.; the Maxwell-Briscoe Co., at Tarrytown, N. Y., and at Auburn, R. I.; the Briscoe Mfg. Co., Newark, N. J.; the two Stoddard-Dayton Co. factories at Dayton, O.; the Courier Motor Co., also at Dayton, O.; and the Columbia Motor Co., Hartford, Conn.

The Providence plant has been sold, while the original Maxwell plants at Tarrytown, N. Y., and Auburn, R. I., the Newark Briscoe factory and the Courier are also to be disposed of, according to the present plan. These are in high-priced land districts and this would make too high the purchases of land required for necessary factory extensions. Further, they are deemed too far from headquarters, and workmen's accommodations are inadequate.

One model only will be made in each of the plants which will be retained. In the former Flanders factory, the six-cylinder Maxwell model will be constructed exclusively, under the designation 50-6. The plants at Dayton will be devoted to the making of the larger four-cylinder type, model 35. Reorganization was progressing rapidly at these Dayton plants when the flood disasters swooped down upon the city, and they will of course be handicapped for the present. It is next to impossible to get any definite word yet as to how they fared. At the Brush and Sampson establishments the new four-cylinder low-priced model 25 will be made.

Statement on Flanders Mfg. Co.

DETROIT, MICH., April 1—The Detroit Trust Co., receiver for the Flanders Mfg. Co., Pontiac and Chelsea, has issued a statement showing the progress made to date in winding up the affairs of the concern. The statement says that it is practically impossible to estimate at this time the amount which may be realized for creditors and stockholders, although so far $246,700 has been liberated.

Appraisal of the properties at Pontiac and Chelsea shows that the assets at Pontiac amount to $[illegible] and Chelsea, $586,182. Preferred creditors received $[illegible] so far, leaving $230,000, which will be paid this month to creditors whose claims have been allowed. The period fixed by the court for filing sworn statements of claims terminated March 20, and on that date such claims aggregated $1,[illegible].265.58. This total was made up by the claims of [illegible] creditors and there are 257 more whose charges amounted to about $15,000 and who filed no proof of what was due them. The liabilities on March 20 amounted to $936,708.17.

For some time after the court appointed a receiver several parts of the two plants were continued in operation, but this activity has stopped. The Flanders Mfg. Co. has no connection with the Flanders Motor Car Co., recently absorbed by the Maxwell Motor Co., Inc.

Ford Enjoins International League

BUFFALO, N. Y., March 31—In United States District Court last week Judge Hazel issued a preliminary injunction restraining the International Automobile League of Buffalo from advertising or offering for sale automobiles made by the Ford Motor Co., of Detroit, Mich. In the original bill of complaint filed from the Detroit manufacturers it was alleged that the International Automobile League had offered and advertised Ford cars at less than the prices charged by the factory for those cars. Losses estimated at $100,000 are alleged to have been sustained by the plaintiff motor car makers The Detroit company claims the local concern sought members at $10 a head claiming to be able to secure Ford cars at a discount. Other defendants in the action are John H. Tranter, Alfred C. Bidwell, William Preiss and John C. Hurley, all of Buffalo.

KINGSTON, N. Y., March 31—A. B. Cordner has been elected president of the Vaughan Motor Car Co., which has been organized to continue in this city the manufacture of the automobile designed by Guy Vaughan. F. E. Moskovics is vice-president and general manager; E. S. Partridge, vice-president and sales manager, and H. W. Johns, secretary and treasurer. The Vaughan car is to be a moderate-priced six-cylinder when it reappears on the market.

Evans Company to Build Trucks

PITTSBURGH, PA., March 31—The Evans Motor Car Co. took out its charter yesterday with a capital stock of $50,000. The incorporators are Everett Philpot, George Anthony, C. C. Woodcock, Howell Brandon, R. H. Evans and A. P. Foster. Mr. Evans stated that $40,000 of the amount had already been subscribed. The company expects to increase the capital stock to $200,000, according to Mr. Evans. The stock will not be offered to the public for sale.

Rochester-Mais Co. to Build Trucks

ROCHESTER, IND., March 31—A company to be known as the Rochester-Mais Commercial Car Co. has been organized for the purpose of building 1,500 and 2,500-pound trucks in this city and plans are being made for a factory building. The directors of the company are: A. C. Davisson, J. M. Ott, R. P. True, Earl Miller and J. M. Mais. All cars built will be of the internal-gear type. The cars will be designed by John A. Mais, who is a younger brother of A. F. Mais, formerly of the Mais Motor Truck Co. and now with the Studebaker Corp.

Argyll Wins Non-Poppet Suit

LONDON, ENG., March 24—The decision in the Knight-Argyll case, in which the American inventor, Charles Y. Knight, sued the Scotch concern for infringement of engine patents, has been handed down and is against Knight & Kilbourne. The case will be carried up to the House of Lords, where the Americans anticipate a more favorable decision, inasmuch as in similar cases in other countries they have been successful in the higher courts.

A. A. A. Adopts Blue Books as Official

NEW YORK CITY, April 1—Arrangements were completed today whereby the American Automobile Association has entered into an arrangement extending over a period of years with The Automobile Blue Book Publishing Company, whereby the Blue Book Road Guides become the official touring books of the association. Under this arrangement the title of the books will be "The Official Automobile Blue Book."

For 1913 there are six volumes of these official road guides with a possibility of a seventh being brought out later in the season. Volumes 1 and 4 will be on the market in a couple of

A. A. A. To Fight Increase in Registration Fees

weeks, and the remaining volumes 2 weeks later. All of the volumes contain many thousands of miles of new road guide information as compared with the 1912 volumes. In one volume alone over 20,000 miles of additional route information is incorporated.

All of the route information in these volumes is obtained by Blue Book cars which traverse the entire country and obtain first-handed the road information.

S. A. E. and N. A. A. M. on Gasoline

New York City, April 2—After doing some preliminary work in investigating the fuel situation the committee of the National Association of Automobile Manufacturers decided to turn over the technical work to a committee of experts from the Society of Automobile Engineers. The expenses of the investigation are to be covered by the N. A. A. M. and it is to follow along two lines. First, the broad commercial proposition of providing an ample supply of fuel at a fair price and second the technical aspect in getting definite information as to the best methods of handling the fuels now on the market and in the investigation of possible substitutes. The first part of the work will be carried on by the N. A. A. M. division of the committee composed of Al. Reeves, A. L. Pope and R. D. Chapin. The technical work will be done by C. P. Grimes, E. E. Sweet and N. B. Pope. The use of carbureting devices for low grade fuels will probably be made a special study by the technical committee.

New York City, April 2—The hearings of rim makers before the pleasure car wheel division of the standards committee of the Society of Automobile Engineers was continued today under the direction of Chairman Henry Souther, who conducted the first hearing in Cleveland, March 12. This committee is aiming at discovering how far the S. A. E. can go in the matter of standardizing quick detachable rims and also demountable rims for passenger cars.

There was a general feeling at today's hearing that lightness is one of the objects to be aimed at in rim construction to take Q. D. tires, and also where the demountable rim is featured. Practically all present agreed with the chairman in that automobile engineers were today demanding lightening of these parts, and further that the present universal rim to take a straight-side tire is 10 pounds more or less heavier than the clincher type of quick detachable rim. One of the questions discussed was: "Would it be possible to eliminate the straight-side tire, which would, of course, eliminate the necessity for the universal type of quick detachable rim?" This would be a difficult problem, as at present one-half the output of several tire factories consists of this type of tire. It was finally decided to submit the question to the Clincher Automobile Tire Manufacturers' Association, which association is composed of several of the tire makers. This organization will be asked to report at the earliest moment.

The possibilities of reducing weight in Q. D. rims was discussed under the head of using better materials for the locking rings, alloy steels being suggested instead of the present steel.

David Fergusson of the Pierce Company addressed a letter to the committee recommending that some standard for bursting pressure on locking rings be set by the association. He cited figures from tests he had made showing the different pressures at which these locking parts gave way. The rim makers agreed that there was little trouble from this score, and where such occurred it was often due to incorrect fastening or to too great pressure, which could be traced to the more general use of power pumps for tire inflation. No definite action was taken on the question.

The feeling was general among some of the automobile engineers that it would be better not to aim at combining the clincher type of quick detachable with the universal, because of the additional weight it calls for, the suggestion being that quick detachable rings be either of clincher design or a straight-edge type, but not a combination of the two.

Association To Urge Campaign Against Unjust Legislation — Favors Reduction of Fees to Actual Cost

New York City, April 1—The American Automobile Association went on record today as being unalterably opposed to any increase in state registrations of motor cars and that the fees be limited to the actual cost of registration. This action, taken at the regular monthly meeting of the executive board, sounds the campaign cry of the parent association and which will undoubtedly be taken up by the two-score or more state organizations affiliated with it. Today's action took the form of a resolution which will be forwarded to all of the state bodies, and a resolution that has been prompted by the various bills introduced in several States.

The board also accepted the proposals of Minneapolis and St. Paul for this year's national tour, which will be run from the Twin Cities to Glacier Park by a route that the Minnesota motorists are mapping out. A committee of seven was appointed to look into the work with Dr. C. E. Dutton, Minneapolis, chairman, and Asa Paine, of the same city, vice-chairman. The tour will undoubtedly take place in July. Three trophies will be contested for, the new National Trophy to the winning touring car, the Anderson trophy to the winning runabout and the Glidden trophy to the winning team representing a club or other organization.

N. A. A. M. to Fight Truck Measures

New York City, April 2.—The National Association of Automobile Manufacturers held its monthly meeting to-day, at which the executive committee accepted the resignations of its former members, Alfred Reeves and S. D. Waldon and elected J. N. Gunn and Alvin Macaulay in their places. Arthur Benjamin, of the American Locomotive Co., was elected a member in the place of Harry Houpt, whose position as general sales manager of the company he has assumed recently.

The executive board named a committee consisting of R. D. Chapin, W. A. Metzger and S. A. Miles to confer with the officers of the American Automobile Association and of the Pennsylvania Motor Federation with regard to the threatened legislation in Pennsylvania inimical to automobiles.

May 7 was fixed as the date of the next monthly meeting at which the final steps for the practical opening of the Automobile Chamber of Commerce, the recently announced combination of the N. A. A. M. and the Automobile Board of Trade, will be considered.

The members present at the meeting were: W. A. Metzger, J. T. Davis, Jr., Walter White, Charles Clifton, H. H. Joy, Hugh Chalmers, A. L. Pope, L. H. Kettridge, R. D. Chapin, W. C. Leland, G. W. Bennett and J. N. Gunn.

Bill for Motor Vehicle Commission

Albany, N. Y., April 1—Senator Loren H. White, chairman of Senate committee on internal affairs, has introduced a bill in the state legislature authorizing Governor Sulzer to appoint a commission of three members to consult with similar commissions from Maine, Vermont, New Hampshire, Massachusetts. Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware and Maryland with a view to uniform automobile laws defining motor vehicles, the use and speed of automobiles and uniform license and registration fees. The commissioners are to serve without pay, but get an appropriation of $3,000 to pay expenses.

New York City, April 1—The Motor Truck Club, of this city, is taking up with Police Commissioner Rhinelander Waldo the subject of the field of manufacturers' licenses in New York City. The club proposes to have a stop put to this molestation.

Metropolitan S. A. E. Hears Two Papers

Care and Maintenance of Storage Batteries and Light Weight Reciprocating Parts for Motors Furnish Material for Animated Discussion

NEW YORK CITY, March 28.—Two papers were discussed at an interesting session of the Metropolitan section of the Society of Automobile Engineers held here last night. The first was a paper by Charles Countcil Munson, Splitdorf Magneto Co., on Batteries, Their Care and Maintenance. The second paper was by Morris Machol, vice-president Hydraulic Truck Sales Co., on Light Weight Reciprocating Parts for motors dealing chiefly with magnelium, a metal composed of aluminum and magnesium.

Chairman Anglada announced that the foreign engineers are expected to arrive in New York, Monday morning, May 26. They will make their headquarters at the Hotel McAlpin and will be entertained Monday and Tuesday by the Metropolitan Section of the S. A. E. A committee has been appointed as follows: Messrs. Kennedy, Chase, Brown, Dean, Dow, Swetland, Wilson, Pope, Slade, Anglada. They leave at 9:40 Wednesday a. m. by special train for the West. Their itinerary will include Pittsburgh, Indianapolis, Detroit, Cleveland, Buffalo, Hartford, New Haven, etc. It is expected that the Metropolitan S. A. E. members will aid in entertaining them Monday evening, and on Tuesday there will be an automobile tour around the city, to the Long Island Speedway, and to some industrial plants in the city.

Several Battery Men Present

The first paper, while given over in a large degree to an elementary study of the dry and storage battery, was sufficiently advanced and indicative of modern practice to provoke an interesting discussion among the five or six members of competing batteries concerns who were present. Taking up the definition of the electric terms employed in battery practice, the author of the paper passed rapidly on through the construction of the dry battery, outlining the customary method of employing a zinc cup which performs the double rôle of container and negative pole. Lining the zinc cup is a series of blotting paper layers and placed in the center of the zinc cup is an upright carbon forming the positive electrode. The electrolyte consists of manganese dioxide and sal ammoniac. The capacity of each of these dry cells is in the neighborhood of 1.25 volts and 35 amperes.

Turning to the storage battery, Mr. Munson stated that he wished to call attention to the fallacy of employing the hydraulic parallel for storage batteries. He said it is wrong to assume the battery to be equivalent to a tank on an elevation because its action is more in the nature of restorative rather than the refilling action called to mind by comparing it to a tank. The electric current is passed through the battery to restore it to its charged condition and not to fill the battery with that current.

There are two types of storage battery. The alkaline and the acid. The Edison is an example of the alkaline type. The other batteries upon the market are of the acid type. Touching on the early experiments, Mr. Munson briefly stated the experiences of Planté in 1859 and 1860 when he placed two lead plates in a sulphuric acid solution and passed a current through this rude cell by connecting the positive wire to one plate and the negative wire to the other. After numerous discharges a brown coating appeared on the positive plate and a gray coating on the negative, forming the familiar surfaces known to present batteries. Since that time we have considerably shortened the process of securing the brown and gray coatings. The coating in the positive plate is what is commonly known now as red lead and in the negative plate lead oxide.

Passing on through the actual construction work of the battery we come to the question of capacity. The capacity of a battery depends on the character, porosity and distribution of the plates, quality and quantity of the electrolyte and its arrangement governing its diffusion and its rate of discharge.

At the meeting last night the chief interest centered on the storage battery used for lighting and starting purposes. The demand of quick discharge made in the latter class of batteries has presented a problem so new to the battery manufacturer that he has not as yet found the solution of the problem. The rate of discharge depends upon the plate area subjected to the electrolyte. It is evident that in a given cell a greater area will be secured by the use of a large number of thin plates rather than a smaller number of thick plates. This is one of the chief features of the starting battery. As explained by Mr. Munson, a starting battery can be readily used for ignition and lighting purposes where the amperage is small and at the same time stand ready to give the quick discharge necessitated by the cranking motor. On the other hand, an ignition or lighting battery would not be suitable for starting purposes, owing to the fact that insufficient area is presented to the electrolyte to furnish the large quantity of current used by the cranking motor in starting against the compression of the automobile engine.

A representative starting cell has six positive and seven negative plates measuring 3-16 inch through and 5¾ inches in length. The internal resistance of such a cell is about .005 ohm. The electrolyte in the storage battery should be at least .5 inch above the top of the plate. Although .25 inch is sufficient in an ignition battery, it will not suffice for the starting battery.

The care of the battery was dwelt upon at length by Mr. Munson, who suggested that the Society of Automobile Engineers should bring out a data sheet for the care and maintenance of storage batteries. He stated that 90 per cent. of the complaints registered against storage batteries during the past year were due to the fact that the car owner neglected the battery, either through carelessness or ignorance. The following points were particularly emphasized in his instructions on battery care:

Some Points on Battery Care

1.—Vents must be kept free or the cell will explode due to the formation of gases under pressure.

2.—Battery must be cleaned frequently and terminals greased to avoid the composition by contact with acid spray.

3.—Battery should be stored away when not in use after having been put through one of the many processes recommended by battery manufacturers.

4.—Water should be added from time to time and not electrolyte.

Discussion was then called for by Chairman Anglada. Some of the principal points of which are brought out in the following:

MR. SLAWSON—What is the difference in plates for batteries intended for lighting and those for starting?

MR. PRATT—A battery that can be used for starting can be used for lighting and ignition, but it does not work the other way; namely, a battery for ignition or lighting may not be satisfactory for starting. A starting battery calls for a very high discharge rate.

MR. NIGHTINGALE—Regarding thickness of plates, the thick plate is used with the ignition battery because the discharge rate is relatively low, and you can discharge every atom of oxide in the plates. In a starting battery it is directly opposite, and a very thin plate is used which may be called upon to discharge at the rate of 150 amperes 6 volts for 4 or 5 seconds. You consequently need plates that will give a high surface discharge, and there will not be any need of a thick plate, as the inside of such a plate could not be used at this rapid discharge rate.

The effect of sulphation and short-circuiting by placing a pair of pliers across the terminals would be very bad, and an explosion would follow, as the oxygen and hydrogen would be exploded by the spark. Sulphation and plate buckling is a relatively slow process. You can discharge a plate below 1.85 volts, in fact to zero, and do it many times, without serious injury, but the longer you do it the greater the damage.

The battery business is becoming very important; one company has already signed for 100,000 batteries for 1914, another company for 40,000, and others for large numbers. Manufacturers should go into the subject of battery equipment to a greater extent.

Chairman Anglada—What is the life of a battery used in combined lighting, starting and ignition service?

Mr. Pratt—This is entirely up to the user of the car. There is very little trouble if the battery is looked after, but so frequently the owner fails to add distilled water when necessary, and does not read his instruction book. The plates should be well covered with water, some battery makers reqiring .25 inch above the tops, others .5 inch, and some others 1.25 inches. Only pure water should be added. It is generally a mistake to add acid to the battery because there is little danger of it evaporating or losing in volume if the cell is properly made. The matter of batteries is largely a question of practical instruction books to owners. The instructions should be brief and explicit and not long technical explanations. Batteries should be placed in an accessible position, and the instruction book should be carried in a part of the car where it is certain to come before the driver's attention. Poor wiring of many cars is responsible for several battery troubles, and a better system of conduits should be used.

Mr. Smith—The Edison Company has not yet developed a battery intended for starting purposes, but will sooner or later. The company at present has a gasoline car operating with an Edison starting battery and during the last 8 months it has given good service. The Edison lighting battery is guaranteed for 5 years and discharging to zero does not hurt it and overcharging does not damage it. There should be a distinction made in instructions issued for lead and alkaline batteries. What suits one does not suit the other. If the S. A. E. is to take up the question of standardizing certain battery features and promulgating instructions for battery care there should be separate instructions for these types of batteries.

Chairman Anglada—Do battery makers prefer to manufacture batteries for starting, ignition and lighting with 24 or 6-volt discharge rate?

Mr. Pratt—This question should be settled by the car and self-starter makers. The 24-volt battery, with the same kilowatt capacity as the 6-volt battery, will cost more to manufacture. The quest resolves iself into one of dollars and cents. The trend to-day is toward 6-volt systems.

Q. What has the Automobile Club of America done relative to standardizing ignition batteries?

Mr. McMurtry—Nothing definite. One of the worst difficulties with ignition and starting batteries to-day is their inaccessibility and the lack of attention they receive, due, not infrequently, to car makers who fail to impress on the buyer the necessity of giving the battery frequent attention, and also the failure of makers of dynamo charging outfits to impress on buyers the necessity of battery attention. The battery-charging problem is a comprehensive one. Take a passenger car in the summertime traveling practically all day on the highways and with little night travel. There is little drain on the battery for lighting and much time for charging. Contrast this with the same chassis with its limousine body for winter use. Little driving is done during the day, and frequently it stands in front of the theater, hotel or club for 6 or 7 hours in the evening with the lights burning. Because of this wide difference in service dynamos should have different charging rates which could be adjusted to meet these conditions.

Mr. Munson—Much battery trouble has been due to chauffeurs and others using wrong sizes of wire when making repairs in the wiring system.

Mr. Sturgis—We should try and standardize the discharge rate of batteries. How many square inches of battery plate surface are needed to give a current of 1-ampere discharge for 10 hours? This should be standardized. Is it not conceded that 20 to 25 square inches of plate are needed for such a discharge? If so, a plate 4 by 5 inches has a surface area of 40 square inches, and would approximately give such a discharge for 20 hours. I think the most important work the S. A. E. could do would be to adopt a standard discharge rate. Adopt one for lighting batteries which might approximate 10 hours; one for starting batteries which might be 1 hour, and another for ignition batteries.

Mr. Nightingale—One of the most important things that battery makers should look after is the standardizing of battery boxes.

Use of Magnelium for Pistons

After a short recess had been taken, the meeting was called to order for the reading and discussion of the second paper on Light-Weight Reciprocating Parts for Automobile Motors by Mr. Machol. The metal magnelium was recommended by the author of the paper for use in pistons and connecting-rods. A chart made at Cornell University to show the value of magnelium as a bearing metal was shown to indicate that in this respect the requirements of a piston were fully met in a manner which promised superiority to cast iron in this respect. The temperatures at which the coefficients of friction were determined were so low that they did not furnish an indication of what would occur in this direction when the metal was subjected to the high temperatures of combustion.

Mr. Machol dwelt on the high conductivity of the metal as compared to that of cast iron. He mentioned this high conductivity as off-setting the highest specific heat of the metal. The result was that the dome of the piston was cooler than with the cast-iron piston because the heat was rapidly carried away from the dome down to the walls or skirt of the piston.

Owing to the fact that the specific gravity of the metal is one-third of that of cast iron and since the same pattern may be used in the casting work, the weight of the reciprocating parts could be reduced 66 per cent. This gave a higher possible velocity of the motor, since one of the limitations upon speed is the inertia of the reciprocating parts.

Mr. Machol also suggested the use of magnelium for connecting-rod purposes and stated that out of three motors fitted with these, one was unsatisfactory and the other two are giving perfect satisfaction. The section of the connecting-rod is in the form of a Maltese cross and not of the common I-beam type. It was stated that in this light outfit it would be possible to do very well with two big end bearing cap bolts because the strains put upon the car retainers would be so small that there would be no fear of fracture. It was pointed out that while magnelium is stronger than cast iron, its elastic limit is but one-third that of the alloy steel used in the manufacture of connecting-rods.

Discussion on this paper brought out the facts that experiments at the laboratory at the A. C. A. on a two-cycle motor showed that the deflector plate on top of the piston was burned away, owing to the fact that the heat is not carried away by sufficient rapidity. Mr. Machol stated that the concern using this motor had since poured out the deflector plate and fitted it with ribs and was now having entire satisfaction with these pistons. It was a matter of carrying the heat down to the skirt of the piston with sufficient rapidity to keep the deflector plate below the melting temperature of the magnelium.

Fuel Prices Affect Car Market

¶ *From a discussion before the American Society of Mechanical Engineers by William T. Magruder, Professor of Mechanical Engineering at Ohio State University.*

The smaller proportionate number of motor cars used in England as compared with this country is doubtless due to the relative prices of suitable fuel. I was informed that there are 150,000 motor cars in Great Britain for a population of 50,000,000 people, or about three cars per 1,000 of inhabitants. In this country almost 1,000,000 motor cars were registered in 1912, to say nothing of the motorcycles, motor boats and other users of oil-power; or one car for each 100 of the inhabitants of the United States, and that the ratio of cars to people in this country is three and one-third times as large as in Great Britain. If there were the same proportionate number of cars used in Great Britain and on the Continent, for which I have no accurate figures, as in America, the price of fuel in Europe would be still greater than it is. But to this large number of motor-car engines must be added more than 1,000,000 gasoline engines used for farm work and in motor boats in this country. Taking the average horsepower of the motor cars to be 25 and of the motor boats and farm engines to be 10, 35,000,000 horsepower of gasoline engines are immediately available for the practical generation of power in this country. Suppose they used as a minimum at rated load .75 pound or 1 pint of gasoline per horsepower per hour for 1 hour of use they would generate 35,000,000 horsepower and require 4,500,000 gallons of gasoline at an estimated cost of $700,000. The total annual supply of American gasoline is estimated to be 1,500,000,000 gallons, and that would last only 333 hours. If every gasoline engine were run at its rated load each day, the annual distillation of gasoline in this country would be sufficient to permit them to be operated for only 1 hour per day, or 333 hours per year. In other words, our present annual output of gasoline is sufficient to operate continually at their rated load only 5 per cent. of the gasoline engines now sold and in operation.

It is probable that some other fuel than gasoline must come into use for oil engines and that this fuel will be kerosene. When the vast amount of kerosene that is now on the market is realized, 3,000,000,000 gallons being distilled annually, it seems certain that kerosene oil will come into very great and general use in the next few years as a fuel for motors.

Non-Poppet Motors Influence Poppet Types

Poppet valve designers seek silence and positive action of newer type

Part I

By E. P. Batzell

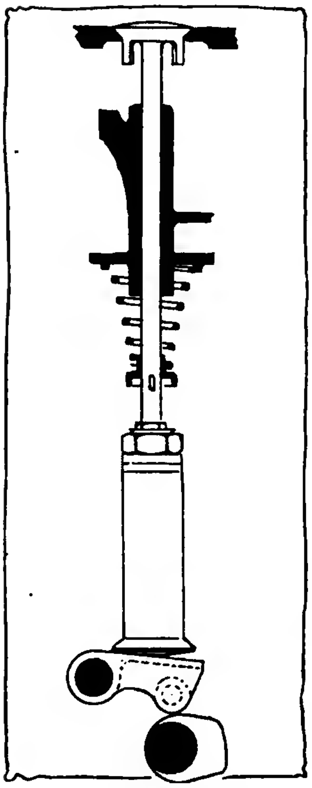

Fig. 1—Novel design of Adler valve

THE advent of the non-poppet valve motor could not fail to be of some influence on the development of poppet-valve type. It is perfectly natural that the older type should make visible efforts to restrain the success of its competitor by following it in some of the approved features. These imitations and improvements are absolutely essential for the purpose of attracting the attention of the public and its goodwill. Otherwise even the mere attraction of a novelty is apt to direct a big majority of the buying public towards the non-poppet valve motors in all those classes of cars, where there is sharp competition between the two types. On the other hand, improvements in poppet valves, in the details where they are surpassed by the non-poppet type, will appeal to those who prefer a better motor of the old type to a new one which may eventually lead the field, but the supremacy of which is not quite decided as yet.

The present situation develops into a more or less sharp contest for supremacy between the two motor types, which though of recent origin already has been of great benefit to the buying public, inasmuch as to it are offered all the competitive improvements brought out on either side.

The advantages over poppet valves generally attributed to the non-poppet valve motors at the time of their appearance are: silence of the valve mechanism; positive character of valve operation, resulting in better motor performance at high speed.

Certain groups of non-poppet valve motors have also demonstrated the following specific advantages over the average poppet-valve motor.

Practically complete absence of wear in those valve parts on which is based the permanent tight closing of the cylinders. Therefore less care is required to avoid leaks in the latter, the leaks being forthcoming only independent from the valve mechanism.

Neat, clean construction of the exterior making a motor of attractive appearance, catching to the public eye.

Big power development per cylinder volume, the power rising steadily up to very high motor speed.

Great endurance, equivalent to absence of trouble, and efficiency.

Simplicity of construction as seen in the limited number of parts in the valve mechanism, etc.

Against this the poppet-valve motor can show only advantages the very existence of which is more or less doubtful. These are: cheaper manufacture, less weight and the fact that the older valve is more universally known and understood, thus facilitating repair and service work.

At present considerable attention is being concentrated on the making of a silent poppet-valve mechanism. The investigation of improvements developed for this purpose is best carried out point by point in respect to the different sources of noise.

These sources of noise are to be found in the valve striking its seat; the valve tappet striking the valve stem or the lifting cam after having left it for some reason or other; worn tappet guides; noisy camshaft driving gears, etc.

The non-poppet valve motors, of course, also require some driving means, such as gears and the like, which too are apt to become noisy in time. But there is considerable difference in the action of the valve mechanism of the two types, the gear being a special source of noise in the poppet-valve motor.

The drive of non-poppet valves is often uninterrupted and uniform, or in those cases when it is of intermittent character the change of the driving speed and direction occurs gradually without causing perceptible jerks and shocks in the whole mechanism, including the gears themselves. On the other hand, at each revolution the motion of the cam in lifting a poppet valve passes through a point when the reactive action of the valve spring tends to drive this cam ahead of its regular motion. Thus the camshaft gear receives an impulse from the valve spring for an instant making it the driving member of the gear train. Depending on the spring effort, the mass of the camshaft and gears, the duration of the period occurring when the drive is reversed, which in its turn depends on the speed of the motor and the number and spacing of cams, it is possible to meet that condition when the forward motion of the camshaft gear is sufficient to take up the backlash between its teeth and those of the actual driving member. This will bring into a more or less abrupt contact the respective tooth sides which are opposite to the working ones. The subsequent effort upon the camshaft to lift the next following valve will again turn the camshaft gear into the driven one.

Prevention of Gear Noise

Such a fast alteration of efforts upon the gears and of their contact surfaces will result in a very pronounced gear chatter unless the clearance between the gear teeth is made and remains very small. *This particular kind of gear noise is entirely foreign to non-poppet valve mechanisms. Moreover, the explained reason of this noise also prevents the possibility of an entirely silent camshaft drive, even with spiral or herringbone teeth, inasmuch as these are not free from backlash.*

After the appearance of the non-poppet valve motor with its more or less silent valve drive, increased efforts have been applied to eliminate the above gear noise in the poppet-valve motors, using various methods.

In one of these an attempt is made to decrease the swinging motion of the camshaft and its gear by increasing their mass and also by offsetting the valve tappet from the camshaft center line towards the oncoming cam. The camshaft gears were provided with lead fillers for the purpose of increasing their mass and also to dampen their ringing sound. The idea of another very interesting construction used on some foreign cars is illustrated in Fig. 1. Here the camshaft gear is made in two parts, one of which is mounted solidly upon the camshaft and actually serves for driving it. The other part is also provided with teeth of the same diameter and pitch as the first one, but it is centered free upon the camshaft and also meshes with the driving gear. Springs are mounted inside of these two gear parts which tend to separate them from each other in the direction of their rotation. By this means continuous contact is maintained between the active tooth surfaces of the driving gear and the one fastened to the camshaft. At the same time the free side of the driving gear teeth are also kept in contact with the free gear part by the spring action, thus eliminating completely any possibility of backlash, except by compressing the gear springs. It is not necessary to have the latter of great strength to make them resist properly the driving action of the valve spring. This construction has given satisfactory results in practice, although it adds some complication to the valve-driving mechanism.

The use of silent chains for camshaft drives has been advanced by the non-poppet valve motor, and a number of poppet-valve motors are also built that way now. This drive method is still gaining popularity, although it is not free from disadvantages. It is not even perfect in the matter of silence, which is the chief reason attributed to its displacing the camshaft gears, but the nature of the chain noise is entirely different from that of the gears. *The silent chain has a tendency to vibrate, especially when the center distance between the chain pulleys is great and the motor runs at high speed. The stretching of the chain increasing its slack acts the same way. This chain vibration causes a very disagreeable rumble, as against the ringing noise of gears.*

Vibration in Chain Drive

The rotation of the poppet-valve camshaft, which is not perfectly even, as formerly explained, can have bad results upon the chain drive, particularly when the vibrations of the camshaft are synchronized with those of the chain. At those moments the chain noise is much increased, and, besides, there is danger of the chain breaking. The proof that the chain noise is chiefly a matter of synchronized vibrations can be readily seen in the fact that it is present only at certain motor speeds, regardless of the vehicle being in motion or standing still. And it is also generally possible to reduce the running noise after it has become quite loud by speeding the motor up beyond the range of resonance or by slowing it down. By further increase of the motor speed one strikes another range of synchronized vibrations, indicated by the reappearance of the rumble, whereas in the intermediate zones the motor runs comparatively quiet. It should be anticipated that further practical evolution of the chain drive will be marked by the introduction of some damper construction which would eliminate the possibility of synchronized vibrations there.

Passing on to the quieting of the poppet valve proper and its lifting mechanism, it must be admitted that very little advancement has been made in forcing the valve head to come to its seat in a silent manner. The writer is familiar only with the Adler valve construction, Fig. 2, which could lay claims to have accomplished this very desirable feature. It will be noticed in the illustration that the valve head below the common conical seat surface is provided with a cylindrical part which fits more or less tightly into the opening of the valve port machined in the motor cylinder casting. The valve itself is in continuous motion during most of the time, its conical face resting on the seat in the cylinder casting only for a short period at the time of the explosion.

For a large part of the compression and explosion strokes when the conical part of the valve head is not seated in the cylinder, the fit of the circular valve head extension into the valve port opening is solely relied upon to keep the cylinder tight. This it is claimed to accomplish satisfactorily. The actual valve opening begins when the circular head is lifted above the edge of its port, at which moment this head still remains guided in the latter by some projected portions of it. The shapes of contact surfaces between the cam, the rocker arm and the valve tappet can be made very favorable for a good character of valve opening. The valve closes the cylinder when the edge of the cylindrical portion meets the walls of the inclosing port opening, and there remains comparatively long compression period during which the conical portion of the valve head is brought down upon the seat. The length of this available period enables the valve parts to be shaped so that the lowering of the valve is carried out in a very gradual manner, leaving no audible sound of the contact between the valve and the seat.

Silence by Valve Setting

The gradual prolonged valve lifting and setting is feasible also with the ordinary poppet valves when roller or roller-shaped valve tappets are used. But this period of gradual lifting and setting has a limit and can only be prolonged in the poppet-valve motor at a sacrifice of the valve opening efficiency.

Silent valve setting becomes imperative when the motor is desired to run quietly at all speeds.

At low motor speed the average rate of valve closing velocity is slow enough not to cause noise.

At a certain higher motor speed the force of the valve return spring begins to be inadequate to preserve the valve and its tappet in continuous contact with the lifting cam, the latter speeding away from the return motion of the valve and tappet.

This leaves the valve free to strike its seat with full force of its spring and of its own inertia in addition. The extent of the sound thus created cannot be limited by the inclosing cylinder walls and water-jacket. It is plainly heard outside. Such noise is best realized by comparing it to the single sound of a stuck valve when released.

Strong valve springs and light valve parts help to reduce, at a high motor speed, the extent of the noise at the valve seat, and, by the way, that also between the cam and tappet. On the other hand, any arising cause which restricts the free return motion of the valve parts is apt to make conditions worse in respect to this noise.

These are practically the only points considered by the majority of motor manufacturers with the object of eliminating valve seat noise, the Adler construction being an exception. The steps taken prove to be far from giving complete satisfaction, and there is no doubt that the non-poppet valve motor can be an easy victor in this particular respect should there be made no further improvement in the poppet valves.

(To be continued.)

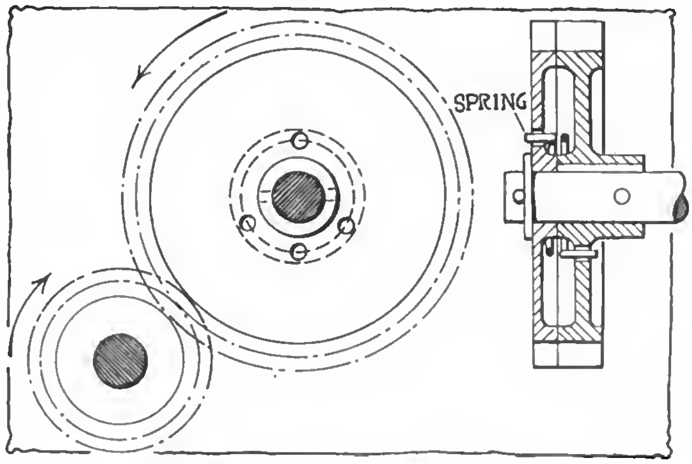

Fig. 2—Camshaft gear in two spring separated parts for silent action

Banking a Hairpin Turn on Road Race Circuit for Spectacular Speed, Either With or Without Saving of Tire Strains—Devices Looking to the Avoidance of Special Motor-Starter Equipment—Balkan Trade News—Impervious Cloths Coming

BANKED Turn for French Road Race—Emulating the American practice of adding to the spectacular interest of a long-distance road race by banking sharp turns, so as to enable drivers to take them without slowing up, the sport committee of the Automobile Club of France has decided to have one such banked turn for the *Grand Prix* race to be run over the Picardie circuit on July 12. The banked stretch will be constructed at Longueau, so as to connect the Noyon and the Montdidier roads which here fork into one another and which form portions of the circuit. The radius of the turn will be made 50 meters. No other details seem to have been definitely decided, but the calculation of a suitable construction has been entrusted to the laboratory engineer of the club, and the latter has made known how he will figure the angle of the bank so as to make the turn safe at any speed which may be considered the maximum allowable. From his example, as given below, it may perhaps be inferred that 60 kilometers per hour is considered a sufficiently high speed at a hairpin turn for engaging the interest of spectators.

On this occasion it is brought to the public's attention by another French engineer and publicist that the nature of a race, in conjunction with the science involved in the proposition, calls for something more than the mere determination of one angle for the bank, as the slope should probably not be rectilinear but either hollow or convex. On bicycle and motorcycle tracks it is convex, as in Fig. 1, while on the Brooklands track it is hollow, as in Fig. 2. In one case the angle decreases from the foot of the bank toward its top, and, as the transition from the larger to the smaller angle is gradual, the slope becomes curved. In the other case the angle increases, and a car driven near the outer edge of the curve is enabled to speed up more, without upsetting or skewing, than one driven along the infield line.

The track is made convex for the cycles because the radius of turns is short while the track is broad. This makes a large difference of radius for the outside and the inside of the curve and, as the centrifugal force which causes skewing and upsetting is in inverse proportion to the length of the radius, for a given speed, it is necessary to bank the sharper inside curve more steeply than the outside one in order to give all the cycles an equal chance for speed.

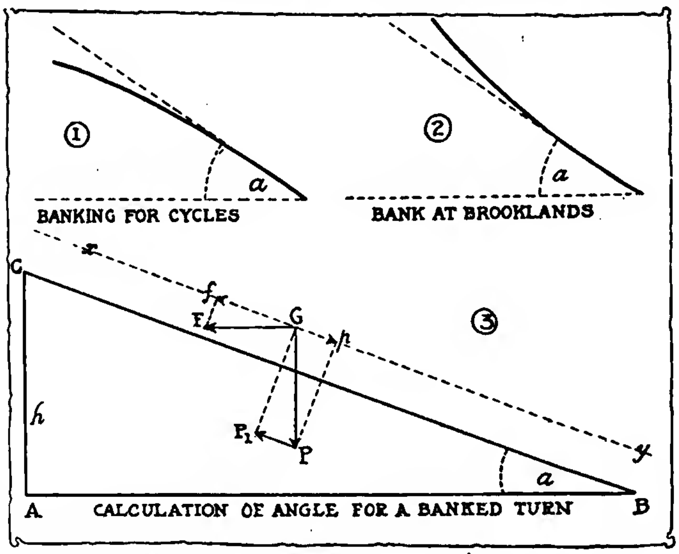
Other considerations prevail for automobiles. They are always raced "with the clock" (so far as the circuit as a whole is concerned, though not at every individual turn) and are usually started at intervals. Unlike the cycles, they are vehicles which are in stable equilibrium, and it is one of the merits required in their design and construction that they shall be able to hold the road at high speed, even on an unbanked road. The assistance given them by banking the road is not vital; in fact, if overdone, it detracts from the technical interest in the results. But it is essential to the racing interest that one vehicle is not prevented from passing another at a sharp turn by developing higher speed at such a juncture. Also, according to the rules of road and race alike, the speedier vehicle must pass to the left of the slower one. To enable it to do so, on a turn to the right—which is the kind largely in the majority when a closed circuit is followed "with the clock"—the outside of the road, where the faster vehicle must pass, if at all, must be banked high enough to allow the superior spurt. This consideration overbalances that due to the width of the road and makes a slightly hollow banking the preferred construction. And this shape of the roadbed has another effect, according to the authority quoted. It causes a vehicle to turn sidewise on the road immediately, if it throws a tire at the turn.

[Similar reasoning would speak for a convex banking at left turns, and as the whole matter of banking for a road race is a compromise, the mathematical accuracy of which becomes nullified through conflict of the things which the racing men must consider—such as that of selecting tires suitable for the average road surfacing of the circuit as well as for that of the banked turn or turns—a plain rectilinear banking should scarcely be unacceptable for a speedway.—ED.]

The club's engineer finds the angle of the bank in the following manner:

He assumes that the object is to connect the two roads by a banked curve following the arc of a circle whose radius is 50 meters; that the width of the road is 8 meters; that the weight of the vehicles is uniformly 1500 kilograms, everything up [though this item is immaterial in his calculation], and that the center of gravity is at a uniform height in these vehicles.

Fig. 3 shows the elements entering in the calculation, the line AB representing the width l of the normal horizontal road, CB the slope of the bank, a its angle of inclination to the horizontal and h the height to which the road is raised at the exterior edge of the turn. G is the center of gravity of the vehicle. The avowed object is to enable a vehicle to pass around this curved road at a certain high speed without having the centrifugal



Figs. 1, 2 and 3—Practice and theory of banked road turns force, acting at G, capable of displacing G along the line *yx* which is drawn parallel with the banked road surface through G. The only element resisting this displacement is the friction acting against lateral displacement at the ground contacts of the four wheels; the co-efficient of this friction is denoted f. It is known in practice to vary from 0.1 to 0.6 according to the tires and the road surface, and a middle value of 0.2 is assumed for it on the supposition that the banked surface is concreted and provided with rills.

The forces acting at G are P, the weight of the vehicle, and F, the centrifugal force, and F can be expressed, according to a recognized formula as equal to $\frac{PV^2}{gR}$, or mass multiplied by the square of the speed, divided by the radius of the curve (g being the divisor 31—our 32.16—by which mass is determined from P).

To find how these forces, acting at a right angle to one another can act upon G in the line *yx*, which is the line in which movement can take place, they are projected upon this line. The projection of P (represented in the line GP) is p, which equals: P sin. a, as appears from Fig. 3. Similarly F has a projection f on *yx* equalling F cos. a. These two forces are opposed and the force F_1 which causes skewing is therefore f minus p.

$$F_1 = f - p = \frac{PV^2 \cos. a}{gR} - P \sin. a.$$

The skewing will not take place so long as F_1 is smaller than F_2, the latter being the amount of lateral friction resulting from that portion P_1 of the weight P which may be considered as pressing vertically upon the banked surface.

The expression for F_2 is, as appears from Fig. 3: $F_2 = fP_1 = fP \cos. a$.

The condition for the stability of G under the forces which work upon it laterally is that F_1 is smaller than F_2, or, in the equivalent terms for these values:

$$\frac{PV^2 \cos. a}{gR} - P \sin. a < f P \cos. a.$$

To simplify, divide on both sides by cos. a:

$$\frac{PV^2}{gR} - P\text{tg.}\, a < fP.$$

Eliminating the common factor P, there is obtained a value for tg. a:

$$\text{tg.}\, a = \frac{V^2}{gR} - f,$$

which is the smallest value tg. a can have, since with this value F_1 and F_2 are equal.

The height h of the embankment is l tg.a, and the smallest value for this height is thus:

$$h = l\, \text{tg.} a = \frac{lV^2}{gR} - lf.$$

[In this demonstration it does not seem entirely obvious why the numerical value of f, being graphically, as in Fig. 3, the projection upon *yx* of the centrifugal force acting horizontally upon the center of gravity G, may be taken as an equivalent of the coefficient of friction. The contention seems to be that f has precisely this value because the force it represents is that portion of the centrifugal force which would have to be resisted through the lateral road friction, if p did not intervene, acting in the opposite direction, and because it holds a fixed relation to the weight of the vehicle, being derived from the centrifugal force which in turn is derived from the vehicle weight. Readers with mathematical energy to spare for this problem might perhaps throw more light upon this element in the calculation.—ED.]

By applying the assumed numerical values for l, V and R to the formula for h and taking 0.2 as an acceptable value for f, as above referred to, one gets:

$$h = \left(\frac{8}{9.81} \times \frac{16.5^2}{50}\right) - (8 \times 0.2) = 2.84 \text{ meters},$$

in which 16.5 stands for the speed in meters per second corresponding approximately to 60 kilometers per hour.

If the banking were to be made so high as to provide safety without reliance upon the lateral friction of the tires with the ground, f should be taken as O, and by inserting this value in the preceding formula, it is found that the height of the bank in that case should be 4.44 meters, or more than one-half of the width of the road.

When banking of this kind is contemplated—and it has the advantage that the throwing of tires at the turn is made less likely to occur—and the calculation is made for a certain width of the road and a certain maximum speed, so that l and V become constants, the formula for h can be simplified to:

$h = \frac{K}{R}$, in which K is the constant $\frac{lV^2}{g}$, figured out in advance.

It is clear that the banking should begin where the curve joins the flat and straight road, and theoretically it should begin abruptly, since the radius passes abruptly from infinite to R. The width of the road permits, however, a gradual transition from a straight course to a turn of the prescribed radius, and the height of the bank may, in accordance with this fact, be decreased gradually from h to O from the point where the turn begins—and from where it ends—for some distance upon the straight road. [To give all vehicles which might be disputing each other the turn an equal chance to continue at maximum speed without departing from their relative places in the width of the road, the turn should thus really be laid out as a hyperbola or as a circular turn connected to the stretches by hyperbolic approaches, the latter banked down to the vanishing point. —ED.]—From *L'Auto*, March 5.

—

RATIONAL Compression Relief—With the usual compression relief cock the inconvenience is experienced that a considerable portion of the force developed by an explosion—in cranking for a start—is wasted, and as the explosions caused by cranking with the compression cock open are naturally weak anyway, the start is not effected until after a number of turns; namely, as soon as finally the hard labor put into the work and the succession of weak explosions have produced a sufficiently favorable condition for accomplishing the send-off.

An improvement in this respect has been devised by Mr. Galaine of France, previously known as the inventor of a muffler which adds to the power of a motor instead of diminishing it. His compression relief cock is shown in Fig. 4, giving first a general view of the little device and in the subjoined figures the positions of its piston valve C during (1) the suction stroke, (2) the compression stroke and (3) the explosion stroke. The valve D, whose upper and lower faces E and F are ground to a plane valve-fit prevents admixture of outside air with the charge drawn from the carbureter. Compression raises this disk until the lateral port of the bore H in the lower valve stem G is uncovered, affording the desired relief. An explosion, on the other hand, with its greater speed and force, drives the valve disk D up against the roof of the piston chamber, thereby obviating any notable loss of power in the driving of the motor pistons. The

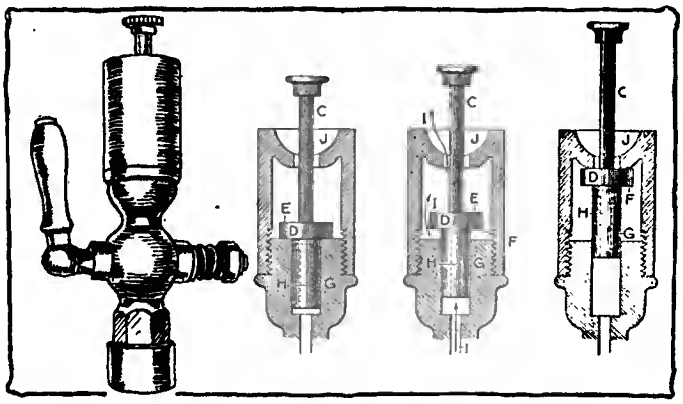


Fig. 4—Improved compression relief device to ease motor-starting

cup J admits of squirting a little gasoline into the combustion chamber before cranking.

The practice of facilitating cranking by opening the compression cock has not been very generally followed, just because what was gained in the reduction of the physical effort was lost in the resulting uncertainty of the start [and because it is inconvenient with 4-cylinder motors]. The Galaine device, by remedying this condition, is intended to make special motor-starting devices of a more complicated nature more or less superfluous. It is especially adapted for sleeve-valve motors, says the reporter, because no decompression can be effected in these by adjustment of the camshaft.—From *Omnia*, March 15.

—

THE Malivert Injector—This device is in the same class as the compression relief device mentioned in another paragraph, in so far as it is intended to make more elaborate motor-starters unnecessary. It has the advantage of being applied as an auxiliary to the carbureter, so that only one device is needed for a four-cylinder motor. Its purpose is to make sure of a rich mixture with the feeble suction produced by cranking of a motor. The tube A, Fig. 5, is connected to the drain of the carbureter under the nozzle, and a hole is made in the induction manifold for the connection with tube H which ends in a needle valve acting as a vaporizer of the fuel discharged through it. The whole apparatus is secured to the float chamber by means of a strap-clasp or similar means. A spring holds the piston of the device down to the bottom of the cylinder unless it is pulled up by means of the cable running over a pulley to the driver. Slightly below the bottom of the piston in its highest position an opening in the cylinder wall connects by channel D with the tube A and thereby with the nozzle of the carbureter, and this has the effect that, when the piston is allowed to descend, the first action is that the nozzle is made to overflow, as if the carbureter were primed. Screw E and nut F regulate this action. As the piston descends further, the gasoline mixture which has been drawn into the cylinder of the device by the raising of its piston is pushed out through valve G and tube H into the induction manifold and is sucked from there into the cylinders in addition to the charge drawn from the carbureter in the normal manner. It is stated that the use of the device makes it a certainty that a cold motor will be started at least at the fifth turn of the crank, and the priming of the carbureter, as done by the device, makes it sure that rich mixtures will be continued long enough to warm the motor, so that it will continue to run with the normal fuel feed from the carbureter. The operation involves thus only one pull upon the cable.—From *La Vie Automobile*, March 15.

MATERIALS for Carriage Upholstery.—A number of developments have taken place in the manufacture of textiles from artificial thread which may prove of interest to the motor car builder. A process by which jute is turned into artificial silk is at present under examination in the German patent office. By means of form of yeast and the addition of glycerine, on which the yeast spores feed, the fiber of the jute is freed from all resinous substance and is rendered extraordinarily fine, smooth and flexible, and the price of the fabric woven from this material can be made very low as compared with silk. It is not stated positively that the principal fault of ordinary jute, which is that of becoming brittle under the influence of air, light and moisture, has been removed, but the material may at all events be available for drapings and upholstery of close vehicles.

A wider utility for automobile purposes is foreshadowed in a recent patented British invention, according to which a silk-like material is made from threads of spun glass, each of which threads is only one-thirtieth as thick as an ordinary human hair and scarcely visible to the naked eye. By the action of chemicals, this thread is made firmer and stronger than any other artificial silk, and the cost of producing material woven from it is said to be only about 30 to 35 cents per kilogram, as compared with $1.50 to $1.75 for the artificial silks made from cellulose. The most promising quality of the new material is however that it is incombustible and very resistant to moisture, acids, alcohol and oils as well as easily cleaned.—From *Kunststoffe*, March 1.

—

TRADE with the Balkan States—According to a recently published report, Germany sold in 1911 to the Balkan states about twice as many motor vehicles as in 1910. The sales were distributed as follows: To Roumania, 647 passenger cars, to Servia, 79, to Bulgaria, 34, to Greece, 10, to Turkey, 82 passenger cars and 260 motor trucks. [Some discrepancies between the scheduled figures and those mentioned in the text of the report casts a doubt over the accuracy of both, however.]

In Turkey, the bulk of the trade is in the hands of England; Austria following and then Germany. America gained a foothold just before the war broke out, and a lively competition with "cheap American cars" is anticipated when, after the war is over, the expected modernization of the Balkans sets in. Americans have fortified their commercial position greatly by shrewd preparatory moves. Thus the founding of the Robert College at Rumeli-Hissar, an "excellently conducted commercial school," is benefiting them greatly; also the organization of the Ottoman-American Development Co. and of the American Chamber of Commerce at Constantinople, which was founded in March, 1911, and already counts 450 members located in all of the more important Turkish cities.

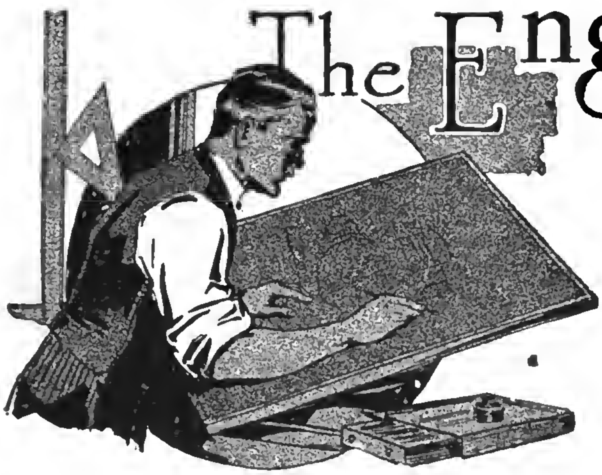
France leads in exports to Roumania, sharply followed by Italy, the sales running mostly to cheap and light cars. Lately the Americans are also invading this market. England supports her trade here by the establishment of repair shops.

Bulgaria has practically no roads, and automobiles are scarcely used for pleasure purposes at all. Just before the beginning of the war, however, American manufacturers sold a number of small cars for stage lines connecting the interior with the seaports of Varna, Baltschik and Kavarna, and these became very popular. When it was decided to enlarge this traffic the demand turned to larger cars, and the orders for these were placed in Germany.—From *Allgemeine Automobil-Zeitung*, February 28.

—

Storage Batteries to Oust Magnetos—It is prophesied by the owner-editor of *La Pratique Automobile* (Feb. 25), that the magneto, which chased the small storage battery from the ignition equipment of automobiles, will disappear from the market in a few years, and that the storage battery will be reinstated as a spark-producer. The prediction is of course based upon the great popularity of electric lighting for cars, which in turn was the result of the perfecting of the tungsten incandescent filament. The need of a generator to supply the electric light current, of a battery for equalizing it and the opportunity for employing the same force for the starting of the motor are considered an irresistible combination compelling the use of the same equipment to furnish the ignition current, and consequently making the magneto superfluous. That the generator can keep the battery constantly charged, while formerly no such facility was at hand (in France), is considered as affording a further guarantee that the change will come about as predicted.

The Engineers' Forum



Horsepower As Basis For Tax Discussed

Relation Between S. A. E. Rating and Legitimate Speed Is Considered by Leading Automobile Engineers

Fault Is Said To Be With Lawmakers, Not with the Horsepower Formula

Vincent Considers Tax on Power Unfair
Not in Accord with Laws, Porter Claims
Education of Legislators Needed—St. John
S. A. E. Formula Very Fair, Says Bohn

WITH reference to the article "Cars Taxed on Unused Horsepower," printed in THE AUTOMOBILE of March 27, a number of leading automobile engineers have communicated with this office and have expressed their opinions which bring out many new details and in a general way agree with the argument of the above-mentioned article. The trouble, it seems to be admitted generally, lies with the law rather than with the formula. The communications follow:

DETROIT, MICH.—Editor THE AUTOMOBILE:—Taking the horsepower of a motor as a basis for taxation is a rather unfair proposition to the owner paying the taxes, unless the taxes are low per horsepower. The power of a gasoline motor increases as the speed increases, up to certain limits. These limits, however, are reached at speeds ranging from 1,600 to 2,000 revolutions per minute. A motor which pulls 67.5 horsepower at 1,600 revolutions per minute will not pull more than approximately 39 horsepower at 750 revolutions per minute.

The A. L. A. M. horsepower rating is based on a piston speed of 1,000 feet per minute, with the bore of the cylinder taken as one of the factors. Considering the stroke of the motors in use to be approximately 5.5 inches, it is necessary to attain 1,200 revolutions per minute to reach 1,000 feet of piston speed per minute. With the standard gear ratio of 3.5 to 1 in the rear axle, a car would attain a speed of 37.5 miles per hour when the motor had reached a speed of 1,200 revolutions per minute. As this speed would be largely in excess of the law controlling speed limits, it hardly seems fair to base taxation on this speed.

Assuming that the law will allow an operator to drive 20 miles per hour in districts in which he is paying motor taxes, the speed of his motor will be but 640 revolutions per minute, or, approximately 35 per cent. of the speed at which it probably pulls its maximum power, and also a speed of but 53 per cent. of that required to reach the A. L. A. M. rating.

Of course, the average automobile will never average 20 miles per hour through districts where motor taxation is in vogue, or, in other words, in cities. I doubt if the average of a motor car in Chicago or New York would be in excess of 8 to 12 miles per hour, or an average motor speed of but 320 revolutions per minute. This would be less than 27 per cent. of that required to reach the A. L. A. M. rating. So that a 40-horsepower motor based on A. L. A. M. rating would not average over 11 horsepower in city use and could not reach 40 horsepower without attaining a speed of 37.5 miles per hour. There are conditions, however, in which the motor, in service in the city, will show considerably more power than this average of 11. These conditions arise when accelerating and using the gears of the transmission, for instance, in first and second speed. It is safe to assume that the car will never travel faster than 15 miles per hour in second speed, which, with an average gear ratio in the rear axle of 3.5 and an average of 6.3 as a total for second speed ratio, would give a motor speed of but 835 revolutions per minute. With these conditions and with a stroke of 5.5 inches, we have less than 70 per cent. of the A. L. A. M. rating, and must also consider that acceleration in second speed is very brief and not of frequent occurrence.

Allowing the Government to assume an average of 20 miles per hour instead of an average of 10, for the use of the car on the city streets, we still only have 53 per cent. of the speed required to reach the A. L. A. M. rating. I would, therefore, be of the opinion that if the motorist concedes twice the average speed at which he is really using the car for a basis of taxation, it certainly should be fair to the Government and this would make a basis of approximately 50 per cent. of the A. L. A. M. rating for horsepower.

The formula for calculating A. L. A. M. horsepower is as follows: The square of the cylinder diameter multiplied by the number of cylinders divided by 2.5.

The advent of the six-cylinder motor has certainly relieved some of the wear and tear on the city streets, owing to the smoothness with which it turns the wheels. An uneven effort to turn the rear wheels without doubt causes more slippage and hence more destruction to the street than does an effort of continued smoothness. There is little doubt but that a six-cylinder motor is easier on tires than a four-cylinder, and, if it is easier on tires, it must be easier on the pavement. The production of six-cylinders in proportion to four-cylinders is largely on the increase, and any taxes for repair of streets should be on the decline rather than on the increase.—J. G. VINCENT, Packard Motor Car Co.

Automobile Taxes High Enough

TRENTON, N. J.—Editor THE AUTOMOBILE:—To my mind the horsepower proposition is very clear, and an explanation pertaining to the difference between the actual power developed on brake test, and the power developed on the road is easily given. The rating so far as the secretaries of state go is plenty high enough.

I mean by this that the speed laws of the different states holding a car to the maximum of 25 to 30 miles an hour and less in cities and towns, necessarily keeps down the revolutions per minute of a motor to such an extent that the development of more horsepower than the rating, or even as much as the rating, is impossible. The fact that the published power curves and statements of the different manufacturers show an exact power development, should not and cannot in any way affect the action of the secretaries of state unless they permit by law speed that would permit this power to be developed.

I believe that if this matter was put in the proper light that a reduction of the horsepower rating is absolutely in order instead of an increase.

It seems to me that it could be conclusively proven that a speed limit of 30 or 40 miles per hour would not permit the development of anything like the S. A. E. rating of the different motors for the simple reason that it does not take that amount of power to propel any vehicle I know of at that rate of speed.

If an increase in the rating is proposed, it seems to me that the question above will have to be answered for the simple reason that a raise in the horsepower rating would practically mean permission to the licensed one to operate a motor developing the power specified in his license, since the license has to do only with the use of the road and does not in any way imply or demand any superior knowledge necessary for the operation of motors of different sizes.

It would, of course, be possible to raise the percentage of taxation per horsepower, but I believe the raise in horsepower rating would not be in accord with the laws as enacted and enforced.—Fenley R. Porter, Mercer Automobile Co.

Richmond, Ind.—Editor The Automobile:—The question of horsepower as applied generally to various types of power-producing appliances is, in the writer's judgment, one sadly in need of revision. The term horsepower doubtless originated far back in the early days of steam engine development and was used for the purpose of designating some idea of the energy capable of being delivered by a mechanical device, as compared with the energy which could be delivered by the well-known draft horse. Unfortunately the comparison is sadly misleading, as every engineer knows that an automobile engine rated at 40 or 50 horsepower does not in any sense represent the power equal to that delivered by so many draft horse. This is the unfortunate feature concerning the point touched upon in your communication.

If our state secretaries and lawmakers in general could be educated along this line and brought to a full realization of the real meaning of the term horsepower, much would be accomplished in a preliminary way to offset the tendency of such officials to raise the rating. In short, the old, time-honored method of power rating is and always has been inadequate, unsatisfactory and misleading and the writer would suggest the use of the word unit, one unit to equal some number of foot-pounds.

The writer's experience with long-stroke motors has proven conclusively that the power of the motor does not increase in proportion to the added length of stroke, and this point should be made clear to our state secretaries, who are doubtless of the opinion that it does and that the addition to the stroke was made wholly for this one purpose.—C. R. St. John, M. E., Westcott Motor Car Co.

Maximum Power Output No Basis

Detroit, Mich.—Editor The Automobile:—Referring to the S. A. E. horsepower rating, wish to say that in my opinion a change in the S. A. E. formula or a new formula is quite necessary. It is true that the S. A. E. rating is very conservative, especially for dynamometer work. However, as the results obtained from an explosive motor in a chassis are quite different from those obtained from a block test, due to the atmospheric conditions and other conditions beyond the control of the operator, it is quite reasonable to assume that the horsepower delivered by the average motor in actual use, and at various speeds, is a close approximation to the S. A. E. rating. If we were to assume that every driver of an automobile were an expert in the handling of explosive motors, the average condition would be radically different. In my opinion it would be rather unfair to base taxation upon maximum results which are possible under certain conditions.

It is quite true that nearly every motor and automobile manufacturer already has, or is planning to adopt what is known as the "long-stroke" motor. Some of these manufacturers have in the past produced motors having a bore in excess of the stroke, from which excellent results were obtained so far as actual performance and power delivered were concerned, and it is true that such motors can be commercially built weighing less per horsepower than a great many of the later so-called "long-stroke" motors.

I really believe it will be a mistake to alter the S. A. E. formula, as in my opinion it is very fair. It is quite common practice, when conducting block tests, to indicate in the report of such tests the horsepower of the motor according to the S. A. E. formula; also to indicate the horsepower nominally delivered on the block, which in nearly every case is in excess of the S. A. E. rating, but, as before stated, the power delivered by the motor in actual service in all probability very seldom exceeds to any great extent the S. A. E. rating.—G. G. Bohn, Hudson Motor Car Co.

Necessity of Rich Fuel Mixtures

Branford, Conn.—Editor The Automobile:—In reading the discussions of the subject of carburetion which have recently appeared in your columns, one is forcibly impressed by the divergence of the views therein expressed.

Coupled with the statement that a rich mixture is necessary for a quick get-away, we are told that this means a waste of fuel. from unconsumed gases, at ordinary road speeds.

Excessive air at high speeds is said to give cylinder pressures endangering present construction, in the face of repeated statements that maximum power is secured from a mixture containing less than the theoretical amount of air necessary for perfect combustion.

Carbonic oxide, CO, in the exhaust is shown to demonstrate a definite heat loss and yet the antagonists of exhaust gas analysis quote erratic results and even enviable mileage with large percentages of CO present.

Chemists demonstrate that 14.94 pounds of air are necessary for the perfect combustion of 1 pound of gasoline vapor, but the consensus of opinion leans toward an excess of fuel for maximum power.

The intake manifold is cited as a necessary evil, while, on the other hand, glass construction has shown that vaporization is completed only in the manifold.

The plea is made for some method of filling the vacuum behind the pistons, in other words, increasing the volumetric efficiency on open throttle, while in the same discussion the statement is made that the velocity in the intake manifold "is from 300 to 400 feet per second," equivalent, in itself, to a direct loss of volumetric efficiency of from 5 to 9 per cent.

Finally, the most sweeping disagreement is reached in the statement that "the American public will not accept a carbureter that gives a uniform mixture under all conditions, but demands a quick get-away, economical running and a powerful mixture at maximum speed." This assertion closely follows a statement in the same discussion that "The rate of flame propagation in a gaseous mixture, other things being equal, is near its maximum at a 12 to 1 ratio. The rate decreases with departure from this value in either direction."

How can these statements by the same author be reconciled? Maximum rate of flame propagation means maximum pressure. Maximum pressure means maximum power output. Why then should the mixture entering the cylinders of an automobile engine be subjected to change? Not for speed, certainly, for the ideal mixture is the quickest burning. Not for power, for it gives the maximum explosion pressure. Not for starting, for it is the most easily inflammable.

The operator of a stationary gas engine, using, let us say, city gas, does not change the setting of his gas valves except to meet variations in the composition of the gas itself, or to compensate for barometric changes. Why should any greater variation of charge be necessary in the automobile engine?

Consideration of this question, in all its varied aspects, involves prolonged discussion, but it is possible that one phase of the subject has been underestimated which, when carefully considered, will help to reconcile many, in fact, most, of the conflicting arguments.

The process of carburetion consists of two equally important factors:

First: Quantitative mixture of liquid fuel and air.

Second: *Complete* vaporization of the liquid and *complete* absorption of the vapor by the air.

Claims for the first of these primary functions are better substantiated in the advertisements than on the road, but rarely does one note even recognition of the second, but none the less important function. Occasionally, to be sure, one hears the claim for "dry gas," but this feature has been largely obscured by the numerous attempts to perfect the chemical composition of the mixture under varying conditions.

As a result a large portion of the charge from the average carbureter consists of gasoline spray, or mist, carried in suspension in rapidly-moving air columns. Under these conditions necessary physical contact of the oxygen with the fuel molecules is impossible, so that the fuel is but partially consumed, resulting in large percentages of CO in the exhaust and, very probably, in utterly untouched fuel when the exhaust valve opens.

Consider, too, how much greater is the density of the *liquid* gasoline than that of its *vapor*, and, remembering that some portion of the fuel from the average carbureter reaches the cylinder in a liquid state, even if minutely subdivided, it is readily seen why a greater proportion of fuel than is theoretically necessary has come to be considered the most effective.

This feature of carburetion is perhaps best illustrated in starting a cold engine. Let us assume that the carbureter is delivering a mixture of, say, one part of gasoline to fourteen parts of air (by weight). When the engine is cranked, owing to the low temperatures present, only a small portion of the fuel atomized becomes a gas. The remainder is speedily released from mechanical suspension in the relatively slow-moving air column, and is promptly deposited on all interior surfaces, so that the gaseous mixture reaching the cylinders is far too lean to be inflammable. Increasing the amount of gasoline by priming increases the total amount of fuel *gas* present in the charge by an amount dependent largely upon whether the priming charge be atomized or not, or whether it be volatilized by the heat of compression from the act of cranking. In any event it is solely the *gaseous* charge within the combustion chamber of a cold engine, that produces the first explosion.

More Gaseous Mixture in Cylinder

The necessity, as explained above, for a temporary excess of fuel does not disapprove the efficacy of a definite mixture, but does emphasize the importance of complete vaporization.

The range of mixture quantity required by the average automobile engine, taking into account the relative volumetric efficiencies at low and high speeds, is usually not less than from one to twenty. That is, the velocity of the mixture in the intake manifold is twenty times as great at maximum speed, with throttle wide, as it is at idling speed, with throttle closed. How can it be expected that one-twentieth the maximum velocity will carry in suspension the same weight of atomized fuel? This alone, although it is by no means the only factor, explains why it is that excess air is demanded at high speeds. The greater attrition of the rapidly moving air, passing surfaces wetted with unvaporized fuel, assists in vaporization, so that the *real gas content* of the mixture within the cylinder is, at least temporarily, greater than before and demands the additional supply of air which it requires.

Non-homogeneity of the mixture has been called upon to explain various erratic results, both in exhaust gas analysis and in actual engine performance. How can a mixture of atomized liquid particles, depending for their suspension upon widely varying velocities of the medium in which they are suspended, form a homogeneous mixture with a gas? On the other hand, what greater homogeneity can be secured from the diffusion of two gases and what more feasible method of promoting diffusion obtains than in the tortuous pasage from the carbureter to the combustion chamber?

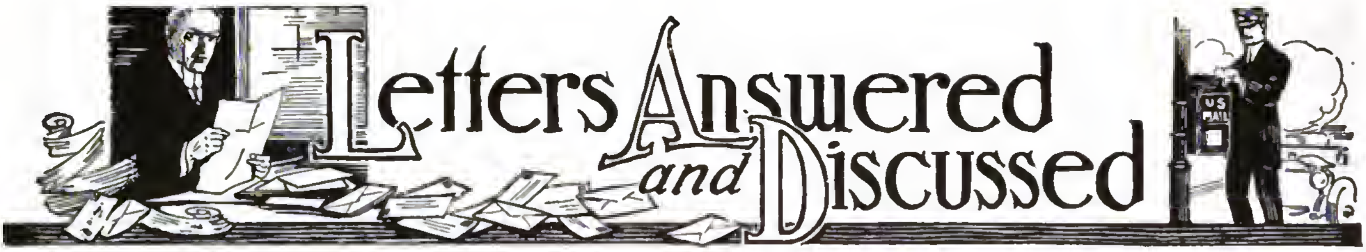
It is beside my present purpose to amplify the many and complex details of the foregoing suggestions, or to propose at this time means for their ultimate accomplishment, but, instead, to reconcile, if possible, on some common grounds, the conflicting opinions of the trained observers as expressed in your columns. Without some such common grounds little progress may be expected in the advancement of carburetion toward the dignity of a science. Enough good work has been done to indicate efficient design, but to accomplish this no aspect of the subject must be neglected.—Arthur B. Browne, Consulting Engineer.

Measurements No Problem—Duryea

Saginaw, Mich.—Editor The Automobile:—The inch system was in use in most parts of the world before the metric was foisted upon us and most mechanics can measure by either system without particular difficulty. A man having a metric micrometer can give the metric measurements of a piece made in inches just as perfectly as he could if it was made to metric size, and the maker of that part, although using inch measurements regularly, can fill the order just as exactly by the use of a metric micrometer. The present arrangement, therefore, presents no serious difficulty. We have tire makers who are supplying tires in metric sizes as well as in inch sizes, and the thing to be desired is not a common method of measurement, but the use of common sizes. It would be just as disadvantageous to a Brazilian to get a vehicle having an odd-size tire measured metrically as to get the same odd-size tire measured in inches; but it does make a big difference to the maker if he must for some fool reason, probably a legal one, change his machinery and his standards to meet the imaginary advantage. If you aim at the end you claim then it seems to me you will get this by standards of sizes rather than standards of measuring means.

The Crane Co., of Chicago, has been advocating metric measurements for modern pipe sizes. This would leave all tools, fittings, etc., just the same as they are at present, but their sizes would be expressed in a mouthful of metric mush instead of in our short, handy, simple English. I can see no gain in such a proposed change.

I have tried to look at this matter from the standpoint of practicability. I carry a tape line having metric marks on one side and inch marks on the other, and I find it much more convenient to use the large inches instead of the small centimeters and to use divisions into halves, quarters and eighths instead of into halves and tenths. I think that others find the same, and that in no place has the metric system driven out the inch measurements, except where the law enforced the change, and that the change there was a disadvantage rather than an advantage. It is easy to theorize on these matters, but theories cost money, and what we want is practical results. Our American makers had much better spend the money they would spend in making such a change in advertising in foreign countries where they can create a market for their goods whether made in inches or meters, and in their foreign catalogues published in foreign languages they can not only give inch measurements, which being stated in Arabic numerals are easy to read, but they can give equivalent metric measurements which will fully remove the objection you mention.—Charles E. Duryea.—Duryea Motor Co.



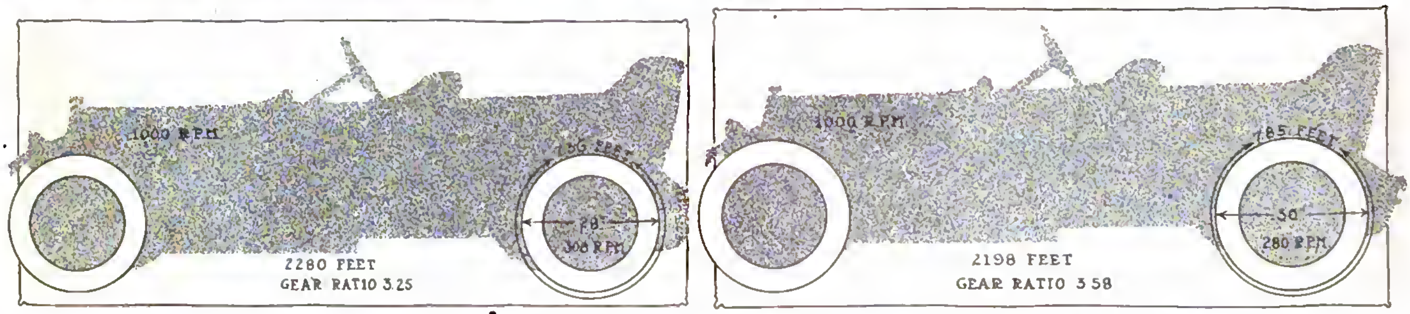


Fig. 1—Comparison of two cars, showing what each would do with the same motor running at the same speed but through a different gear ratio and through different size tires. At the end of 1,000 motor revolutions one car will have traveled 2,280 feet, while the other will have gone 2,198

Two-In-One Brake Pedal Suggested—How Show Spaces Are Chosen—Oversize Tires Discussed—Effect of Gear Ratio on Pulling Power—Different Size Tires on Rear Wheels—Thermo-Syphon Circulation—Tire Pressure

Suggests Divided Brake Pedal

EDITOR THE AUTOMOBILE:—In the March 13 issue, in a reply to R. R. Saulpaugh's differential query, you state, "In turning a corner more power is exerted for the outside rear wheel." It seems to me, that this would bear a discussion. Suppose we had a car of 60-inch tread making a right angle turn of a radius of 25 feet, the inner wheel would travel a distance of 39.2 feet, the outer wheel 43.1, 3.9 feet farther, roughly speaking 10 per cent. farther. Now if we had a pair of balances with 10 pounds in each pan and the scales were lifted by the central support, both weights would sum up evenly but now if we wanted 1 pan to lift .1 faster than the other, we would have to shift the central support toward the slower moving pan, or else add weight to it. The added weight would vary according to the weights in the pan, and the speed at which they were lifted. If we had a turning power of 100 pounds on the differential 50 pounds would be distributed to each rear wheel by the compensating wheels of the differentials, the speed turning a corner varies .1 the leverage, or 10 pounds, 5 pounds added to the inner rear wheel, make 55 and 5 taken from the outer reduces it to 45 pounds, or in other words (the front wheels being at an angle to the line of the rear wheel, the force of the inner rear wheel is delivered crosswise of the front wheels) there is 10 pounds of the engine force being exerted to make the front wheels skid, causing an increased wear of tires. Now if we had a divided brake pedal so that a small side shift of the foot would brake either rear wheel as desired, a braking strain of 10 pounds on the inner wheel would prevent the inner wheel from pushing this much force against the ground and the car would go around on an even keel, or a slight increase of brakes would make a slight drag on the inner wheel and assist in pulling the front end around. This would be a great advantage on a car but I suppose the makers will not add it until users get wise to it and demand it. It would be a great thing on a bad road where one rear wheel slips into a mud hole and spins around; slightly braking it, would give the other wheel a chance to pull out. A racing car so equipped could turn a corner with higher speed and greater safety making a great gain in time.

Brandenville, Pa. JOS. MUNDEN

Lots Drawn for Show Spaces

Editor THE AUTOMOBILE:—What plan is followed in allotting space to different car manufacturers at the New York and Chicago shows? It seems there would be much rivalry for the choice of positions.

Oakland, Ia. F. W. P.

—Show spaces are allotted by a double system of drawing which cannot help but be fair. The manufacturers are first classified according to output. They are divided into definite classes in this manner and then the buildings in which the show is to be held are divided so that the most prominent floors are given to the first class, the next prominent to the second class, etc. These floors are divided into spaces. If there are 100 in the first class, 100 numbers are put in one hat and 100 names put in another hat. Simultaneously a number and a name are drawn from these two hats by different people and this determines the order of choice. For instance if the name Packard were drawn from the hat at the same time as the number 6, Packard would have sixth choice. In this way each of the members of each class secure their spaces

Merits of Oversize Tires

Editor THE AUTOMOBILE:—I have a 1911 Cadillac equipped with 34-4 tires. Oversize tires have been recommended. Would you advise using them, as my car is rather heavy I read something once about oversize tires giving some trouble as the item inferred that they were more difficult to fit. Is this so; what is the reason for it? I have heard that an oversize tire would not keep its seat. but that it tends to creep.

If a 34-4 tire costs $40 and an oversize $52, it seems to me that one-quarter extra mileage would be required out of the higher-priced shoe to give equal returns on the investment. This would mean about 3,750 miles on an oversize against a straight 3,000 on a 34-4. Is the larger shoe likely to run that much longer without showing any more wear than the smaller shoe? If the increased cost of the inner tube is considered it seems to me that an oversize would have to make 4,000 miles to give equal service. I should welcome a discussion on this matter, as I had about made up my mind to change to larger shoes. Yet I want to look before I leap.

New York City. J. D. Martin.

—Experts of the tire world have unqualifiedly recommended the oversize tire for cars which seem to be too heavy and which cause a too rapid deterioration of the shoe. On the face of it, this appears to be true, but there is another side to the question. A close examination of the shoe should be made to determine whether it is wearing out through cutting or through the actual wearing away of the surface of the tread. In and around New York City where the automobilist not infrequently encounters glass-strewn streets, which occur so unexpectedly that he is compelled to run over a large section of fractured milk bottle or other glass, nails, tacks, etc., it will be found that the majority of tires wear not through the grinding off of the surface, but through large cuts which cannot be repaired or numerous small cuts which allow moisture to penetrate and rot the fabric or sand to distort the casing and to rip the tread from the body of the tire.

In New England, on the other hand, where the tourist finds that most of the running is confined to country roads of the dirt variety, the chances are much more in favor of the tire having worn in the regular manner; that is, by the wearing off of the tread.

Now it is a certainty that a large tire will cut just as quickly and will deteriorate just as rapidly as will one of the small size. Therefore if your tires are discarded on account of cuts it would not seem to be economical to use the larger shoe.

Assuming that your tire wears from the surface, the oversize tire will be more economical. In the first place, blowouts will be cut down 100 per cent., hence inner tubes will last longer. In the second place, what applies to a beam in a building also applies to a tire. If a beam be used which will just support a given weight, that beam will have to be renewed many times sooner than would be a beam which had a margin of safety of exceptional amount. Or, again, consider the parallel with an engine bearing: a bearing which is of just sufficient size to carry the load put upon it by the crankshaft safely will have to be renewed three times as compared to a bearing which has a factor of safety of 60 or 70 per cent. The load at which a tire is capable increases rapidly with the diameter of the tire, hence you are giving yourself an enormous factor of safety by using the oversized tire.

The entire situation may be summed up by stating that if your tires are actually wearing out and not being cut to pieces you will find it more economical to use the oversize.

Pulling Power Through Gear Ratio

Editor The Automobile:—Will you kindly advise me which car has the greater pulling qualities, one with a gear ratio of 3.25 to 1 with 28-inch wheels or one with gear ratio of 3.58 to 1 with 30-inch wheels.

Calcite, Col. C. P. Hinds.

—Your question may be best answered by a study of the accompanying diagram, Fig. 2. Assume that the motor develops a given horsepower of 1000 revolutions per minute. Taking the first case which you mention, that in which the gear ratio is 3.25:1 and the wheels 28 inches in diameter, it will be noted that at this engine speed the rear wheel is revolving at the rate of 308 complete revolutions per minute. A wheel whose diameter is 28 inches covers 7.36 inches, neglecting slip, in one revolution. In 308 revolutions it will have gone 2,280 feet.

Bearing the above figures in mind, consider the second instance with the same motor developing the same power at 1,000 revolutions per minute with the gear ratio of 3.58:1 and the rear wheel turning at the rate of 280 revolutions per minute, the distance traversed by the rear wheel would be 2,198 feet. The circumference of the 30-inch wheel measures 7.85 feet.

It is evident that the car first mentioned would be traveling faster for any given motor speed, but the second car, being geared lower, would be able to take a correspondingly steeper hill without a change of gear. For each revolution of the motor the car first considered would travel 2.28 feet against the 2.20 feet of the second car. Or it would gain .08 feet per motor revolution. Assuming the first car to be traveling 30 miles an hour, the second car would be traveling 32.4 miles an hour. In this same ratio as the speeds the amount of resistance will be found to vary inversely. If a stretch of sand interposed just sufficient resistance to cause the first car to change gears, the second car would be able to pass through it with an 8 per cent. margin of strength.

Automobile Companies Maintain Schools

Editor The Automobile:—What automobile companies have schools of instruction such as that of the Cadillac company and how is admission to such schools secured?

Six Mile Run, Pa. Oscar Davis.

—The Cadillac company maintains a school which is unique in that it trains engineers to be employed by the Cadillac concern and pays them a nominal wage during this time. The requirements for entrance are merely upon recommendation of some recognized authority. The payment at the school is just sufficient to maintain the living expenses of the students while there. Other large concerns, as Pierce, Packard, etc., have schools of instruction in driving for the owners of the cars. Packard maintains a school for its own employees. A local agent or branch manager can recommend a man for the school with the understanding that he shall be trained in the manufacture of the automobile and also secure a training in the selling end of the business.

Different Tires on Rear Wheels

Editor The Automobile:—Is it possible in case of an emergency to run with a 36-inch tire on one of the rear wheels and a 37-inch tire on the other? Would the differential overcome this difference of tire size? Do you think the difference would be noticed by anyone riding in the car? I have been told that this would be hard on the motor and rest of car. Is this true?

La Crosse, Wis. A. Werner.

—It is very possible in case of emergency to run with a 37-inch tire on one wheel and a 36-inch tire on the other. What would happen is set forth diagrammatically in Fig. 2. While one wheel is making 1.07 revolutions the other would be revolving 1.05 times. The amount of power absorbed by each wheel would be directly proportional to the effort it was exerting in driving the car. This effort is proportional to two things, first, the work carried by the wheel, and, second, the peripheral speed of the wheel. The weight carried by each of the wheels would be so nearly the same that for all practical purposes we may consider it equal. It is evident that in proceeding a distance of 9.69 feet while carrying a weight W against a coefficient of tractive effort T, 9.69 WT foot-pounds of work will have been accomplished. During this time the other wheel will have 9.42 WT' foot-pounds of work. Assuming the factors T and T' to be equal it is evident that the work done by each wheel will be

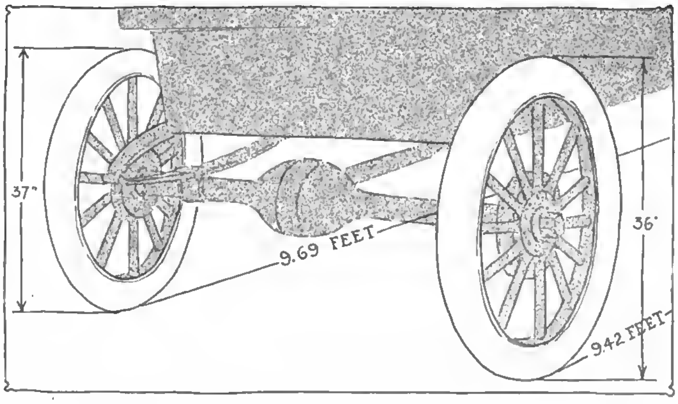

Fig. 2—Diagram showing the travel per revolution and the effect on the car of different size tires on the rear wheels

exactly proportional to the factors 9.69 and 9.42. The action of the differential in allowing one wheel to turn more rapidly than the other would not harm it or the car in any way as that is the exact purpose for which the differential is intended, namely, to permit different peripheral speed for each of the rear wheels. The only detrimental feature that you would have to work against would be the unsymmetrical appearance of the car and the fact that one tire, the smaller, would probably wear much more rapidly than the other.

Circulating System on Overland

Editor THE AUTOMOBILE:—Should the water in an Overland 21 fail to circulate under all conditions, say, 10 degrees above zero or colder, if not frozen up? At the service stations they say this will happen if the lower half of the radiator is not covered to protect the motor without its being frozen or clogged otherwise.

Lorain, O. J. A. K.

—The water is circulated in an Overland car by the thermo-syphon process. The water in the jackets surrounding the cylinders becomes heated by the temperature of combustion and in the same manner as the water in a pot tends to circulate, the warmer water has a tendency to rise. If you will observe the action of the water placed on the stove, you will note that as soon as the temperature rises there is a tendency for the water at the bottom of the pot to rise to the top being displaced by the cooler water above. It is the same in the thermo-syphon system of cooling. The water-jackets, manifolds and radiator are filled with water. When the temperature of the water in the jackets rises sufficiently for it to become much lighter than the water above it in the outlet manifold it tends to rise to this manifold and to be displaced by the water which enters from the intake manifold. A natural current is thus set up which becomes more rapid as the water becomes warmer and when a high temperature is reached the water in the jackets is often converted into low-pressure steam which accelerates the thermo-syphon system to a marked degree.

When the water in the bottom of the radiator becomes intensely cold it tends to form a break in the system for the following reason: It will be noted in Fig. 5, which is a diagrammatic view of the Overland system, that the water flowing from the radiator to the cylinders must first rise through a small section of pipe P. When the water is exceptionally cold it is evident that it would take considerable pressure for the water above to force this through, but owing to climatic conditions the water in the radiator may be chilled so rapidly that it is unable to displace the pocket below the pipe P. For this reason the lower section of the radiator should be covered in cold weather. After a time the water surrounding the jackets would become so hot that the pressure of the steam formed would be sufficient to blow the water in the pocket up into the jackets. In an extreme case the pressure in the jackets would hold the water from entering either at the inlet or outlet, but this would only be likely to happen in case the system was clogged and had not been given proper care. As a general rule, it may be stated that the water would circulate even if the radiator were left uncovered, but that this circulation would not be as efficient as if the radiator were covered.

It must be remembered that the effect of keeping the radiator covered in a thermo-syphon system is much different than when keeping the radiator covered in a pump circulating system. In the latter the water is circulated at a uniform rate regardless of the outside temperature. The amount that the water is cooled in passing through the radiator depends to a large extent on temperature of the outside atmosphere. When the water is cooled sufficiently in warm weather it is evident that it will be cooled more than enough in cold weather. The gasoline motor works most efficiently at high temperatures. The reason for this is that the heat which would be thrown off through the cooling water at low radiator temperatures is converted into useful work at higher radiator temperature. The water surrounding the jacket in a pump circulated system attains very nearly the same temperature in winter or summer. But when the radiator cools it to a marked degree it is necessary that energy in the form of heat be lost when raising the water to the fixed jacket temperature. For this reason the cold motor is inefficient and it means an actual saving in the money spent for fuel for the owner to protect the radiator in cold weather. At extremely low temperature it is not only necessary to cover the radiator, but also to spread the covering over the entire bonnet.

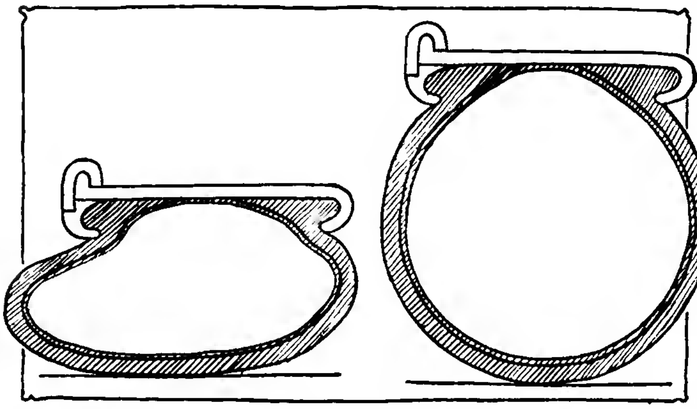

Fig. 3—Showing how the weight of the car on a deflated tire decreases the internal volume

Pressure Due to Car Weight

Editor THE AUTOMOBILE:—Is the pressure or strain on a tire, that is pumped up to ordinary pressure, relieved to any extent by removing the weight of the body from it? As long as a tire is kept up to ordinaray pressure, does jacking it off the floor relieve the strain on it to any extent? Is it any easier to pump a tire with the wheel jacked up than it is with the weight of the car on the tire? If there is any difference what causes it?

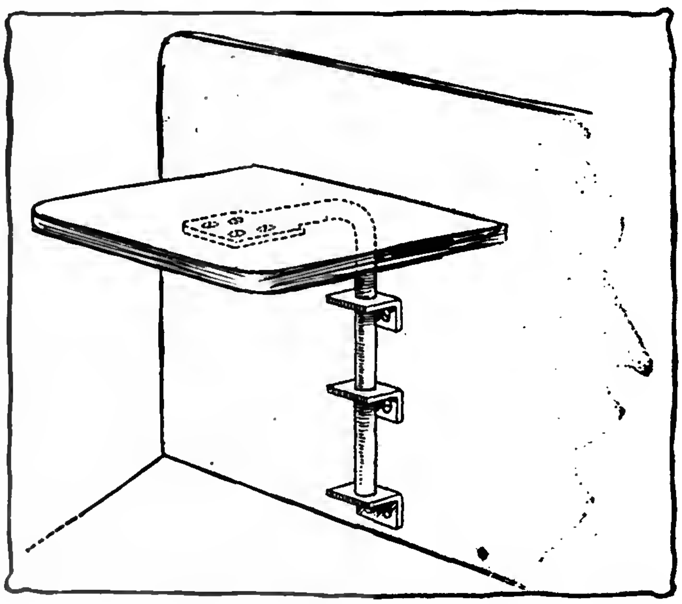

Fig. 4—Method of attaching removable home-made seat for child. Bracket is tapered or stepped

Rochester, N. Y. M. B.

—The pressure in a tire is greater when the car rests upon it than when a car is jacked up. If you take a rubber ball filled with air and stand upon it the pressure in that rubber ball will be greater than if you held the ball in your hand without squeezing it. This latter instance is parallel to that of a car in which the tires are relieved of the weight. If you have a given quantity of air, the smaller the volume in which you put that air the greater the pressure which will be exerted by the air. In the tire there is a definite amount of air. The pressure of this air varies inversely with the volume it occupies. When the tire is round the air is at its maximum volume and hence its minimum pressure. When the weight of the car is on the tire it is no longer round and the volume is redneed as illustrated in Fig. 3. Therefore, the pressure in the tire is greater when it carries the weight of the car.

If there were any doubt upon the above statements it would be removed by the following thought: The pressure exerted by the air must carry the weight of the car. If it did not the car would rest flat upon the ground and not upon a cushion of air. The weight of the car flattens a tire until the pressure within that tire becomes high enough to carry the weight of the car and no more. The more air that is in the tire the less the volume within the tire has to be decreased to bring the pressure to the amount necessary to hold the car. Hence the more air that is in a tire the less it will flatten out under the weight of the car. Jacking up the car relieves the total pressure within the four tires to the amount of the weight of the car. Since it is

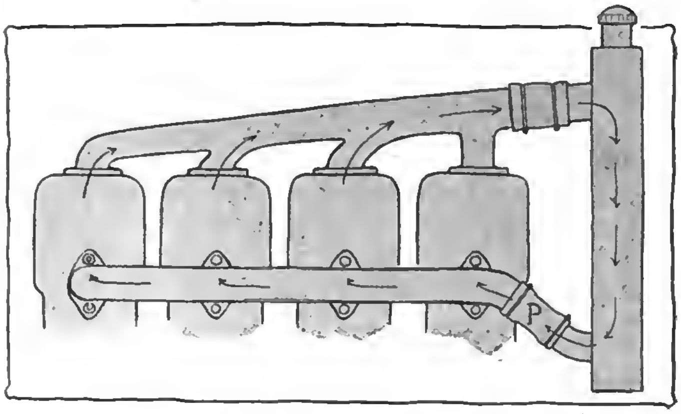

Fig. 5—Diagram of the thermo-syphon system used on the Overland car—Water circulated without aid of pump

harder to pump against a higher pressure than a lower one it is harder to pump the tire when it is resting upon the ground than when it is jacked up; provided that the pressure is only raised to such an amount that the tire will be at the desired pressure with the car resting upon the ground.

Few Pressed Gears Used

Editor The Automobile:—Having overheard a discussion a short time ago relative to the difference between a cut gear and a pressed gear, I am writing to get some information of your opinion of same. I am at a loss to know just what a pressed gear is, and would appreciate your opinion which is more efficient of the two gears and also your definition of the pressed gear.

Philadelphia, Pa. H. C. H.

—By pressed gears you doubtless refer to gears made by die-casting or drop-forging processes. A few of these gears are made by scattered concerns but many of these are gradually dropping the manufacture as it is of course impossible to make them as accurately or as well as by the cutting process generally used. If made in large quanities for light work such as in hand ice cream freezers, etc., they are sufficiently accurate and can be made very cheaply. They cannot compete with the regular machine-made gear.

Child's Seat in Runabout

Editor The Automobile:—I have a Buick runabout Model 30 and I want to get a seat suitable for a child, same to be placed in front of the passenger. Do you know of any manufacturer from whom I could get this seat?

St. John, N. B. A. L. F.

—Supplementary seats are manufactured by the following concerns:

Amesbury Brass & Foundry Co., Amesbury, Mass.
C. A. Buffington & Co., Berkshire, N. Y.

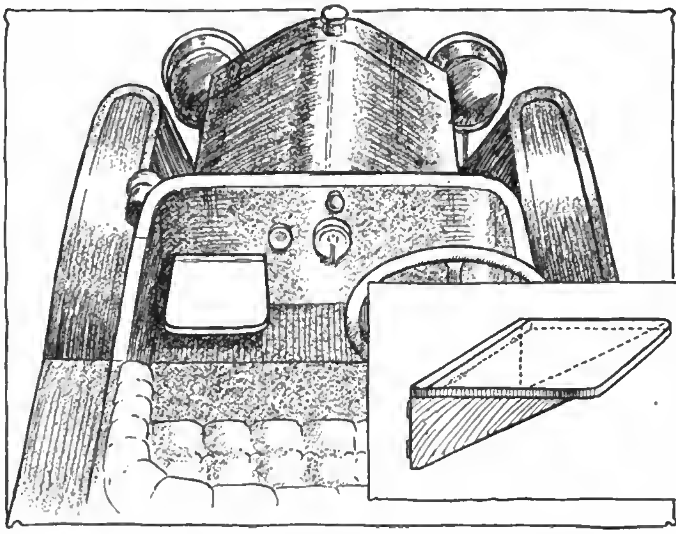

Fig. 6—Small folding seat used for a child—Can be made at home and with good wood is sightly

Empire Gear & Top Co., 207 W. 22d St., Philadelphia, Pa.
Eureka Seat Co., 407 Rhode Island Ave., Buffalo, N. Y.
Glendale Mfg. Co., 152 W. 34th St., New York, N. Y.
Hill Mfg. Co., 28 Fuller St., Buffalo, N. Y.
Hodge & Graves Co., Amesbury, Mass.
Hume Carriage Co., 1000 Commonwealth Ave., Boston, Mass.
C. P. Kimball & Co., 39th St. and Michigan Ave., Chicago, Ill.
McKinnon Dash Co., 252 Amherst St., Buffalo, N. Y.
Metal Stamping Co., 13th St. and Boulevard, Long Island City, N. Y.
Polson Mfg. Co., 27 Chenango St., Buffalo, N. Y.

You can if you desire, make your own seat. Two methods are suggested in Figs. 4 and 6. If the weight of the child is not excessive this will serve your purpose about as well as a supplementary seat made by a regular manufacturer. The first method consists of a fold down seat which is fastened to the dash in the manner shown in Fig. 6, with a hinged bracket and also a hinge in the seat; when the seat, it is simply folded up and the brackets swung into place. When not desired it takes up practically no room and if made of walnut or mahogany or covered with leather it will present a very neat appearance. The seat could also be made on a permanent bracket as shown in Fig. 4 and then when required could simply be inserted into the socket clamped on the dash. Where the weight of the child is excessive it would be better to have some sort of seat in which the weight was carried by the floor rather than by the dash.

Timing of Exhaust Valves

Editor The Automobile:—Please tell me the timing of exhaust valves of American Napier runabout of the Niche type made in the year 1905. The valves have no adjustments and are worn down so badly I want to draw them out a little as I do not seem to be getting as much power as I should. The inlet valves are of the automatic three-in-one type.

—The exhaust valve opens about 7 degrees before lower dead center and closes from 0 to 5 degrees after upper dead center.

Morristown, N. J. Harry Ford.

Please Sign Your Inquiries

The Lozier Light Six

Type 77 Has Unit Power Plant of 36 Horsepower—Electric Starting and Lighting Features

Cylinders in Threes—Left Steer and Center Control—Valves Have Cast Iron Heads and Steel Stems

ALTHOUGH adhering to many of the former Lozier characteristics, the light six, or type 77, is radically different in many respects. Principal among the changes is the motor. Like the big car, the light six, which, by the way, is so called to distinguish it from a little six, has a unit power plant. But its cylinders are of the L-head type, cast in blocks of three.

The new type motor develops 50 horsepower, although its cylinder dimensions of 3.625 by 5.5 inches are responsible for the rating of 36 horsepower. This bore and stroke give a true long-stroke motor, the ratio being 1.52.

Inlet and exhaust valves are on the right, the design of the manifolds being such that there is a separate connection to each cylinder, as shown in the motor view, Fig. 5. Cover plates completely inclose valve springs and stems to the exclusion of all foreign matter. Valves are made with cast-iron heads and carbon-steel stems, the two parts being fused together. The idea of this construction is that valves so constructed show a tendency toward uniformity of wear and less liability of pitting.

Taper Valve Springs

Valve lifters are of rocker form, the Lozier engineers believing this type to be somewhat quieter than the ordinary straight-lifting type. Valve stems are provided with check nuts which make for easy adjustment. The springs are tapered and constructed from tempered steel wire. The reason advanced for the use of taper springs being that they permit of truer valve seating than do straight springs and prevent uneven valve stem wear.

The crankshaft construction is also new to Lozier design. There are three main plain bearings and three throws. It is a drop-forging, the flywheel flange being integral.

Pistons of gun iron are fitted with four rings, three above the wristpin and one below. The rings are of the concentric design, the lower one acting as an oil ring to prevent the lubricant from working up into the combustion chamber. Oil grooves are cut in the piston faces to aid in the even distribution of the cylinder oil.

The camshaft, a view of which is shown herewith, Fig. 1, is a heat-treated drop forging, cams being forged integral with the shaft. It is easily removable through the front of the crankcase. Timing gears are helically cut.

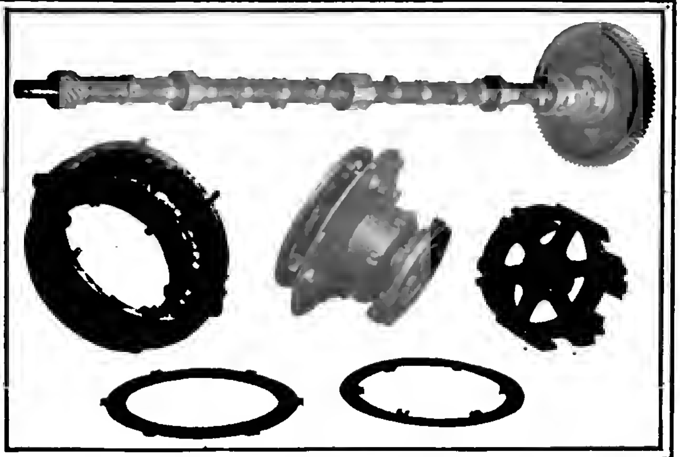

Fig. 1—Camshaft and clutch details of Lozier light six

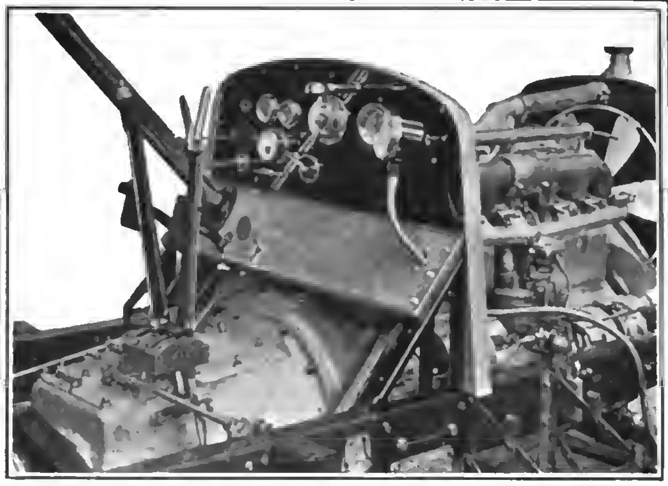

Fig. 2—Dashboard and unit power plant of latest Lozier

The crankcase construction is worthy of special note. Cylinders are bolted to a rectangular base of aluminum which forms the upper half of the crankcase and which fills up the entire space between the motor and the side-frame members, affording a mounting for magneto, lighting generator, etc.

Lubrication of the motor is by a combination system making use of a force-feed-splash-gravity arrangement. A gear-driven oil pump, located in the rear of the engine base forces the oil from the oil sump to the main crankshaft bearings, the main lead from this pump passing to a dash gauge and thence to the point of circulation. Leads run from this main passage to the crankshaft bearings, the surplus oil flowing by gravity down into the individual troughs under the connecting-rods. The caps of the connecting-rods are provided with small integral dippers which plunge into these troughs as they revolve, splashing the lubricant in the conventional way up into the cylinders. lubricating the connecting-rod bearings, piston and cylinder walls. In thus flowing back the oil is drained through a series of fine-mesh screens. Leads from the main oil passage beyond the sight feed also carry the lubricant to the camshaft bearings, magneto, pump and front end gears. It is stated that a gallon of oil is sufficient to cover from 400 to 450 miles under ordinary conditions.

The radiator is of the horizontal, square-tube type, with tubes 3 1-2 inches deep, affording an unusually large radiating surface. The cooling fan has a diameter of 18 inches, and located conventionally between cylinders and radiator, is driven by a canvas belt .25 inch in width.

A Bosch high-tension magneto in connection with the dual system, the other source of ignition being a storage battery, is used on the new type 77. One set of spark-plugs is used, being inserted directly over the inlet valve. The magneto is placed on the left side of the engine base just back of the pump, its shaft being driven by an extension of the pump shaft.

Automatic Gasoline Tank Pressure

As on the larger car, the gasoline tank is suspended at the rear of the frame. It has a capacity of 20 gallons and fuel is fed from it by pressure, the air being supplied automatically by a positive-plunger pump arranged in one of the valve lifters. The pressure is regulated by a blow-off valve at the top of the check valve mechanism on the side of the lifter. An auxiliary hand pump is provided on the footboard of the car. A pressure gauge on the dash indicates the pressure in the tank, while another gauge fitted to the tank shows the amount of fuel contained.

The new car is equipped with a Gray & Davis electric starting and lighting system. It is entirely independent of the ignition system. The lighting generator and the motor which is used for starting are entirely separate units, both being located on the right side of the engine, as shown in the illustration. The generator is placed just back of the fan driving pulley and is gear driven by means of an extension of the fan driving shaft. The generator produces at the rate of 12 amperes when the car is traveling at a speed of 15 miles an hour. This speed is about that maintained in ordinary city driving and is sufficient to keep the battery fully charged at all times. The battery has a capacity of 120 ampere-hours and its voltage is 6.

Operation of Starter

The starting motor gear meshes with teeth cut in the periphery of the flywheel on performing its starting duty, the starter pedal being located in the floorboard.

A slight pressure on the pedal permits a small amount of current to pass through the armature of the starting motor, turning it very slowly and at the same time connecting the motor gear with the flywheel. When the starter pedal has been pressed down to its extreme position a switch is thrown, thus sending the full current from the battery to the electric motor turning the crankshaft over at about 100 revolutions a minute. When the engine starts under its own power the starter pedal is released, springs then sliding the starter pinion out of mesh and breaking the connection between storage battery and motor.

The multiple-disk clutch is somewhat different from that of the other Lozier product in that alternate disks are fitted with cork inserts.

The transmission gearset is selective, three speeds forward and reverse, direct on third and when furnished in standard designs has a ratio of 3.75 to 1 on high. Following is the reduction for the different speeds:

First	9.97 to 1
Second	6.07 to 1
Third	3.75 to 1

The rear axle receives its power through a substantial shaft which is entirely inclosed in a torque tube, as in former Lozier construction. The front end of the torque tube bolts to a cross-member of the frame through a substantial spider. A new feature of this construction is the swiveling of this cross-piece at either end where it joins the side rails of the frame. This freedom of movement allows for differences in the relative height of the frame and the rear axle to the housing of which the torque tube bolts through a flange. Unevenness of road surface raising one wheel higher than the other and thus bringing the rear axle out of its normal plane is allowed through a moving connection at the rear of the spider where it joins the torque tube proper. The tube is braced by rods which run diagonally from its front end to the axle.

The differential gears are cut from alloy steel as are the beveled driving gears and pinion. They are fitted with adjustable thrust bearings so that a perfect relation may be maintained between the two driving gears. The axle is of the floating type. The front axle is a drop forging of I-beam construction. The road clearance under the front axle, which is the minimum of the chassis, is 9.3 inches.

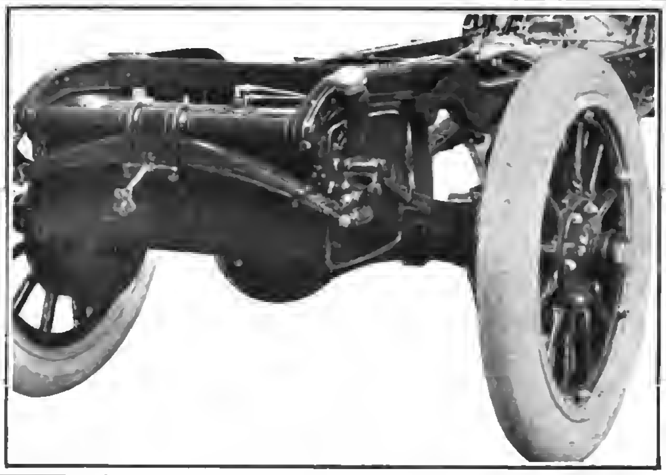

Fig. 3—Rear springs and suspension of gasoline tank

Former spring suspension obtains on the new six, in that half-elliptics are used in front and a platform system in the rear. Each rear spring is half-elliptic, the two side springs being mounted outside the frame.

Brakes are all internal expanding, 16 inches in diameter. The two brakes, foot and emergency, are placed side by side and operate on the same drum. The shoes are faced with a combination woven-wire and asbestos band .25 inch thick.

The wheels are fitted with demountable and quick detachable rims, carrying 35 by 4.5-inch tires all around. All wheels are mounted on annular ball bearings.

Turns in 38-foot Circle

The Lozier company places its steering wheel on the left, while the brake lever and change-gear lever are in the center. The car requires a circle of 38 feet in diameter in which to turn.

All bodies are mounted on the standard chassis. The types are five in number and include the Montclair model five-passenger touring car, the Fairmount two-passenger roadster, the Metropolitan five-passenger fully inclosed limousine, the Coronado six-passenger, semi-four-door limousine and the Touraine three-passenger coupé.

Running boards are entirely clear, the spare tires being carried in the rear, while tool boxes are fitted in specially designed aluminum compartments in the aprons between the running boards and the frames. The windshield in the open models is specially designed for the car and forms a part of the body.

Car Builders and Batteries

BATTERY makers have just cause for complaint against a great many car manufacturers. It is true that in the main the cars of today have been perfected to a wonderful degree, but there are still a great many details which are not given the attention they deserve by the men who build the car. One of these, and a very important one, is the storage battery.

Every car builder should furnish the purchasers of his product with instructions on the care of the storage battery which comes with the car. These instructions should be brief and very simple. It does not require a twenty-page booklet to impart the necessary information.

Every car builder should see that the battery is readily accessible. Too often it is placed under a seat or mounted under the car in such a way that it may not be reached without getting under the car. Every car owner should be instructed to inspect his battery regularly and provision should be made for facilitating such inspection.

It has been stated that practically 95 per cent. of electric self-starter troubles are due to the owners' ignorance regarding the care of the battery. From this it may be seen that it is up to the car manufacturer to remedy this condition of affairs.

The practice of giving demonstrations of the power of self-starters by running the car on the starter should be vigorously discouraged by both makers and dealers. It imposes an excessive strain on the starting mechanism and also impairs the battery.

Adequate Lubrication

SEVERAL comprehensive tests of gasoline motors made within the last 2 years in Germany, France and England have demonstrated the necessity for additional lubrication during continued operations at full loads when the size of the motor exceeds a certain limit.

Some of the comprehensive tests made by Dr. Riedler in his German laboratory have gone far to demonstrate that when a motor has a bore exceeding 85 millimeters it is necessary to furnish additional lubrication to that regularly given when the motor is working continuously at its full load or with a possible overload.

On the other hand, Dr. Riedler's reports have shown that with motors under this size not only is this additional lubrication unnecessary but that the motor efficiency per volume of displacement is greater. His tests demonstrated that there is a continual increase in efficiency from the fuel consumed as the motor size is reduced from 100 millimeters to 80 or lower.

Dr. Riedler's results are highly interesting in view of the present tendency towards smaller motors on the American market, and also because of the longer strokes being used. There is a rapidly developing feeling in America that smaller motors will serve for our present-day cars, a fact, to an extent, due to improved roads as compared with 4 or 5 years ago.

European makers are busily engaged for 1914 on improvements in lubrication of the motor, and in nearly every case efforts are being expended to regulate the oil flow in accordance with the work done, and to increase the oil flow in a high ratio as the speed of the motor increases. To do this the foreigner is increasing his pressures slightly over that of 1913, and is more and more getting away from splash lubrication and using only pressure.

A good example of the necessity of extra lubrication for motors operating at continued high speeds was found in the most successful racing cars in Europe a year ago, when the pressure feed to the bearings was more than ten times that used on stock passenger cars. With this vastly increased lubrication there was a perceptible looseness in the fittings of the bearings, these being so loose in the crankshaft and connecting-rods as to cause pounding if used for regular passenger-car service.

Most interesting results could be looked for by officially testing some of our larger motors on continuous high-speed work at the Indianapolis Speedway, where it would be possible to keep a constant over-load for long periods. The results of such tests, if covering a well-graduated series of motor sizes, would be most valuable, and it is to be hoped that some of our makers can be induced to co-operate in such a test.

Lubrication is yet far from perfection. Our present systems are generally adequate for normal road use in which rarely over 50 per cent. of our S. A. E. horsepower ratings is utilized in propelling the car on the highway within the legal speed limit, but as soon as special service is called for, extra provisions have to be made for lubrication.

Improved lubrication is necessary for another reason, namely, the introduction of block motors and also the present progress towards longer stroke types.

Motor Spirit Increases Horsepower

Comparative Test of 40-Horsepower Tractor Engine Shows 10 Per Cent. Increase in Power Developed on New Fuel—No Adjustments Necessary in Changing Over From Gasoline

DEVIL'S LAKE, N. D., March 28—Motor Spirit in a test made here recently proved that it would increase the power of a tractor engine by 10 per cent. over that obtained when gasoline is used as fuel. In a Case two-cylinder tractor engine rated by the factory at 40 horsepower, Motor Spirit developed 46.23 horsepower on the brake, while on gasoline, only 41.93 horsepower could be realized.

These tests were made March 13, by the Case School of Power Farming, with G. B. Gunlogson, M.E., as engineer in charge, assisted by representatives of the Standard Oil Co. and the Case company. The object of the tests was to determine the relative thermal value of Motor Spirit as compared with gasoline as fuel for internal combustion engines; to determine the relative maximum power of gasoline engines using Motor Spirit and gasoline; to determine the relative consumption of both fuels, to determine the changes and adjustments necessary in gasoline motors and carbureters for Motor Spirits and the flexibility in power and speed and the ease of starting the motor with Motor Spirit as compared with gasoline. Also, it was intended to discover the effect of the new fuel on the engine in the matter of heating, preignition, carbonization and fouling of the spark plugs.

A two-cylinder opposed Case tractor rated at 40 horsepower, with a normal speed of 450 revolutions per minute was used. This engine is equipped with a Rayfield model R T carbureter, and as the engine is opposed, the manifolds necessarily are unusually long. No provision was made to heat the intake air or the fuel before it was passed into the cylinders so that the best of results were not obtained owing to the cold weather which prevailed at the time of the tests.

Conditions therefore, were not ideal and this fact may have affected the comparative quantities of the test. This difference, however, can only be slight and would rather effect the showing of the engine than the object of the test. The fuels used in the test were Motor Spirit of about 52 degrees Beaumé gravity and ordinary commercial gasoline of 58 degrees gravity.

No Alterations Necessary

No adjustments were made in the motor in changing from one fuel to the other and the only necessary adjusting on the Rayfield carbureter was in raising needle valves slightly—about one and three-quarter turns and increasing the lift of the needle.

The results of the tests follow:

On Gasoline

Test No.	R.P.M.	B.H.P.	Time, Minutes
1	487	42.31	10
2	481	42.10	12
3	466	41.37	15
Av.	478	41.93	12

On Motor Spirit

Test No.	R.P.M.	B.H.P.	Time, Minutes
1	491	46.48	15
2	491	45.60	15
3	473	46.60	12
Av.	485	46.23	14

Greater power for Motor Spirit as compared with gasoline, 10 per cent.

The engine behaved in every way as well when Motor Spirit was used as fuel; there was no noticeable difference in the running of the engine with the change in fuel after carbureter adjustments were made, except a slight amount of gray smoke from exhaust only occasionally. The [illegible] motor with the different fuels was [illegible] difference was slight, and owing to the [illegible] be ascertained with any degree of certainty

It was found that the cold weather affected [illegible] engine in this respect. The engine when [illegible] well on both fuels but a cold engine which [illegible] outside over night had to be primed with high [illegible]

This also was the practice when the ordinary [illegible] in the same engine, so little effort was made [illegible] engine on Motor Spirits. No difference in the [illegible] the cooling water was perceptible with the change of [illegible] temperature was not ascertained accurately for [illegible] did not exceed 180 deg. Fahrenheit.

There was no knock or preignition at any time [illegible] fuel. The spark-plugs were removed after the first two [illegible] gasoline and also after the two tests on Motor Spirit were [illegible] and it was found that slightly more carbon had accumulated [illegible] the plugs during the tests with Motor Spirit. This was [illegible] form of soft soot and was almost imperceptible after these [illegible] tests.

The economy tests were not made at this time but will be made at Grand Forks, N. D., in a few weeks and very extensive economy tests will be made at that time.

Oil Trade Competition Growing

NEW YORK CITY, March 28—An address by G. D. Chamberlin, counsel for the National Petroleum Association, read before the German Reichstag in connection with the illuminating-gas bill before that house, gives some interesting information on the present status of the petroleum industry.

According to the address, the entire refining capacity of plants operated by the former oil trust amounts to no more than 80,000,000 barrels a year, while the independent refineries have a capacity of over 63,000,000. The latter number 125. The ratio between Standard and Independent oil refineries is, at present, according to the above figures, 56 and 44 per cent., respectively. In 1904 the ratio was 85 to 15, and as in 1911 the total number of refining plants was almost twice that of 1905, it becomes obvious that during that period they have grown 600 per cent.

The entire oil consumption in Germany for the purpose of illumination is about 6,000,000 barrels a year and of this 5,000,000 are imported from the United States. As soon as the bill now under consideration in the Reichstag was formulated, the independent refineries were informed of the opportunity of breaking into the German market and an inquiry was made as to the possibility of supplying the above-outlined oil demand of the Empire. The result is that the independent producers are now able to supply to Germany 5,400,000 barrels a year, which could probably be made to suffice the demand.

The address, in an appendix, shows that during 1911 the world production of crude oil was 345,512,185 barrels of 42 gallons, an increase of 24,712,041 barrels over the previous year. Of the total production, 63.80 per cent. or 220,449,391 barrels were produced in the United States and 19.16 per cent. or 66,183,691 barrels in Russia, while no other country contributed as much as 5 per cent. of the total, although there were about another dozen oil-producing countries.

Upper—Majola car in the recent Tour de France on the road between Nice and Avignon. The illustration gives an idea of some of the scenery along the route followed by the tour

Lower—Duray driving his Metallurgique along the road between Nice and Avignon, a short distance from the scene depicted above

Nine Cars Are Perfect in Tour de France

Seven Others Finished 2,880-Mile Run with Penalizations—Remaining Twelve Fail to Finish

¶ *The entrants finishing with perfect scores are: Buick; Aries; Corre La Licorne; Anasagasti (two cars); Metallurgique; Barré; Majola, and Pierron. An Alcyon lost 2 points, a Hurtu and a Bozier each lost 3 points, and an Aries, a Corre La Licorne, S. C. A. P. and Pierron finished with 4 points penalization. The trip was made in 15 days, including 12 running days and 3 days of exhibition at important centers.*

PARIS, FRANCE, March 18—Out of twenty-eight cars to start in the Tour de France 2,680 miles sealed bonnet reliability test, nine came home with clean scores, seven finished with penalizations and twelve fell by the roadside. The clean scorers are Buick, Aries, Corre La Licorne Anasagasti (two machines), Metallurgique, Barré, Majola, Pierron. In addition, an Alcyon finished with the loss of 2 points, a Hurtu and a Bozier with 3 points each, and Aries, Corre La Licorne, S. C. A. P. and Pierron with 4 points each.

This competition was a new one for France. The organizers wished to prove that a modern light car with a chassis price not exceeding $1,600 could make a complete circle around France, taking in the Alps and the Pyrenees, with no more attention than 10 minutes each morning for oiling and slight adjustments. For this purpose all the essential parts of the cars were permanently sealed, the loss of one of these seals entailing disqualification, and the toe boards, underpan, bonnet and radiator filler cap had seals which could be broken every morning for 10 minutes only. If these seals were touched during the run, points were lost, the penalty being 2 points for a radiator filler cap, 3 for toe boards and under pan, and 4 for the bonnet.

The trip had to be made in 15 days, this including 12 running days, when the mileage varied from 190 to 254, and 3 days given up to public exhibitions in important centers. These exhibitions gave the drivers a rest and enabled the salesmen who accompanied the tour to convince the natives of the value of their product. The same advantage does not appear to have been taken of the commercial possibilities as a year ago. On the last occasion several of the chiefs went on the trip on private cars and got into touch with all the agents en route, stirring up enthusiasm among them and among prospective purchasers. This was not done to the same extent this year, and it was of course impossible for the drivers to make any attempt to see agents or customers.

The tour failed to reveal any serious mechanical defects in the competing cars. Many of the withdrawals were due to reckless driving. The competition called for an average speed of 19 miles an hour on each daily run. In every case there was a desire to be first into controls, some of the drivers maintaining an average of 30 miles an hour for runs of 250 miles. On the first day a Rolling and an Optima were eliminated. Albert Guyot had to lift the bonnet of his Pierron and lost 4 points. An Aries lost 4 points and a Bozier 3 points on the second day. In this latter case it was declared that the toe board seals had broken accidentally, but this protest was not allowed.

Among those who went out were Barriaux, the Alcyon race driver, with a reported bent front axle, and his team-mate Louis Wagner, who failed to give any news of himself. An Aries claimed an encounter with a cow; a Ponette an encounter with a stone wall. Repusseau's Anasagasti, a South American car built in Paris, lost its radiator fan in the Pyrenees, thus causing overheating. A Barré claimed that both rear tires burst on a bend and a companion machine preferred a close acquaintance with a stone wall. On the last stage, when only 20 miles from home, Riviere, who had driven his Metallurgique hard from the beginning, was held up with rear axle troubles, a mishap which was officially put down to a leaky gasoline tank. This machine had possessed a clean score up to this point.

No complete team succeeded in getting through the trials without the loss of a unit. Buick and Majola started with only one car and got that one through without the loss of points. While at Nice the Buick was backed into by another competitor, but this did not prevent it finishing in good shape, despite its bent front axle.

One of the weakest points of the car equipments appeared to be the provision for baggage. In nearly all cases there were only two men aboard, thus leaving the whole of the rear compartment free for personal belongings and spare parts. Not a single car had a sufficient oil supply to undertake the long daily runs without renewal. In consequence fillers were brought up through the bonnets or reserve tanks were fitted on the dashboards, thus making it possible to renew the supply without lifting the bonnet. The regulations stipulated that the cars should be standard models, but this was not rigidly enforced. One of the firms, for instance, took out the standard motor and put in a specialist's high-efficiency 3-liter model.

The following is the list of machines finishing with clean scores:

Car	Driver	Cylinders	Bore	Stroke
Aries	Vandenhorn	4	2.9	5.5
Corre La Licorne	Collomb	4	2.9	5.9
Anasagasti	Brown	4	3.1	5.5
Anasagasti	D'Avary	4	3.1	5.5
Metallurgique	Duray	4	3.1	5.1
Barré	Revaud	4	3.1	5.5
Majola	Doutre	4	2.6	3.9
Pierron	Delaunay	4	3.5	5.1
Buick	Drouillet	4	3.7	3.7

1,000 Miles in 6 Days in Quaker Run

PHILADELPHIA, PA., March 29—Approximately 1,000 miles were covered during the past 6 days by the Multiplex car in the 30-day sealed bonnet test being conducted by the Automobile Club of Philadelphia. Unusually heavy going was encountered throughout the week, frequent heavy rains converting the roads into quagmires and necessitating slow running, with a consequent decrease in the total mileage.

The following routes were covered:

Saturday—Philadelphia to New York hy way of Bristol, Trenton, Princeton, Plainfield, Newark, and retnrning via Elizaheth, New Brunswick, Princeton, Columbus, Burlington and Camden.

Sunday—Philadelphia to Lancaster via Paoli, West Chester, Downingtown, Coatesville, Gap, Lehman; returning, Mechanicsburg, Blue Bell, Morgantown, Conestoga, Downingtown, Philadelphia.

Monday—Philadelphia to Mays Landing and return hy way of Camden, Gibbstown, Pedricktown, Pennsville, Salem, Quinton, Shiloh, Bridgeton, Millville, Malaga, Mays Landing.

Tuesday—Philadelphia to Bethlehem, through Easton, Pa., over to Phillipsburg, N. J., back to Washington, Schooley's Mountain, Chester, Bedminster; returning, Somerville, Princeton, Trenton, Langhorne, Bustleton, Philadelphia. The original intention to go to the Water Gap from Phillipsburg on this day had to be abandoned owing to wretched road conditions above Belvidere.

Wednesday—Philadelphia to Camden, Hammonton, Pleasant Mills, New Gretna, Absecon, Egg Harbor, Mays Landing; returning, Hammonton, Indian Mills, Medford, Mount Holly, Columbia, Burlington to Palmyra and back to Camden.

Thursday—Owing to heavy rain, day's work was confined to a short spin to Trenton, N. J., and return.

PHILADELPHIA, PA., March 29—On Saturday, May 3, the Quaker City Motor Club will conduct its annual spring sociability run to Atlantic City, N. J., and return. The event will be of the same nature as last year's, except that the gasoline economy test will be omitted, prizes to be distributed under the rules governing secret time schedule runs.

Washington Truck Run Sanctioned—The Washington, D. C., Post motor truck reliability run, which is to be held May 5, 6, 7 and 8, has been sanctioned by the American Automobile Association.

Upper—The Alcyon car which finished with a perfect score on the road between Nice and Avignon in the recent Tour de France, showing the way the rock has been cut to make room for the road
Lower—Competition was close at some points on the road between Nice and Avignon and some of the cars were bunched

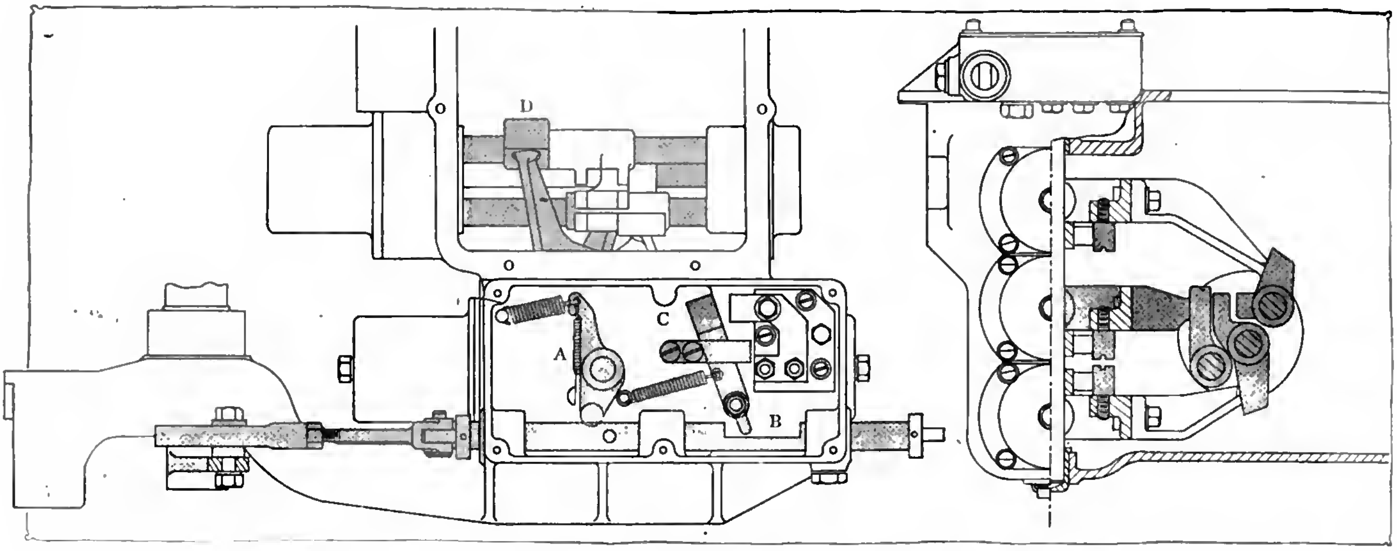

Fig. 1—Plan and end views of Vulcan electric gearshift now fitted to the S. G. V. cars as regular equipment

Vulcan Electric Gearshift

S.G.V. Car Adds New Control to Stock Cars—Solenoid Coils Used to Make Speed Changes

Electric Control Adds 46 Pounds to Car Weight—Exerts Pull of 150 Pounds at 17 Amperes

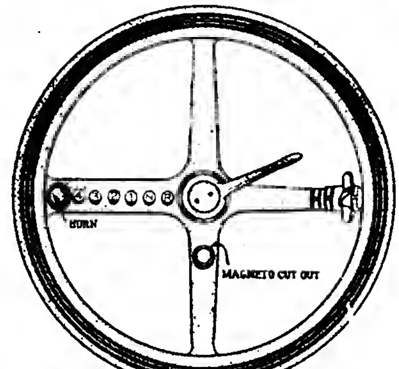

Fig. 2—Appearance of the steering wheel when control buttons are located in the spider. On demonstrator model buttons are arranged in circle on metal box

IT requires half the usual time to shift gears with the Vulcan electric control as now applied to the S. G. V. car. A system of buttons on the steering wheel and a slightly added length of clutch pedal throw compose the system as far as the driver of the car is concerned. It is merely necessary to touch a button corresponding to the speed at which it is desired to travel, press down the clutch pedal and let it back and the shift is made.

An idea of the appearance of the steering wheel with the device attached is given in Fig. 2. The buttons are numbered corresponding to the speeds which they control. If the fourth speed button is pushed down, the clutch thrown out and then re-engaged, the car will be in fourth speed. If the driver is traveling through traffic on third speed, he can set the second speed button and be ready at any moment by a simple motion of the clutch pedal to be in second speed. Or conversely, when traveling through traffic on second, and having the third speed button pressed down, a shift to third may he made instantaneously and without lifting the hands from the steering wheel.

It is impossible to strip the gears with this system because the clutch must be fully disengaged before the gears begin to move. The gears are always in neutral before the shift is made. This is accomplished by a positive mechanical action which is a part of the pedal motion in disengaging the clutch.

No two speeds can be engaged at once because each speed is governed independently of any other and an interlocking device provides that no two buttons can be down at the same time. If the second speed button is set and the driver changes his mind and decides that his next shift will be into fourth, he merely presses the fourth speed button and the second speed button returns to its normal position. Pressing the button marked Neutral, leaves all the buttons up.

The secret of this control is a system of solenoid coils. There are five of these coils, one for each forward speed and one for reverse. Two switches are interposed in the line between the battery and the solenoids, first, a knife switch which is controlled by the clutch pedal and second, the push button switch operated from the steering wheel. The knife switch controls all the changes while the push button switch only controls the particular solenoid belonging to the speed which it is intended to engage.

A study of the clutch pedal arrangement shown in Fig. 3 will disclose the fact that the pedal moves through a link L, for the first part of its motion and during the rest of its movement, picks up the link and pulls it along with it. The first part of the pedal throw has only to do with the clutch. The clutch may be slipped in ordinary driving in the usual manner. The movement after the clutch has picked up the link operates the knife switch sending the current through the solenoid coil and pulling a plunger against a magnet with a force of 150 pounds. This force is transmitted through an arm to the gear shifter fork and the speed change is made.

In the sectional elevation given in Fig. 3, the solenoid coils are seen. These are labelled first, second, third, fourth and reverse speeds in the drawing. The plungers are shown in neutral position. When the button is pressed and the knife switch thrown in a 12-volt current is passed through the coils surrounding the plungers and they are drawn against the magnets. The pull of 150 pounds is enough to shift the gears instantaneously and without any sign of clash. Since the gears cannot be shifted until the pedal has traversed sufficient distance to fully disengage the clutch, there is no danger of stripping the gears through meshing while the clutch is still engaged.

The box containing the switches and solenoid coils is mounted on the side of the gearbox. An idea of the method of arrangement may be seen in Fig. 1. The left view in this illustration is a diagram looking down on the shifter mechanism. The pedal and switch shaft B, may be seen along with the knife blade switch C, and the neutral camshaft lever A. The function of

Tate Electro Vaporizer

Electrically Heated Spray Into Intake Manifold Insures Easy Starting From Cold with Heavy Fuel

Device is Wired to Lighting Battery and is Only in Action for a Few Seconds When Starting Up

FOREMOST among the subjects engaging the attention of automobilists at the present time is that which, with perhaps an undue show of concern, has become known as the fuel problem. The gradual introduction of the heavier kinds of fuel is inevitable, and there is a disposition among many to imagine, among other things, increased trouble in connection with engine starting, as the result.

There is little ground for such anxiety, in spite of the faet that the carbureter as made at present will need further evolution to enable it to deal with a heavier grade of spirit. The possibilities of kerosene have stimulated action on the part of carbureter designers and there is doubtless a great deal of experiment in this direction, much of it quietly conducted, going on throughout the country at the present moment.

A primary need in the vaporization of heavy fuel so as to permit easy starting is the addition of heat. Without it the efficiency of all the various engine cranking devices on the market will be greatly diminished. This heat is only necessary at the start. Once warmed up, vaporization of even as heavy a mixture as 50 per cent. gasoline with 50 per cent. kerosene presents no insuperable difficulties to the carbureter.

With the widespread adoption of electricity on the modern automobile, the Tate Electro Vaporizer illustrated herewith, designed to meet the above requirements is of interest. This device consists essentially of a flange-shaped container to be inserted between the carbureter and the intake manifold, provided with a number of jets through which the fuel after heating by means of electricity, is sprayed into the manifold passages. The supply of gasoline to these jets is governed by an electro-magnetic valve incorporated in the device and operated by a switch on the dash.

A sectional plan and elevation of the vaporizer is shown in the accompanying illustration. It will be seen that the flange-shaped body F, which is made of a non-metallic substance, is drilled to coincide with the gas passage and bolt holes of the carbureter flange, the annular groove G being formed into a closed chamber by the insertion of a tight fitting brass tube through which a number of fine holes, J, are drilled around the diameter. A resistance coil, C, is arranged within the groove and connected to external terminals, from which wires lead to a magnetic valve and thence to the battery and switch.

The valve normally remains elosed by the action of a light spring bearing on the needle. Current passing around the coil of the magnet lifts the needle through the magnetic attraction of a light iron armature fitted to its lower end. The device is connected to the main gasoline supply at S.

In the operation of the vaporizer the dashboard switch is first elosed allowing current to flow simultaneously around the valve coil and the heating coil C. The valve then opens, admitting the fuel to the channel and in contact with the heating element, where it vaporizes, and on cranking the engine is ejected through the holes J. The spray mixing with the air drawn into the manifold results in a rich explosive mixture entering the engine. After starting up, the dashboard switch is opened, throwing the vaporizer out of action.

It will be noticed that the device is extremely easy to fit, occupying small space and requiring only slightly longer flange bolts. No special battery is required as a current of 5 amperes at 6 volts is sufficient to operate and this is easily available for the short periods necessary by attachment to the ordinary 3-cell lighting battery. The makers state that with the current above mentioned a period of 6 seconds is all that is necessary to fill the intake manifold with a hot gasoline vapor.

This vaporizer is being marketed by the United Motor Equipment Co., Chicago.

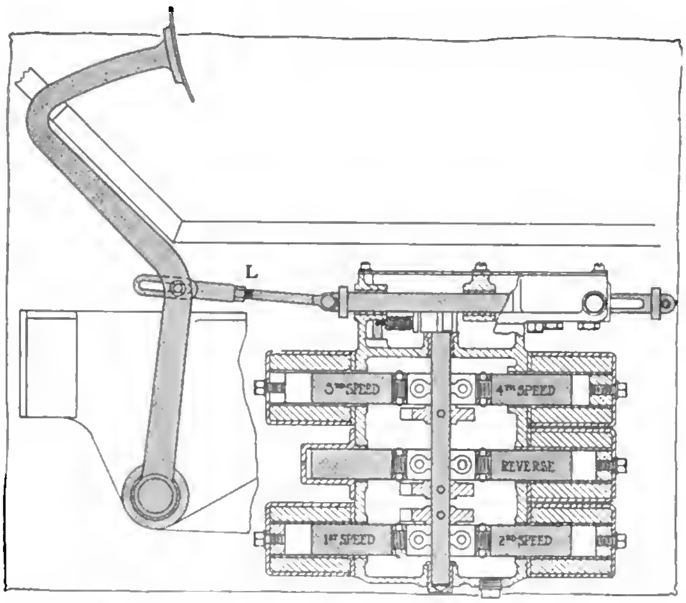

Fig. 3—Sectional elevation through Vulcan electric gearshift, showing Solenoids

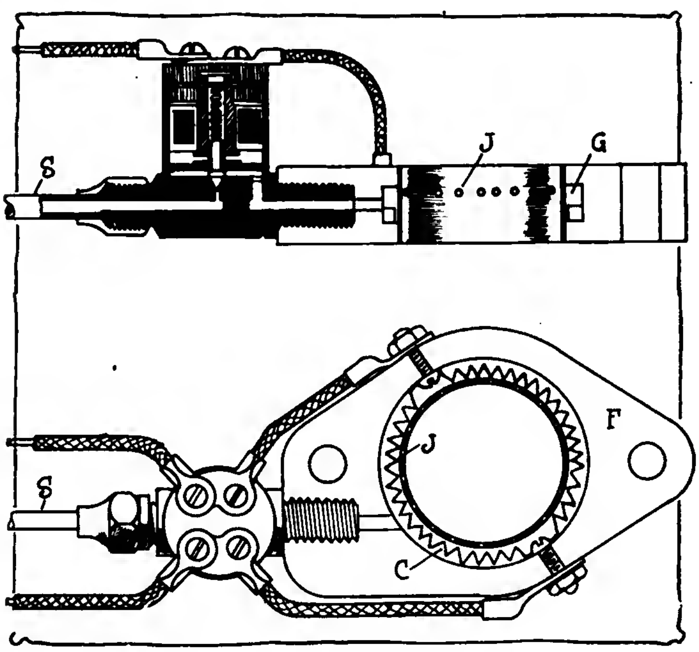
the eamshaft which extends across the control box between the solenoids, Fig. 3, is to positively pull the gears back to neutral between shifts.

The current required to make the shift is 17 amperes, and the S. G. V. company figures that 300 shifts can be made with less current than it takes to start the car once and that the added weight to the car is but 46 pounds when the entire electric control system is considered. This includes lighting and starting. The buttons on the steering wheel are arranged on the demonstrator model on a circular box instead of in the steering wheel spider as shown in Fig. 2.



Sectional views of Tate Electro Vaporizer

Gearsets Show Conservative Design

Selective Sliding-Gear Varieties Maintain Lead, Although Designs with Gears in Mesh Are Always Numerous—Four-Speed Types Offered by Most Makers

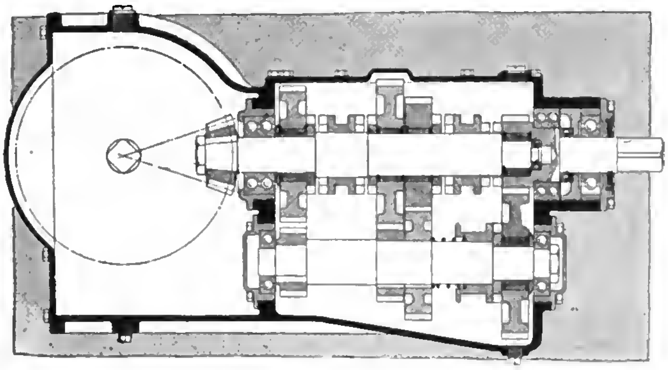


Fig. 1—Cotta model ECA. The gears are always in mesh

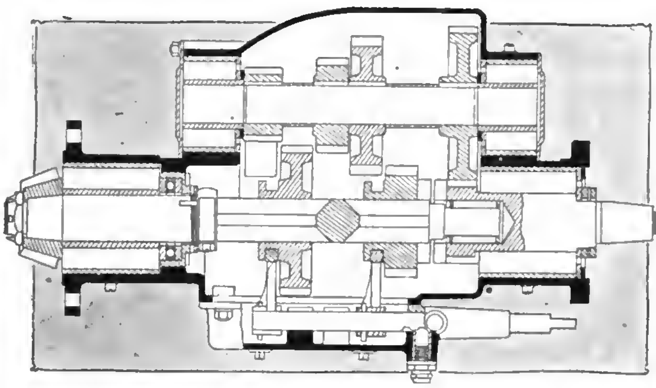

Fig. 2—A Covert sliding-gear type for commercial cars

MANUFACTURERS who make a specialty of producing gearsets for the automobile builder show little or no change in the design or construction of their products over the preceding year other than an occasional detail refinement. In fact, the gearset unit is now looked upon as practically standard, the majority of the types being of the sliding, selective style with a layshaft carried at the side of or below the main shaft. There are, however, several constructions in which the gears are constantly in mesh, dogs or jaw clutches being shifted in place of the gears.

Refinements, if any, have generally consisted in the strengthening of such parts as the shifting forks; changing the composition of some of the steels or other materials used in the constructions; mounting the shafts on other types of bearings; widening the gear faces; changing from splined to squared shafts, or vice versa; or in making other small differences, each of which, in itself, is of small consequence, though in the mind of the designing engineer of enough importance to increase of efficiency to merit its incorporation.

A résumé of the types offered by some of these specialists is given.

Brown-Lipe

The Brown-Lipe Gear Company, Syracuse, N. Y., manufactures gearsets for use in connection with the crankcase as a unit power plant construction, or for mounting on the frame apart from the crankcase. In Fig. 3, model 35 is shown, which is designed for use as a unit with the motor, the clutch and flywheel being seen mounted in connection with it. The design here seen has three forward speeds and reverse of the selective type. The shafts are both mounted on Timken roller bearings which are carried in removable cages in the ends of the gearcase. The sliding gearshaft is squared, its forward end being also carried on a Timken bearing. At the rear where it passes through the gearcase this shaft is provided with an adjustable packing ring which prevents oil leakage from the case. The lubricant is put into the gearcase through a large hole tapped at the top, while a plug at the bottom rear end of the case allows it to be drained when necessary. The ratios of the change gears in this design are 1.76 to 1 for the medium speed, 3.36 to 1 for the low and 4.32 to 1 for reverse. The Brown-Lipe gearsets are also mounted on annular ball bearings if so specified.

Cotta

In the gearset designs manufactured by the Cotta Transmission Company, Rockford, Ill., all gears are always in mesh, the individual clutch system being employed. In their standard forms, these outfits are furnished either for trucks having jackshafts and chains to the rear axles, for light commercial vehicles or for pleasure cars having shaft drive to the rear axles. In the Cotta construction, on the face of each of the speed change gears, which are mounted on roller bearings, there is a set of jaw clutches. On the driven shaft are two corresponding double sliding clutches, by means of which any one of the speed change gears may be locked to the shaft. On high speed the driving and driven shafts are locked together and the clutch on the counter shaft is disengaged. The drive is then direct and the counter shaft and all main shaft gears are idle. When the sliding clutch is returned from direct to neutral position the countershaft clutch automatically drops back into mesh.

The type of Cotta gearset shown in Fig. 1 is known as model ECA for jackshaft construction for trucks having a capacity of from 3 to 5 tons. The gears have a face width of 1.5 inch, the pitch of the transmission gears being 4.5 to 6; while that of the differential gears is 3.5. Gear ratios are 2 to 1 for intermediate, 4 to 1 for low and 4.125 to 1 for reverse. The reduction at the differential is 3.07 to 1. The same gear ratios are employed with the shaft drive types.

Several slight changes have been incorporated in Cotta construction. The gears were formerly mounted on plain bearings: they are now carried on roller bearings. The shifting forks have been shortened and made heavier. The ends of these forks are now provided with rollers where they are in contact with the clutch shoulders, having formerly been plain ends.

Covert

Covert gearsets are made for commercial vehicles ranging from the small 1,000-pound delivery wagon up to the 7-ton truck, as well as for pleasure cars from 20 to 50 horsepower. These are manufactured by the Covert Motor Vehicle Company, Lockport, N. Y., and are designed for use in unit with the rear axle, as well as for jackshaft truck constructions. Fig. 2 gives an idea of the general design of a typical Covert type. The shaft on which the sliding gears are mounted is squared, while all shafts are mounted on Hyatt roller bearings in the usual constructions, although several models are made in which the shafts are carried on annulars. In either case, the thrust load on the shaft connecting with the differential gears is taken by a thrust ball bearing, as seen in the drawing, Fig. 2. The shifting rod is carried at the side, being provided with the conventional ratchet arrangement for locating the various shifting positions. Oil packing rings prevent the escape of the lubricant from the housing. The gears are all of nickel steel which is carbonized, heat-treated and ground to fit the shafts and receive the bearings. The shafts are also of nickel steel, hardened and ground. Covert gearcases are of compact design and made of light malleable iron castings. They are provided with substantial flanges for bolting to the rear axle housing at the rear end and for attaching to the torque tube at the forward end. The portions leading to the flanges are webbed, making the construction very strong.

Detroit Gear and Machine Company

Although this Detroit concern makes the majority of its gearsets according to special specifications furnished by each of its customers, it also makes several standard types designed by its own engineers. A typical outfit for unit power plant constructions is shown in Fig. 5. This is a three-speed, selective, sliding-gear design, which may be said to be conventional in most respects, conforming to the latest engineering dictates. It is a center control type. The shafts are all carried on annular ball bearings, the main shafts being mounted on large single-row bearings, while double-row bearings carry the layshaft. A ball-thrust bearing is placed at the forward end of the propeller shaft connection. This shaft also is provided with a packing ring where it passes through the gearcase at the rear. The gears are of nickel steel and have .875-inch faces, the pitches being 6 to 8. The speed ratios are, for intermediate 1.875 to 1; for low 3.2 to 1; and for reverse 3.9 to 1. The sliding gear shaft is provided with four splines instead of being squared, as were the other types already considered. The usual cover plates and oil filling and drain plugs are provided.

Driggs-Seabury

The Driggs-Seabury Ordnance Corp., Sharon, Pa. produces a full line of standard gearsets for commercial vehicles. These being truck outfits, have the differential and bevel gears in combination with the change-speed gears for jackshaft designs. They are made in sizes ranging from the type for the 1-ton job to the 7-ton outfit. They all have three forward speeds and reverse, except the largest size, which has four forward speeds. The maker claims extreme simplicity of construction and accessibility for these gearsets. The gears are of large diameter, carried on splined shafts. These parts are of alloy steel.

Three-point suspension is a feature of the Driggs-Seabury units, the forward end of the gearcase providing a bearing for a universal trunnion which is swung from a cross-member. Jackshafts and housings are furnished to meet the requirements of the customer, they not being standard parts as yet. The several speeds of the gearset are controlled selectively by shifting rods assembled as a unit in a separate housing bolted to the right-hand side of the case, the removal of which allows the gear to be withdrawn at any time without disassembling the shifter box. The gearcase is provided with oil-filling and drain plugs, while oil packing rings surround the shafts entering and leaving.

Fuller

The Fuller & Sons Manufacturing Company, formerly the Michigan Automobile Company, Ltd., Kalamazoo, Mich., is now manufacturing its 30 to 40 horsepower, three-speed, selective, model T gearset in large quantities for automobile builders. This conforms to the general dictates of present engineering practice. The countershaft and the mainshaft are of large size, the main bearings being Hyatt roller types. The large idler gear runs on a solid roller bearing, while a double roller bearing carries the main shaft stub end. The case is of aluminum alloy while all gears and shafts are made of chrome-nickel steel. A variety of control sets is offered for both center and side control, while cases for either left or right drive in several styles are to be had. The Fuller concern also carries two models of planetary transmissions ranging from 6 to 12 and from 12 to 25 horsepower. These are designed for either chain or shaft drive.

Lefever

In the automobile line, the Lefever Arms Company, Syracuse, N. Y., manufactures selective-type gearsets and jackshafts for commercial cars from 12 to 40 horsepower; planetary gearsets and jackshafts from 12 to 40 horsepower; selective gearsets for pleasure vehicles up to 45 horsepower; and change gear levers.

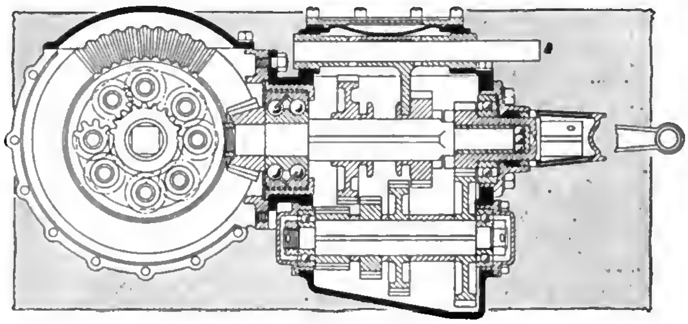

Fig. 4—Lefever gearset for trucks up to 40 horsepower

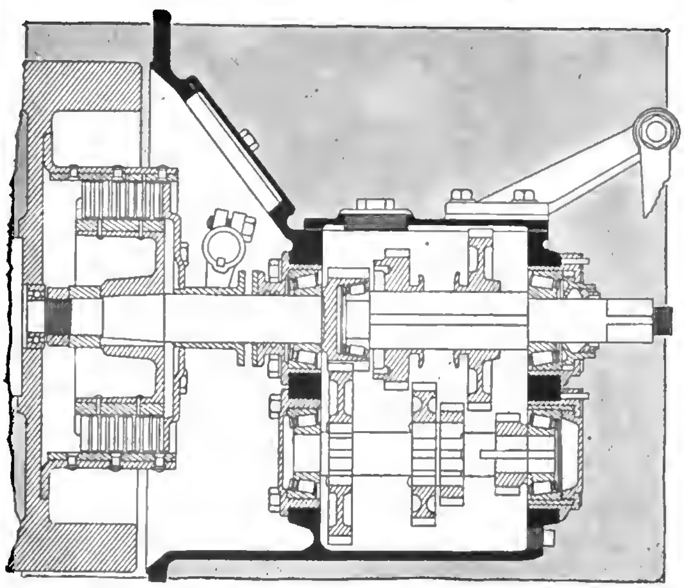

Fig. 3—Brown-Lipe model 35 unit power plant gearset

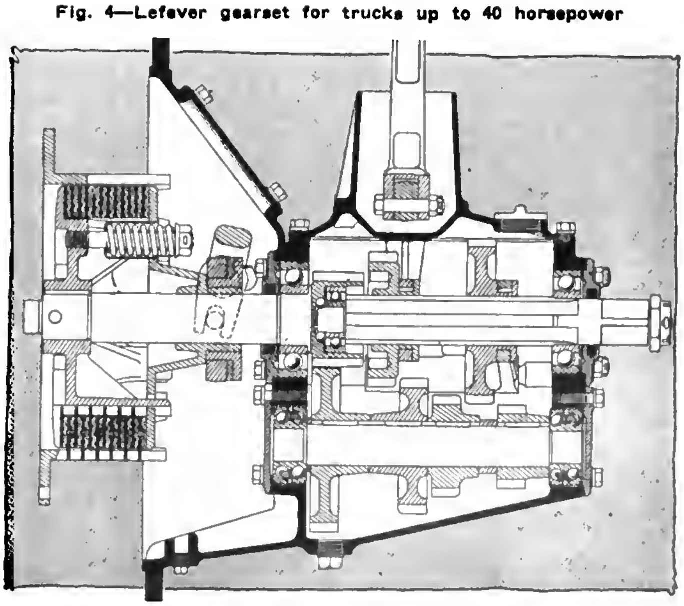

Fig. 5—Detroit Gear and Machine Co.'s unit design

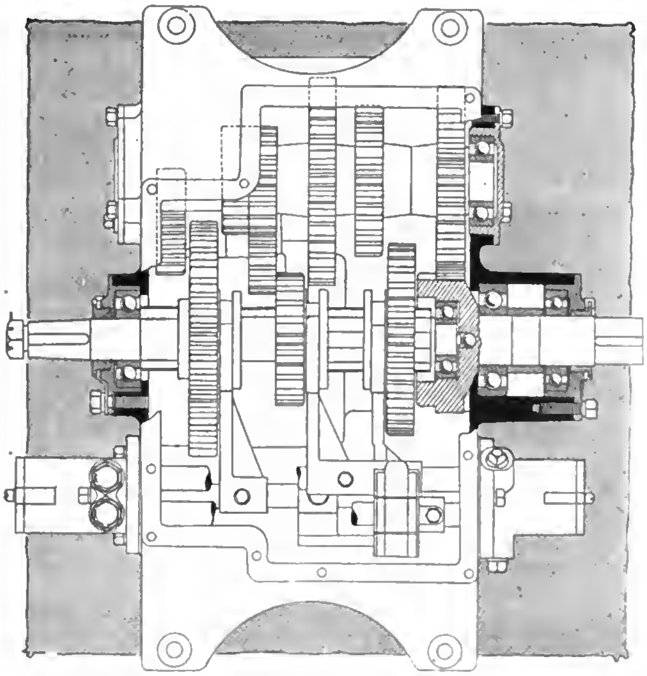

Fig. 6—Warner-Toledo four-speed type, direct on third

A typical design is the model 20, a sectional side view of which is given in Fig. 4. This model is for large trucks. This year sees no changes in the design of the Lefever products. Referring to Fig. 4, the gearcase bolts through a flange to the differential housing in the usual way. The shafts are mounted on annular ball bearings, a double-row bearing carrying the rear end of the mainshaft. A thrust ball bearing is placed at its forward end. At this end there is also a large packing ring preventing the leakage of oil from the case. The shafts carrying the gears are squared, the main sliding shaft being 1.1875-inch and the layshaft 1 inch square. All gears are made of 3.5 per cent. nickel steel, heat-treated. A feature of the Lefever gearsets is their compactness. They are provided with either single or two-rod control. The former allows application to any standard make of car, the only lever attachment being at the side of the frame, or the center, as the case may be. The Lefever planetary types are interchangeable with selective gearsets on the same jackshaft, the flange connections being standard.

Muncie

Practically all types of gearsets are numbered among the products of the Muncie Gear Works, Muncie, Ind., the pleasure car line including three- and four-speed types for mounting in unit with the motor and for placing amidships of the chassis apart from the power plant. In the commercial vehicle list are found selective, sliding gear types and planetary designs for assembling in unit with the jackshaft or for separate installation. All types of sliding gear constructions have ball bearings to carry the shafts, the heavier styles containing double-row ball bearings. Considering model T 64, which is a four-speed design, the speed reduction on first is 2.75 to 1; on second 1.56 to 1; and on fourth, .83 to 1. The third speed is the direct drive, the fourth having a 20 per cent. increase over direct. Another four-speed type is furnished, having direct on fourth, the ratios being: first, 3.6 to 1; second, 2.07 to 1; third, 1.32 to 1; reverse, 3.9 to 1.

In all designs suitable packing rings are provided where the shafts enter or emerge from the case, preventing oil leakage. Shafts are splined usually with four splines. Suitable cover plates for oil insertion and for inspection and adjustment are provided.

Warner-Toledo

The Warner Manufacturing Company, Toledo, O., announces that it is making a very complete line of three- and four-speed sliding gearsets arranged for sub-frame, unit power plant and rear axle constructions. The two latest gearsets of the Warner make are models 134 and 154. Both have four forward speeds, the former providing direct drive on third speed, and the latter giving the direct on fourth. Model 134 is shown in Fig. 6. The general description of both is the same. The housing of .28-inch aluminum has either four supporting arms for fixing to the sub-frame, or it is arranged for attachment to the crankcase of the motor. The gears have .875-inch faces and are of heat-treated alloy steel. They have very large diameters, the distance between the main and countershafts being 5 inches. These gears have a 14.5-inch pressure angle and have a 5 pitch. This angle gives a smooth rolling action tending to silence, it is said. The mainshaft has a diameter of 2 inches, while the layshaft is 1 1-2 inches in diameter. These are carried on annular ball bearings and the countershaft is splined for the gear sliding. Adjustable packing rings prevent oil leakage, and the shifting yoke rods are fitted with locating plungers.

The Warner company specially recommends these gearsets for heavy touring cars with motors up to 60 horsepower, although they are also suitable for the ordinary car. The gear ratios are well-proportioned, being determined by the results of considerable investigation on the part of the company's engineers.

Warner-Muncie

Every kind of selective, sliding gear type of gearset is manufactured for the trade by the Warner Gear Company, Muncie, Ind. That is, they are provided for unit power plants; for separate mounting on a subframe or on the chassis amidships; for rear axle unit constructions; for truck installations in connection with jackshafts. Model T-21 which is a type for 35 to 45 horsepower cars and has three forward speeds, is shown sectionally in Fig. 7. This is a typical Warner pleasure car construction for unit power plant application, the multiple-disk clutch in its separate compartment also being shown. The shafts are carried on Timken roller bearings, while the usual cover plates, oil plugs and oil packing rings are to be found. The sliding gearshaft is provided with four splines. The gears of this model are 1 inch in face width and their pitch is 5. They are made of an alloy steel, heat-treated and ground, and are automatically locked in and out of mesh. The layshaft in this design is carried below the mainshaft and not at the side as is the case with some of the designs which we have seen.

Although Timken bearings are shown in the construction herewith, the Warner concern furnishes its gearsets mounted on ball bearings if so ordered. It does not list planetary types of gearing, but states that it is in a position to manufacture this type of transmission as designed by its own engineers or according to approved designs of others on order.

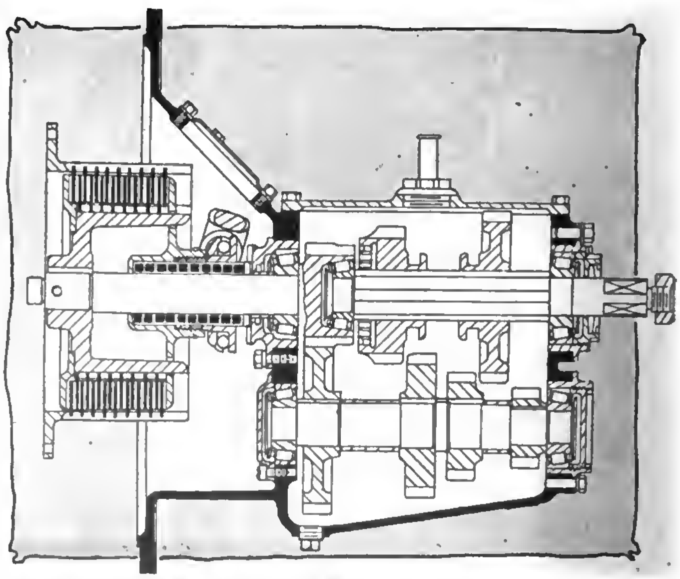

Fig. 7—Warner-Muncie model T-21 unit-with-motor type

Mondex – Magic Gearset

Single Pinion on Pivoted Shaft Transmits Drive to Stepped Internal Gear

A CHANGE speed transmission that represents a radical departure from ordinary practice is the Magic gearset, incorporated in the Mondex-Magic car, represented in this country by the Aristos Co., New York.

In this gearset the power is transmitted at all speeds through a single pinion which meshes with a special conical gear member connected to the forward end of the propeller shaft. This pinion, P, Fig. 2, is formed in one piece with the rear portion of a driving shaft S which connects to the clutch by a universal of the ordinary type. The shaft carries, just in front of the pinion, a sliding block J having ball bearings, which forms a means of moving the shaft end radially across the guide plate G. By doing so the pinion may be brought into mesh with any one of a series of internal toothed rings cut in the driven member C. The stepwise arrangement of these teeth is shown in Fig. 1. They are cut conically, that is, the common center of generation of all four rings is at a point corresponding with the universal at the forward end of the driving shaft. The high gear is obtained by inserting the driving pinion in the center gear ring where it acts as a jaw clutch. This forms a direct drive, as shown at A, Fig. 2. The low-gear position is shown at B.

The operating mechanism is not included in the illustrations, but this consists simply of the transverse shaft of the hand lever passing through the side of the gear casing at F, and having on its inner end a lever which engages with the sliding block J. A stud projecting from the under surface of the block into guideways and notches in the plate G makes it impossible to bring the teeth in mesh other than by a sliding movement.

Reverse is obtained by moving over the shaft until the driving pinion is in engagement with the intermediate pinion R, and then inserting both into the main gear member. This is accomplished by means of a lip L on the block which is brought up against a flange on the intermediate shaft, locking the two together. It will be observed that on all forward speeds the reversing pinion is standing idle, being held out of action by a light spring inside the bearing.

The driving pinion is kept in mesh by a spring surrounding the rear half of the driving shaft. The latter is really in two pieces, the forward portion, that connected to the universal being solid, while the part forming one with the pinion is tubular. A sliding keyed joint connects the two.

The conical gear member C is also in two pieces, but this is purely for constructional convenience. One ring contains the toothed racks for the first and second speeds, the third and high-gear teeth being cut in the other.

A short shaft, running in a plain bearing contained in a rearward extension of the gearbox, carries the gear wheel C, and transmits the power to the propeller shaft.

For operating this gearset a hand lever of the ordinary type is used, but the gate is much simpler, consisting of a series of regular steps for the four speeds and reverse. The rear edge of the gate represents the neutral position. By pulling the lever straight back, no matter what speed gear had been in mesh, neutral is secured.

Although, theoretically, some objection might be raised at the angularity of the driving shaft when in its low-speed positions, actual practice on the road, one car fitted with this gear having been tested over 18,000 miles, shows that this detail has less bearing on the efficiency than would be supposed. Efficiency with this method of drive is obtained by great accuracy in the cutting of the teeth and by the use of as long a driving shaft as is permissible. In the particular gearset illustrated the length of the shaft is such that the greatest angularity, which occurs on low speed, is the comparatively low figure of 4:30.

Bolt-on inspection covers are fitted to the gearcase and the forward extension which contains the driving shaft. The whole forms a single unit and is supported in the chassis on the three-point principle.

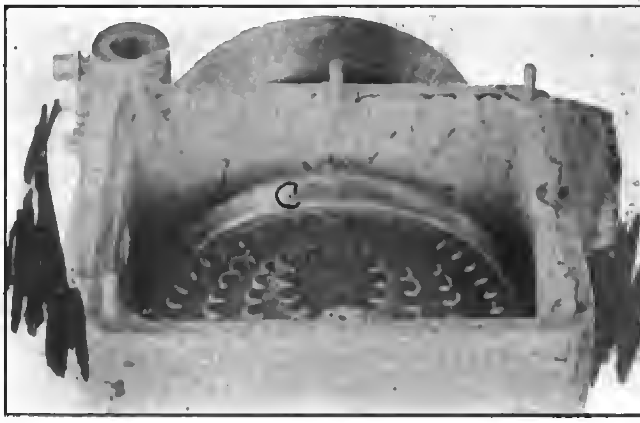

Fig. 1—Front view of the driven member, showing the four internal tooth rings which mesh with the driving pinion

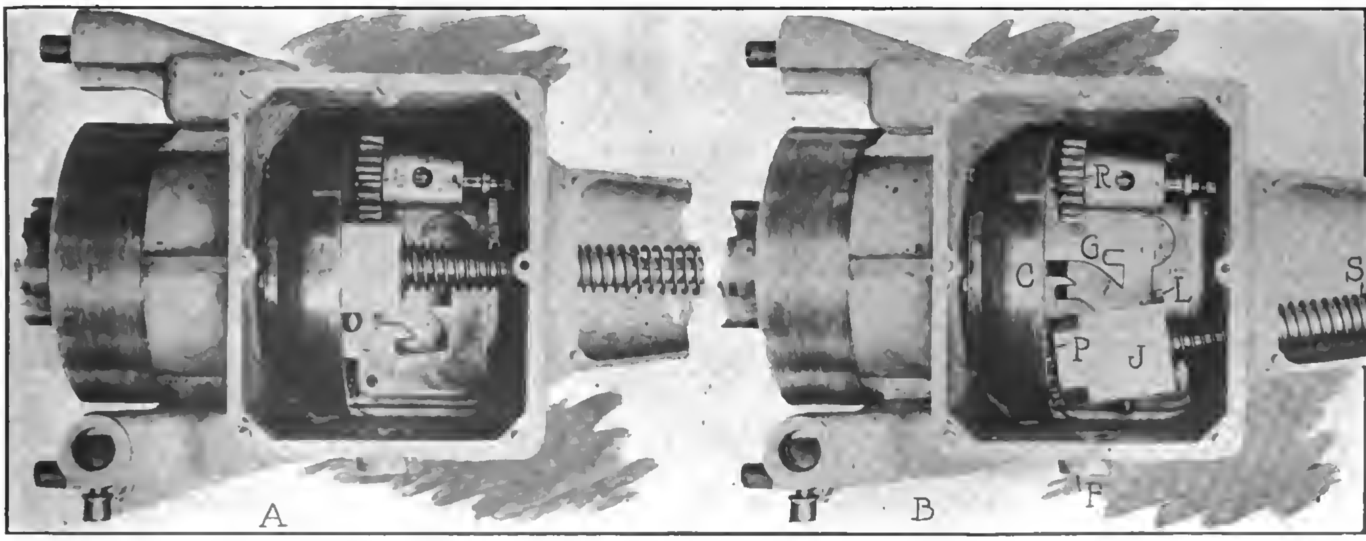

Fig. 2—The Mondex-Magic transmission in high and low speed positions. In high the drive is direct

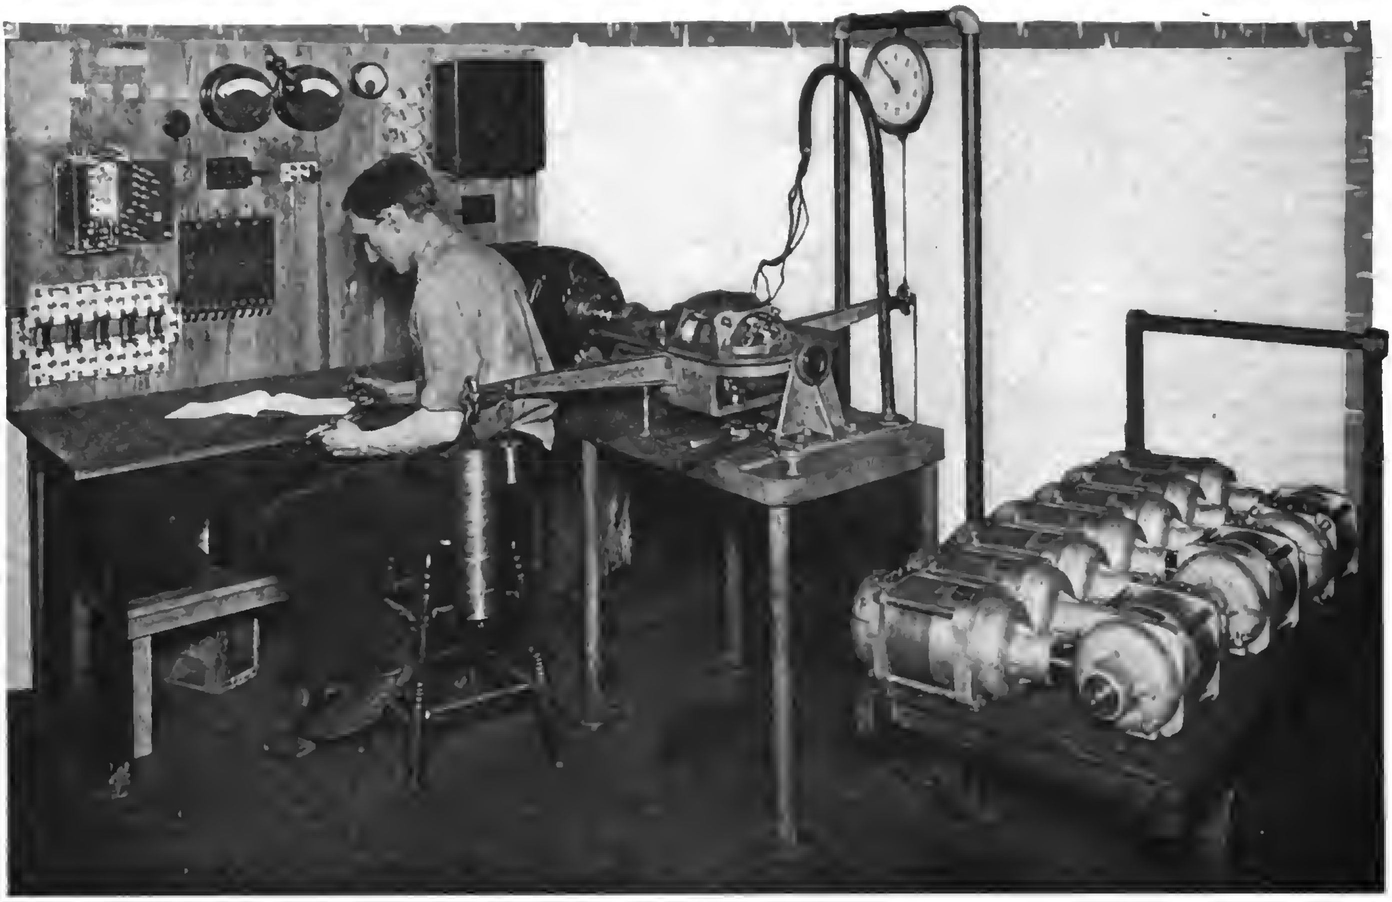
Factory Miscellany



Testing apparatus used to determine the efficiency of the Aplco starting and lighting system in the factory at Dayton, O.

THE illustration herewith shows the testing device used in determining the efficiency of the Aplco starting and lighting apparatus, at the plant of the Apple Electric Co., Dayton, O. The apparatus is a small dynamometer upon which the output of the motor is registered. If the torque exerted by the electric cranking motor falls below the standard required for the size of the motor it is rejected. As a motor the motor-generator used by the Aplco system must develop a capacity 200 per cent. greater than that required to turn over the automobile motor to which it is to be fitted. When used as a generator the motor-generator must develop sufficient current to light a full set of lamps and maintain the current in a storage battery at a speed corresponding to 12 miles an hour of the car. The performance of each instrument is noted and a record kept corresponding to the number of the instrument. It takes only one man to operate the testing outfit, and as may be noted, he sits at a table, operates the switches on the torque lever and notes down the readings at different speeds and under different loads. This gives a complete record of the performance of each instrument. These records can be filed and a complete check on the instruments in service maintained.

SALT LAKE Wants Truck Factory—If the plans and hopes of certain citizens of Salt Lake City, Utah, are carried out, the Utah state capital will have an automobile factory in the near future, representing an investment of $1,000,000 or more. The intention is to start a plant for the manufacture of motor trucks, suitable for mining work, for which there is a big market in Utah and the neighboring states.

Winton Increases Wages—The Winton Motor Car Co., Cleveland, O., has recently voluntarily increased the wages of its employees 10 per cent.

Mohawk Buys Stein Plant—The Mohawk Rubber Co. has been organized at Akron, O., and has bought the Stein Double Cushion Tire Co. plant and machinery for $350,000.

Evans Builds—The Evans Motor Car Co., Nashville, Tenn., which is being organized by R. H. Evans, has secured an 8-acre site 6 miles from Nashville and will erect a three-story building, 250 by 300 feet. The company will have $200,000 capitalization, and the plant will cost $60.000.

Ford's Los Angeles Plant—Bids for the construction of a five-story reinforced-concrete factory building to be built in Seattle, Wash., by the Ford Motor Car Co., Detroit, Mich., and to cost in the neighborhood of $250.000, will be called for within the next 30 days by the N. W. representative, H. P. Rice. It will be located at the south end of Lake Union.

Duff Plant Moved—The Duff Mfg. Co., manufacturer of the Barrett lifting jacks, has moved into its new plant and general office building located on Preble avenue, N. S., Pittsburgh, Pa. The new plant comprising approximately 68,000 square feet of area is located on a 5-acre site. The company is also planning the erection of plant in Chicago, Ill., and expects to have this factory in operation by next fall. A Canadian plant will be equipped this summer to be in operation by the early fall of 1913. The Canadian plant will be located at Windsor or Hamilton, Ont.

Big Los Angeles Plant—Plans are being prepared for the factory to be established on the 30-acre site in Wilmington, Cal., for the Los Angeles Motor Truck Mfg. Co. It is the intention to erect five reinforced-concrete buildings. The plant complete will cost, it is estimated, more than $300,000. The main factory building will be two stories, 60 by 300 feet; assembling building, one story, 120 by 200 feet; finishing building, one story, 80 by 280 feet; administration building, two stories, 40 feet by 60 feet, and power house, one story, 60 by 60 feet. Offices of the company have been opened in the Los Angeles, Cal., Investment building.

Ford's Kansas City Addition—The Ford Motor Co., Detroit, Mich., will increase the capacity of its assembling plant at Kansas City, Mo., and add equipment.

Land Deeded to Goodrich—Seventeen acres of land at St. Catharines, Ont., have been deeded to the B. F. Goodrich Co., Akron, O., for a Canadian tire factory, which it is said will employ a thousand men.

National Rubber Purchases Land—The National Rubber Co., Alliance, O., recently organized, has authorized the purchase of land and asked for the submitting of bids for the construction of the new plant.

Swinehart Awards Contracts—The Swinehart Tire & Rubber Co., Akron, O., has awarded contracts for the addition of a three-story building to its main plant at Akron, O. The new structure will be 100 by 70 feet.

Ford's New Plant—The Ford Motor Car Co., Detroit, Mich., is planning the erection of a new plant which is to be six blocks long and three stories high. Three million barrels of cement will be employed in its construction.

New Heat-Treating Building—The Weston-Mott Co., Flint, Mich., manufacturer of automobile axles, is planning the erection of a new heat-treating building. The plans call for a one-story building 75 by 325 feet of saw-tooth design.

Lock Plant in Findlay—A new manufacturing project has matured in Findlay, O., with the incorporation of the United States Automobile Lock Co., with $15,000 capital. The company will manufacture a new type of automobile locking device.

Motor Truck Corporation Builds—The Motor Truck Mfg. Corp., Mount Vernon, N. Y., has been incorporated with a capital stock of $150,000 to manufacture and deal in motors, engines, etc., and will establish a plant at that city in the near future.

To Enlarge Plant—Bids have been given by the Cole Motor Car Co., Indianapolis, Ind., for a $150,000 addition to the present plant. The new addition will be L shape, four stories high, built along modern lines. When finished the advertising force will move to the new plant.

Work on New Departure Plant—Work is now well under way in the Hartford, Conn., plant of the New Departure Mfg. Co., which was formerly occupied by the Whitlock Coil Pipe Co. The local plant will be utilized for the production of shaft hangers thus relieving the main works where automobile bearings are featured.

Building Permit to Swinehart—A permit was recently applied for by the Swinehart Rubber Co., Akron, O., for a three-story building, to be erected at Howard and North streets. This structure will be erected at a cost of $20,000 and will be occupied for tire building. The new plant will be 60 by 102 feet.

The Automobile Calendar

Shows, Conventions, Etc.

Mar. 27-April 3....Quincy, Ill., Mississippi Valley Automobile Show, H. F. Hofer, Director.
Mar. 31-April 5....Manchester, N. H., Automobile Show, Dealers' Association, J. H. Graham, Manager.
April..............San Antonio, Tex., Annual Show, San Antonio Motor Car Show Co.
April 1-6.........San Francisco, Cal., Motor Truck Show, Coliseum Hall, *Motor Field.*
April 5-19.........Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.
June 5, 6, 7.......Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October............Paris, France, Automobile Show, Grand Palais; 10 days.
November.........London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

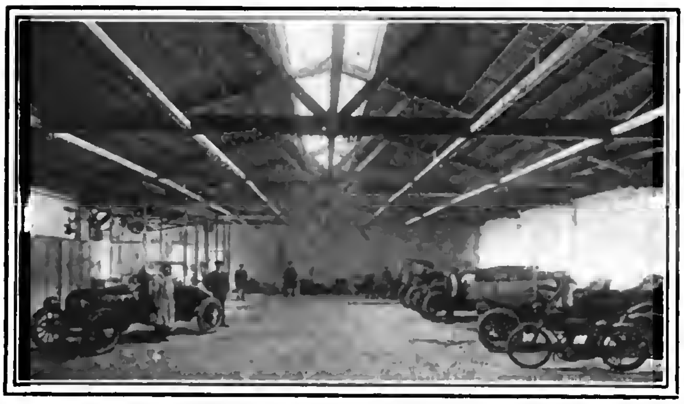
April 28-30........Chicago, Ill., Commercial Vehicle Demonstration, Chicago Motor Club.
May 5-8...........Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14............New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.
June 25-28.........Chicago, Ill., Non-Motor-Stop Reliability, Chicago to Boston, Chicago Automobile Club.
July 1............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16.........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 4-6...........Tacoma, Wash., Road Race, Montemara Festa Automobile Committee.
July 8-16.........Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 27-28.........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 27...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

April ....Barcelona, Spain, International Exhibition.
May ....St. Petersburg, Russia, International Automobile Exposition, Building of Michael Maneze, Imperial Automobile Club of Russia.
July 12...........Amiens, France, Grand Prix Race.
July 18-26.........London, Eng., Imperial Motor Transport Conference.
Sept. 25...........Isle of Man, International Stock Car Race.

Part of the wrapping-room at the factory of the Goodyear Tire & Rubber Co., Akron, Ohio. In this room the tires are put through a wrapping process before going to the vulcanizer for their first cure

Streets are wide and cars are numerous in Los Angeles, Cal. The above illustration shows part of the Los Angeles automobile row



View of the interior of the new garage adjoining the salesroom of the Buxton & Childs Auto Co., Los Angeles, Cal., distributors of the Moon

TRUCK Replaces Twenty-One Wagons—A gasoline motor truck and trailers have been shipped to the Wilbert mine near Arco, in the mountains north of Pocatello, Ida., to take the place of twenty-one wagons and twenty-one drivers in the transportation of ore from the mine to the railroad station.

Limbach Tribune's Engineer—H. C. Limbach has been made chief engineer at the Tribune Motor Co.'s plant, Detroit, Mich.

Central Adds New Agency—The Central Tire Co., Philadelphia, Pa., has opened an additional supply agency at 136 North Broad street.

Coronet Takes Service Recorder—The Coronet Mfg. Co., Cleveland, O., has taken the agency for the Service Travel Recorder Co., that city.

Bryte to Handle Allen Wrenches—A. Bryte, of San Francisco, Cal., has taken the distributing agency for Allen wrenches on the Pacific Coast.

Schwab Speedwell Branch Manager—F. N. Schwab has been appointed branch manager of the Speedwell Motor Car Co., Dayton, O., in Chicago, Ill.

Tarlton Sells Garage Interest—P. E. Tarlton has sold his interest in the Tarlton-Porter Garage, Kenton, O., to C. B. Porter, who will conduct the business in the future.

Bricker Production Manager—M. L. Bricker, formerly superintendent of the Briggs-Detroiter Co., Detroit, Mich., has been advanced to the post of production manager.

Symonds in New Quarters—The Symonds Motor Car Co., 1228 So. Flower street, Los Angeles, Cal., opened its new headquarters. This firm represents the Marion car.

Times Square Company Buys—The Times Square Auto Co., New York City, has purchased the site at 56th street and Broadway, formerly occupied for years by Wyckoff, Church & Partridge.

Indianapolis Branch for S. R. B.—The Standard Roller Bearing Co., of Philadelphia, Pa., has opened a branch at Indianapolis, Ind., at 1201 State Life Bldg. L. M. Watkin, Jr., will be in charge.

Davis Plans New Garage—Rex Davis, automobile dealer of Theresa, N. Y., and agent in that town for the Ford car, plans to construct a new garage on the Getman House property, that city, this summer.

Blake with International Motor—K. M. Blake has resigned as manager of the Boston, Mass., branch of the Locomobile Company of America, Bridgeport, Conn., to become the New York sales manager for the International Motor Co.

Babcock Joins Enterprise Metal—H. L. Babcock, formerly with the H. H. Franklin Mfg. Co., Syracuse, N. Y., has become Western representative of the Enterprise Metal Co., of Syracuse. He will make his headquarters at 305 Ford building, Detroit, Mich.

Chandler Opens Cleveland Offices—The Chandler Motor Co., has opened temporary offices in the Swetland building in Cleveland, O. Sales Manager Emise says a factory site has been secured in Cleveland and that production will be in full swing by July 1.

Columbus Wants More Equipment—It is proposed to purchase a new combination ambulance and patrol wagon for the use of the police department of the city of Columbus, O. It is also urged that automobiles be purchased for the use of the detective department.

Moline Sales Force Meets—The Moline Automobile Co., East Moline, Ill., recently started a series of meetings representing all of its branch managers as well as the field force representing the factory. A full day was put in in discussion of the car in detail at the plant. Addresses were made by C. H. VanDervoort and R. W. Phelps.

New Agencies Established During the Week

PLEASURE VEHICLES

Place	Car	Agent
Akron, O.	Hudson	City Auto Sales Co.
Baltimore, Md.	Pullman	Shaffer Mfg. Co.

Newark Purchases More Apparatus—Newark, N. J., has purchased three Palmer-Singer light six roadsters for its fire department.

Eames Standard Electric Manager—Hayden Eames has been appointed general manager of the Standard Electric Co., Jackson, Mich.

Bornstein with Premier—H. D. Bornstein has joined the Premier Motor Car Co., and will assist in the advertising and publicity work.

Takes L. & M. Tire Agency—The W. W. Price automobile repair works has taken on the agency of the L. & M. tires in Carrolton, O.

Smith Motz Tire Manager—The Motz Tire and Rubber Co., Akron, O., has engaged J. G. Smith as manager of its New York City branch.

New Fire-Fighting Apparatus—An automobile hook and ladder truck, costing $5,100, has been added to the Paris, Tex., fire department, making three motor machines now in service.

New Garage Owners—The Swalm Hardware Co., Pottsville, Pa., is about concluding negotiations for the purchase of the Youse garage, that city.

Middletown Wants Three Trucks—The fire department and council of Middletown, Pa., are considering the purchase of three automobile hose trucks.

Interborough Orders G. V. Trucks—The New York Railways Co., New York City, has ordered twenty-five electric trucks from the General Vehicle Co., that city.

Dustin Retail Sales Manager—The American-Marion Sales Co., 1896 Broadway, New York City, has secured the services of Lee N. Dustin in the capacity of retail sales manager.

Pope's Providence Service Station—The Pope-Hartford Automobile Co. has leased a new building, two stories high, 50 by 100 feet, in Providence, R. I., and will use it for a service station.

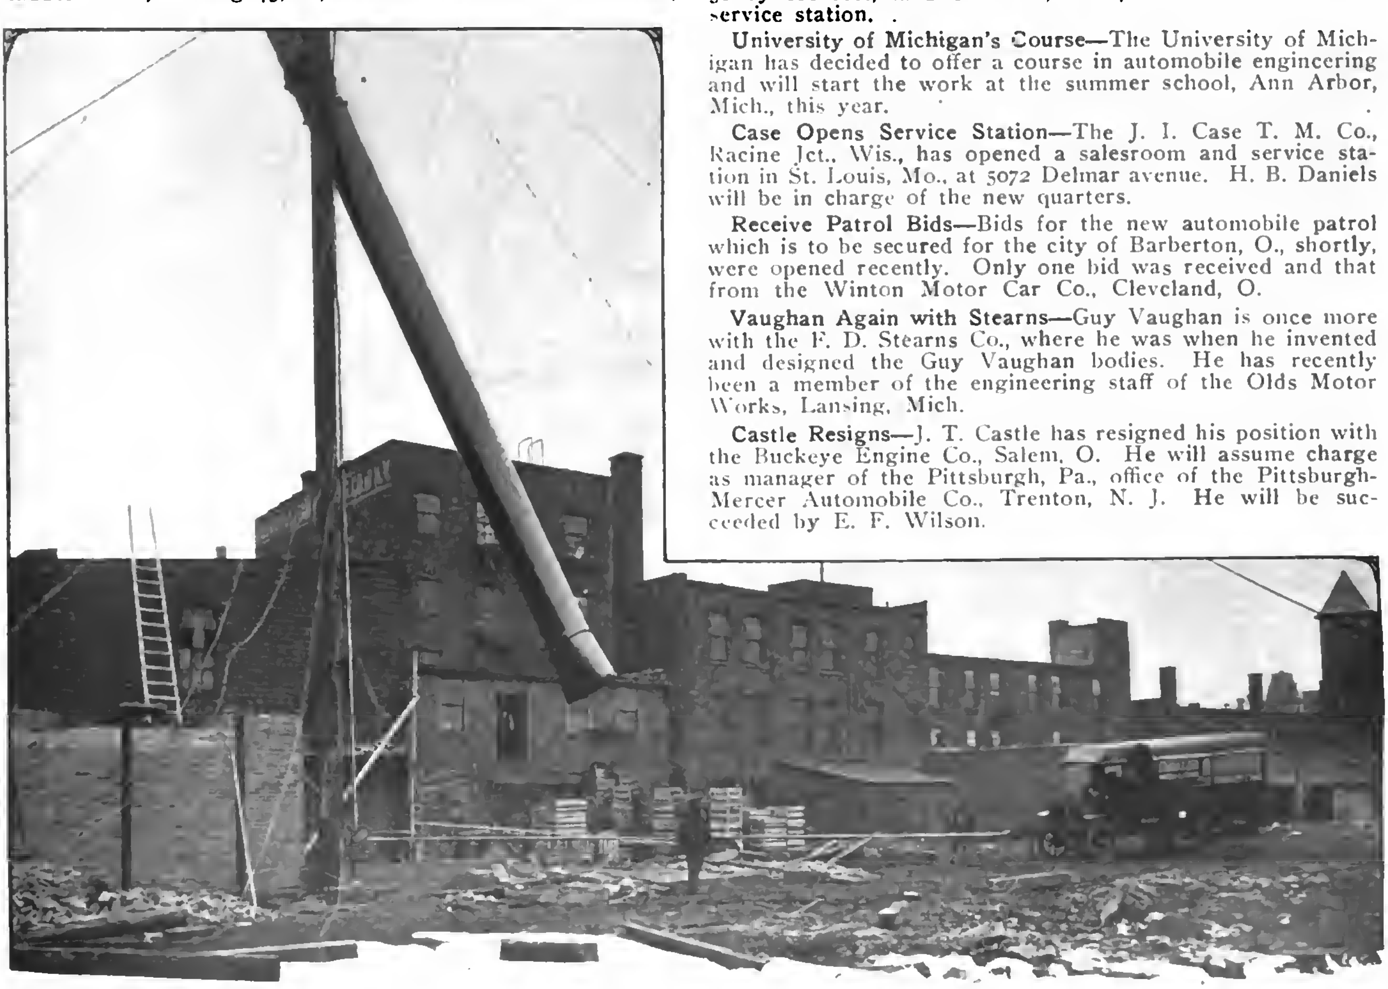
University of Michigan's Course—The University of Michigan has decided to offer a course in automobile engineering and will start the work at the summer school, Ann Arbor, Mich., this year.

Case Opens Service Station—The J. I. Case T. M. Co., Racine Jct., Wis., has opened a salesroom and service station in St. Louis, Mo., at 5072 Delmar avenue. H. B. Daniels will be in charge of the new quarters.

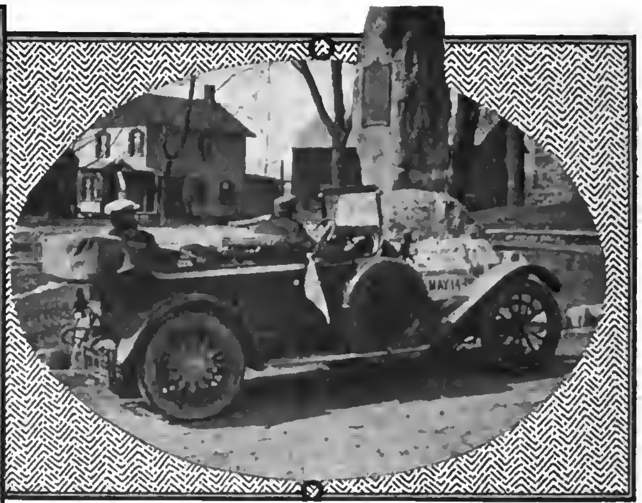
Receive Patrol Bids—Bids for the new automobile patrol which is to be secured for the city of Barberton, O., shortly, were opened recently. Only one bid was received and that from the Winton Motor Car Co., Cleveland, O.

Vaughan Again with Stearns—Guy Vaughan is once more with the F. D. Stearns Co., where he was when he invented and designed the Guy Vaughan bodies. He has recently been a member of the engineering staff of the Olds Motor Works, Lansing, Mich.

Castle Resigns—J. T. Castle has resigned his position with the Buckeye Engine Co., Salem, O. He will assume charge as manager of the Pittsburgh, Pa., office of the Pittsburgh-Mercer Automobile Co., Trenton, N. J. He will be succeeded by E. F. Wilson.



Showing one of the many duties to which a motor truck may be subjected. A White 3-ton truck utilized to hoist an 80-foot sheet-iron smoke stack into its cradle, 12 feet above the ground



The West Hudson and Catskill endurance, reliability, hill-climb and fuel economy test gives promise of being exceedingly interesting. It is planned to run the test, which will be conducted by "Senator" W. J. Morgan, on May 14-15. The accompanying illustrations depict the pathfinding car, an Alco six, at various points on the route which has been selected for the run. The one shown above at the left is from a photograph taken half way up the mountain between Palenville and Haynes Falls, N. Y. That at the right was taken at the monument at New Paltz.

Bennett with Abbott-Detroit—A. L. Bennett has become sales manager for the Abbott-Detroit Co., New York City.

Kelly Oakland Factory Manager—W. D. Kelly has been appointed factory manager of the Oakland Motor Car Co., Pontiac, Mich.

Stoddard Garage Addition—The Stoddard Motor Car Co. will erect a two-story addition, 60 by 50 feet, to its garage at Springfield, Mass.

Cole Agent Moves—The G. R. Cowie Co., Washington, D. C., has removed from 1317 H street, N. W., to 2121 Fourteenth street, N. W.

Skinner Portland Ford Manager—H. C. Skinner, from Houston, Tex., is now manager of the Portland, Ore., branch of the Ford Motor Car Co.

Plugit Tire Agency Established—Sub-agents for the Plugit liquid tire filler have been established throughout the state of Maryland by the Baltimore representatives, Gauer and Blaycock.

Atkinson Pacific Manager—Robert Atkinson, for some time past associated with J. W. Leavitt & Co., of Portland, Ore., has resigned and will act as manager of the Pacific Car Co., in Seattle, Wash.

La Grande's Fire Equipment—La Grande, Ore., though a city of the small class, has recently motorized its fire department, $8,000 being spent by this eastern Oregon city in the purchase of an automobile.

Bieler Branch Sales Manager—The Carl Spoerer's Son Co., Baltimore, Md., has appointed O. R. Bieler to take charge of the sales end of the Bosch products for which the Spoerer company is the local representative.

Adds Accessory Department—D. S. Hendrick Co., Inc., agent for the Abbott-Detroit, Franklin and Stewart truck, at 1024 Connecticut avenue, has added an accessory department. It will be under the management of W. Elkins Reed.

Hart Stewart-Warner Manager—T. M. Hart has recently been appointed manager of the Portland, Ore., branch of the Stewart-Warner Speedometer Co. He was formerly manager for the company in Los Angeles, Cal. He will be located at 57 No. Broadway.

Moran Executive Engineer—G. R. Moran, formerly chief engineer for Barthel, Daly and Miller, and later executive engineer in charge of the Detroit, Mich., office of the New Departure Mfg. Co., has taken a similar position with the Suspension Roller Bearing Co., Sandusky, O.

New Garage in Birmingham—Loveman, Joseph and Loeb have let a contract for the erection of a new garage at Avenue C and Twenty-first street, Birmingham, Ala. The building will be modern in every way and will be the largest structure, it is claimed, especially designed for automobiles in that city.

Another Railroad Adopts Automobile—Official notice of the adoption of motor-car service on the Chicago, Peoria and St. Louis Railroad has been given out. According to this notice four of these cars have been purchased by the company and two of them will be put into service in the near future.

General Motors Leases Building—The General Motors Truck Co., Detroit, Mich., has secured a long lease on a piece of property in the heart of automobile row and a building to be used as a salesroom and garage will be erected in the next 90 days. The building will be one story and will cost to build about $20,000.

Will Share Display Expenses—Owing to the increasing use of automobiles in the interior towns of Louisiana, New Orleans dealers are planning to share expenses in a display of cars at a number of points. Accessory dealers also will join the movement. An effort is being made to get special rates on the railroads for the transportation of the cars intended for exhibit purposes only.

University's Extension Course—The university extension division of the University of Wisconsin, Madison, Wis., has made another innovation by establishing an extension course in the operation and management of motor cars and trucks. The first class has been formed at Sheboygan, where E. M. Gorrow of Oshkosh, Wis., instructor in the extension division, is imparting knowledge and instruction relative to motors. Other classes are being established in Superior, La Crosse, Martinette, Wausau and other principal cities. The departure in extension work by the University of Wisconsin is attracting wide and favorable attention.

Automobile Incorporations

AUTOMOBILES AND PARTS

Accident, Md.—Motor Car Sales Co.; capital, $25,000; to manufacture, sell and deal in all kinds of engines, vehicles, etc. Incorporators: Newton Gies, G. N. Emory, C. C. Frederick.

Buffalo, N. Y.—Ivey Motor Truck Co., Inc.; capital, $10,000. Incorporators: Chas. A. Ivey, A. L. Rusling, Frank G. Heller.

Nashville, Tenn.—Evans Motor Car Co.; capital, $200,000. Incorporator: R. H. Evans.

New York City—Greater New York Motor Co.; capital, $10,000. Incorporators: Samuel Marusi, Samuel Feldman, Cæsar Pianisani.

New York City—General Auto Trucking Co., Inc.; capital, $25,000. Incorporators: George W. Freeman, Albert A. Benedise, Thomas G. Gannon.

New York City—Motor Coach Co.; capital, $500,000; to manufacture autos, motor car hearses and burial coaches. Incorporators: Sam Richenthal, Elbert R. Benyunes, Herman Miller.

New York City—Service Motor Truck Co. of N. Y.; capital, $7,500. Incorporators: Charles H. Roman, Elias T. Silverstein, Peter L. Stickney.

New York City—Signal Motor Truck Co., Inc.; capital, $350,000. Incorporators: F. C. Canfield, J. S. Coates, W. C. Floyd-Jones.

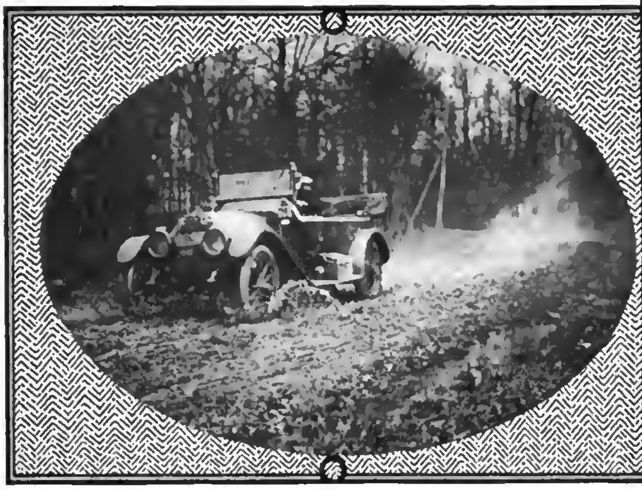
Schenectady, N. Y.—Schenectady Auto-Car Co.; capital, $10,000. Incorporators: Emmet Fisher, A. Langaneuer, L. Buonfiglio.

Steubenville, O.—National Wave Motor Co.; capital, $1,000,000; to manufacture wave and water motors.

Ayer, Mass.—Robert Murphy's Sons Co.; capital, $30,000; garage. Incorporators: John R. Murphy, William Murphy, Robert F. Murphy.

Columbus, O.—Motor Owners' Supply Co.; capital, $40,000; to handle a complete line of automobile accessories and supplies. Incorporators: Geo. A. Archer, W. G. Fisher, James W. Carroll.

Columbus, O.—F. & H. Wire Co.; capital, $25,000; to manufacture and deal in wire wheels for automobiles and accessories of all kinds. Incor-



Two more views of the pathfinding car on the West Hudson and Catskill endurance run. The above illustrations show the extremely muddy state at the present time of some of the roads in the region to be traversed by the tour. By the middle of May, when the run is scheduled to be held, these roads will probably be in excellent condition. Naturally, the scenic attractions will constitute one of the greatest features of the trip, the route to be followed winding up steep grades into some of the most picturesque parts of the Catskills and down into the quaint old, villages filled with legendary interest. The pictures shown above were taken between New Paltz and Newburgh, New York.

Byrne CarterCar Manager—C. J. Byrne has been made manager of the CarterCar Co., Minneapolis, Minn.

Minneapolis Buys Patrol—The Minneapolis, Minn., police department has bought a Winton Six car for use of the detectives and the chief of police.

Critchley President I. A. E.—J. S. Critchley has been elected president of the Institution of Automobile Engineers, London, Eng., for the session 1013-14.

Auto Supply Leases Stores—The Auto Supply Co., Beloit. Wis., has leased the stores at 422-426 State street, Beloit, and will at once establish a large accessory and tire store.

St. Cloud Buys Saurer—The city of St. Cloud, Minn., has bought from the Twin City Motor Co. a Saurer motor sprinkling truck. The machine carries a 1,200-gallon tank.

New Twin City Garage—The Twin City Auto & Tire Co., Marinette, Wis., has purchased three lots on Hall avenue, that city, and will erect a new garage and sales building to cost about $25,000.

Superior Joins A. A. A.—The Superior, Wis., Automobile Club, which has been in existence for five years, has voluntarily voted to join the Wisconsin State Automobile Association and thereby the A. A. A.

Engineers Open Legal Bureau—The Automobile Engineers, St. Paul, Minn., will open a legal bureau and an exchange by which employers may get reliable chauffeurs. A branch is to be established in Minneapolis.

P. O. Tests Automobile—The Montclair, N. J., post office is testing the plan of using an automobile for collection and delivery of parcel post packages. The automobile may be adopted permanently for the parcel post service.

Diemann Granted Garage Permit—William Diemann, 725 Greenfield avenue, Milwaukee, Wis., has been granted a permit to build a garage and salesroom at that location to cost $10,000. No agency lines have been decided upon as yet.

Oil Company Plans Warehouse—The Viscosity Oil Co., Chicago, Ill., which is owned principally by the Travers interests of Beloit, Wis., is planning the establishment of a large warehouse and station at Durand, Wis., to supply the northwestern states.

I. A. E. Trip to U. S.—Up to the present some twenty members of the Institution of Automobile Engineers have definitely intimated their intention to take part in the trip to the United States, but it is anticipated that this number will be doubled before the sailing date arrives. The date for leaving London is May 17.

Goodrich Opens Minneapolis Quarters—The B. F. Goodrich Co., Akron, O., has opened its new quarters in the recently completed Glenwood-Inglewood building, Minneapolis, Minn., utilizing two floors and the basement, each 50 by 150 feet. A balcony is swung over the first floor. The company is making the first showing of the $500 clay model of the factory buildings.

Few Red Sea Coast Automobiles—There are sixteen automobiles in Aden, of which number six motor buses are practically useless. There is one 3 1-2-ton French motor truck. Only two of these cars are American, but one owner proposes to introduce six Fords as public vehicles, and has ordered two. All cars in Aden have been brought there since 1910, and many are second-hand. Only two or three are sold annually.

Changes in Locomobile Company—G. H. Bryan has assumed the duties of assistant advertising manager of the Locomobile Company of America, Bridgeport, Conn. W. H. Davis, Jr., formerly advertising manager of the Stoddard-Dayton Automobile Co., has been placed in charge of truck advertising. A. A. Stewart has joined the service department. F. P. Crockett has been appointed sales manager of the truck division of the Boston, Mass., branch.

Chance for Agency—A report from an American consular officer states that a firm in a Latin-American country, which has been acting as agent for a German automobile manufacturer, claims to have sold over 200 cars in less than two years. This firm now wishes to obtain the representation of a low-priced American car and asks to be put in touch with manufacturers, from whom it desires prices, terms, etc., with catalogs and prices of repair parts. Bank references are furnished and correspondence should be in Spanish. Those interested will please answer through the Bureau of Foreign and Domestic Commerce, Washington, D. C., File No. 10,600.

Automobile Incorporations

porators: L. S. Frayer, Chas. G. Howard, S. K. Wissinger, Chas. S. Hamilton, E. R. Sharp, Jr.

Islip, N. Y.—Brightwaters Garage, Inc.; capital, $1,000. Incorporators: Russell M. Fanning, William H. Corwin, Stewart L. Fanning.

Jacksonville, Fla.—Seminole Rubber Co.; capital, $1,000,000; to manufacture tires and otber automobile accessories. Incorporators: Geo. F. Hardy, Geo. H. Lutz, J. J. Weyer.

New York City—Henscbel Tire & Rubber Co.; capital, $10,000; to manufacture tires for autos. Incorporators: Rudolph Henschel, Anna Henschel, William A. Wollman.

New York City—Hoffman Taxi Cab Co.; capital, $5,000. Incorporators: Richard J. Cruice, Andrew J. Finnerty, Geo. B. Jenkins.

New York City—Mohawk Rubber Co. of N. Y.; capital, $10,000; to deal in tires and rubber goods. Incorporators: Morris E. Mason, Chas. W. McLaughlin, Milton Dammann.

New York City—Peerless Tire Co.; capital, $15,000; to deal in auto tires and tubes. Incorporators: Michael Schiavone, Geo. P. Calenda, Louis Schiavone.

Pittsburg, Pa.—Auto Vulcanizer & Specialty Co.; capital. $5,000. Incorporators: Alfred Dickson, H. W. Graib, Frank L. Stern.

CHANGES OF CAPITAL AND NAME

Cincinnati, O.—Leyman-Buick Co.; capital increased from $50,000 to $100,000.

Columbus, O.—Quiggle Auto Co.; capital decreased from $10,000 to $2,000.

Detroit, Mich.—Lozier Motor Co.; capital increased from $3,000,000 to $5,000,000.

Fremont, O.—Safe Storm Front Co.; capital increased from $35,000 to $100,000.

Philadelphia, Pa.—Standard Gas & Electric Power Co.; change of name to Vulcan Motor Devices Co.

EMERGENCY Automobile Tire—Consisting of a sheet-metal shell, the ends of which are held together by a bolt screwing into threaded openings of the caps which form the ends.

The emergency tire described in this patent consists of a shell made of sheet steel which is wound spirally as seen in Fig. 1. The shell S has left and right threads at its ends and caps C are applied over these threads to reinforce the shell ends. A cable K extends all through the tire and the cable ends are operatively connected with the caps C, holding thec aps tightly in place on the shell ends. The caps are formed with internally threaded members extending into the inside of the tire and a left and right threaded bolt engages these threads, connecting the two shell ends and permitting of tightening or loosening them.

No. 1,057,388—to Frank L. Bigsby, Kirksville, Mo. Granted March 25, 1913; filed October 3, 1911.

Shock Absorber—Including two heads and friction disks between them.

The shock absorber Fig. 2 includes two hollow, abutting heads, each of which has a radially-extending arm and one of which supports a ratchet wheel rotatable in it independently of the head itself. The head carries a pawl which engages the ratchet, permitting its rotation in one direction only; this pawl is disengaged from the ratchet if the latter is moved in the opposite direction. From the center of the ratchet wheel extends a barrel which has radially projecting lugs and is journaled in the opposed head; the latter is formed with radially-disposed notches on its inside face. A number of friction disks are arranged in frictional engagement with each other between the two heads and alternate disks have teeth engaging respectively with the barrel and the notches in the head.

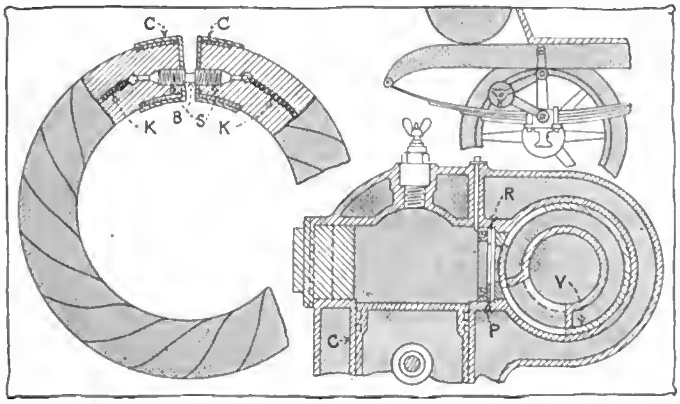


Fig. 1—Bigsby emergency tire. Fig. 2—Bohm shcck absorber. Fig. 3—Tartrais valve packing

No. 1,057,030—to Andrew Bohm, Morristown, N. J. Granted March 25, 1913; filed October 21, 1911.

Rotary Valve Packing—Consisting of a threaded ring in the cylinder wall, a packing ring and a washer between them.

The subject matter of this patent is a packing for a rotary valve, Fig. 3, which consists of a threaded ring R which is screwed into the cylinder wall opposite to an opening which communicates with the rotary valve V provided for admitting and exhausting the cylinder gases. A packing ring P is in contact with the valve V and a washer is in place between the two rings, means being provided for stopping the opening.

No. 1,057,297—to Eugene Henri Tartrais, Montmorency, France. Granted March 25, 1913; filed June 15, 1912.

Automobile Lifting Jack—Consisting of a vertical web formed with a stop for engaging the axle support.

The jack described in this patent, Fig. 4, consists of a body which is formed of a flanged base portion B and a vertical, segmental web W. The latter extends along the longitudinal middle of the base and has a stop on its upper edge. An axle support which consists of a bar B1 pivoted at P to the body and provided with a device adapted to engage the stop serves for raising the automobile and holding its elevated position.

No. 1,057,315—to William T. Adams, Cornith, Miss. Granted March 25, 1913; filed April 3, 1912.

Automobile Tire—Comprising a fabric ring held together by a binder.

The tire described in this patent and shown in Fig. 5 consists of a hard, compact ring R; the latter is composed of transverse, radially arranged plies of woven fabric which are compressed circumferentially, radially and transversely of the ring. The plies of the ring have their threads arranged diagonally to form a wearing surface of thread ends. The plies are held assembled and compressed by a binder B.

No. 1,056,976—to Bradford H. Divine, Utica, N. Y. Granted March 25, 1913; filed March 6, 1911.

Shock Absorber Construction—Being of the friction-disk type.

The shock absorber, Fig. 6, consists of two outer disks, an inner disk of smaller diameter than the outer disks and lever L carrying these disks. A friction member is arranged between one of the outer disks and the opposed face of the inner disk and is provided with a surface which frictionally engages the inner disk; it is formed with a ring outside of the periphery of the inner disk, and another friction element is in place between the ring and the second outer disk. A third friction element contained inside the ring has surfaces co-acting with the second mentioned friction element and one with the inner disk. The three friction elements have contact surfaces spaced different distances apart. One of the levers is movable into successive contact with these surfaces.

No. 1,057,292—to Charles N. Sowden, Guantanamo, Cuba. Granted March 25, 1913; filed June 12, 1912.

Trunnion Radiator Suspension—Ball trunnions resting on cap plates supported by the frame form the suspension.

The subject-matter of this patent is a radiator support for automobiles which consists of ball trunnions attached to opposite sides of the radiator. Two-part cap plates are removably secured to the trunnions and have internal surfaces which conform to them. They have cylindrical external surfaces and fixed brackets on the side frames which have cylindrical bearings inclosing the cap plates and permitting limited longitudinal sliding movement.

No. 1,056,874—to James E. Woodbridge, Bridgehampton, N. Y., assignor to F.I.A.T., Poughkeepsie, N. Y. Granted March 25, 1913; filed June 28, 1907.

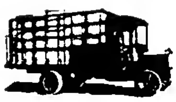
The Automobile

Front view of the largest automobile factory in the world. The plant of the Ford Motor Car Co., Detroit, Mich.



Detroit

The City Built by the Automobile Industry

By L. V. Spencer

DETROIT is the world's automobile center. Its machines have been shipped to every port and have penetrated to every nook and corner of the earth where automobiles are permitted to go. spreading the motor car fame of America's "City of the Straits" broadcast.

Whenever the world thinks of the automobile, it thinks of Detroit. If Mr. Dealer in Naples or Hamburg or Vienna is thinking of taking on a line of motor vehicles, he writes Detroit.

With an estimated production this year of nearly 400,000 machines, valued at close to $500,000,000, Detroit enters the fourteenth year of its active automobile history as the heart of the motor vehicle industry, the growth of which is unparalleled in the annals of the industrial world.

In a decade it has overtopped all of the other healthy industries of the city. Just as Pittsburgh centers the steel industry, as Chicago is noted for its great packing houses, as Marseilles is world-famed for its silk industries, so Detroit is the pulse of an industry which 20 years ago was looked upon as a joke.

Though originally possessing no greater advantages than half a dozen other American cities, Detroit today offers greater inducements perhaps than any other community for the location of factories dependent upon the automobile industry. Here are located parts and accessory plants of all descriptions, in addition to the many automobile factories, and the very concentration of all these different phases naturally means a steady increase from year to year. The automobile maker who intends to assemble his product need no worry about freight rates, or delays in transportation for getting his products to his own plant. It is only necessary to transport them from their places of manufacture, perhaps a distance of a few city blocks or a few miles.

Detroit's automobile manufacturing history dates back to about the year 1899, when the industry assumed the form of a commercial enterprise, although Henry Ford, and R. E. Olds, developed horseless carriages which would actually run before that date. The Detroit Board of Commerce records show that in September, 1899, the Olds Motor Works commenced operations in Detroit with a capital of $500,000, which was then sufficient for the company's activities in that city as well as in Lansing.

Meantime, Henry Ford continued to work with his car, experimenting and inventing and later building a small plant in the suburbs. June 27, 1903, his company was incorporated. The present great Ford plant is the largest in the world.

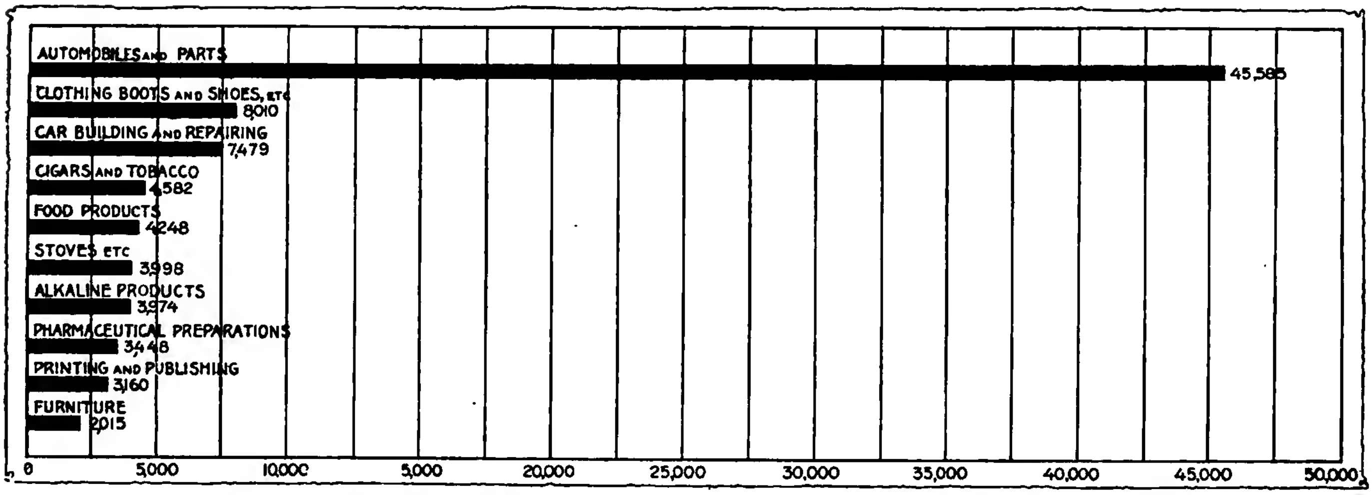
But these early concerns—if they can be called "early" when not yet 15 years old—were soon followed by others.

In 1901 the Cadillac company was launched with a $300,000 capital; and 2 years later, in 1903, the Packard commenced operations with $500,000 capital.

During the year following no fewer than twelve concerns were recorded, and in 1905 ten more took out incorporation papers. None of these twenty-two was ever firmly established and within a few years they were either absorbed by laterly formed companies or were forced to go out of business. Their products were not sufficiently practical to give the public confidence in them and the freak stage had not yet been passed.

In 1909 the Chalmers-Detroit Co., which is now the Chalmers Motor Co., and the De Luxe, since absorbed by the Studebaker Corp., were formed. In 1910 the Regal and the Brush were born. The latter has recently been absorbed by the newly-formed Maxwell Motor Co.

The Detroit automobile industry plans to manufacture cars to a value this year which will exceed the total assessed valuation of the City of Detroit for 1912. The estimated value of the production of cars reaches the stupendous figure of $462,180,000,



Employees of some of Detroit's leading industries in 1911 as compiled by the State Labor Commissioner

while the total assessed city valuation for the fiscal year 1912 to 1913 amounts to $456,816,100.

The accompanying table showing Detroit's annual production of cars from 1905 to the present is of particular interest.

During those 9 years the increase has been almost unbelievable to the average person, but to the Detroiter it is looked upon as the natural course of events. **Any one of a dozen single factories today is manufacturing more complete machines than the entire city industry produced during 1905.**

But the product has practically doubled within the last year, more machines being built here alone than were produced in the rest of the country in 1912, according to the factories' own statements, which bid fair to be lived up to in nearly every case. These figures for the present year are composed largely of passenger cars, although the other classes are fairly well represented:

	1912	1913
Gasoline pleasure cars	185,560	367,450
Gasoline commercials	4,310	12,875
Electric pleasure cars	1,870	3,675
Electric commercials	510	1,150
Totals	192,250	385,150

One big factor in this great passenger car showing is the tremendous production of the Ford plant, which will this year turn out 200,000 complete machines on a schedule soon to be raised to 1,000 cars per day, yet, all classes of vehicles reveal a largely increased production over 1912, the commercial class showing the greatest gain of any and putting the city unmistakably in the lead in the production of business cars, as well as passenger types, as the following percentages will bring out:

	Per cent.
Gasoline commercial car increase over 1912	198.6
Electric commercial car increase over 1912	125.0
Gasoline pleasure car increase over 1912	98.3
Electric pleasure car increase over 1912	96.6

Yet it should not be considered that Detroit has no lines of activity save those connected with the making of motor vehicles. Bearing on this phase of the question the accompanying table, showing the value of Michigan's products as compared with the same lines of endeavor for Detroit alone are of interest.

The automobile industry leads by a comfortable margin, as shown by the census reports, but it is not Detroit's only means of salvation. Brass and bronze products, foundry and machine shop products, tobacco manufactures and so on total high in the millions, and in their respective lines have more than put Detroit "on the map."

In its thirty-three automobile factories now operating, Detroit employs 48,450 wage earners, as compared with 30,863 for 1911.

These figures are exclusive of the parts and accessory manufacturing plants. The increase in number of men so employed has grown in 9 years from 2,000 to near the 50,000 mark.

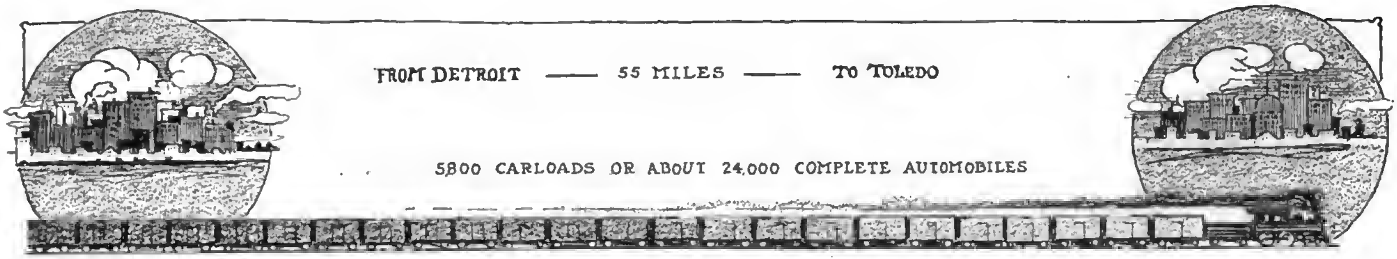
On paper this great army of wage earners does not seem nearly so large as it actually is. When it is considered that there are more men in Detroit employed in making automobiles alone than the entire population of such cities as Allentown, Pa., Berkeley, Cal., Davenport, Iowa, Macon, Ga., and Cambridge, England, the significance of industrial Detroit is perhaps better brought home to the average person. The figures extending over 9 years are given below:

1904	2,034
1905	4,500
1906 (estimate)	6,000
1907 (estimate)	7,600
1908	8,430
1909	16,000
1910	27,200
1911	30,863
1912	48,450

There is a constant demand for automobile workers in Detroit. The above are typical advertisements

Adding to the great number in the automobile plants, the many thousands employed in the accessory and parts making concerns, the 1913 daily average total reaches 72,675 as against 45.585 for 1911.

The number of automobile, automobile parts and accessory plants in 1911 reached ninety-four, while at the present time the industry concentrated in Detroit is inclusive of 158 plants making exclusively automobiles or products pertaining to them. Of course, if the many concerns making such parts as screws, nuts and bolts, which are used in the motor car but which nevertheless are demanded in other constructions as well, are in-



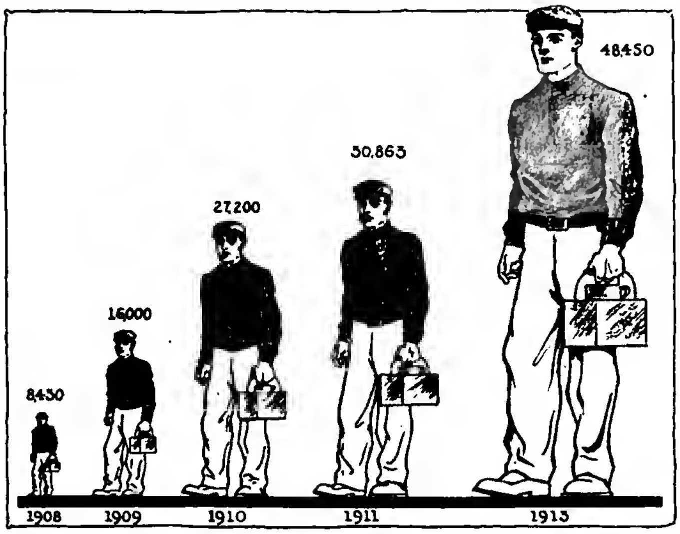
The carload shipments of automobiles from Detroit during February, if made into a single train would reach from that city to Toledo, O.

cluded, the total number of plants would be still further increased.

Since 1910 the automobile factories of Detroit have undergone numerous changes and many of the names once well known are no longer in the automobile roster.

In 1911 there were 2,126 factories in the city and at the present time this has increased to 2,450. The total employed male wage earners in the city during 1911 was 97,056, while in 1913 the number approximates 110,000.

With these figures before us, the exact status of Detroit's leading industry is easily determined. Let us consider the following tabulation, which summarizes the factory figures just given:



The number of wage earners in Detroit automobile factories (exclusive of parts and accessory makers) has increased six-fold in the last 5 years. The above illustration graphically depicts the phenomenal increase which marked each succeeding year

Automobiles and parts	45,585
Clothing, boots and shoes, etc.	8,010
Car building and repairing	7,479
Cigars and tobacco	4,582
Food products	4,248
Stoves, heating apparatus	3,998
Soda ash, alkaline products	3,974
Pharmaceutical preparations	3,448

This table, which shows several of Detroit's leading industries, reveals the fact that each of a half dozen motor car factories employs more men than do some of the other complete industries of the city. The clothing and boots and shoes contingent does not reach the number in the Ford factory alone by some 6,000 men, while the number employed in either the Packard shops, in the Cadillac, or in the Studebaker plants, is in excess of the entire cigars and tobacco following. Yet Detroit is regarded as the "Tampa of the North," so far as the manufacture of smoking materials is concerned, as may be seen by the high standing of that industry in the table given above.

	1911	1913
Wage earners in all automobile parts and accessory plants	45,585	72,675
Number of automobile, parts and accessory plants	94	158
Proportion of motor car industry wage earners to total Detroit population	8.4%	12.8%
Total number of factories	2,126	2,450
Total wage earners in all factories	97,056	110,000
Proportion of automobile parts and accessory plants to total number of factories in the city	4.42%	6.45%
Proportion of wage earners in automobile industry to total wage earners of the city	50%	66%

It will be seen that the proportion of motor car wage earners to Detroit's total population during 1911 was only 8.4 per cent., while in 1913 it has increased to 12.8 per cent., an increase of 4.4 per cent., which is a remarkable gain for a single industry in 2 years.

Comparing the city's wage earners as a whole with those affiliated with the automobile industry, we find that 1911 showed 50 per cent. of the total number of wage earners to be in the automobile class. This year the increase has been 16 per cent. But comparison of the total number of automobile and parts and accessory plants with the aggregate number of factories in the city shows the very small percentage of 4.42 in 1911, while at the present time only 6.45 per cent. of the total number of establishments are in the automobile class. Thus, although the number of factories is small in comparison with the whole, each one of these employs a large number of men and brings the total motor industry wage earners to the head of the list following:

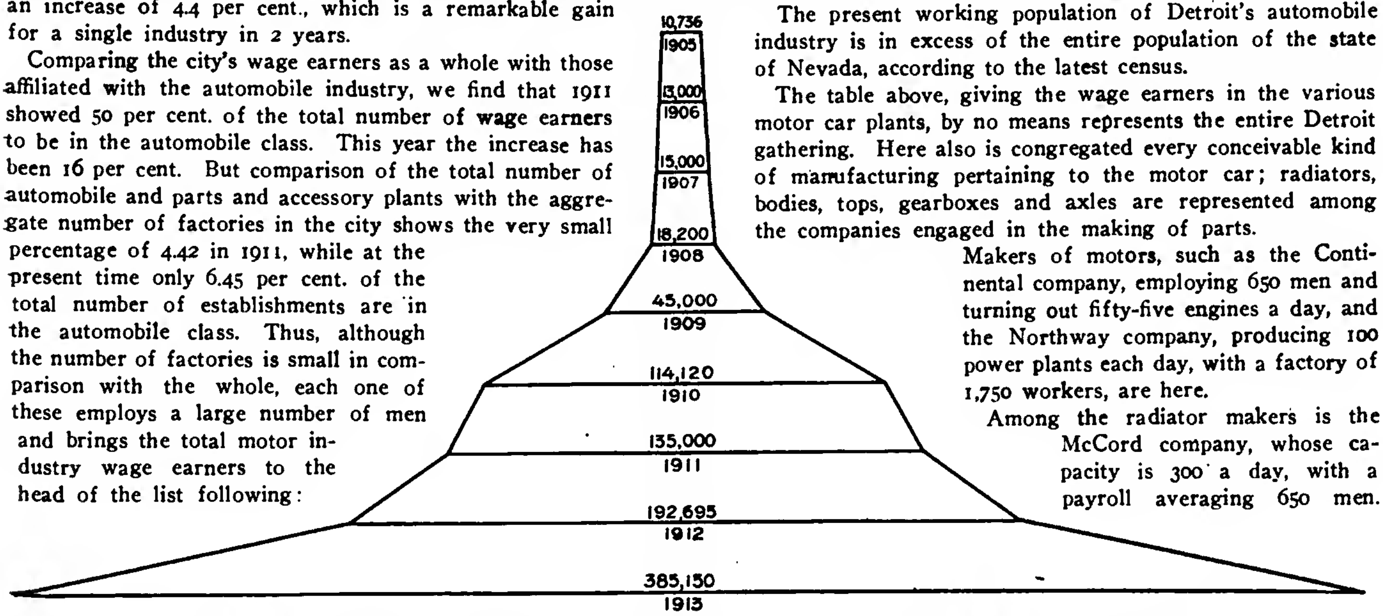
A table showing the number of wage earners in each of the city's automobile plants in 1911 and at the present time is given below. It reveals to the skeptical the difficulty of Detroit's municipal problem of housing thousands of working men close to their places of occupation, which are spread over the entire city and mostly in the outlying districts. No one section may be regarded as the automobile center of the city, for many of the factories are from 4 to 10 miles apart.

The present working population of Detroit's automobile industry is in excess of the entire population of the state of Nevada, according to the latest census.

The table above, giving the wage earners in the various motor car plants, by no means represents the entire Detroit gathering. Here also is congregated every conceivable kind of manufacturing pertaining to the motor car; radiators, bodies, tops, gearboxes and axles are represented among the companies engaged in the making of parts.

Makers of motors, such as the Continental company, employing 650 men and turning out fifty-five engines a day, and the Northway company, producing 100 power plants each day, with a factory of 1,750 workers, are here.

Among the radiator makers is the McCord company, whose capacity is 300 a day, with a payroll averaging 650 men.



The ever-expanding funnel of Detroit's automobile production, showing the increase from year to year

Three examples of modern automobile factory construction to be seen in Detroit. The buildings, besides being large and spread out over a considerable area, are designed to afford plenty of light and air for the workmen

Among the axle contingent is the Timken company, producing 125,000 axles a year and employing 150 men. It is said to be the largest axle factory in the world, having 250,000 square feet of floor-space.

Looking further, we find the Hayes Mfg. Co., retaining 1,100 workers and producing 15,000 to 20,000 automobile bodies a year; the Jeffery-DeWitt company, with its 140 men, turns out 1,500,000 complete spark-plugs a year. It produces 14,000 porcelains each week.

The Holley Bros. company will this year produce 250,000 carbureters on a daily schedule of 1,000 instruments, with an average payroll of 250 men.

Then there is the Disco company, which will turn out 30,000 electric starting devices this year, and which employs 100 men, and the Hyatt Roller Bearing Co., with a force of 1,000 men, turning out over 2,000,000 of its type of bearings.

While the parts and accessory makers are not all on this enormous scale, they are all thriving and each is adding to Detroit's ever increasing production. This year these plants are 125 strong.

With this great production the Detroit industry is face to face with a serious problem—that of securing sufficient automobile freight cars for the transportation of its many machines. Indeed, the freight car situation has been considered of so serious a nature that the Traffic Bureau of the National Association of Automobile Manufacturers has seen fit to open an office in Detroit, in order to better cope with the problem at first hand. Likewise, the Detroit Chamber of Commerce has a similar bureau for the aiding of shippers.

During January, 5,000 carloads of automobiles left the city, while during February this number was increased to 5,800. Before the season is well advanced these figures will be much larger. Each freight car carries from one to eight machines, depending on the size. Considering all makes shipped, it seems probable that the average number of automobiles per freight car runs about four, hence the shipments of machines for the first 2 months of the year have reached the enormous total of about 43,200. February's carloads, if arranged in a single train would have a length of approximately 55 miles, equal to the distance from Detroit to Toledo.

Obviously, with such enormous outgoings of freight cars, it is a very serious matter to insure the return of all of these when empty. Shippers of other classes of goods can make use of the automobile cars as well as they can any other type of box car, while the automobile maker must necessarily use only specially constructed cars which will admit machines through the doors. This handicap has been greatly felt within the last year or so.

But Detroit realizes the need for protecting its automobile factories so far as it is in its power, and through the good offices of the Associated Traffic Bureau and the Traffic Departments of the Board of Commerce it is coping with the situation as best it can.

Last year, Detroit makers were forced to resort to a number of schemes for storing their cars pending shipment. It would have meant many thousands of dollars to have held up the production of cars during the busy season and hence the manufacturers went merrily on while shipping was many times practically at a standstill. Motor cars were stored wherever space was available, the Cadillac company, as a case in point, having sometimes as many as fifty completed automobiles outside its warehouse at one time. Other plants resorted to the use of temporary shelters, such as sheds and tents.

It is probable that this year will see many like instances, although the factories have nearly all increased their floor-space in order to take care of such emergencies.

Table Showing Detroit's Annual Production of Cars and Valuation of Same, Based on Average List Price

Year	Cars Built	Value
1905	10,736	$12,883,200
1906	13,000	15,600,000
1907	15,000	18,000,000
1908	18,200	22,600,000
1909	45,000	54,300,000
1910	114,120	134,587,000
1911	135,000	162,000,000
1912	192,695	231,234,000
1913	385,150	462,180,000

The makers realize the importance of making every freight car count, for at the present time a real famine in rolling stock is predicted for April and May here.

The Studebaker Corporation has just made an investment of over $60,000 for facilities for thus loading its machines. The switch tracks back of its plants are 20 feet above the level of the factory yard and the new loading platform is merely a massive shelf, two city blocks long, with elevators.

Another aspect of Detroit's great position in the industry is brought out by its exports which, though going to all parts of the world, are principally to Canada, England, South Africa and New Zealand. During January and February of this year, Canada bought 267 Detroit cars, valued at $387,231; England purchased 122; South Africa 80, and New Zealand, 30. The table shows the principal exports for the first 2 months of the year:

	No.	Value
Canada	267	$387,231
England	122	134,353
South Africa	80	105,096
New Zealand	30	34,804

Yet, it is not all motor cars which find markets abroad, for the Detroit parts and accessory makers also do a good business with the foreigners; nor is the passenger car alone exported, commercial vehicles having a fairly good sale so far this year. During January and February, passenger cars valued at over $500,000 were sent abroad, while next comes the miscellaneous parts, which aggregated $385,000. The table follows:

	No.	Value
Commercial cars	38	$37,979
Passenger cars	522	652,486
Tires	...	22,859
Engines	1,085	96,334
Other parts	...	385,385
Total value		$1,195,043

Figures Showing the Value of Michigan's Principal Products, as Compared with Detroit Alone. The Automobile Industry Leads. These Figures Are from the Last Census Reports

	Detroit	Rest of the State
Automobiles and their parts	$59,356,000	$37,115,000
Boots and shoes	2,744,000	2,512,000
Brass and bronze products	12,297,000	1,593,000
Canning and preserving	1,568,000	3,403,000
Confectionery	1,136,000	1,808,000
Copper, tin and sheet iron products	3,534,000	1,395,000
Electrical machinery	1,148,000	1,179,000
Foundry and machine shop products	18,296,000	27,103,000
Fur goods	1,738,000	546,000
Iron and steel, steel works and rolling mills	2,297,000	373,000
Leather goods	1,396,000	1,164,000
Liquors, malt	4,942,000	4,898,000
Patent medicines and druggist preparations	11,558,000	1,917,000
Printing and publishing	7,291,000	10,057,000
Slaughtering and meat packing	12,850,000	565,000
Stoves and furnaces	5,676,000	4,547,000
Tobacco manufacturers	12,773,000	3,406,000

With these figures as a basis for estimate for the entire year, 1913 looks to be a record breaker for export business and it should reach $30,000,000 for the value of Detroit-made automobiles alone. From a total of $82,000 worth of machines during 1903, in 10 years Detroit has succeeded in convincing the world of the merit of its machines, yearly increasing its exports at a tremendous rate. This is forcibly brought out below:

1903	$82,933
1904	162,529
1905	255,597
1906	269,554
1907	422,101
1908	399,010
1909	699,706
1910	2,106,615
1911	3,864,994
1912 (estimated)	19,500,000
1913 (estimated)	30,000,000

The present average value of the exported car is, for the commercial class $1,000, and for the passenger type, $1,250, showing that our market abroad is for just the type of medium-priced vehicle on which Detroit's fame is largely based.

Last year the foreign market for American cars reached the stupendous figure of $30,000,000 and of this amount about 65 per

Two more examples of the type of buildings erected and occupied by the automobile manufacturing companies of Detroit. The illustrations furnish a very good idea of the magnitude of the plants, which turn out more automobiles than all the factories of Europe combined

An avenue at the Packard factory during the noon hour. Here 6,700 men are employed to build 4,500 automobiles and trucks

Double-decking shipments by the Studebaker loading crews

cent. was paid to makers of Detroit, proving that cars made here have withstood the test of foreign roads and foreign conditions.

An interesting feature of the financial side of Detroit's invasion of the foreign low-priced car market is furnished by the Commercial Manager of the First National Bank of Detroit. "The first question of the shipper entering the foreign export trade," he says, "will be invariably, 'How am I to be paid for my goods?' "

"If the foreign buyer has remitted the cost of the car when placing his order the procedure is the same as for home sales, as all he has to do is to ship the car consigning it to the buyer. If, however, the cars are to be paid for on arrival, the service of

Noontime at the Ford factory, which is working on a schedule of nearly 1,000 cars a day. There are over 14,000 men on the payroll

a bank having its own correspondents abroad is required and it is a part of that bank's function to collect the drafts made against these shipments. Such drafts supported by the necessary shipping documents may be discounted by the bank as are domestic drafts.

"In other cases, the buyer abroad arranges for a bank credit which authorizes the Detroit shipper to draw under specified terms a draft with shipping documents attached for the exact invoice amount in a foreign currency. Such drafts are readily salable and can be bought by the bank operating a foreign department so that the shipper receives the exact invoice amount for his goods on the day they leave his factory.

"These credits are generally established in pounds sterling and have become quite popular with Detroit shippers. An exporter operating under such credit is relieved from the responsibility ordinarily attached to his direct drafts upon the consignee, so that an arrangement of this kind is a most desirable one."

A review of Detroit's position in the industry would be incomplete without a few references to the greatest of all the world's automobile factories, the Ford plant. It is difficult for the average person outside of Detroit to realize that this single factory will manufacture this year 200,000 complete machines, yet it is a fact, the minimum schedule calling for 150,000 cars with a reserve of 50,000, which from all indications now will all be needed to supply the demand.

WAGE EARNERS IN DETROIT AUTOMOBILE FACTORIES

Abbott	430	450

Add for unnamed, etc	253	1,385
	30,863	48,450

Note A—The Flanders, Brush and Sampson plants, which are subsidiaries of the Maxwell Motor Co., are now operating, but we are not at liberty to give their present number of employees. The total of the Maxwell wage earners in Detroit, however, is included in the miscellaneous figure at the bottom of the list.

And yet, the Ford plant, though many times larger than any of its neighbors, is only one of the thirty-three within the boundaries of the city.

No one will dispute the great influence which the mammoth industry has had on the city's growth. Its population in 10 years has increased nearly 150,000 and its building has gradually risen until it is today among the leaders in total annual building cost figures. The table below, showing building statistics for sixteen cities during the last year, serves to indicate Detroit's position. It has surpassed St. Louis, Cleveland, Washington, Kansas City, Pittsburgh, Buffalo and many other cities of its size.

San Francisco	$20,915,000
Boston	19,287,000
DETROIT	19,014,000
St. Louis	18,613,000
Cleveland	16,994,000
Washington	16,562,000
Minneapolis	13,735,000
Kansas City	13,274,000
Milwaukee	12,465,000
Pittsburgh	12,300,000
Cincinnati	11,808,000
Buffalo	10,335,000
Baltimore	8,991,000
St. Paul	8,915,000
Denver	6,086,000
New Orleans	3,157,000

It has been said in some quarters that Detroit's banks are too intimately related to its automobile industry and that should the industry fail, it would carry with it many millions of dollars in the banks. Surprising as it may seem, the average Detroit bank carries only about 25 per cent. of business chargeable to the automobile industry, directly or indirectly. The city's many lines of activity contribute greatly to its resources and it is incorrect to believe that a municipality which today ranks ninth in banking activities, having grown from a position near the bottom of the list, would be so tied up with any one line of activity that a general failure of that line would carry with it all the financial intesets of that city. Still, the automobile industry has done more toward the rise of the city than any other.

Detroit has risen to its present position on a firm foundation and is here to stay. It has come to be one of the great industrial communities of America and is destined for a greater future. Conservative estimates give it a population of 1,000,000 in 1925, and, granting a proportionate growth in other respects, the city's future has no black cloud to mar its bright prospects.

The Studebaker shipping organization, like that of nearly every other Detroit automobile plant, cultivates efficiency. The illustration shows an hydraulic elevator lifting cars from the factory yard to the loading level. Car can be brought to the platform regardless of the position of trains on the sidings. The shipping equipment of the company represents an investment of $60,000. The switch tracks back of the plants are 20 feet above the level of the factory and the new loading platform is a massive shelf as long as two city blocks, with railroad sidings

*Includes rivets for studding tires.
**Includes only material ready for re-manufacturing.

WASHINGTON, D. C., April 8—Under the new Wilson-Underwood tariff bill introduced today many reductions are made in automobiles and automobile parts, as well as in raw materials that go into the makeup of cars. On chassis imported the present duty of 45 per cent. *ad valorem* is cut to 30 per cent. but complete cars made up of chassis and body remain at the 45 per cent. mark.

On finished parts going into the makeup of a car the reduction is still greater, being from 45 per cent. to 20 per cent.

On ball and roller bearings the tariff is cut from 45 to 25 per cent., almost as much as on finished parts.

Other reductions include axles and parts, chains, rough forgings, malleable castings, steel ingots, iron in stages between ingots and bars, iron ore, welded tubes, flexible tubing, cylindrical tanks, and a score or more of other articles as enumerated in the schedule herewith in which the tariff under the new Underwood proposed plan is in one column and the present tariff under the Payne schedule in the other.

What the attitude of the American car and parts makers will be to the proposed reductions cannot be stated at this time but if telegraphic expressions can be taken as a criterion, the present outlook is not considered seriously. Henry B. Joy, president of the Packard company and chairman of the Tariff Committee of the National Association of Automobile Manufacturers, expresses himself as follows on the new schedule:

"It is impossible in so short a time for me to formulate any serious and intelligent opinion as to the effect of the new Wilson tariff bill in detail. Any person must know that when the fence is taken down the cattle and hogs will get into the corn field. Just so the greater imports will take place under reduced tariffs in very many lines of industry. How serious this will be time can only prove. It is a self-evident principle that when materials are purchased from abroad American employment and production in those articles is to that extent so much curtailed."

Col. Charles Clifton, member of the tariff committee, has expressed himself by saying: "Too early to give anything definite regarding the working of proposed tariff, I am satisfied, however, that the American automobile industry is here to stay."

James Couzens of the Ford company, says: "Do not believe reduction in tariff on automobiles or any of the parts entering therein will materially, if at all, affect the industry. At present details are too limited to speak accurately, but on the surface we have no opposition to make to any of the new schedules."

R. D. Chapin, of the Hudson company, expresses himself to the effect that: "From the information so far at hand I can see no detrimental effect to the automobile industry in the proposed tariff reduction."

Detroit Makers Show Little Concern

DETROIT, MICH., April 8—*Special Telegram*—There appears to be very little concern among the Detroit manufacturers of automobiles as to the contemplated reduction of import duties on automobiles and other products used by the motor car industry. While it is yet quite early for any of the heads of the industry here to formulate any conclusive opinions as to the effects of the new Wilson tariff bill, it is the consensus of opinion of the half dozen prominent makers interviewed today that the proposed reductions would make little or no difference to the industry as a whole.

Imported products used today in automobiles are less than 1 per cent. as compared with those obtained from domestic sources. The greatest percentage of parts imported are ball bearings, which probably amount to from a half to two-thirds of the number used in American cars.

The makers in this country are very much better equipped to make moderate priced and cheap cars than are the Europeans and hence very material tariff reductions would have little or no effect in this direction. However, this would not hold true in other industries, which are not so well equipped for cheap production, such as woolen goods manufacturers, and so on. The reductions will have no appreciable effect upon car cost, although raw metals, such as aluminum, nickel, antimony, lead and so forth would be imported at slightly less cost than under the present tariff schedules. However, the importations of these products by automobile manufacturers are in the minority as compared with those obtained here at home.

Opinions of Other Makers and Importers

A. L. Riker, of the Locomobile company takes a slightly different view of the proposed tariff, and states: "I greatly fear that if this bill reducing the duty on chassis from 45 to 30 per cent. and on finished parts from 45 to 20 per cent. goes through, it will have a disastrous effect on the American automobile industry, for it will permit foreign chassis to be imported at a lower cost than the American manufacturer can produce them; and as proof of this, the American manufacturers have submitted statistics to the Senate Finance Committee showing that if the duty were so reduced it would be difficult for the American market to compete with the European market."

The views of importers of complete cars are best expressed in the brief which they presented before the Ways and Means Committee some months ago, asking for reductions on chassis and parts. The present reduction in tariff would mean considerable to the purchaser of an imported car. In some cases it would amount to one-half of the difference between 45 per cent. and 30 per cent., in other words, 7.5 per cent. ad valorem.

Mr. Hoey, of the Benz interests, says: "That reducing the duty on a chassis from 45 to 30 per cent. would cause a material reduction of prices. A 36-horsepower model now costing $5,600 would probably be reduced to $5,000. Similarly with commercial motor vehicles, a truck listing at $6,000 would probably be reduced to $5,300 and other trucks, chassis, selling at $5,250, could be cut to $4,500."

Henry N. Allen of the Metallurgique interests, is authority for the statement that: "With the present practice of importing complete cars from France, the prices on his cars would not be influenced. There is a possibility of a French body builder opening a factory in this country, which would permit the chassis to be imported and bodies built in this country under which arrangement there could be a reduction of $500 in the selling price of a $6,500 car."

The attitude of the importer of foreign automobiles is expressed in the brief submitted by E. Lascaris on behalf of the Automobile Importers' Alliance at the hearing on January 10, before the Committee of Ways and Means. In this brief it was suggested that the duty of 45 per cent. on finished automobiles was prohibitive and no longer necessary. This view was supported by the fact that whereas 781 cars were imported up to December 1, 21,700 cars were exported.

In the importers' brief, protest was made against the classification of the automobile as a luxury. The product of the fourth largest industry of the country is used as a matter of necessity by doctors, farmers and the world at large.

The importers were of the opinion that a duty of 25 per cent. would be more fair to all concerned than the present 45 per cent. At the suggested rate the importers pledge themselves to import 3,000 cars at an approximate value of $6,810,000. On this amount the duties would be $1,702,500. At the present rate of duty the value of the parts imported is 15 per cent. of the value of the total import but with the reduction asked the increase in parts imported would raise the revenue from parts alone $255,000.

As far as reduction in price to the consumer is concerned, if the Underwood schedule went into effect, Mr. Lascaris stated in his brief that the average price for the year of 1912 of the foreign car is $2,275, and the average price of the exported American article $1,000. The average selling price of the foreign vehicle in America is $4,500. The average selling price of the American vehicle is $3,000. The difference represents the duty and freight, 50 per cent.

Views of the Parts and Accessory Makers

To the importers of ball and roller bearings the proposed cut in tariff from 45 to 35 per cent. is disappointing as they had requested a reduction to 25 per cent. or possibly 20. The importation of ball bearings for use in motor cars is an important item, and the briefs filed before the Committee of Ways and Means at Washington show that approximately 75 per cent. of the ball bearings used in American cars are imported, but 25 per cent. being of home manufacture. The brief further states that approximately 80 per cent. of the ball bearings manufactured in Germany are exported to America. The figures show that during 1912 anti-friction bearings were imported to the gross value of $1,508,939 which, on the 45 per cent. schedule paid a duty of $679,022.55. To this sum freight to the extent of $75,446.95 has to be added, giving a grand total for the year of $2,263,408.50, as the gross value of foreign ball bearings included duty and freight when landed here.

This brief further shows the steady increase which has been made in the importation of anti-friction bearings within the last few years. The figures for custom receipts are: 1908, $57,000; 1909, $193,000; 1910, $597,000; 1911 $487,000; 1912, $679,022.55.

The brief presented by the ball bearing importers further states: "Steel balls and ball bearings are imported from Germany Italy, France, Sweden, Switzerland, and England, and if the tariff on steel balls and ball bearings is reduced to 25 cents, it is evident that competition will compel the importers of these goods to give the benefit of this reduction to the user."

The representatives of American bearings in their petitions to the Ways and Means Committee stated that: "American labor costs two to two and one-half times that of foreign labor in this branch of the metal industry, and further the foreign product comes into fair competition with us, and that only 2 1-2 per cent. of this product is represented in the cost of an automobile, hence there is no reason for disturbing the present duty of 45 per cent."

The Rhineland Machine Works, represented by J. W. Blackford, when asked what would be the practical reduction of the duty on bearings from 45 to 35 per cent., stated that if the manufacturer of cars received the larger share of the benefit accruing from such a reduction he had every reason to be satisfied; and that the company felt it was itself also entitled to a margin of the profit caused by a reduction.

Louis Marburg, of Marburg Bros., estimated that the actual wholesale price reduction which will be caused by a 45 to 35 per cent. cut of the duty would be about 5 per cent. of the present wholesale price to manufacturers.

The R. I. V. company was of the same opinion with regard to a wholesale price reduction.

J. H. Lehman, of the J. H. Lehman Mfg. Co., stated that in the case of his company, if the tariff were actually reduced, the manufacturer would get the full benefit of the reduction, whatever it makes.

A prominent importer stated that the reduction to the car manufacturer will amount to from 5 to 7 per cent. of the present price, if the proposed reduction of duty to 35 per cent. goes through.

To Build Church Cars

CHICAGO, April 9—Formation of a $1,000,000 corporation to be known as the Church Motor Car Co., recently incorporated in Delaware, has just been announced to manufacture pleasure cars and trucks using the Church pneumatic system automatic motor, which has been developed by the Automatic Motor & Engineering Co., Chicago.

The incorporators of the new Delaware corporation are: A. G. Latter, W. J. Malony and N. P. Coffin. Manufacture of cars in quantities will commence in Chicago immediately, and it is expected to have the first model on the street by the middle of May and deliveries will commence, according to present plans, by September 1. Efforts are being made to obtain a factory site in Detroit, and the permanent plant will be established in that city, the Chicago factory being only temporary.

The car will be radically different from existing types so far as power plant is concerned, as it will employ the pneumatic motor and transmission system developed by Edmund S. Church. This involves a pneumatic clutch which takes the place of both clutch and gearset and also is automatic in that the ratio of engine speed to car speed varies automatically with the load. The system at the same time provides for pressure fuel injection pneumatic starter and tire inflater and pneumatic tire jacks. It it stated that the engine handles not only gasoline but kerosene and even crude oil as fuel. The motor is four cylinders, 3 1-2 inches bore and 5 inches stroke, and rated by the maker at 90 horsepower. The car will appear in three models of 132 inches wheelbase and the bill includes a touring car, roadster and speedster. It is to be sold at about $2,500.

United Rim Co. Dissolves

AKRON, O., April 8—The United Rim Co., of this city, held a formal meeting Friday and decided to dissolve. R. B. Beebe, its sales manager, was appointed trustee to wind up the company's affairs as soon as possible, which will be not later than June 1. The United Rim Co. is a holding company owning the rim patents of Goodyear, Goodrich, Morgan & Wright, Hartford, G. & J., Diamond and Continental.

Truck Industry Grows 200 Per Cent.

Estimated Production for 1913 Is 51,586—Total Value of Vehicles Made Estimated at $98,288,872—There Are About 280 Gasoline Vehicle Manufacturers and Thirty-Two Electric Vehicle Makers

NEW YORK CITY, April 9—Surprisingly rapid growth by the commercial vehicle industry is indicated by reports of production received from manufacturing companies during February and March, 1913, by the National Association of Automobile Manufacturers. The results of this second census of the industry by the association are given in detail in a statistical report just issued to the trade and are compared with the results of the previous census to show the increases in output and the fluctuations in average prices from year to year.

The total output of commercial vehicles of all kinds and types reported for the year 1912 by 170 companies was 21,939, as compared with a total of 10,655 reported for the year 1911 by eighty-five companies, and 10,374 reported for all preceding years combined up to the end of 1910 by the same eighty-five companies. It is believed these companies represented about 75 per cent. of the total production of the country, while the 170 companies reporting for 1912 and 1913 probably represent about 90 per cent. of the total output.

The estimated production for the year 1913 is 51,586 vehicles.

The figures given show that each year's output closely approximates the total output of all preceding years combined, thus:

Reported output prior to 1911	10,374 + 25%	=	12,968
Reported output during 1911	10,655 + 25%	=	13,319
			26,287
Reported output during 1912	21,939 + 10%	=	24,133
			50,420
Estimated output during 1913	51,586 + 10%	=	56,744

This is a rate of growth of approximately 200 per cent. annually.

The total value of the vehicles reported made in 1912 was $42,942,828, and of the estimated reported production in 1913 $98,288,872. These figures compare with an aggregate value of $22,292,321 for the vehicles produced in 1911 and of $20,485,231 for all vehicles manufactured prior to the end of 1910.

With the exception of a dozen or fifteen companies, all of those that failed to send in reports are relatively new companies that produced few or no vehicles last year or are older companies whose individual output probably did not reach fifty vehicles in any case.

Index of Industry's Growth

The data furnished in the reports provide a valuable index of the growth and trend of the motor truck industry. Some makers may be disappointed in their expectations for the present year, but on the whole the estimates of production for 1913 are believed to be fairly conservative, as nothing was to be gained by any manufacturer in exaggerating his figures, because the census was a secret one in which names of companies were not to be attached to the reports.

Although 280 gasoline vehicle manufacturers and thirty-two electric vehicle makers are listed in one of the leading automobile directories, the association has been unable to elicit replies to communications of any nature from about 40 per cent. of them, from which it is assumed that they are not very active or important.

Reports received from the 170 companies are classified as follows: Gasoline vehicle makers, 140; electric, twenty; mixed system, three; gasoline fire apparatus, seven; tricars, three; tractors, two; steam, one. The gas-electric vehicles and the tractors are made by the electric and gas vehicle makers.

Analysis of the reports shows that the largest and most rapid increases in numbers have been made in the 1,000, 1,500, 3,000, 4,000, 6,000 and 10,000-pound capacities in gasoline vehicles and in the 1,000, 2,000, 4,000 and 7,000-pound sizes in electric vehicles.

There has been a notable tendency to change models, particularly among the gasoline vehicle makers. Taking account only of companies making full reports for both years, 1912 and 1913, it is found that thirty-five models have been dropped by the gas car makers and forty-four new models added, while the electric vehicle makers have dropped twelve models and added five. The changes are most pronounced in the 2,500, 3,000, 5,000, 7,000, 8,000 and 12,000-pound sizes in gasoline vehicles and in the 1,500, 2,000, 3,000 and 7,000-pound capacities in electrics.

The mean average price of all the commercial vehicles produced in 1912 was $1,957.37; that of the gasoline cars, $1,868.95, and of the electric vehicles, $2,465.18. In 1911 the average value of all gas trucks sold appeared from the records to be $2,079.16 and for all preceding years combined was $1,955.70, while in 1911

Automobile Securities Quotations

The rubber quotations still maintain the fluctuating qualities exhibited during the last few weeks. Goodrich has jumped 5 points and Goodyear has fallen off the same amount. The other rubber quotations have been fairly steady, Ajax-Grieb being at the same figure as last week. The other quotations will be found to be fairly strong as may be expected from the fact that the reports of flood disasters have proven for the most part greatly exaggerated.

the average price of all electrics reported was $2,759.66, and for all preceding years was $3,369.72.

Fluctuations in prices of the various sizes of both gas and electric vehicles over a period of years show that the price of the 1,500, 3,000, 4,000, 8,000 and 10,000-pound sizes of gas vehicles have decreased materially, while the prices of the 2,000 and 6,000-pound sizes have increased notably. In electric vehicles the average prices of the 1,000, 2,000, 4,000, 8,000 and 10,000-pound sizes have been reduced while in the 1,500, 3,000, 7,000 and 11,000-pound sizes they have increased.

Output and Valuation of Different Classes of Commercial Vehicles

Reported by 170 companies in February and March, 1913.

	1912		1913	
	No. Cars	Aggregate Value	No. Cars	Aggregate Value
Gasoline vehicles	20,052	$37,474,308	44,245	$83,073,200
Same, value estimated*	100	162,357	1,775	2,620,847
Fire apparatus	140	843,900	232	1,422,250

No More National Truck Shows

NEW YORK CITY, April 7—The executive committees of the N. A. A. M. and Automobile Board of Trade at their meeting on April 3 reached the decision that no more truck shows were to be held in New York and Chicago hereafter. This action has been foreshadowed ever since the closing of the shows in these two cities this year, and now has become definite.

Incidentally, the two bodies decided that it would he of advantage to hold one large pleasure car show instead of two, and it was decided to exhibit all the automobiles, during a 1-week show, in the Grand Central Palace, where plenty of space is available, while the Madison Square Garden has proved more and more inadequate during the last few shows.

While in previous years the ground floor and two stories of the Palace were used for automobile exhibitions, for 1913 three additional floors will be devoted to this purpose, giving a total of six floors. Each of these has 55,000 square feet, making a total of 330,000 square feet. If necessary, even more space could be provided. The Palace has ample elevator facilities so that the show will be as easy to view as if all the cars were stationed on one or two floors.

Automobile Blue Book Sues A. C. A.

NEW YORK CITY, April 7—The Automobile Blue Book Publishing Co. has filed suit, in the District Court of the United States. Southern District of New York, against the Automobile Club of America, alleging infringement by the latter of the copyright granted on various editions of the several volumes of the Blue Book.

The hill of complaint tends to show that the Tour Book of the Automobile Cluh of America, published in recent years, and, according to the Blue Book, to he published again in 1913, utilizes the information gathered laboriously by the editors of the Blue Book and compiled in this publication. It it claimed that the information thus collected and published has been rearranged and put in a new guise.

After lining up the preliminary evidence, the bill of complaint prays for a perpetual injunction restraining the A. C. A. from publishing and selling the Tour Book, the sale of which, it is claimed, actually injures the business of the Automobile Blue Book.

Third Motor Spirit Plant

Another Refinery for New Fuel Added to Standard Oil Plant at Neodesha, Kansas

CHICAGO, ILL., April 5—A third refinery for production of Motor Spirit, the new fuel, will be in operation by the first of next year. This refinery will be an addition to the present oil refining plant of the Standard Oil Co. at Neodesha, Kan. The addition, including the stills for the production of the new fuel, will represent an outlay of about $200,000. Motor spirit will be distilled by the Burton process of pressure distillation under royalties from the Standard Oil Co. of Indiana.

Two other refineries are producing the new fuel, one at Whiting, Ind. and the other at Alton, Ill. At the Whiting plant about $2,000,000 worth of apparatus has been installed to produce and handle motor spirit. The production of this plant is about 50,000 gallons of motor spirit daily and that of the Alton plant is about 10,000 gallons daily. The production of both plants is being increased as rapidly as new stills can be put in commission.

Brown Co. Sues 35 Per Cent.

NEW YORK CITY, April 9—The Brown Co., Syracuse, N. Y., has filed suit in the U. S. District Court, Southern District of New York, against the Thirty-five Per Cent. Automobile Supply Co., claiming that the latter are infringing upon patent No. 43,241 granted on November 5, 1912, to Carley Gould Weld, assignor to the Brown company. The subject-matter of the patent is an engine-driven tire pump of the spark-plug type.

Market Changes of the Week

This week's markets were noted for their steadiness, few changes taking place. Scrap rubber rose $.00 1-8 on Saturday, calling at $.10. It remains in a firm position. Stocks abroad are light and strength there is reflected here. Cottonseed oil fluctuated throughout the week its highest price being $6.85 a barrel, and the closing $6.70, with no change. There has been some falling off in the consuming demand, according to all accounts, especially with lard showing a weaker tendency. The movement of petroleum into consuming channels continues liberal and the market here retains a firm tone. Both petroleums remained constant, Kansas at $.88 and Pennsylvania at $2.50 per barrel. There was an absence of new developments in the fish oil markets. The trading was generally limited to jobbing quantities. Gasoline remains firm at $.22 1-4. Tin this week fluctuated but managed to close at $48.00, experiencing no change, an unusual event. Electrolytic and Lake coppers both rose, the first $.00 1-4 and the second $.00 1-8. The lead market is quiet and slightly easier, spot and nearby shipment commanding $4.35 at the 100-pound rate. Raw Italian silk rose again $.05, closing at $4.35.

Non-Poppet Motors Influence Poppet Types

Springs between valve stem and cam silence poppet valve action

Part II

By E. P. Batzell

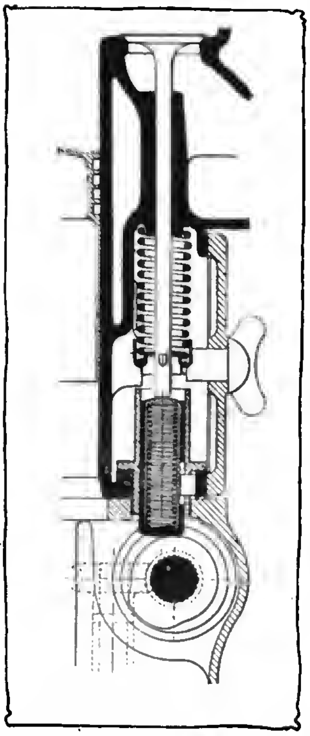

Fig. 3—Telescopic valve tappet on Germain motor

A GREAT deal more of attention is being paid nowadays towards the silencing of the noise arising from the valve tappet striking the valve stem when starting to lift it, and also the noise of the valve tappet striking the lifting cam, which takes place when this tappet does not follow the cam at all times. The first of these noises exists even at the slowest motor speed, unless special silencing means are employed. The other, that between cam and tappet, generally appears only at fairly high motor speed, when the strength of the valve spring is not sufficient to keep the lifted parts in constant contact with the cam.

Neither of the two sources of noise mentioned was objected to until the advent of the Knight sleeve valve engine. They were accepted as more or less unavoidable features of the high speed automobile motor. Motor building practice of that time indicates this, inasmuch as then there were in use valve and tappet clearances of .010 inch to .0156 inch. The tappet mechanism at the valve stem end was fully exposed, no particular attention being given to make extra light valve lifting parts and springs of ample strength, all of which is rendered worse in the matter of noise by the simultaneous employment in some instances of cam shapes especially adopted for quick valve lifting and closing.

In comparison with the above the present conditions show a marked decrease of the heavier roller type of valve tappets. For the sake of silence the most frequently encountered valve and tappet clearances amount only to a few thousandths of an inch, for instance .004 inch and as low as .002 inch. The valve tappet ends striking the valve stem are sometimes covered with a semi-elastic material to prevent a metal to metal contact. Almost in all cases the valve and tappet mechanism is inclosed, either by a single cover for a number of valves or by individual caps for each valve. The weight of valve parts, their motion and the valve spring strength are being carefully regulated in accordance with the anticipated motor performance. The silencing means mentioned are most often found in practice because they involve no radical changes in the motor construction. At the same time they are not fully accomplishing the results desired, as they give a silent valve system only for a certain range of motor speed and also only a temporary one.

Although the methods of attaining silence so far mentioned have produced satisfactory results at ordinary speeds it is noticeable that considerable noise is still generated when running fast. Small tappet clearance and valve covers are not sufficient to bring the poppet valve motor into competition with the non-poppet valve type in the matter of silence. A continuous quiet contact between valve stem and tappet at very high motor speeds may be obtained by using extra strong valve springs, but this is not practical on account of increased liability of spring breakage, besides much wear in the cam and in the whole valve lifting mechanism.

Various means have been adopted to reduce the sound made by the tappet striking the valve stem. In Fig. 3 is shown such an arrangement of the Germain motor. Here the tappet is composed of two parts telescoped one into the other and spread from each other by an inside spring, which is made considerably weaker than the valve spring. Thus the upper tappet part by action of the internal spring is forced against the valve stem end, remaining in constant contact with it. The minor variations arising in the valve mechanism length, to take care of which the valve and tappet clearance is provided in the ordinary motor, in this construction are taken up by the deflection of the same internal spring, the actual tappet clearance being inside and at the bottom of the external tappet part. In this location the clearance can be filled with oil, which will help to muffle the noise of contact between the two parts, the noise also being less audible because the actual contact takes place inside the mechanism.

Constructional Accuracy Necessary

A construction of this sort can serve its purpose well when the parts are accurately made. It gives a quiet valve action when the clearance in the tappet parts is small, which, however, it is difficult to maintain for a long time, because one part hammers out the other. Hardening on the inside improves matters, but it affects the shape of the parts, which are preferably thin. Grinding after the hardening will restore their shape, but this is a difficult operation on the inside surface of the outer tappet part. Hardening makes it also probable that minor defects in the material and its treatment in time are liable to bring forth cracks in the thin parts due to the constant pounding. As a whole, this construction requires considerable attention in manufacture, as well as in its maintenance, at the same time giving but a slight advantage over the ordinary arrangement, when small tappet clearances and valve covers are used. In another Germain construction the interior of the tappet parts is filled with felt in place of the spring.

Among other details on which depends the noisy or silent action of poppet valves the actual amount of valve lift is important. The greater the distance through which the valve is made to travel the greater the inertia to be overcome at the turning points of the reciprocating motion with a resulting increase in the noise when the cam strikes the valve stem. And where the cam is not immediately under the valve stem but is situated at one side, acting through a rocker, there is an opportunity for further development of objectionable noise according as to whether the cam lift, considered apart from the actual valve lift, is great or small.

Attempts have been made to gain the advantages of a small lift cam simultaneously retaining a larger valve lift and the desired timing, by using a tappet lifting rocker anchored as shown at R, Fig. 4, whereby the cam lift is multiplied at the tappet end of the rocker. A cam constructed for a small lift offers the following advantages: It is more easily shaped in accordance with the requirements of an efficient valve opening, the maximum size of which can be reached through less degrees of the rotating cam motion. With the rocker arm equipped with a roller for following the cam it is possible to give the valve a very gradual initial lift, also letting it down to its seat in the same manner, this without any material sacrifice in the character of the valve opening. Of course such a valve lifting has to be accelerated more during another portion of the period, requiring heavier valve springs for the same degree of quietness. The smaller cam obviously permits also a more compact cylinder and crankcase construction, less distance being required between the crank and camshafts to make their parts clear each other properly, which is particularly important with the popular long stroke motors. The valves are thus brought nearer towards the cylinder which gives a better, more efficient and lighter construction all around.

Rocker Arms Re-introduced

It is noticeable that quite a number of modern motors again are being equipped with valve lifting rocker arms, which were used very extensively in the early days of the automobile industry, but which were discarded later on. No doubt some purposes are well served by them, although with added complication, and with more parts in the valve mechanism that are liable to wear out and cause noisy action. Only very careful execution of the rocker arm mechanism can warrant their reintroduction for the purpose of making a more silent valve action.

One of the most interesting constructions for a poppet valve lifting mechanism is the Chenard and Walcker arrangement represented at B, Fig. 4. It serves as an example illustrating the extreme of measures taken thus far towards silencing the poppet valve action. In fact, this construction in connection with one permitting a quiet closing of the valves, like the Adler previously described, should form a combination giving about the most silent results that can be expected.

The camshaft C, in the Chenard and Walcker motor, is inclosed in a compartment separate from the crank case, to which compartment oil is supplied positively through a bottom opening from a by-pass of the main oil feeding line. Thus the camshaft compartment is filled with oil to some height above the cam and above the lower end of the valve tappet, the oversupply of oil flowing back into the crankcase through another opening provided at the proper oil level. The valve lifting mechanism includes a rocker arm A riding on the cam, but acting upon the valve tappet through an intermediate flat spring S, the latter being secured to the rocker itself and bearing against the lower end of the tappet, which it lifts into constant contact with the valve stem. Consequently, in the whole mechanism there are no clearances between the component parts, which would have to be passed through before the parts are in working contact. No noise could be generated here as in instances when the parts strike one another. However, the arrangement of the rocker arm, its spring and the valve tappet offers sufficient clearance in their motion, so that the variable length in the valve parts can be taken care of in the space between the rocker and the spring. The relative motion of these latter parts is merely a rolling one during most of the time when the valve is to be lifted. And even when this rolling motion becomes a straight lifting one, just before the valve leaves its seat, there is an oil film present between the rocker surface and that of the spring, which cushions their contact in the absence of the rolling motion.

The whole construction affords a silent valve lifting action and at the same time it reveals only remote possibility for such wear in it, which in time would result in noise audible outside. The valve tappet has also very little side thrust to bear, except that caused by the slight angularity of the rocker spring against the tappet, and by the eventually not exactly central and parallel relative motion of this tappet and of the valve stem. The latter cause for side thrust is not a defect of construction, but would follow from wear in the guides or uneven tension of the valve spring. The possibility of harmful wear is greatly reduced in this construction by the following means: The supply of oil to the lower end of the tappet should provide ample lubrication of the tappet guiding bushing, which, moreover, cannot be pounded out, as it is frequently done in the case of common poppet valve motors, because the side thrust is slight. The tappet lifting rocker arm is pivoted with a long leverage reducing the motion in its pivot pin, and the latter is also submerged in oil.

Surfaces Require Hardening

The greatest amount of real sliding motion in this construction occurs between the cam and its following rocker part, but proper hardening of their surfaces will render the wear negligible, especially in the presence of an excess of lubrication. Even when the contact surfaces of these parts would wear off somewhat this will not be followed by noise, inasmuch as the character of their relative motions remains practically unchanged. Also the continuous contact between all mechanism parts is interrupted, due to the action of the flat spring. Some noise would be apt to arise if improper treatment of the parts, or uneven distribution of their material, should leave soft spots on the cam and rocker of the sort that can be pounded out into depressions in the even surface, thus giving great irregularities in the lifting or settling motion of the valve parts. Otherwise it is only up to the strength of the valve and the rocker springs to preserve these parts in continuous contact at high motor speed.

The Chenard and Walcker motor is built with comparatively large cams, the camshaft proper being in size equal to the size of crank pins in the two-bearing crankshaft. This, together with the housing of the camshaft, adds considerably to the width of the crankcase. However, the valves are with advantage kept close to the cylinders, which is rendered possible by offsetting them from the line of the camshaft, at the same time without altering the regularity of their motion, which is transmitted through the rocker. The large clearance available between the rocker and its spring permits the construction of cams of an easy shape. At the same time they can be made so that the maximum valve opening after being reached remains constant for some duration of the suction stroke, giving a condition very favorable for a good cylinder filling at high speeds. The same applies also to the cam and rocker construction, Fig. 4, this also serving as an example where a good valve opening is obtained with small cams.

(To be concluded)

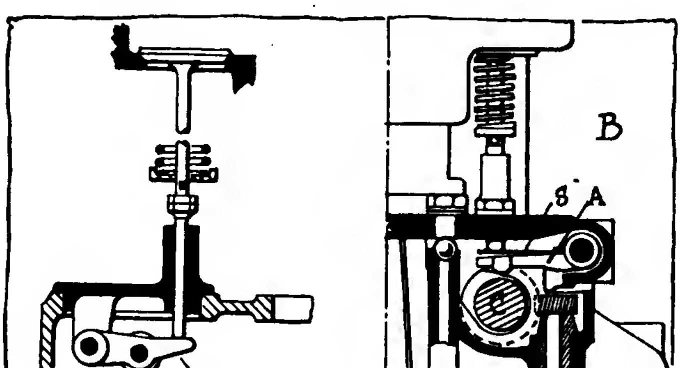

Fig. 4.—Method of valve operation in which the lifting action is multiplied by rocker arm. B, Chenard Walcker construction, showing introduction of flat spring between rocker and valve stem

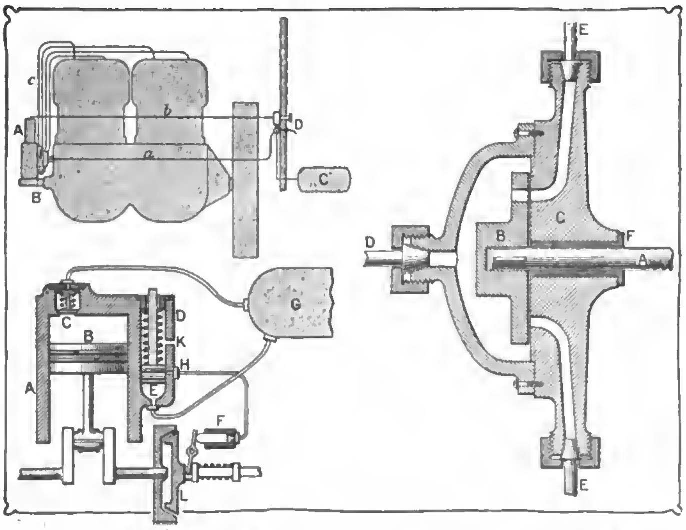
Compressed-Air Motor-Starters Found Least Cumbersome and Sufficiently Reliable By French Builders, Economy Also Considered—Pre-Ignition and Its Avoidance —Some Examples of Cast-Steel Truck Wheel Construction—German Crisis

AIR Preferred for Starters in France—Given the choice of starting an automobile motor either by means of a special explosive charge, such as one formed from acetylene gas or by a forcible injection of gasoline vapor, or by an electric motor or by a compressed-air motor, the French market is developing a preference for the latter form of auxiliary device. The reasons are set forth briefly by D. Renaud. The objection to a gasoline vapor charge is that it is difficult to regulate it so as to have it unfailingly ignitable, and while acetylene detonates easily, does not condense in a cold motor and [any mixture from 3 to 65 per cent. being explosible—Ed.], an overdose of this gas may cause a much more violent explosion than is desirable. When ignition fails, it is necessary to go through the process of cleaning the cylinders of the poor mixtures before trying to introduce new and better ones, and this process is more laborious than starting by cranking. With regard to the electric starting equipments it is mentioned that the effort required for starting a motor amounts to about 60 per cent. of the power developed by the motor when it is in operation at a comparable angular speed of the crankshaft, and that an electric equipment powerful enough to overcome such a resistance must be so large that it becomes an encumbrance and impracticable for the average owner of a car otherwise mechanically operated. [The author knows of course that much may be said against these objections and for the systems which he rejects, but apparently he means to suggest that the viewpoints mentioned by him should be decisive in a general judgment on the subject.—Ed.]

Among the compressed-air devices, some act directly on the motor shaft, and others send the air to the cylinders to act upon the pistons, one after another, until the motor is running normally.

The first of these types does not depend upon finding the motor pistons in a certain position to start with and is represented in the Barbey self-starter which is used on Delaunay-Belleville cars and consists in a four-cylinder air motor mounted in front of the gasoline motor and arranged to be clutched to the motor shaft. It receives compressed air from a tank on the dash when the motor is to be started and, on the other hand, is driven by the gasoline motor when the tank must be refilled.



Figs 1, 2 and 3—Mechanics of compressed-air motor-starters

On account of the smaller equipment involved, greater interest attaches to the second type. It is based on the ascertained fact that a gasoline motor in good order always comes to rest with all of the four pistons at the same height and that one of them therefore always is in the position of a half-finished power stroke. If air is sent to the cylinder where the piston is in this position, it will thus act upon this piston exactly as the gas explosion acts during normal operation, and in order to effect a start safely it is only necessary to arrange a distributer device which will send air first to the cylinder which is found in the position referred to and successively to the other cylinders in the order in which they get into the same position. As soon as the speed imparted to the crankshaft is sufficient to draw an ignitable charge into one of the cylinders and to effect the compression of the same, the start is bound to follow, and the moment an explosion occurs from which the pressure is greater than that of the air, the automatic valves in the distributer cease to admit air.

All the apparatus necessary for assuring this result comprises a special distributer device connected to the different cylinders by tubes of small diameter, a special automatic intake valve for the compressed air in each of the cylinder heads and an air-tank connected to the distributer. The compressed air is usually produced by means of a small pump actuated at the driver's option from one of the gear shafts, and it is usually sent first into a small reserve tank. The general arrangement is shown in Fig. 1, in which A is the air-tank, B the distributer, C the reserve tank, D the control organs, *a* tubes from the reserve, *b* tubes to the reserve and *c* tubes to the cylinders. The distributer is the only organ presenting features not familiar from other mechanical devices. It must be so built as to avoid air leaks when it is feeding the cylinders and to avoid friction when it is not operating. Fig. 3 shows one such arrangement. A is a half-speed shaft driven from the crankshaft, B a rotary slide valve keyed to rotate with A but capable of a small longitudinal displacement on the shaft, C the distributer-disk forming one side of the air-collector in which air is received through the valve D from the air tank, E the air conduits to the cylinders, F the bushing in which shaft A turns. The air pressure holds the ground face of the rotary slide valve tightly against the distributer-disk C, as soon as air is admitted. The hole in the slide valve can be made large enough—in the form of a curved slot—to make sure that air will reach one of the cylinders when first admitted, even if the pistons are not found strictly midway between centers, and thereafter the slide valve is rotated and takes care of the successive distribution to the four cylinders. When the start is effected and the air supply is cut off, the slide valve is detached from the face of the distributer and revolves without friction This device need only be from 2 1-2 to 4 inches in diameter.

A somewhat different distributer is used in Delahaye fire engine motors and has so far proved itself reliable. It was designed and made by Letombe and Aucoc and is shown in Fig. 4. It forms a feature in a general arrangement like that represented in Fig. 1. This distributer has four piston valves D placed 90 degrees apart around a cam disk B keyed upon the camshaft of the motor. The space at the outer ends of the pistons is in constant communication with an annular space C in which the compressed air is received by way of R, and from which four conduits M lead to the cylinders. When air is admitted, all the pistons are pressed against the cam-disk, but only the one opposite to the notch *b* in this disk can be displaced toward the center of the device, thereby uncovering the corresponding air conduit to one of the cylinders. When the air pressure ceases, the pistons also cease to press against the cam disk and the device revolves without appreciable friction.

The intake valve for the air which must be provided in each of the motor cylinders opens from the outside inwardly and its spring must be strong enough to resist the ordinary suction of the intake stroke, for which purpose a four pound spring pressure [per square centimeter] is sufficient, even if the carbureter is throttled down.

A compressed-air motor-starter can be arranged so as to require no attention with regard to the filling of the air tanks. To this end, the compressor pump is connected with one of the shafts in the motor by a cone clutch on the plan shown diagrammatically in Fig. 2. A is the compressor cylinder with piston B and valve C connected by a tube with the air tank G. In the adjacent small cylinder D the piston E is pressed toward the bottom by a spring, against the resistance of the air pressure underneath. If sufficient to raise the piston until the port H is uncovered, the air pressure travels through a tube to the small cylinder F and drives the piston in the latter against a lever which disengages clutch L and releases the compressor shaft from the driving shaft. Obversely, if the air pressure under piston E is low, the clutch springs pushes the clutch into engagement and puts the compressor to work. K is a safety port limiting the air pressure to a maximum, being necessary because a relief port in cylinder F, for example, would leave too small a margin of air pressure to work with, so that the clutch would be continually engaging and disengaging.—From *Omnia, March 22.*

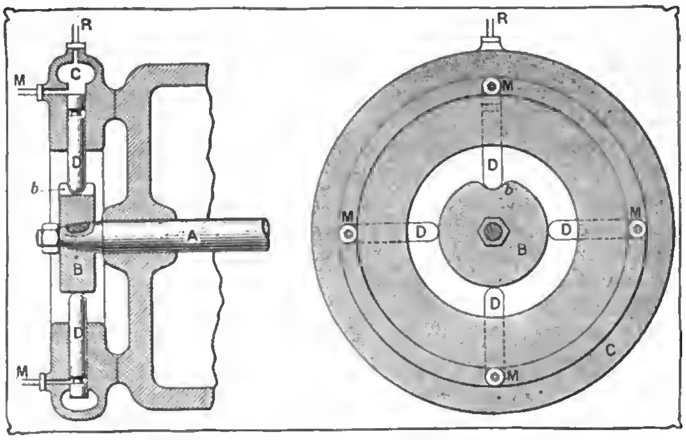


Fig. 4—Distributor for Delahaye starter of fire engine motor

POSSIBLE Causes of Premature Ignition.—While great progress has been made in this respect, no motor builder can yet guaranty absolute immunity against premature ignitions. They may occur as well during the indnction as during the compression stroke in a four-cycle gasoline motor. In two-cycle motors with fresh-air scavenging they can occur only during the compression, but in the two-cycle automobile motors, in which the burnt gases are driven out by the fresh charge under light pressure, ignition may take place also during the charging period preceding the compression.

If in a four-cycle motor the incoming charge takes fire, a loud detonation is heard in the induction tube, but damage is rarely done and the motor usually continues to operate. The usual cause is a mixture [for the preceding explosion] which is too poor, too rich or not homogeneous, so that a part of it burns very slowly and remains aflame after the exhaust is ended. A weak spark which ignites only a very small portion of the charge may cause similar effects. In all these cases the ignition is plainly due to the incoming charge meeting a flame upon entering the cylinder. The same condition, with its slow fires and incomplete combustions, can also cause unburnt gases to become ignited in the muffler. The remedy is suitable carbureter adjustment, a powerful or multiple (dual) spark and the avoidance of dead space in the combustion chamber.

Premature ignition during the compression is, on the other hand, not noisy. It often passes unheard. but its effects make themselves felt very soon. Diagrams taken during such explosions show that the gas pressure begins to rise at the middle of the compression stroke, increasing the torque of the motor shaft at that moment in an abnormal manner, and that it reaches altogether excessive values toward the end of the stroke. Moreover, as the dissipation of heat in the cylinder walls is at the same time interfered with, the sudden absorption of heat in the gas tension creates a negative area (in the diagram) which often annuls completely the positive work. The smallest of the inconveniences which then arise is the stopping of the motor. It is often preceded by heated bearings due to the expulsion of oil from between the friction surfaces under the exaggerated pressures. Obliged to take cognizance of this eventuality, motor builders have strengthened the motor shafts in order to avoid the fractures which previously occurred too often.

This kind of premature ignition may be due to mixtures which are too rich or contain a surplus of hydrogen, but it may also be caused by insufficient cooling of the cylinder, by poor insulation in a high-tension commutator, by an excess of lubricating oil, by the use of an oil which leaves carbon deposits and by the fouling of the cylinder walls due to tar or coal dust contained in the gas charges [the latter item referring apparently to the use of benzol as fuel].

The best means for obviating these damaging pre-ignitions consist, apart from the precautions mentioned before, in working always with very clean gas of small hydrogen-content and constant composition, without excess of lubricating oil and in refraining from pushing the motor to its power limit.

As the effects of pre-ignition is the more serious the higher the compression is, it may be characterized as imprudent to design a motor for average piston pressures as high as 6 or 6.5 kilograms per square centimeter. The exact cause of pre-ignition can in any case be detected without difficulty by a careful examination of the conditions.—From a communication by Prof. L. Letombe to the Society of Civil Engineers of France, February 7, reported in *Technique Moderne*, March 15.

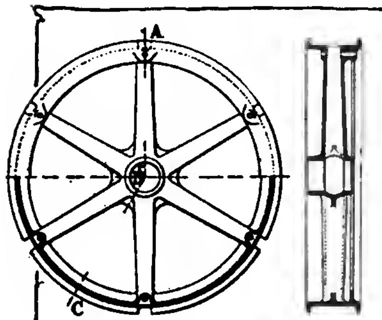
Crisis Expected in Germany—According to an insistent editorial article in *Auto*, the organ of the Society of German Automobile Engineers, the German automobile industry has during the past few weeks experienced serious setbacks in its export business and its representatives in the foreign countries have ascribed the rapid and untoward change to the American competition. An automobile show in Berlin at the earliest possible moment, and preferably during the coming summer, is suggested as a suitable remedy and a means for averting a crisis. What lies at the bottom of the trouble, however, it is admitted, is the hesitating slowness of most German manufacturers in adopting and organizing sound mass-production methods. It is thought an exhibition may furnish a strong object lesson on this point.

CAST-STEEL Wheels for Trucks—The orthodox view to the effect that wood wheels are the only ones which are fit for heavy truck service has been aired industriously in France of late in connection with reviews of the latest military tests, and the one-sided opinions and conclusions which have been expressed have now called out dissenting voices. Commandant Ferrus steps into the breach for cast-steel wheels fitted with rubber tires in an article of which an extract is presented in the following:

The opinion of French constructors continues to be rather unfavorable to the metal wheel, but this opinion seems to rest on a misunderstanding. The theoretical objections to the metal wheel—lack of elasticity, brittleness, sluggish traction vibrations—are in truth well founded and proved, but these reproaches apply only to the metal wheel fitted with iron tires.

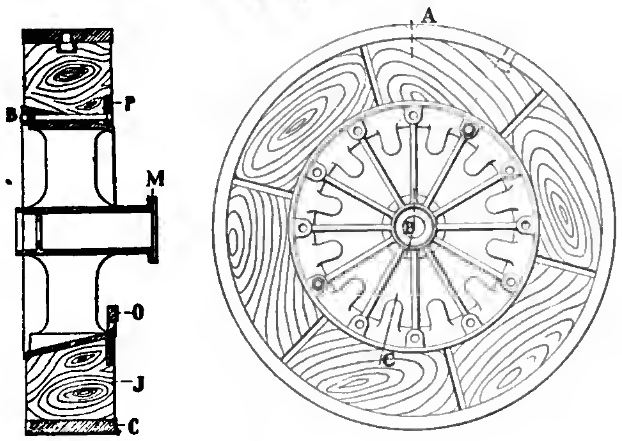
Wire wheels, now coming into fashion again for automobiles, would certainly be detestable if fitted with iron or steel tires; yet they are acknowledged to be excellent when equipped with rubber tires.

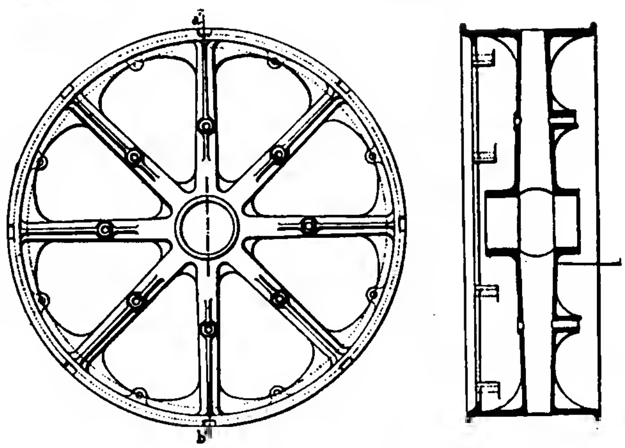
The fact is that in France the metal wheel—with rubber tires—has been condemned without serious trial. On the other hand, a glance at the development in Germany reveals the fact that the German truck builders employ the cast-steel wheel exclusively and that they claim for it the advantages of being cheaper than the wood wheel, notably lighter, unaffected by the weather and never in need of attention, having only the one defect of being practically unrepairable in case of severe accident and breakage. In its new regulations for subsidized motor trucks, which go into effect April 1, 1913, the German government has, moreover, made it obligatory to have these trucks equipped with cast-steel wheels.



Figs. 6 and 8—Front and rear N. A. G. cast-steel truck wheels

Fig. 7—Beausoleil's adjustable mixt wood and cast-steel truck wheel with iron tire.





The very real shortcomings of wood wheels are well known and those of steel wheels are less well known, but the experience gained abroad proves at all events that these possible shortcomings, whatever they are, are not prohibitive. The steel wheel should not be ostracised but tried. But the steel wheel without rubber tires has been tried and has been found wanting, having all the faults charged against it. The types to be examined are those steel wheels which have been used in France or abroad with rubber tires. Among these are the Fischer, the N. A. G., the Hugon and the Beausoleil.

The Fischer wheel is made at the electro-metallurgical works at Schaffhausen, Switzerland, and is poured from electrically made steel (Herault furnace). It is manufactured in two types, one which has hollow spokes and also a hollow rim and which is difficult to cast and correspondingly expensive, and another in which the spokes alone are hollow. Both are cast in one piece. The all-hollow type should be by far the best. It can be greatly deformed without breakage. It is light, a set of four for a five-ton truck weighing, without the tires, 500 to 550 kilograms.

The Neue Automobil Gesellschaft (N. A. G.) of Berlin employs a type the construction of which is shown in Fig. 5 and Fig. 7, representing respectively a front and a rear wheel. The sectional view under Fig. 5 is taken on the broken line ABC of the side view. These wheels are used for six-ton trucks, and the front wheel weighs 50 kilograms, the rear wheel about 135 kilograms. They are assembled in the middle plane by means of bolts, as clearly indicated in the drawings, and the solid rubber tire is mounted directly upon the cast rim.

Some interesting wheels for heavy trucks have been designed by Hugon, an engineer at Calais. The tread is formed of steel blocks, each of which is secured by a socket joint to a steel rod which passes radially through the wheel rim. But on the outside of the rim each steel block rests on a block of soft rubber, and the inside of the rim is lined with a thick band of the same material against which there is pressed a steel plate by passing the securing-rod for each block through all of these parts and threading a nut on its inner end. These wheels are in service on trucks of 2 1-2 and 6 tons used for the transportation of material at the Astricourt mines at Pas-de-Calais.

The Beausoleil wheel is of the mixt type. It comprises, as shown in Fig. 6, a hub of cast steel and an iron tire separated by a wood rim whose function is to deaden vibrations. This expedient of interposing a wooden lining between the metallic parts has been tried repeatedly, especially for vehicles intended for the colonies, and always with the worst possible results. It is in fact easy to understand that the wood will work loose under the influence of alternating drought and humidity and that the wheel will then soon be out of commission. But Beausoleil has had the ingenious idea of giving the cast-steel hub the form of a truncated cone, against which the wooden lining J may be tightened up by means of the bolts B and the plate P, and as the lining is composed of individual wooden blocks this adjustment can be made easily and without taking the wheel apart or dismounting it; in fact as a road repair. As also nothing prevents the use of rubber tires on a wheel of this type, its development may be worth watching.

The experience with sheet-steel wheels riveted together has not so far been commercially favorable, though many wheels of this kind have been turned out. It seems to be feared that the rivets will work loose, but this fear is perhaps not well grounded if suitable rubber tires are used [the fear relates perhaps mostly to that period in the life of a rubber tire when it is worn down and thin.—Ed.]. At all events, however, pressed-steel wheels, in which few rivets need to be used, would seem preferable, and their construction presents at the present time no special technical difficulties—none comparable with those which were encountered at first in the production of cast-steel wheels of small weight and which have been overcome only through the great progress accomplished lately in metallurgical processes and foundry practice.—From *Le Poids Lourd,* March 14.

Engine Testing at the Northway Plant

By J. O. Heinze

¶ Editor's Note.—*This paper is based on a report delivered by John O. Heinze at the January session of the Society of Automobile Engineers from the Motor Testing Committee, of which Mr. Heinze is chairman. The object of this report was to set before the various engineers what the Northway Motor & Mfg. Co. is doing in the way of testing motors, with the object that the various testing methods in use in other factories might be later presented before the society and that eventually the motor testing committee would be able to evolve some standardized form of testing apparatus for the various parts of the motor.*

Justification

Professors in college laboratories have done a great deal of testing, and they have given us certain formulas to work by in our gasoline engine field, but unfortunately a great deal of this mathematical work is rather difficult for the average automobile engineer in the workshop, and we desire something more practical.

Were we to employ mathematics altogether we would a great many times go astray, for the reason that we all have to take into consideration the commercial end of automobile engines, the manufacturing advantages, machining ability and the general behavior of the product in the hands of the customer in general use. We have all been building engines and we have been varying our bore and stroke. We have been varying the individual elements of an engine, and we have been plotting horsepower curves along different lines.

A disadvantage that the automobile engineer has to put up with, differing from that experienced in electrical engineering and other branches of the engineering profession, is that we cannot go on the open market and purchase apparatus in the same way as the electrical engineers, who can go and purchase a voltmeter or ammeter or a Wheatstone bridge. We know no concern to go to and say "I want a complete set of apparatus for testing engines." The automobile engineer must design his own apparatus.

The testing done in colleges is very scientific. A professor can put an engine on the block and leave it there for a month, and in the course of his testing he will take gas analysis; will measure the heat losses with very delicate calorimeters; will measure the explosive temperature with a pyrometer; will measure the cylinder compression very accurately, and will measure the air resistance with venturi tubes, as well as making other scientific measurements. All these tests take a long time to make and are more or less delicate. Consequently, in the average laboratory we wish to resort to testing apparatus which gives us quick and practically accurate results, and I believe that these results will be just as accurate as most of the scientific work done in colleges. A great many pieces of testing apparatus which we would like to use have not been designed, and the apparatus which we have built and designed has been, in a measure, crude. As time goes on, however, more delicate instruments, giving greater accuracy, will be brought into use. It seems to me that we engineers should suggest the kind of apparatus to be used in the engine testing laboratories, so that we may all test our motors along similar lines, and then our results will admit of fair comparison.

As a committee we should suggest a standard curve sheet, a standard data sheet, and also certain essential tests, being careful not to be too scientific.—J. O. Heinze.

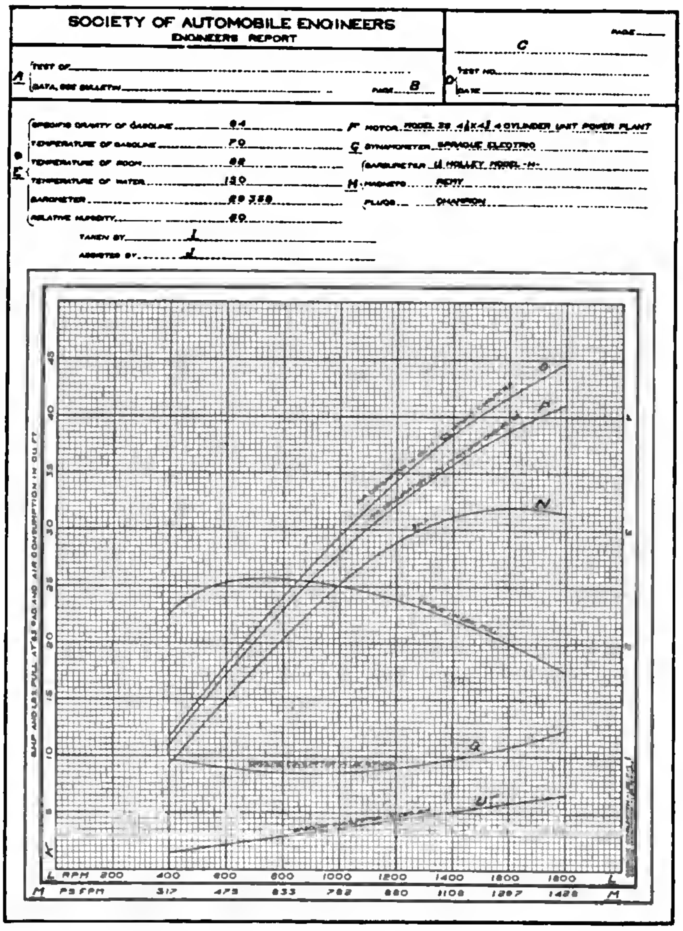


Fig. 1—Proposed standard curve sheet to be used for engine testing

I HAVE here a number of plans, diagrammatic views and apparatus and methods pursued in making tests at the Northway Motor & Mfg. Co. plant. They are not what you might consider the most scientific, but they are of practical accuracy and are such apparatus as give us comparative results from day to day so that we know what we are doing.

Fig. 1 is a sheet which might be adopted as a standard curve sheet to be used by the engineers, and on which I have plotted curves representing different elements in the operation of an engine. On the top of this sheet is the name of our Society, "Engineer's Report," and underneath it the subject of the test. Whatever the test is, whether of a certain make of carbureter, magneto or engine, should be written in here. At A is where we should record that this test is entered in our bulletin of a certain date, and at B the page number of our yearly book or bulletin. At C is the record that the individual engineer can keep in his own files. At D is recorded the test number and the date

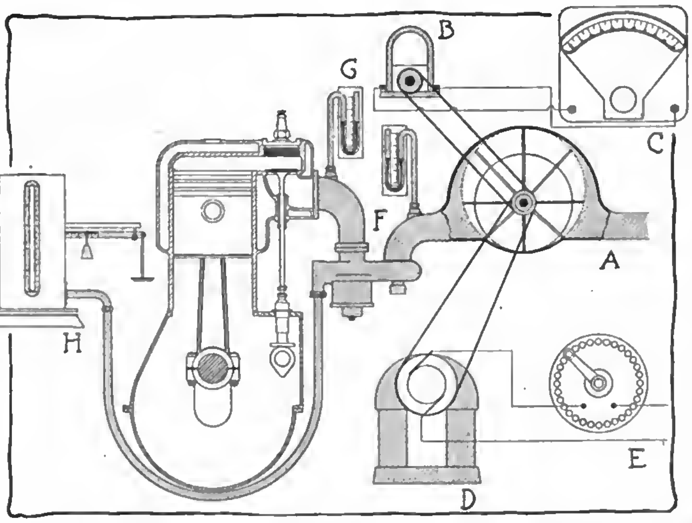

Fig. 2—Method of applying air meter to carbureter for testing purposes

that the test was made. Of course he can put the date of the test for the benefit of the society. At E I have indicated what I believe should be taken into consideration on the day the test is made. It contains the specific gravity of the gasoline, the temperature of the same, the temperature of the room, the temperature of the circulating water, the barometer and the relative humidity. At F is recorded the model, number of the models and the bore and stroke, whether it is four-cylinder or six-cylinder, and whether it is a sliding-valve or poppet-valve motor. At G is recorded the kind of dynamometer, whether it is a water brake or an electric and who is the maker of same. At H is shown the make and type of carbureter used, also the kind of magneto and spark-plugs.

Now it may seem advisable that we also should give the weight of the motor, the weight of the pistons and connecting rods, as well as the amount of offset of the cylinders from the center line of the crankshaft, or, perhaps, give other items which you think are of importance.

At I is given the name of the engineer who made the test. If he has an assistant, the assistant's name should also be given at J.

Calculating Horsepower

Below is the sectional paper. The figures at K give the brake horsepower, also pounds pull on a brake beam of 63 inches radius. It is shown here reading from 1 to 50 horsepower. However, it might be advisable to make this scale show from 1 to 100 horsepower. It is also necessary to give the length of the brake beam in inches from center of shaft. If we use a 63-inch brake beam, which is the size I use, the pounds pull at the same time indicates the horsepower by simply multiplying pounds pull times speed and by placing a decimal after the first three figures, which are fractions of a horsepower.

It might also be advisable to show at K the horsepower output for 1 cubic inch of piston displacement, so that we not only have the total horsepower but the horsepower output per cubic inch of piston displacement.

At L are the revolutions from 200 to 2,000, but it might be advisable to show it read to 3,000 revolutions. On scale M are the piston speeds per minute in feet.

I have plotted six curves of a Northway four-cylinder 4.125 inches bore and 4.75 inches stroke motor. The curve N gives the brake horsepower at different speeds; curve O gives the volumetric air consumption in cubic feet per minute without the carbureter; and curve P the air consumption in cubic feet per minute with the carbureter. Curve Q shows total gasoline consumption in pounds per hour. Curve U gives the gasoline consumption per pound per horsepower-hour and is the gasoline efficiency of the motor.

The object of plotting air curves is to know the volumetric efficiency of an engine in order to give the engineer an opportunity to determine from this curve whether his valve timing, size and lift are correct for the highest efficiency, and measuring the air consumption without the carbureter and with the carbureter, the difference gives the air losses due to the carbureter.

The volumetric efficiency of the engine charted here has depreciated very nearly 10 per cent., due to the use of the carbureter. You might say that is of no importance, but it is if you are measuring different carbureters. If you can get a carbureter that does not depreciate the volumetric efficiency of the engine it naturally produces a greater horsepower output. On the other hand, the gasoline consumption test is for the purpose of determining the carbureter efficiencies, and by comparing the cubic feet of air consumption in relation to the quantity of gasoline consumed in a given time tells us the relation of gasoline to air at different speeds and torques. If I adjust the carbureter

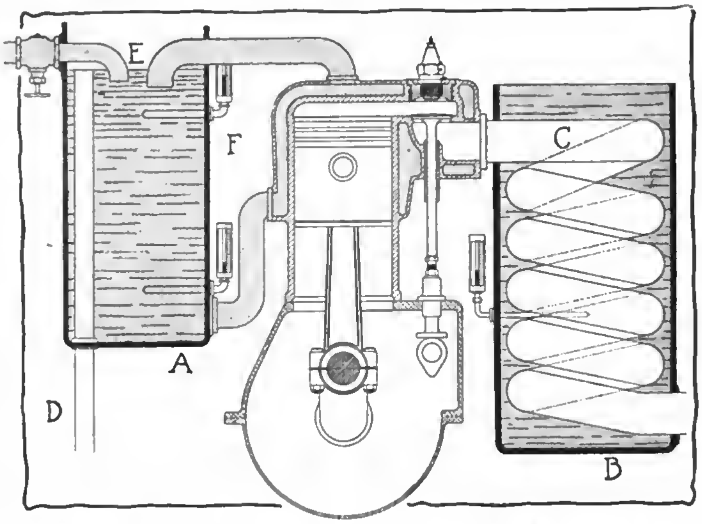

Fig. 3—Apparatus for determining heat losses in water circulation system

to maximum efficiency at 400 revolutions and now speed up the engine to 2,000, and if the relative rate of mixture has varied so that there is a greater percentage of air to gas as compared to the lower speed, this then will tell us that this carbureter is not accurately mixing the gas and air for the different speeds in the proper proportions. What we are trying to do is to select a carbureter which gives that same relative rate of mixture at low and high speeds. Unless we plot air and gasoline curves we cannot very well determine the relation accurately. It therefore seems that it is essential to know what our air efficiency is in comparison to our gasoline efficiency. It is also advisable to show the mechanical losses in the engine; this will tell us whether our connecting-rods and pistons are too heavy or if there is an excessive piston or bearing pressure, and show also in which direction we should proceed along the line of experimentation to make improvements.

Most Efficient Cam Design

By plotting air curves and changing the shape of cams and varying the valve lift, the cam which makes possible the greatest air consumption will produce the greatest horsepower output in the motor.

At the Northway plant we have an experimental engine in which there is a sliding camshaft having a cam on same which is pointed on one end and very broad on the other end. If now by the air meter we measure the cubic feet of air consumed per minute, and move the cam to and fro, and note the indicator of the air meter rise and fall, whatever position of the cam the engine consumes the greatest amount of air determines the proper shape of the cam for maximum power at the particular speed of motor desired. Therefore, you see, to measure the air is one of the processes which it is necessary to consider to get the maximum horsepower output in our motor. We must, however, take into consideration what that engine is supposed to do. Is it for racing purposes and we want to get the greatest possible power out of the engine regardless of speed, or do we desire to build a motor producing the greatest power at 1,000 feet piston speed? What we are striving to do is to determine the proper shape of cam for different revolutions to produce maximum power, so you see volumetric efficiency must be taken into consideration when making engine tests.

Air Meter on Carbureter

At the Northway plant I constructed an air meter, Fig. 2 A, which was calibrated so that every revolution represented a certain volume of air. It consists simply of a drum 10 inches in diameter and 10 inches long with vanes that move in and out. The drum rotates on ball bearings; the air passes through this air meter and on through the carbureter. The revolutions of the drum are recorded by a Weston magneto tachometer, B. The scale C of the Weston instrument, which ordinarily reads revolutions, is graduated to read cubic feet of air. The engine is driven by the electric dynamometer when using the air meter. It is necessary to drive the air meter by a small electric motor D, the speed of which is regulated by a rheostat E. If a motor was not used, naturally there would be some lag in the speed of the drum of the air meter due to suction which would introduce an error. I have inserted in the air pipe between air meter and carbureter a small U-shaped liquid pressure gauge F; if there is any variation of pressure one column of the liquid will be higher than the other. The speed of the air meter should be so regulated that both columns are of the same height. I also use a similar U-shaped pressure indicator G inserted in the intake pipe between the carbureter and the cylinders.

H is a copper tank containing 10 gallons of gasoline, provided with a gauge glass graduated in pints. This tank rests on platform scales so that the gasoline can be weighed. If I run the engine 300 or 400 revolutions for 5 minutes, measure the air in cubic feet, weigh the gasoline in pounds, then run the engine at 1,000 revolutions the difference in the quantity between air and gas at different revolutions determines the carbureter efficiency. It is advisable to always resort to the same instruments to get accurate comparisons. By these measurements I can quickly determine which is the best carbureter.

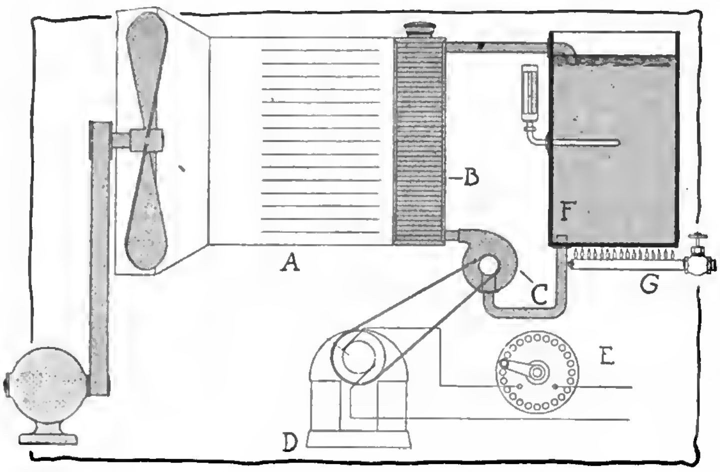

Fig. 4—Method of determining correct size of radiator for given engine

Other engineers may resort to different methods to get the same results. Some use a venturi tube to measure air consumption and by calculus determine the quantity, whereas by this air meter you get direct readings and eliminate figuring. This is a very simple method of getting air and gasoline readings in order to determine carbureter efficiency.

When I run the engine under power and plot air curves the air efficiency due to running the engine under power, and then afterwards run it by the dynamometer, the difference between the air consumption when the motor is running under power and getting the action of the back-pressure as compared with the same engine running without the firing conditions gives the losses that are produced by the back pressure in the cylinder. I can check up readings in that way and know whether the back-pressure due to the muffler produced undue volumetric losses and consequent loss of power.

In connection with engine tests we naturally also want to know what our heat losses are, due to loss of water circulation and exhaust gases. Fig. 3 shows the arrangement of apparatus, which consists of a tank A, which is of a certain size and contains 500 pounds of water. The water from the engine circulates through this tank. On the exhaust side is another tank, B, which also contains 500 pounds of water, and through which circulates a coil of copper tubing C of such length and size that when the exhaust gases finally pass out through the end of the coil the gas is at atmospheric temperature, or nearly so.

Radiator Size Determined

If the motor is run under power at 40 horsepower and has 500 pounds of water in the cooling system at atmospheric temperature, then by recording the degrees rise in temperature of the water, and also the time in minutes, I can quickly tell the heat losses due to the water circulation. The exhaust gas heat losses are similarly measured by water absorbing the heat. In order to maintain a constant temperature there is an overflow pipe E and cold water inlet, and thermometers F indicate the temperature of the water at the inlet as well as the outlet from the motor. By this method I can determine accurately that a motor running at 1,000 revolutions per minute and developing 30 or 40 horsepower produces so many heat units in the water circulation and exhaust.

If we consult a radiator maker using the above method of test he would proceed as follows: He would first connect the 500-pound tank of water to the pump which the automobile manufacturer will send him, and which is for use on that particular motor, and rotate the pump at a certain speed. Then after heating the water up to a certain temperature he would put the radiator inside of a box in which air could be forced through the radiator at a known number of feet per minute, constituting an artificial air draft the same as the car meets on the road. By measuring the velocity of the air by an anemometer at a certain number of inches per hour, it follows if we draw the heat out of the 500 pounds of water in the tank in the same time that it took the engine to produce it, that this would determine the proper size radiator to use in connection with an engine of a particular size.

At the present time what do we do? We go to the radiator manufacturer and say: "I have a 40-horsepower engine. I

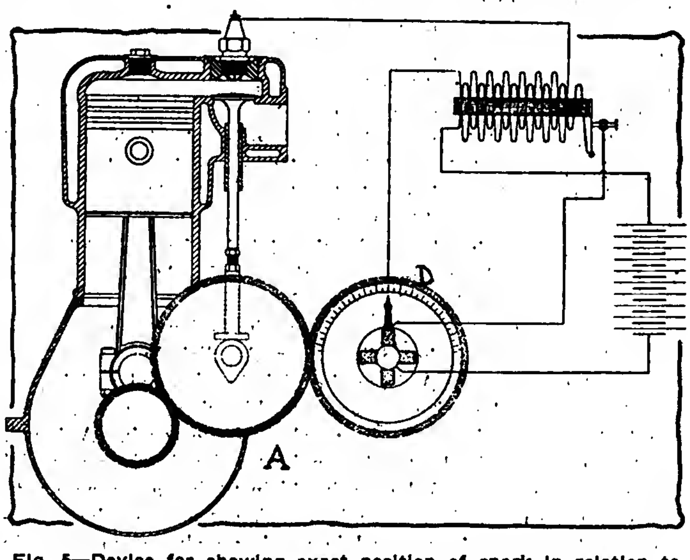

Fig. 5—Device for showing exact position of spark in relation to piston

want you to give me a radiator." From some experience he has had in the past the maker will say, "I think this radiator will be satisfactory." You put it on the car and later find out it is too small because the water gets excessively hot. If you select the radiator in the winter and it gives the best results it then is too small for the summer. If it is correct for the hottest days in the summer then it is altogether too large for the winter. Because of this, we should make our radiator determination by some similar empirical method and adopt some standard volume of water for comparison; it may be 500 pounds or 1,000. I have adopted 500 pounds because I find in the practical testing of engines of different sizes this figure was entirely satisfactory and gave accurate results.

Fig. 4 shows the radiator test apparatus, in which A is a box with a fan at one end of it. The radiator B is placed at the other end of the box inclosing it. C is the water pump. The water pump is driven at engine speed by a small motor D controlled by a rheostat E. F is a tank which contains 500 pounds of water. This water is heated by a gas burner G to a certain degree. *Then air is forced through the radiator at a known velocity and note made of the time that it takes the radiator to pull the heat out of the water. If the water cools off at the same rate that the engine heated it up, the radiator is correct in size. This, then, is a method of determining the proper size of radiator for a given size engine.*

Fig. 5 A shows an instrument of importance in testing, in order to eliminate all possibility of errors being introduced by variations of ignition. It consists of a graduated metal dial D in the center of which a pointer is rotated by the camshaft at camshaft speed. The secondary spark jumps from the end of the pointer to the dial. The pointer is set in relation to position of piston so that when it stands at zero the piston is on upper dead center, or maximum point of compression. The high-tension current passing through spark-plug also passes from the pointer to the dial simultaneously so that one can determine accurately when the secondary spark takes place in relation to the piston. It seems advisable that we should eliminate the breaker box timing and go by the secondary spark entirely. If the breaker box on the magneto is now advanced or retarded the secondary spark will indicate on the dial the amount of advance or retard of the firing point of the ignition. If we make carbureter tests from day to day we want to know definitely the position of the spark in relation to the piston.

Heat of Spark To Be Constant

The other element which enters into consideration is the heat of the spark. It is not absolutely necessary to know accurately what the real heat value of the spark is in heat units, but the spark which we get from day to day should be of the same heat value and should be measured and standardized. I designed an instrument, shown at the left, Fig. 6, for measuring the heat of the spark. A is a very fine wire supported on two posts, B and C. In the center of this wire is soldered a small globule of metal, 1-8 inch in diameter. Fastened to this metal globule is a little hook to which is attached a silk thread which is wound around a pivot and the end fastened to a small spiral spring to keep the thread in tension and also the wire A. Mounted on the pivot is an indicator which moves over a graduated dial. D is a small terminal placed opposite the globule of metal. The secondary jump-spark current crosses the gap E. At the same time this current passes through the spark-plug. If I run the engine and magneto at 1,000 revolutions per minute for 10 minutes and note the readings of the indicator on the dial due to the heat imparted to this wire A from the globule of metal and by the spark, causing the wire to expand, this, then, gives a quick method of determining the heat value of the spark. Although it does not give the heat value in heat units, it gives a useful comparative reading of the spark. If in testing a magneto running at 1,000 revolutions per minute, after 5 minutes the instrument indicates 40 degrees, while another make of magneto in 5 minutes produces only a 20-degree deflection, then the heat

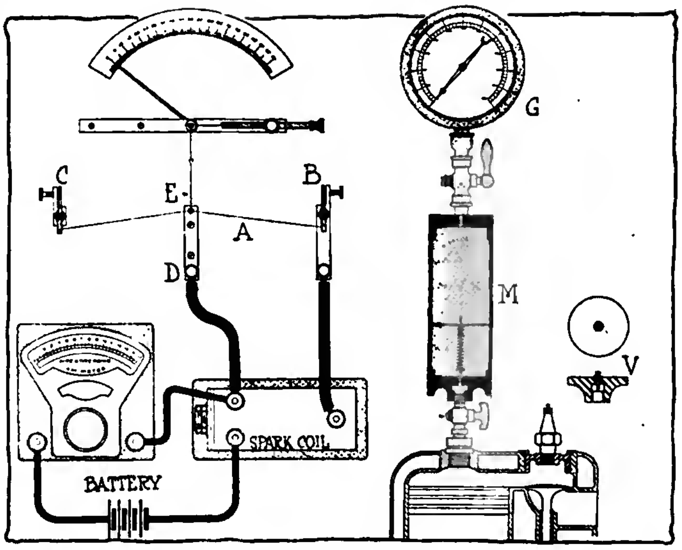

Fig. 6—Instruments for measuring heat of spark and cylinder compression

value of the spark of the magneto which produces only 20 degrees is only one-half as much as the one which produced 40 degrees.

If I am testing an engine today on 20 degrees ignition value and tomorrow on 40 and do not know it and get different results I am then liable to credit the results to conditions which do not exist and thereby introduce errors which should be eliminated. We must standardize the heat of our spark as well as spark setting.

Fig. 7 shows a device for measuring carbureter acceleration and is a means of determining rate of throttle opening. A drum A drives a fan B in which the fan blades are adjustable. Around the drum is wound a cord supporting a weight D. Connection between the throttle lever and the drum is made as shown in the diagram. The weight opens the throttle by the cord, drum and fan at a certain rate. By determining the rate of throttle opening and the increase of speed of the engine at different loads from a certain speed to a higher speed, carbureter acceleration can be accurately determined. Naturally the carbureter which accelerates the engine to the greatest number of revolutions in the quickest time determines the acceleration qualities of that particular carburter, and therefore is the one that we should use.

Fig. 8 shows apparatus and means for measuring engine vibrations. As is well known, that is a very serious matter with many engine builders. We endeavor to reduce engine vibration by reducing the weight of the reciprocating parts, such as pis-

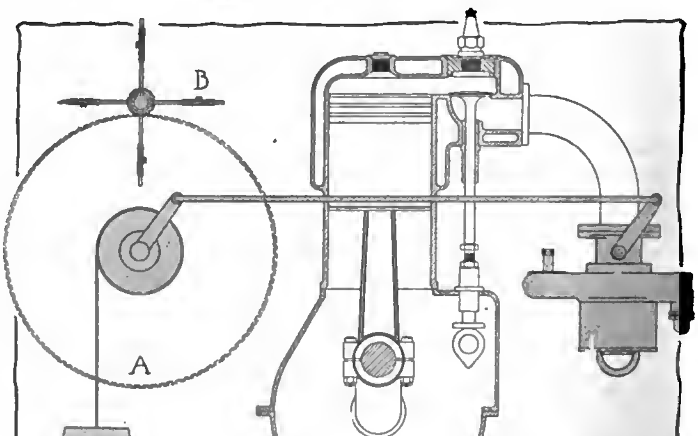

Fig. 7—Fan governor applied to throttle lever for determining acceleration properties of carbureter

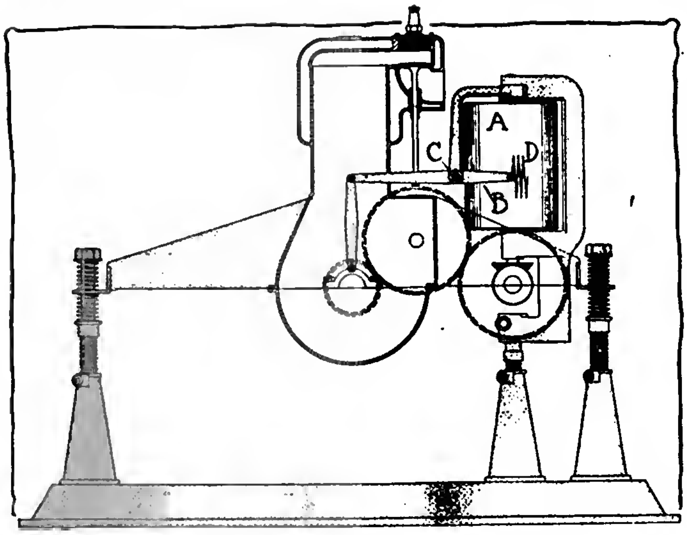

Fig. 8—Apparatus for measuring engine vibration and determining range of synchronous speeds

tons and connecting-rods, and also by balancing the crankshaft and flywheel. I found in practice that the maximum vibration is not altogether due to the weight and movement of the reciprocating parts, as will be shown later on after having described the apparatus used.

The drum A, Fig. 8, is rotatively mounted on a column rigidly held to a base plate. Secured to the engine cylinder is the indicating arm B which is pivoted at C. The end of this arm carries a pencil which marks on the paper at D on drum. If we run the engine by a separate source of power at different speeds we get a certain amplitude of vibration, and when we operate the engine under its own power we get an entirely different vibration having certain peculiar characteristics showing excessive vibration between 1,000 and 1,400 revolutions and minimum vibration below 1,000 and above 1,400, indicating that a sort of synchronism takes place at a certain speed, where power developed and weight of engine are such as to produce harmonious oscillations of great amplitude.

Naturally the automobile manufacturer who designs the car and the engine does not want this excessive vibration to take place at the normal running speed of the engine, say, 20 to 30 miles an hour. He would like to have this excessive vibration take place at a speed at which the car does not ordinarily run, say, at 40 or 50 miles an hour.

Fig. 9 shows apparatus designed along the lines of the Hospitalier Carpentier manograph excepting that I resort to a rotating drum D making one revolution for two revolutions

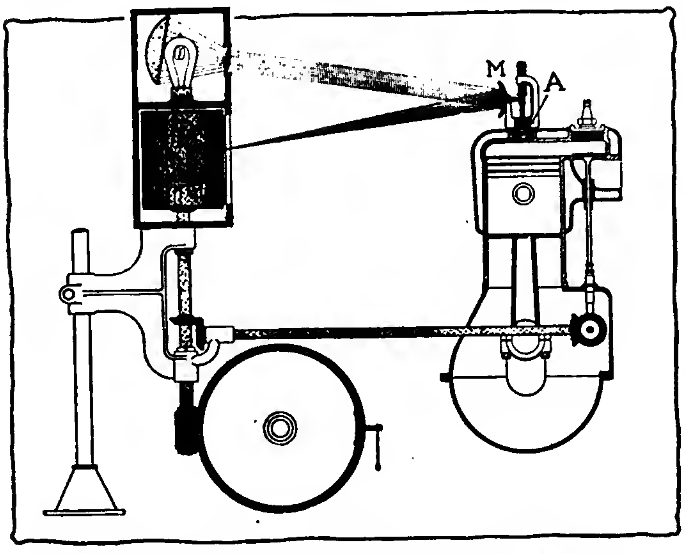

Fig. 9—Manograph for obtaining cylinder pressure diagrams

of the crankshaft. Around the drum is wound a sensitized film. Upon this film is photographed by a beam of light from the mirror M operated by a small piston in cylinder A a line, which line indicates the pressure variation in the combustion chamber of the gas engine cylinder during its four cycles and at various speeds.

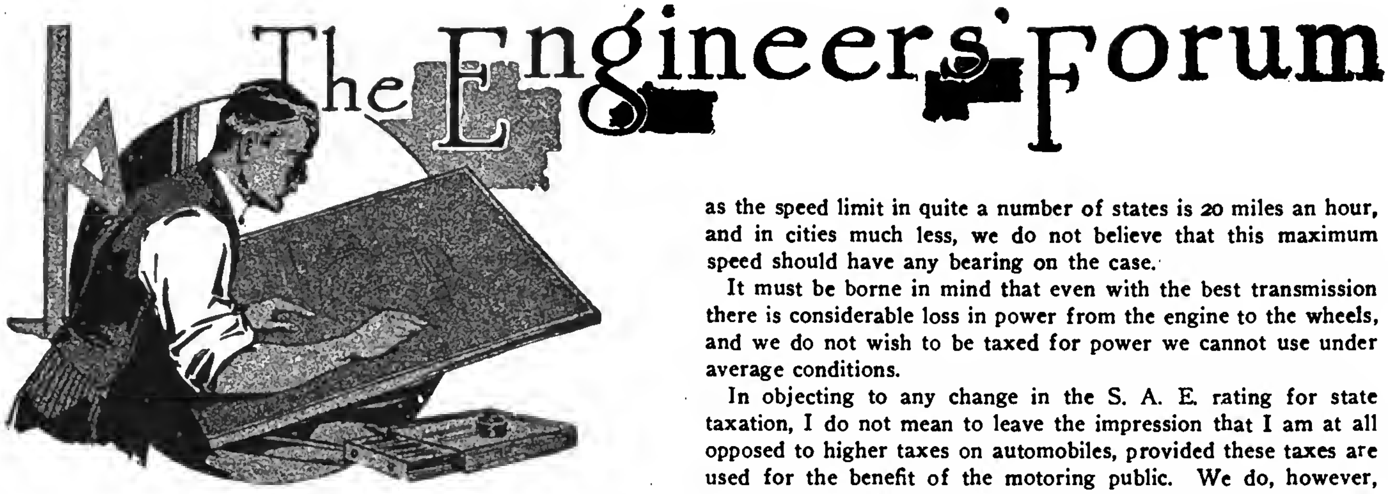
A device which I use for measuring cylinder compression is shown at the right, Fig. 6. M is a chamber of fairly good size, having a valve V, so that as the engine runs the indicator on the pressure gauge G does not bob up and down, but goes up gradually. Now we can get the compression, hot or cold, of the different cylinders by this instrument. There are, no doubt, many other ways to measure cylinder compression; this is simply one way to do it.

Requirements in Leaf Spring Design

¶ *From a paper read before the Society of Automobile Engineers by Leavitt J. Lane.*

In the design of spring leaves there are several important factors to be considered. Each leaf should be so tapered from the center outward that strains set up when the springs are in action may be distributed gradually. In the same manner the leaves taken collectively should have the same resulting taper, that is, the bottom or top leaf, as the case may be, should be the longer, each succeeding leaf being shorter in length so that under load the whole spring will approximate a true arc. In goving over a rough road, springs are subjected to considerable side-sway. To take care of this it is advisable to have some means of preserving alignment. Various methods are available. Near the end of each leaf there may be cut a slot into which projects a bead from the leaf underneath; or at the same point there may be formed a rib having a longitudinal movement in the indentation formed by the making of a rib in the leaf above. These ribs and slots should be so placed that each is covered by the next leaf above, resulting in their being out of sight and free from dirt. There is a little difference in the comparative value of the shape of the leaf points. The round bevel end is in most common use. Springs more than 2 inches wide should not have French or diamond points, as they entail unnecessary waste. In most cases the long leaf supporting the master leaf should have square points, especially with a high cambered spring, in the case of which the torsional strain on the master leaf is considerable. As a means of holding graphite or other spring leaf lubricant the leaves may be slightly concaved on both the top and bottom, and the space between filled with the lubricant to prevent rusting of the parts and to add to the wearing quality of the spring by decreasing friction.

The best results of spring suspension can be determined by experimentation only. The front end of the front spring must be anchored securely to the frame, as it takes the forward thrust load. The rear end may be allowed more or less play by means of a suitably designed shackle. The spring may lie in a horizontal plane or be somewhat inclined. In some cases raising the spring slightly at the forward end adds considerably to the riding qualities. The front end eye-bolt must be of such strength as to take care of the bearing load as well as the forward thrust load. It is imperative that this bolt be made of a steel of good anti-fatigue qualities. The front left-hand spring should be so designed in respect to strength that it will properly take care of the downward thrust induced by the torque developed in the motor, which revolves in a clockwise direction according to the general practice. This torque rarely exceeds 150 pounds, but it is necessary to make a trial for accuracy. The suspension of the rear spring depends to a great extent on the design of the chassis distribution of load, etc. If the spring takes the driving effort, the front eye-bolt must be designed to this end. At the present time about 50 per cent. of the American cars are driven in this manner.



Horsepower As Basis For Tax Discussed

Part II.

Prominent Automobile Engineers Vary in Their Opinions as to the Relative Value of Formulae

Farr Opposed to Changing S. A. E. Rating
Planche Thinks A. L. A. M. Formula Inadequate
Should Rate the Average Motor, Says Holmes
Brake Test Unfair, Says Granquist
Should Be Taxed for Capacity, Says Heising
S. A. E. Rating Should Be Retained, Claims Mixer

THAT the article entitled "Cars Taxed on Unused Horsepower, which appeared in The Automobile for March 27, was timely is borne out by the widely divergent opinions expressed by the leading automobile engineers of the country. Some of these views on the subject are given herewith:

Indianapolis, Ind.—Editor The Automobile:—I am very much opposed to any change in the present S. A. E. rating, as I believe that this is about as good as any other simple formula which could be devised, and also we think it would be rather confusing to adopt any other at present. Also the fact remains that if this should be changed, it should be to reduce the resulting horsepower instead of increasing it, as very few engines come up to the S. A. E. rated horsepower from the formula $\frac{D^2 \times N}{2.5}$ at the average speed at which cars are run. We do not believe that this average speed exceeds 20 miles an hour.

As an illustration of this point, the National company has spent considerable time in developing the maximum horsepower of its engines, and at the rate of 20 miles an hour (cars geared on an average of 3 to 1, which would be turning the engine over at about 560 revolutions per minute) our engines develop about 32 horsepower under steady pull.

According to the S. A. E. formula, this engine, which is four-cylinder 4⅞ by 6, is rated at 38 horsepower, so you see that at 20 miles an hour on the road there is quite a wide margin between the actual horsepower and the S. A. E. rating. Of course we realize that at much higher speeds on the road the horsepower does come up very materially. For instance, at 90 miles an hour, at which our cars have been known to run, this engine develops about 110 horsepower. As there is no possibility of a car running anything like this fact on an ordinary highway, and as the speed limit in quite a number of states is 20 miles an hour, and in cities much less, we do not believe that this maximum speed should have any bearing on the case.

It must be borne in mind that even with the best transmission there is considerable loss in power from the engine to the wheels, and we do not wish to be taxed for power we cannot use under average conditions.

In objecting to any change in the S. A. E. rating for state taxation, I do not mean to leave the impression that I am at all opposed to higher taxes on automobiles, provided these taxes are used for the benefit of the motoring public. We do, however, object to any discrimination against the motor car and the use of these funds for other purposes than good roads and in other ways which are of service to the motorist.—William G. Wall, National Motor Vehicle Co.

Springfield, Mass.—Editor The Automobile:—It is my remembrance that at the discussion on the question of adoption of the Royal Automobile Club's formula by the Mechanical Branch of the Associated Automobile Manufacturers, while nearly all tests of American-made motors at that time showed to more or less degree a considerable increase over the ratings given by this formula that it was the consensus of opinion of engineers present at those meetings that motors in general after being run a year by the average customer would not show on a test bench in excess of this formula, and it is the writer's opinion that the average car will not at this day.

I have made several tests of our motors which were the general run of our output and have found that they run considerably over this, in fact, checked up approximately with the formula that the writer has used for a number of years. This formula is the total cubic displacement of the motor divided by 8. We have made several tests of motors here which have checked with this almost exactly and also have had one test made by the Massachusetts Institute of Technology which showed the same results. We believe that if another formula is to be adopted, it should not give a rating higher than that mentioned above.

Our model S is a 6-cylinder motor, 5-inch bore by a 5.5-inch stroke rates by S. A. E. rating, 60 horsepower, by the writer's formula, 80.99 and the Incorporated Institution of Automobile Engineers, 108.88 horsepower.—H. G. Farr, M.E.—Knox Automobile Co.

Detroit, Mich.—Editor The Automobile:—A great deal has been said, a great deal has been written on the question of a formula for horsepower rating of gas engines, and it seems that no one can agree on that question. However, the question is, and has always been a very simple one.

The formulas given by the Royal Automobile Club of England and the A. L. A. M. were never anything but incorrect formulas. No engineer would try to figure out the power of a steam engine in figuring only on the bore of the cylinders without taking the stroke into consideration. Yet, for several years the public has been deceived with so-called formulas taking in account the bore only, not even mentioning the speed of the motor; and really long before the A. L. A. M. formula or the R. A. C. formula had been created, there existed a correct and accurate formula giving the exact power to be obtained from a gas engine of a given bore and stroke at variable speeds.

We have reference to the Hospitalier Ringelmann and Witze formula, which is as follows:

$$P = \text{Horsepower} = K \times d^2 \times l \times N \times n$$

in which P is the horsepower, d the bore of the cylinders, l the stroke, N number of revolutions per minute, n the number of cylinders of the motor, K a variable co-efficient, which we might call the efficiency co-efficient, varying with the design of the motor, the number of cylinders, the quality of the workmanship, the degree of perfection of the balance of the motor, in short, a co-efficient which can express the exact relation between the efficiency of different types of motors.

This co-efficient has a value well-defined for the maximum power of a given motor of one, two, three, four, six or eight cylinders, and it will be found as the number of cylinders increases in the motor, K decreases steadily for the same power on account of increased frictions and losses of calories.

It is well to state too, that, as the bore of a motor increases, for the same number of cylinders, K increases too, for if the power increases proportionately with the square of the diameter, the losses through friction and dissipation of heat units increase only proportionately to the diameter up to a certain limit.

This may seem a little complicated to the layman, but in the end a pretty fair idea of the power expected may be figured for the average size motor used in automobile construction. The bore and stroke are given in meters. We shall give the following values to K:

One cylinder	K—5.25	Four cylinder	K—4.58
Two "	K—4.90	Six "	K—4.13

To give an example let us take the Chevrolet six motor which has a bore of 3 9-16 inches and a stroke of 5 inches, or in meters 0.0905 bore, and 0.127 stroke. The formula will give us at 1,950 revolutions per minute:

$$P = 4.13 \times \frac{2}{0.0905} \times 0.127 \times 1950 \times 6 = 50.25$$

which is the power maximum shown by inspecting the curve of the Chevrolet motor. A value of K can be obtained easily to apply on bore and stroke given in inches it has only a great many decimals, being of a very low value.

The average owner of a car uses only the maximum power of his motor on exceedingly infrequent occasions, he generally drives his car on high gear at a speed in the neighborhood of 20 to 25 miles an hour, which corresponds to a speed of 750 to 1,000 revolutions of his motor. This is mostly what he uses every day to drive his car. If we apply our formula to the Chevrolet motor, we find that the power at 1,000 revolutions is

$$P = 4.13 \times \frac{2}{0.0905} \times 0.127 \times 1000 \times 6 = \text{about } 26 \text{ horsepower.}$$

If we compare with the A. L. A. M. formula we find that it gives a power of 30.6 horsepower for our motor, therefore our average owner is not even using all the power allotted to him by this dear A. L. A. M. formula and should not be taxed any higher, for it certainly would be an abuse of power (both ways).—E. Planche, Chevrolet Motor Co.

—

Syracuse, N. Y.—Editor The Automobile:—I believe the present rating should be corrected to take into account the different strokes of the different motors now being made. The rating which should be adopted should be a conservative one, one that the average motor will meet, and not a rating that represents the best motor, keyed up to the very highest condition. This would really be the rating that the average motor would come up to that is in the service of the owner.—A. Holmes, H. H. Franklin Mfg. Co.

—

New Brunswick, N. J.—Editor The Automobile:—Regarding the growing sentiment among our secretaries of state toward adopting new methods of taxation of automobiles according to horsepower and abolishing the present S. A. E. or A. L. A. M. ratings, it seems to us that this tendency is not in the right direction, for the following reasons:

In the first place, the speed at which an automobile may be driven over the highways is fixed by law. Secondly, the power necessary to drive any machine at this speed depends upon the weight and consequent resistance of that machine.

This power may be the full capacity of a small motor or a small portion of that of a large motor. In other words, it requires a certain power to do a given work, regardless absolutely of the size or nature of the power plant. Incidentally it seems to us that any taxation according to horsepower alone is fallacious.

Horsepower taxation according to the S. A. E. or A. L. A. M. formula is fair to all makers alike, while systems based on brake tests or cylinder capacity would be distinctly unfair, as they would put the burden of heavier taxes on makers of more efficient motors in the first case, and on makers of larger ones in the second. Since it is a fact that the large motor is more durable than the small, due to its operating at a lower average speed and frequency, these other systems of taxation would militate against motors superior either in efficiency alone, or in long life also, and would place a premium upon inefficient and undesirable motors, thus working out as highly unsatisfactory to the progress of the art, the owner, and the trade in general.—G. E. Granquist, Simplex Automobile Co.

—

St. Louis, Mo.—Editor The Automobile:—Very few of the average car owners and chauffeurs are able to keep their motors in such shape as to develop the full horsepower, according to the factory rating, and which was no doubt obtained at the factory under the very best conditions. This is easily proven when a car is brought up to the factory to be tuned up and a noticeable difference in power occurs after one of the factory experts has worked on it a short time. I believe that the A. L. A. M. rating is entirely adequate for the power obtained in general use.

It occurred to me that it might be more fair to the automobile owner to tax their cars according to their capacity, instead of the actual horsepower or a combination of the two. For instance, a man using a 40-horsepower, two-passenger car should not pay as much as a man using a 40-horsepower, seven-passenger car, any more than the man with a 5-ton truck with a 30-horsepower motor in it should pay less than a man with a 3-ton truck with a 40-horsepower motor.

The subject, we believe, is one of great interest, and there are numerous little points upon which sound arguments could be based. The writer is of the opinion that the article you have in mind will be one of great interest throughout the country, both to manufacturers and car owners.—George F. Heising, Moon Motor Car Co.

—

Racine, Wis.—Editor The Automobile:—I wish to express the following views in regard to S. A. E. formula for horsepower rating:

I realize that from a selling standpoint S. A. E. rating is not all that it should be, being based on bore alone it does not give the sales agent the necessary leeway to specify the horsepower, taking into account the different strokes which might be used with this same bore. However, from the manufacturer's standpoint and from the consumer's standpoint I feel that the S. A. E. horsepower rating is a fair rating for operation of the car on the road. I do not figure that we get much more out of our motors with the average driver using them on the road than S. A. E. formula allows them. On block test, however, this runs up from 50 to 60 per cent. more at times. I would therefore suggest that the S. A. E. rating be retained as it is practically the only fair rating which has been suggested up to the present time.—W. G. Mixer, J. I. Case Threshing Machine Co.

—

Wilkes-Barre, Pa.—Editor The Automobile:—I believe that a more equitable method of taxation would be one based upon the piston displacement of the motor rather than upon the A. L. A. M., or S. A. E., formula. It is well known that neither of these formulas take account of the high piston speed and consequent increased horsepower developed by the latest type of motors.—A. M. Dean, Matheson Automobile Co.

Light Delivery Cost

Record System and Cost Figures Obtained by Its Use by South Bend Owners

By Proper Economy, Packages May Be Delivered at Average Cost of 1.63 Cents

ONE of the fields in which the exception ought to be the rule is in the application of system to small truck fleets. In other words, among the thousands of companies and individual owners employing one or a few small commercial vehicles there is only an exceedingly small percentage which keeps operating records in scch a manner that actual benefits may be derived therefrom. To produce such records which may serve as a basis for operating cost reduction, it is necessary that the forms used for recording the data are so designed as to permit the entries of all facts bearing any relation to operating cost.

Below are described and illustrated three forms designed by the Studebaker Corp., South Bend, Ind., for the benefit of users of Studebaker 20 delivery cars. A few instances of the results obtained by records kept on these forms are also given.

The basis of the entire record system is a daily delivery and supply record, Fig. 1. This form is 8.5 by 7.25 inches, printed on thin tan cardboard and affording space for recording the mileage traveled by the car, the number of stops made, the number of packages delivered and the number of trips for both morning and afternoon of a day. The total mileage made during the day is recorded at the top of the blank, as are the company's number of the car, the name of the driver and that of the helper delivering the goods to the customers. Below the work record, the supplies used during the day are noted. These records include the quantities of gasoline, lubricating oil, transmission grease and what material is used for washing and polishing the car or any parts thereof. A record is made of the pressure maintained in the tires during the day, of adjustments made on the car and of tire repairs. When the statement has been filled out, it is signed with the driver's and his helper's initials and is turned over to the delivery superintendent.

At the end of the month the information recorded on all the daily cards pertaining to one car is summed up on a monthly operating expense record, Figs. 2 and 3. This form is 8.5 by 13

GRAND TOTAL A.M. AND P.M. DELIVERIES

12 trips.
33.04 miles covered.
103 stops.
107 packages delivered.
6 hours 3 minutes actual running time (motor running continually from time of start till return to store).
2 hours 3 minutes time stopped (motor running while making deliveries).
1 hour 28 minutes time loading and waiting for orders to be put up.

inches and printed with black ink on fairly heavy white paper. Fig. 2 shows the front of the blank, on which the type capacity and model of the car and the date on which the monthly record is filled out are entered; the same applies to the name of the owner and his address as well as the car number used by the company and the name of the driver. The rest of the front page is filled out by the spaces for copying the daily records of mileage, number of stops, packages delivered, fuel, oil and transmission grease used, as well as incidental expenses and remarks. One line is provided for each of the 31 days of the month and the last line serves for footing the totals.

Fig. 3 shows the reverse side of the blank giving the monthly totals of the various items appearing on Fig. 1. It also affords space for recording the average number of deliveries per day, miles per day, miles per gallon and gallons per day.

With reference to these three blanks, the following should be noted. The daily record card blank is not always filled out completely, but in many cases only the mileage, the gasoline and the oil consumption are given. Of course, it is better to also make out complete delivery records as they will help the owner to decide what the truck is worth to him. Anyway, the Studebaker Corp. supplies these blanks principally to companies who have

Annual overhauling of machinery, and incidental repairs to car due to wear and tear and service of car. (Estimated)		50.00
		$1,516.94
Average cost operating car per day, 300 days in year		$5.00

(In figuring the cost of horse-drawn vehicles, your total year's cost should be figured with the regular 365 days that makes up a full year.)

not used automobile delivery before; after a certain time, progressive companies supplant this stock form by specially designed blanks better adapted to the specific requirements of the company's operating conditions. The Studebaker Corp. also supplies the double form shown in Figs. 2 and 3. This form enables a user to figure totals and averages and the corporation assists him in calculating his fixed expense and depreciation, so that every month he may charge off a certain amount in addition to the running expenses and know to the dollar how much it costs him to operate a car per month, per day, per mile and per package.

Now to the practical record examples. The operating record for the month of August of Joseph Grueger & Son, South Bend, Ind., on page 815, shows a total expense for the month of $94.25, which includes a supply cost of $7.55, figuring gasoline at 14.5 cents per gallon, which, of course, would be too low for any locality farther away from the sources of the national gasoline supply. The amount, $7.55, may seem low, but is explained by the entire absence of repair and incidental expenses. On the working days during August, 1912, the Studebaker 20, to which the record refers, covered a total of 480 miles, making the supply cost per mile 1.5 cents. Figuring an average of seventy de-

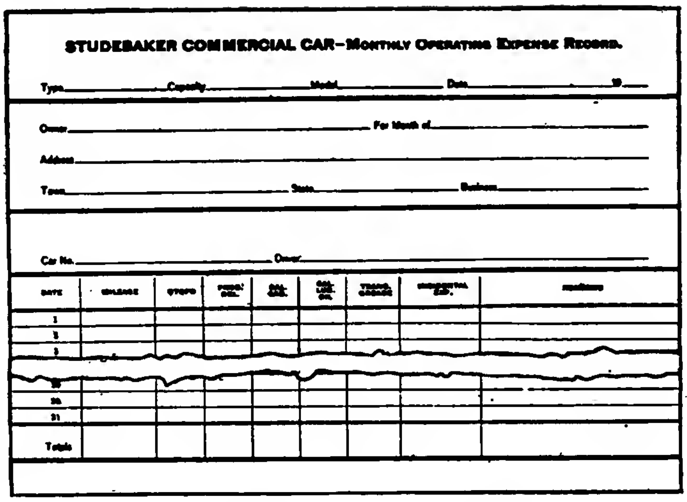

Fig. 2—Monthly record blanks for digesting data

liveries per day, the supply cost per delivery is one-third of a cent. The fixed expense is $86.70, which includes a monthly driver's salary of $60, without which the expense would only be $26.70. Assuming that the owner could run the car himself he could save $60 a month, bringing the total expense of operation down to $34.25, or the total cost per package delivered to 1.63 cents.

Another instance which, while higher in certain items results in a lower total, is that of J. Bergsted's Studebaker 20, the operating record for August, 1912, appears herewith. Like the previous instance, the car referred to in this case is used in grocery deliveries and makes about fifty deliveries a day which, however, are distributed over a wider area than in the case of the other car. Consequently, the supply cost per delivery is .6 cent as compared with .33 in the case of the first-mentioned car. The fuel cost per mile, however, is only .66 cent, against 1.5 cents in the case of Grueger's car. The car operates only 5 days during the week; the owner starts out at 6 a. m. and calls on his customers to take their orders. At 8 he returns to his store and then sets out to deliver the goods as well as those ordered over the telephone. By driving the car himself, he saves the salary of a driver, while the clerk who attends to the store during his absence is required there anyway and his pay is considerably less than that of a driver. Due to this economy the total operating cost of $33.04 per month is realized, which, distributed over 1,050 packages, makes the total delivery cost per package 3.2 cents, or practically twice the cost of the first example. However, the automobile delivery enables the owner to

Total expense per year	3,564.25	1,391.24	2,173.01

greatly increase his business radius and there the profit comes in.

On this page full calculations of cost referring to two Studebaker delivery wagons used by a South Bend department store are given. The figures are arranged in a form digesting the schemes of both Figs. 2 and 3. An exact survey of the figures will undoubtedly prove of interest to truck users. The calculation of fixed and total expense result in a total cost, for the two trucks, of $1,391.24 per year, as compared with $3,564.25, the cost of horse delivery of the same amount of goods. Companies having experience with horse delivery will be in a position to check the horse figures which are not out of the ordinary, but rather normal; while the automobile fixed expense are taken relatively high, as is seen by the interest charged at 6 per cent., the depreciation at 20 per cent. and the provision of two full sets of tires for 1 year's service.

An interesting record which is well suited to be included with the description of the cost-keeping systems above described is that of a demonstration made by the Studebaker Corp. to a South Bend grocer on October 5, 1912. On pages 814 and 815 the results of this demonstration appear tabulated, much in the same manner as the daily record, Fig. 1, except for greater detail. In making a delivery car demonstration, the corporation, of course, attempted to determine exactly the work done during all the time spent by the truck in demonstration work, and for this purpose not only the number of miles covered and packages delivered, as well as fuel and lubricants consumption, are given, but also the time during which the car was running on each trip, the time spent standing while delivering parcels and the time spent in loading the car again. In this manner a most exact record is obtained, which is best fitted to convince a prospective buyer of the advantages of a truck. The average operating cost per mile was, in the case of the demonstration here recorded, 1.2 cents and that of delivering each package .5 cent. In addition to giving the report of the demonstration made, the corporation supplies the prospective customer with an estimate of truck operating cost based on this experience, so that the whole situation is put clearly before him.

By instructing its customers how to properly record the cost of operating their trucks, the Studebaker Corp. makes it possible for them to soon arrive at a very economical basis of operation. As a result, there is little difficulty in satisfying the purchasers, and a satisfied buyer is always a promising prospect.

Among the New Books

Works on Machine Practice, Automobile Construction, Scientific Management and Metallurgy Are Offered

Third Annual Appearance of the Automobile Engineers Yearbook for 1913—Book Indicates British Trend

MACHINE DESIGN HOISTS, DERRICKS, CRANES. By H. D. Hess, M. E., Professor of Machine Design, Sibley College, Cornell University. Published by J. B. Lippincott & Co., Philadelphia, Pa. 386 pages, with 318 illustrations and 18 inserts. Cloth, $5.

Either as a book of reference or as a text-book on machine design, applied especially to hoist derricks, cranes and allied subjects, this work will be found most complete. The different principles of mechanics involved in the study of these particular branches of machine design embrace so broad a field that it practically covers a general course in this branch of applied science. As the author states, the book is intended to aid the work of machine design in technical schools and colleges and to serve as a reference work in drafting rooms where a general field of machine design is covered. The author has drawn from prominent engineering sources much of his information and supplies the rest by a queerly expressed compendium of compiled information. The early chapters of the work lead into the more detailed study later by giving the elements of the strength of materials entered into the construction and design of all hoist, derrick and crane parts.

WORM GEARING. By Hugh Kerr Thomas. Published by McGraw-Hill Book Co., New York City. 86 pages, with 33 illustrations and numerous tables. Cloth, $1.50.

In this work the author has probably for the first time devoted a whole work to the branch of applied mechanics known as worm gearing. The growth of the worm gear throughout England for the past few years and its introduction into America renders this book of timely interest to the automobile manufacturer and to those interested in the construction of passenger and commercial cars. In fact, the author, although dealing with the worm gear as a general subject, especially considers its application of the rear axle of the automobile and has illustrated this phase of worm gear thoroughly. The work on the worm gear and its ramifications is exhaustive from both theoretical and empirical standpoints.

MOTOR CAR PRINCIPLES. By Roger B. Whitman. Published by Appleton & Co., New York. 335 pages, with more than 100 diagrammatic illustrations. Cloth, $1.50.

Designed as a sister work to *Gas Engine Principles* by the same author, this book, as naturally would be expected, deals with the entire chassis. The engine is given particular attention, however, in a clear and explicit manner. It is a book that renders possible the comprehension of the motor car by the owner or driver new to the mysteries of automobile and gas engine construction. Although elementary in character, the work is sufficiently advanced to provide all the knowledge necessary for a thorough understanding of the principal mechanical features of any car. The movements involved are clearly defined and as far as the purposes of a car owner are concerned the book is complete.

SCIENTIFIC SALES MANAGEMENT. By Charles W. Hoyt. Published by George B. Woolson & Co., New Haven, Conn. 204 pages, illustrated by numerous forms and engravings. Cloth, $2.

The principles of scientific management are difficult to apply to such an occupation as that of a salesman. The personal element is so strong in this line of work that it takes the most careful study to be able to make the application. The personal element reason is not the only one to be reckoned with. The difficulty attached to keeping in touch with a man who is many hundred miles away from the central office renders it necessary to apply considerable thought to the control of the salesman. The author points out the methods employed by different large concerns and suggests others which are the fruit of the author's investigations along these lines. The value of conventions, meetings and councils for salesmen is discussed in the work and the bad effects of the so-called "ginger talks" are also brought out. The value of contests, competitions, house organs, percentage distribution and sales promotion by various means are thoroughly considered and discussed. An interesting chapter is that on the standardization of sales arguments in which printed manuals are given, furnishing a list of questions which may be asked by the prospect and the standard answer which has been worked out, in all probability, at one of the salesmen's conventions.

MIXED METALS OR METALLIC ALLOYS. By Arthur H. Hiorns, head of metallurgical department, Birmingham Municipal Technical School, third edition, revised and enlarged, published by Macmillan & Co. New York City. 469 pages, with zinc illustrations. Cloth, $1.50.

The object of the author is to show what the uses of mixed metal are and where each particular alloy would be most suitable. The preparation of alloys is taken up in the early part of the work, along with a discussion of the nature of the different metallic elements and their methods of working. After this discussion the nature of each class of alloys, such as copper, brass, zinc, silver, etc., is discussed separately in separate articles. The book should be valuable as a handbook as it is arranged in a logical order and takes up the story of mixed metals where the volumes on metallurgy generally leave off.

THE AUTOMOBILE ENGINEER YEAR BOOK FOR 1913. Published by the Automobile Engineering Publishing Co., Ltd., 20 Tudor street, London, E. C., Boards, 1 shilling.

This is the third annual automobile year book. It contains tables and data of special application to automobile work. It is a hand-book of the material, design and features of construction entering into all grades of motor cars. Besides this, methods of making the calculations necessary in automobile design are explained and the work is supplemented by tables giving the specifications of the leading English, Continental and American cars, with illustrations of modern design for engines, gearboxes and axles. It is a complete indicator of the trend of motor car design as seen in the British market.

A PRIMER OF THE INTERNAL COMBUSTION ENGINE. By H. E. Wimperis, M. A. (Cantab.) 143 pages, with numerous illustrative half-tones and diagrams. Cloth, $1. Published by D. Van Nostrand Co., New York City.

Primarily intended as a text-book, this work furnishes an excellent review course. The different chapters throughout the book are supplemented by examples to be worked by the student. The answers to these questions and examples are given in the back of the book and afford a check on the work of the student. The eight chapters are devoted to an introduction and past history of gas engines and a chapter on heat thermodynamics, practical engine problems, gas producers, design and testing. The more important engines of the early days, such as those of Otto, Lemoir, etc. are shown in diagram and carefully explained.

GAS ENGINE PRINCIPLES. By Roger B. Whitman, author of Motor Car Principles, published by D. Appleton & Co. New York City. 248 pages, with seventy-four line drawings and diagrams. Cloth, $1.50.

There are fifteen chapters in this book, all devoted to the gas engine. The first chapters take up the early forms of motor and give a short résumé of the thermo-dynamics involved in the gas engine. The remaining chapters are devoted to carburetion, ignition, lubrication, cooling, care and maintenance. The three last chapters in the work are on motor troubles. The first gives the causes, second gives the effects and the third gives the method of locating the trouble. Large type and good paper help to make the subject matter readily comprehendible. As a text book it would give great satisfaction.

Believes in Wire Wheels—Removing Rust from Metal Body—How to Take Out Stubborn Round-Head Bolts—Effect of Sea Air on a Car—What Is the Meaning of the Word Horsepower?—Deduction of the A.L.A.M. Formula

Views on Wire Wheel Situation

EDITOR THE AUTOMOBILE:—The recent adoption of wire wheels as optional equipment by a number of automobile manufacturers revives interest in the relative advantages of the two types of wheels.

The most valid objection against the wire wheel is the fact that wire spokes will rust, and because of their great number and the way they are interlaced, wire spokes are very difficult to keep clean.

Some people object to the appearance of wire wheels, as they claim that the massive bodies of our modern road locomotives look better when supported on spokes of adequate size, but this objection will probably disappear as we become accustomed to the wire spokes.

That the wire wheel is stronger, especially against side strains, may be accepted as well established, in view of the fact that the design of a wire wheel permits of the distribution of the material to the best advantage. This ability to withstand wide strains is most important, as it is through side thrusts that wheels most frequently collapse.

The fact that the wire wheel was once in almost universal use, only to be displaced by the artillery type, is not conclusive proof of the inherent defects of the wire wheel as a type; for the recrudescence of old ideas in improved forms has been a frequent occurrence in the automobile industry. The use of improved materials, such as non-rusting alloy steels, Monel metal, or bronze wire having a high tensile strength, would remove all objections as to the rusting of wire wheels and would probably be a strong factor in promoting their universal introduction.

Allegheny, Pa. MURRAY FAHNESTOCK.

Compression Fallen Off

Editor THE AUTOMOBILE:—The compression in my motor was greatly reduced just after I had my valves ground. It is now all right. Why is this?

New York City. READER.

—It is very common that a motor has poor compression immediately after carbon is taken from the cylinder. This is due to small particles which lodge on the valve seating, where the cleaning has not been carefully done. The compression soon returns.

The present practice for compression pressure in the modern touring car averages about 65 pounds to the square inch, cold. There are some cars, however, which run as high as 85 and 90, although it is very undesirable to go quite as high as the latter figure in a small or medium-powered car used for touring purposes. Take your compression, however, by gauge, which could be inserted in the spark-plug aperture, rather than by attempting to determine it by volumetric computation. It is impossible to accurately compute the volume of the combustion chamber by any of the empirical formulæ.

Rust Spots on Car Body

Editor THE AUTOMOBILE:—Is there any remedy or preventative for rust spots on a car body except repainting? My car has two or three small patches of rust on the doors, the finish being in good condition otherwise. This rusting will, of course, spread unless something be done to prevent it. What would you advise?

2—There are certain greases on the market which contain wood fiber for use in gear boxes and differentials. It is claimed the use of this grease prevents noisy gears. Is the use of such grease harmful to the gears?

3—Are not the rather complicated and heavy electrical outfits carried on most modern cars a step in the wrong direction, inasmuch as they add much complication and weight to a machine which already has enough of these attributes? It seems to me that, although these electric starting and lighting systems may be all right in the hands of expert chauffeurs, for the average owner who does his own driving they are too complicated to be a very great help or convenience. For instance, what would a driver, who is not an electrical expert, do if he should find himself some dark night, 20 miles from assistance, with his electric lights out and no way of starting his motor? These electric systems do sometimes balk, statements of their makers to the contrary notwithstanding.

With acetylene lights the cause of their failure to work is always easily located and remedied, which cannot be said of most electrical systems.

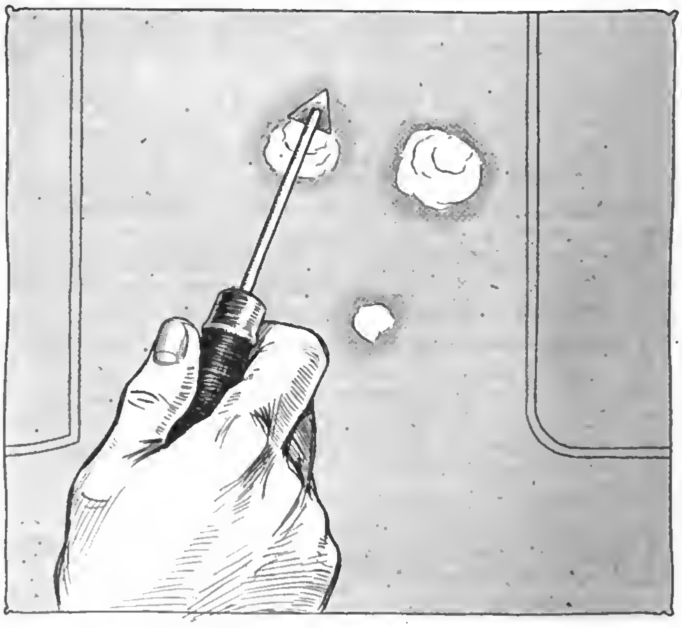

Fig. 1—Use of the scraper comes first in taking off the worst of the rust. The triangular scraper can be used for this work

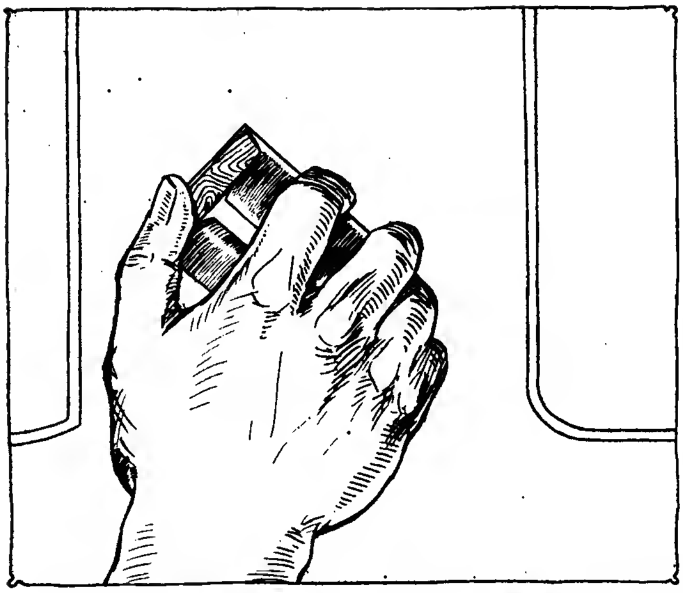

Fig. 2—Using the emery cloth. Put block of wood beneath to secure firm backing

The salesmen and demonstrators are woefully ignorant of the electrical systems on the cars which they are trying to sell. Last winter at the shows many salesmen did not know whether their cars were equipped with 6-volt or 60-volt systems. They did not know how much the system added to the car's weight, how much power they used up, some did not even know where the different units were located. If men who sell cars for their business cannot answer these vital questions, how can the non-technical owner be expected to maintain and operate these electrical puzzles?

East Canaan, Conn. D. C.

—1—The only remedy is to remove the rust spots and touch up with a little paint. This will, of course, leave these spots of paint standing out from the other paint on the surface of the car, but the appearance will not be so bad as it would be were the rust left on the body. If your car has not a polished finish, it would be possible to give the entire car a coat of paint or two. This is done frequently with cars finished in a dull battleship grey or similar colors.

Removing the Rust

The method in removing the rust will be to first scrap off the rougher part of the rust and then finish by rubbing with emery and finally with cloth and kerosene. This will give a smooth surface that will hold the paint. The latter should not be applied, however, until the kerosene has entirely vanished from the surface of the metal. A good painter can touch up small spots so they can hardly be noticed after a few days' use of the car. The degree to which the new paint is apparent, however, depends to a large extent on the color of the car.

About the best method of applying paint to spots and fading this paint off into the older painted parts is to employ a paint gun. By this method the paint is sprayed on the surface of the metal and the amount put on in each particular spot can be gauged to a nicety. The progressive steps in the work of removing rust and coating the surface of the metal are shown in Figs. 1, 2 and 3. Fig. 1 illustrates a method of doing the scraping work. The scraper used may be of any type, even an ordinary piece of metal being sufficient for the purpose. It is necessary to use such a device to break the harder accumulations of rust and to get it started. Fig. 2 shows how the body should be rubbed gently with fine emery. A block of wood is used to give a hard surface beneath the emery and to be able to apply the pressure at the necessary points. After the emery has done its work and taken off the last perceptible bit of rust and the metal is bright and clean, the paint is sprayed on with the paint gun, as in Fig. 3, or a brush may be used instead of the gun.

As far as rust preventives are concerned, it may be stated that the only method to pursue is to keep the metal work painted. A combination of moisture and air will always cause rust, and since along the East Coast the air contains more or less saline moisture it is necessary to be particularly careful.

2—Greases such as you mention are merely temporary devices for preventing noise. If a gear is worn badly enough to require some such means of silencing it, it will surely go further in a short time. As far as harming the gears is concerned it is doubtful if actual damage would be done. The only thing to be feared is that the wood fiber of a somewhat stringy nature may get into the bearings and prevent their functioning as freely as they should.

3—It cannot be said that the electric systems which have proven so popular during the past 2 years are a step in the wrong direction. The care of these systems is so simple that it is a fact that the car manufacturers who use this system say the more the driver or owner leaves the system alone the better they are satisfied, with the exception, of course, of adding a little distilled water to the storage battery from time to time.

The supposition you make of a driver finding himself some dark night 20 miles from assistance with his lights out and no way of starting his motor is highly improbable. It would mean that the storage battery was exhausted or that the generator had failed to store it or to operate correctly or that the car was not equipped with an auxiliary ignition system. Where the storage battery is depended upon to furnish ignition as well as lighting and starting current, there is always a set of dry batteries to use in an emergency. Where the magneto is used, the dry cells are, of course, not required.

Convertible Lamps Used

As for the lights, the side lamps generally supplied are of the combination kerosene and electric type so that should anything happen to the electric system the kerosene part of the lamps may be used. This leaves a fairly good emergency equipment in case the complete breakdown you mention should ever occur. It may also be said of the acetylene system that if you were in a bad place and your tank went empty you would have a hard time getting home. You are no doubt right in stating that it would be easy to find out the cause of the trouble, but it would be harder to remedy the trouble on the road. It all comes back to care on the part of the owner. If he lets his acetylene tank run empty or allows the electrolyte in the battery to become bad through his failure to add water he must shoulder the responsibility and not try to put it off on the manufacturer or an alleged complicated system in the usual manner.

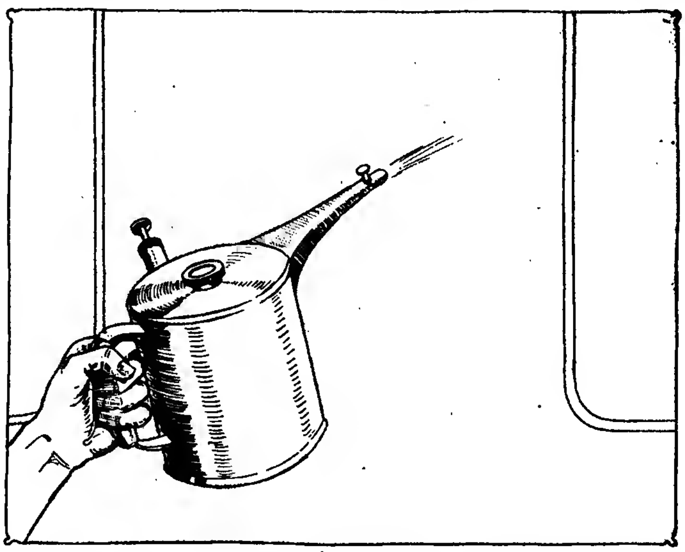

Fig. 3—Spraying paint on spot with paint gun. New color should fade into old

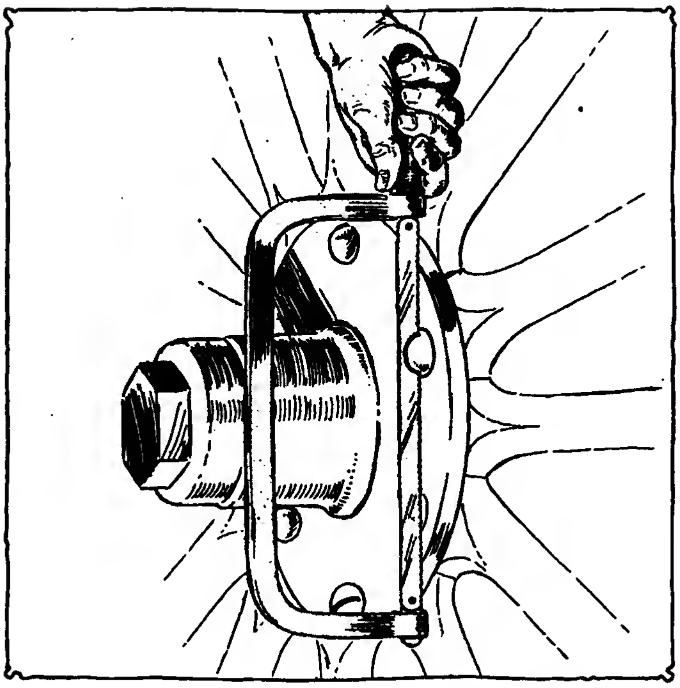

Fig. 4—Slot the heads of the round-headed bolts to make space for screwdriver

Your statement in regard to the ignorance of salesmen on the electric starting and lighting outfit is true in most respects. You must remember, however, that in many instances the cars seen at the New York show with electric starters were merely sample cars and the first to appear with this equipment. In fact, many of the cars which went to the Garden and the Palace have never been inside of the New York showrooms and the salesmen themselves saw these hurriedly assembled products for the first time at the automobile show. Since that time many have become familiar with the details and construction of these starters and have mastered the electric knowledge necessary in explaining them to prospective buyers.

In many instances the cars which were equipped with electric starters at the Garden and Palace shows had the electric equipment fitted on them in such a hurry that it has been decided to change the method of installation. It did not take a keen student or observer to note that the method of drive and mounting employed on some cars were so weak that it could not stand up under the vigorous requirements of electric cranking.

As far as the non-technical owner is concerned, he need only confine himself to adding water to his battery and to operating his starting switch when he wants to start the motor.

Storing a Car in Salt Air

Editor The Automobile:—I am a winter resident here and expect to store my car for the summer. As the salt air is bad for rust I will ask for advice:

1—The best way to leave the radiator. Some recommend filling with rain water and keeping full. Others to fill with water with some oil on top and the drain so the oil will form a coating on the metal as the water lowers. Others say to flush and dry out and nothing else. I have been thinking that after cleaning and drying out it might be a good plan to fill with a light grade of cylinder oil and before using clean with warm water and sal soda to remove what remained after draining. This would clean out the oil.

2—The best way to leave engine. Will it be best to leave everything intact, as used—oil in reservoir, ignition connected, etc., and wrap a blanket around to keep out moisture? How would it be to inject a gun of cylinder oil into each cylinder and then turn the engine over a few times so as to give the walls extra lubrication to prevent rust and insure easy starting? Have heard of cases where the piston rusted fast.

3—Would you advise something for the leather, and have you anything to recommend?

4—Is it good policy to entirely deflate tubes? My experience has been that tubes left partially inflated on wheel were all right when put in use again, while those which were taken out and left flat developed cracks when put under pressure.

Daytona, Fla. J. W. F.

—1—If you are willing to sacrifice the rubber hose connections on your radiator the best way would be to fill the water system with kerosene oil. You can then be absolutely sure that the radiator will remain uncorroded and that the water-jackets will not rust, no matter how long you leave your car exposed to the sea air. Any oil would suffice for this purpose but kerosene is mentioned on account of its cheapness and the fact that it will fill the bill as well as anything else. Another method is to fill the radiator with rain water and then seal it so that it is impossible for any air to enter. Water alone cannot cause rust. It requires the presence of free oxygen and this is only found to any extent in the atmosphere. The free oxygen present in and around sea coast towns owing to the ozone-like atmosphere and the presence of a large amount of water vapor render rusting processes rapid. When the atmosphere is not allowed to come in contact with the metal while it is damp but little rust will form. If this method is to be used the radiator should be filled to its very top, corked and the cap then screwed tightly in place. The radiator overflow pipe should also be corked.

Oil Needed in Cylinder

2—If you will run your motor for a short time with an excess supply of oil getting it up to high speed and then cutting off the ignition so that it will have opportunity to throw itself over several times or be thrown over by the weight of the car in coming down a hill or coasting up to the garage there will be sufficient oil in the cylinder to avoid all chances of rust during the summer. If you were to shoot a gun full of cylinder oil into the cylinders, it would deposit in a thick layer on top of the piston and give you carbon trouble when you again started your motor next fall. The outside of the motor should have every bit of rust scraped off and a coat of black engine paint put over it.

3—You should take a can of neatsfoot oil and go all over the leather work. This will keep it soft and will not permit it to crack or break when again used. If you use a leather cone clutch, this should also be soaked with neatsfoot oil to keep it soft while the car is not in use. In lieu of neatsfoot oil castor oil may be used. The odor of the latter is not so pleasant, however, and the neatsfoot oil is more advisable.

4—You should partially deflate the tire and block the car up to take the weight off its wheels to relieve the strain on them as much as possible. Leave about 30 pounds pressure beneath. Do not store the car in a place where the sunshine can beat in on the tires or on the body. The best place to keep tires is in a cool, dry, dark spot where the temperature does not exceed 70. This may be an impossibility, but you should approach it as nearly as possible. It would be wise to take the tires off and coat the rims with graphite paint in order to prevent any possibility of the tires rusting on the rim. It would be also wise to throw a large cover over the car while it is in storage.

Explanation of Horsepower

Editor The Automobile:—Please let me know what is meant and how is the horsepower of an engine determined and when does this engine develop said horsepower?

Brush, La. M. W. Lenert.

—To understand what horsepower means one must first understand what the meaning of the term foot-pound is. A foot-pound is the amount of energy required to lift the weight of 1 pound 1 foot. Two foot-pounds of energy are required to lift a 1-pound weight through a distance of 2 feet or to lift a weight of 2 pounds through a distance of 1 foot. In other words, foot-pounds are the products of weights multiplied by distances. For

10 pounds to be lifted a distance of 10 feet would require 100 foot-pounds of energy.

Power is energy applied at a given rate. A horsepower is 33,000 foot-pounds applied in 1 minute. That is, if 1 pound was lifted a distance of 33,000 in 1 minute 1 horsepower would have been exerted, or if 66,000 pounds were lifted a distance of 1 foot in 1 minute 2 horsepower would have been exerted.

Power Includes Time

When it is understood that a horsepower is the power required to exert 33,000 foot-pounds of energy in a minute, the horsepower of a motor will be readily understood. Suppose that to move a car of given weight at a speed of 1,000 feet per minute a steady resistance of 330 pounds was offered. In pushing this 330 pounds resistance through a space of 1,000 feet 330,000 foot-pounds of energy would have been exerted in 1 minute. In other words, since 33,000 foot-pounds per minute make a horsepower, 10 horsepower will have been exerted by the motor.

When a motor is tested on the block in the laboratory the throttle is opened wide and the motor is made to work against the greatest resistance it can overcome. Supposing that the motor exerts a given pull during the period of 1 minute and this pull is exerted through a certain leverage. We would have the factors necessary to calculate the horsepower of that motor because we would have the foot-pounds per minute exerted. The resistance against which the motor works is commonly secured by means of a brake, and consequently this horsepower which is calculated from the tests on the laboratory block has been named the brake horsepower. This is the horsepower of the motor which is commonly referred to. The motor develops this horsepower when it exerts the energy in foot-pounds corresponding to the horsepower rating.

There is another kind of horsepower known as the indicated horsepower and the letters i. h. p. are used to designate it, while the brake horsepower is generally expressed by the letters b. h. p. The indicated horsepower is figured in this manner:

The exploding gases exert during the working stroke and average pressure P upon the heads of the pistons. This average pressure is what is known in engineering work as the mean effective pressure, and is often expressed by the initials m. e. p. Since the pressure P is expressed in pounds per square inch the total pressure will be this pressure P times the area of the piston head A. That is, during the working stroke these is a pressure P. A. being exerted on the head of the piston. This working stroke pressure is in pounds. If it is multiplied by the length of the stroke L we will have the foot-pounds exerted by the exploding gases. We have but to bring in the factor of time to get the expression into foot-pounds per minute. If the engine is turning over N revolutions per minute and it is a four-cycle engine there will be $\frac{N}{4}$ working strokes in which the pressure P. A. is being exerted or in which the energy P. A. L. foot-pounds is being exerted. In one minute, therefore the number of foot-pounds will be $\frac{1}{4}(P \times L \times A \times N)$ foot-pounds exerted. Since there are 33,000 foot-pounds per minute to a horsepower, the horsepower of the motor will be $\frac{P \times L \times A \times N}{4 \times 33{,}000}$. This horsepower is known as the indicated horsepower of the motor.

It is evident that the i. h. p. does not take into account the mechanical efficiency of the motor. That is to say the brake horsepower will never equal the indicated horsepower of the motor owing to the fact that there are frictional and heat losses which cannot be prevented. The mechanical efficiency of a motor is the relation of the brake horsepower to the indicated horsepower.

The A. L. A. M., an association of automobile manufacturers which has now passed out of existence, realizing the value of a formula which would give an approximation of the brake horsepower without the time required to make the block tests have deduced a formula from the indicated horsepower expression given above. In deducing this formula they have reasoned as follows:

They have noted that the length of the stroke times the number of revolutions per minute or $L \times N$ in the numerator is equal to the speed of the piston in feet per minute. After making numerous tests, they have decided that a motor generates its maximum power under average conditions at a piston speed of 1,000 feet per minute, has an efficiency of .75. They have therefore equated $L \times N$ to 1,000. This leaves the expression for indicated horsepower $.75\frac{P \times A \times 1{,}000}{4 \times 33{,}000}$ or $.75\frac{P \times A}{132}$

The expression area A is equal to $.7854\,D^2$. Substituting this and also 75 pounds for P, which is assumed to be the average mean effective pressure, we have by solving:

$\frac{D^2}{2.48}$ or, for N cylinders $\frac{D^2N}{2.48}$ approximately $\frac{D^2N}{2.5}$.

This formula is used extensively in horsepower calculations.

Removing Wheel Hub Bolts

Editor THE AUTOMOBILE:—I cannot remove the bolts which hold the hub on my front wheel. Round-headed bolts are used and when I turn the nut, the entire bolt turns. As the bolts are round-headed there is no way of holding them so they will not turn. How can I get them off?

Batavia, N. Y. SUBSCRIBER.

—You can get them off by following the method illustrated in Figs. 4 and 5. That is by slotting the heads of the bolts with a hacksaw and then holding them with a screw driver. This will take but a few minutes and will not mar the appearance.

Please Sign Your Inquiries

[THE EDITOR OF THIS DEPARTMENT is in receipt of several letters signed Reader, Subscriber and by initials. No attention will be paid to anonymous or unsigned letters; readers who wish to make use of these columns must sign their letters as an evidence of good faith. No names will be published if the writer of the inquiry or communication does not wish the name to appear. It is only necessary to state this in your letter. Other letters which have not been deemed of sufficient general interest to publish in these columns have arrived without the sender's address so that it is impossible to answer them by mail. We are delighted to have our subscribers use these columns and most cordially invite correspondence, insisting only on the rules just mentioned.—EDITOR.]

The Youthful Giant

GROWING at the rate of 200 per cent. per year, the motor truck industry gives promise of soon becoming a dangerous competitor, numerically, of the passenger car industry. The latest statistical figures compiled by the commercial vehicle department of the National Association of Automobile Manufacturers show unmistakably the phenomenal growth of the truck industry since 1910, containing, as they do, the interesting fact that this year the total truck output will exceed 56,000 machines.

¶ *This increase in manufacture has an added interest in that state legislatures are today focusing their major efforts for higher registration fees on trucks.*

¶ *In less than 18 months there will be approximately 100,000 motor trucks in use in this country, and if it were possible for legislators to increase the annual registration on these from an average of $10 per vehicle to $50 it would mean an added annual tax on the industry of $4,000,000, a sum that eventually must come out of the pockets of the makers.*

¶ *This year has witnessed the first concerted action of legislators to impose irrational registration fees annually on motor trucks. Next year will witness a campaign for still higher fees. It is today imperative on all concerned to work against the spirit of compromise, accepting a limited fee this year, only to be pestered next session and all thereafter for higher fees. The motor truck must bear its share of the burden, but all users of streets and public highways must pay their equal share for the use of these public thoroughfares.*

A Competitive Tariff

THE Underwood competitive tariff bill has been introduced, but introduction is a long distance from passing. Introduction in such measures means the signal to begin opposition, and from this date forward opposition will be the word from many interests in the automobile industry.

Reducing the tariff on automobile chassis from 45 to 30 per cent. would mean an approximate saving of one-half this to the ultimate buyer. Reducing the tariff on finished parts of automobiles, not including tires, from 45 per cent. to 20 per cent. would mean a serious invasion in a few accessory lines, but even should such a cut be made, which is highly problematic, the increased facilities for production in the American factory would practically balance the lower wages paid to the European maker.

By a reduction in forging of iron and steel from 30 to 15 per cent. little commotion will be created because the American forging plants are better equipped for economical production than the foreign plants and while it is true that a few years ago the foreigner surpassed us in the production of alloy-steel forging, yet today the majority of these used in our automobiles are largely the products of American plants and American labor.

The most serious aspect of a possible tariff reduction is that of passing the critical point when American methods of multiple-economical production fall below the level of cheap factory labor in Europe. The labor scale in American factories is in some cases two and nearly three times that of the foreign manufacturer, and the framers of the present tariff will be defeating their own aims if by hoping to benefit the working man by reductions in the necessities of life they cut off his available income by placing him on a competitive basis with the worker of Europe, an act which would mean a cut in labor prices among the thousands of workers in the American automobile factories.

While American automobile factories are the most modern so far as equipment of any manufacturing plants in the world there is one respect in which production can be economized upon without sacrificing quality of materials, quality of workmanship or quality of appearance, and that is in the matter of more advanced systems of scientific management so far as production is concerned.

Conditions of this nature have been unearthed in many of the older industries, which had imagined they had reached the zenith of efficiency production. It is certain that in a number of automobile factories similar conditions exist. In fact, this is true in a few of our large plants. To such few makers the words of President Wilson in his message should be heeded. They are:

"We long ago passed beyond the modest notion of protecting the industries of the country and moved forward to the idea that they were entitled to the direct patronage of the government. For a long time—a time so long that the men now active in politics hardly remember the conditions that preceded it—we have sought in our tariff schedules to give each group of manufacturers or producers what they themselves thought that they needed in order to maintain a practical exclusive market as against the rest of the world."

Urges Outdoor Fall Show for Trucks

Should Be Held Between the Truck-Selling Seasons—Believes That Such a Show Will Be Held Within Another Year.

By William E. Metzger

DETROIT, MICH.—April 4—The editorial in THE AUTOMOBILE for March 13, entitled "Silk Stockings on Trucks," meets my ideas precisely.

Naturally, I believe, Detroit would afford as good a location as any for a midsummer truck show. The state fair grounds here offer every necessary accommodation for such a show.

This show ought to be held, in my estimation, between the truck-selling seasons—say the middle of September to the first of October. This date would be best for the reason that most trucks are delivered to consumers just before the hot summer season or just before the cold winter season. By having the show late in September, at which time the business men would have returned from their summer vacations, I am inclined to feel that the truck manufacturer would be able to get a line on the market in time for his fall deliveries.

Nearly 2 years ago I advanced the idea of an early fall show, believing then that what the truck manufacturer needed was an opportunity to show by actual demonstration the superiority of motor trucks and the possible saving to the great and varied lines of industry which are in the market for these commercial vehicles.

This truck display at any central point in the Middle West would, I believe, bring interested people from all over the United States—people who would want to come and investigate the truck as applied to their particular line of business. The educational feature would be much enlarged by the display of the various labor-saving devices that accompany the trucks, many of which are being made by independent concerns, not truck manufacturers. Contests could be had in the loading and unloading and the carrying of various commodities. These tests would forcibly bring before those interested throughout the country the actual loss that they are sustaining daily in their various lines of business by not using up-to-date truck equipment, and this necessarily would be of great benefit to the truck manufacturers. Personally, I cannot see, excepting from a selfish standpoint on the part of some makers who fear competition, any possible reason why one commercial show held in the early fall is not the best solution of the matter of commercial shows. In all of my talks with various truck manufacturers, not one of them has advanced a reason against this show, which to me seems logical. I am inclined to believe that such a show will be held within another year.—WILLIAM E. METZGER.

Why Should Automobilists Pay State Fees?

By Charles E. Duryea

SAGINAW, MICH., April 4—I am much pleased to see your editorial on "Raising Revenue," which appeared in THE AUTOMOBILE for March 20. This is a matter on which automobilists have been asleep all these years. Just why they should pay for as a privilege that which is their constitutional right, namely, the right to use their machines on the highways, as freely as other vehicles use them, is a question I have never been able to understand. The bicycle people fought this matter to a finish, and won, many years ago; and one of the automobile magazines coming directly from the bicycle business has maintained a consistant stand on this ground, but most of the others have paid no attention to this important question.

That it is a matter of revenue only is readily seen by watching the progress of this form of taxation in the various states. New York at first issued a perpetual license, or tag, for identification purposes, but lately seeing an opportunity for revenue has made it an annual one. There is no excuse for such action. One registration during the ownership of the vehicle is just as good as a dozen so far as police protection is concerned. Further, the mere cost of registration at the most is all that should be charged. If the automobile user must pay toll, he is discriminated against, and such legislation is objectionable class legislation. How it works in Pennsylvania may be shown by the following facts:

The commissioner of highways has full power there. My motor buggies were not serially numbered, and my owners could not give manufacturer's number. A statement to this effect brought licenses 1 year, but the next year they were refused, although the law had not been changed. The owners appealed to me, and I took the matter up with the highway commissioner, who insolently replied that it was none of his business. The law required a manufacturer's number to be given, and if there were none, why no license was issued, or words to that effect. If this is not confiscation of property, what is? After considerable delay and inability to use their cars the commissioner relented enough to issue the licenses without a manufacturer's number, as he had previously done. Not only is this an outrage which no American citizen should be compelled to stand for, but it is rank idiocy. I could have conveniently supplied numbers to those particular owners and no one would have known the difference. They would have been my numbers so far as the law was concerned, but of what value would they have been to the state department or anybody else, and how could the commissioner of highways know whether or not those numbers were correct ones? Further, most vehicles are numbered, if numbered at all, on a removable metal plate, so there is nothing to prevent moving the plate if the owner desires to transfer the number to some similar vehicle.—CHARLES E. DURYEA.

Struggle Against Bills

Pennsylvania Automobilists Endeavor To Stop Bad Legislation—Many Measures Against Trucks

HARRISBURG, PA., April 5—Automobilists in this state are rallying around the Pennsylvania Motor Federation and the various dealers' organizations in their effort to stem the flood tide of motor-mad legislation now pending before the legislature here. Senator Buckman's bill is the bone of contention. This bill was originally drafted by the Pennsylvania Motor Federation, but was changed in not a few respects before its introduction so that in its present form it is being opposed not only by the Federation but by all other motoring interests in this state. This bill has a new scale of registration fees for passenger cars and motor trucks. The fees for passenger cars are according to horsepower, and those for motor trucks according to gross weight. Following are the fees:

Passenger cars under 20 horsepower	$5.00
Passenger cars under 20-50 horsepower	10.00
Passenger cars over 50 horsepower	15.00
Motor trucks under 4,000 pounds	10.00
Motor trucks under 4,000-5,000 pounds	15.00
Motor trucks unler 5,000-10,000 pounds	20.00
Motor trucks under 10,000-15,000 pounds	25.00
Motor trucks under 15,000-20,000	30.00

By this schedule the registration fees on motor trucks are more than doubled as compared with the present fees, but other bills have been introduced which make these fees $30, $50 and $100 according to the load capacity of the trucks.

Restrictions on Motor Trucks

This new legislation places further restrictions on motor trucks, in that the maximum weight of a truck with its load is 20,000 pounds, or 10 tons, and that of this total, not more than 15,000 pounds can be carried on one rear axle. This places a restriction on present methods of truck construction in which the total gross weight carried on the rear axle is sometimes 80 and as high as 85 per cent. of the total gross. Naturally trucks of this construction wil be barred from the highways if such legislation were to be enforced. There is at present a movement to get the maximum permissible weight on a truck increased to 25,000 pounds, but it is certain that this is being opposed by certain canal interests throughout the state who have many bridges not capable of withstanding such loads; and it is also being opposed by certain counties in which the old-fashioned type of covered wood bridge as constructed 60 years ago is still in existence. The present legislation goes still further and aims to restrict the overall width of a motor truck to 88 inches. One interesting aspect of the present campaign is the fact that a traction engine company selling many traction engines in this state has circularized every county in the state asking that the voters go against the present $50,000,000 bond issue on the ground that traction engines with cleats on the wheels will not be permitted to use the improved highways. So strong was the influence against the bond issue in several counties because of this circularizing work that the bill was again returned to committee and a public hearing on it will take place this week.

Of the many bills against motorizing interests introduced many will never come out of committee. One or two desirable bills have been introduced. In this category is the Dunn bill providing that "All fees for licenses of motor vehicles collected shall, after deduction of collection expenses, be returned to the respective county where the licensee shall reside to be used in repairing and maintaining the roads of such county." Another bill provides that "All moneys derived from the registration of motor vehicles and the licensing of operators are to be paid into the treasury to be used in the improvement of roads." This bill further goes on to state "that the sum of $1,800,000 now in the treasury derived from the fees of registration be specifically appropriated for highways improvement and maintenance." Up to the present time Pennsylvania has not had a law permitting of the use of registration fees for highway improvement.

NEW YORK CITY, April 7—The automobile authorities of New Jersey are doing their best to inforce the 15-day limit for foreign cars entering the state. Two inspectors are stationed at the ferries which carry cars from Manhattan to New Jersey and other inspectors check incoming and outgoing out-of-state cars in other places. The inspectors meet regularly and by comparing their records determine what automobilists pass the 15-day limit for free travel in Jersey, so that their owners may be requested to take out Jersey licenses.

The state legislature has adjourned without taking any action of the various automobile measures proposed to it.

Motorists Fight Bay State Bills

BOSTON, MASS., April 5—Those who have been following the motor legislation and fighting the battles for automobile owners in the Bay State this year have had plenty work cut out for them, for there was a much larger number of bills presented than in past years.

The two most important matters have not yet been reported, the bill relative to trucks, limiting the weight and increasing the fees on them, and a bill to limit the speed of motor vehicles in the state.

The Highway Commission began the year by making a report to the Governor in which it went into the matter of legislation. This report stated that some some law should be passed for the preservation of the highways by limiting the speed and weight of motor trucks and prohibiting traction trailers that dug holes in the roadways. It also suggested that the same fee be charged for trucks as horse-drawn vehicles. Another suggestion was a law limiting the speed in this state to 25 miles an hour. It also suggested that the law be amended relative to operators from other states; that the law of the road be fixed, and the penalty for reckless driving be changed. Bills covering all these points were drawn by the commission and submitted. The bill relative to reckless driving is now a law, so that any person convicted of operating a car recklessly, without authority, for a wager or under the influence of liquor may be sentenced to jail for from 2 weeks to 2 years, and fined $200 for a first offense and for a second offense of driving while intoxicated the penalty is 1 to 2 years, no fine being allowed.

The bill to change the law of the road so that motor vehicles could pass street cars on the right-hand side—the Supreme Court having ruled it was unlawful to go other than on the left—was passed. Also the Commission's bill placing non-resident operators under the same regulations and laws as Bay State motorists got a favorable report and was passed.

This year there has been no bill to increase the passenger car fees, but there is a bill that would reduce them. It calls for $5 for 25 horsepower or under; $10 for 25 to 50 and $15 for all over 50. No report has been made by the committee on this yet, but it will probably be given leave to withdraw. Other bills on which the committee has not reported is one to strike out the 10-day clause for non-residents; a rebate bill to refund part of the money for registration if a veichle is lost, stolen, burned or sold before August 1, so that an owner loses the use of it; a bill put in by Mayor Fitzgerald to give back to the different counties the money taken in fines and which now goes to the State treasury for good roads, and the truck and speed bills reported above. It is expected that if the committee reports a speed law it will be one of 30 miles an hour, but any change will be fought by the motor interests, who are satisfied with the present law which calls for a reasonable speed.

The bills that have been reported upon make quite a representation when considered. One bill seeks to change the burden of proof from the government to the motorists in case of an accident by having the numbers of a car become prima facie evidence that the owner was responsible for whatever damage it caused. This bill was killed in other years, but this time it got to the Senate up to a third reading when the motorists woke up and sent a flood of letters to the State house that checked it.

A bill put in by the Highway Safety League requiring all motorists who figure in an accident to send a report of it to the Highway Commission was reported favorably, and is now in the lower branch of the legislature. The words "full report" were stricken out so that merely the notice of the accident is to be given. There is some doubt as to its being a constitutional measure. A bill that would require judges to place on file all complaints of motorists arrested for not having their licenses, if they proved in court that they were entitled to drive a car was reported leave to withdraw. The A. L. A. measure seeking permission to erect signs on the State highways met with the same report. So did the bill to increase the penalties to 20 years' imprisonment for anyone causing a death with a motor car. Mayor Fitzgerald's bill seeking to get a portion of the motor fees for the Boston Park System was dropped. A measure to prevent motor cars going within 15 feet of a street car that had stopped to take on or leave off passengers was also dropped. Another bill to compel motorists to stop within a few feet of a moving or standing car was dropped. The measure to change the age for licensing operators from 16 to 18 years of age got an unfavorable report.

From the point of view of many owners and makers the most important measures put in were two bills that would prevent cars being registered if it were possible to turn off the lights from any seat, either in front or in the tonneau, or the body of a limousine. This would mean the rearrangement of all cars electrically equipped. There were two hearings on these bills and the committee reported unfavorably on both. The bill to change the light law so that it would apply to vehicles in cities as well as those on the State highways as the law now reads was not reported favorably. The same fate was given the bill for a force of State Highway inspectors to check speeding. A bill that would prevent a man ever getting a license if he had once been convicted of operating under the influence of liquor was reported leave to withdraw.

S. A. E. on Worm Drive

Larger Bearings and Means of Adjustment Advocated at Detroit—Aluminum Alloys Also Discussed

DETROIT, MICH., April 4—The annual business session of the Detroit section of the Society of Automobile Engineers was held last night in connection with the regular monthly meeting. Officers for the ensuing year were elected as follows: Chairman, E. T. Birdsall; Vice Chairman, G. E. Cox; Secretary and Treasurer, H. A. Connell.

The report of the secretary and treasurer showed that at present the section has 147 members and that cash on hand in the bank totals $515.27, with no outstanding debts.

Following the business session technical matters were taken up. The first talk was given by Mr. R. T. Wingo, of the Superior Machine & Engineering Co., Detroit, Mich., and was a comparison of worm and bevel drive axles, which was characterized as being an exceedingly live subject just now. Mr. Wingo's remarks were confined chiefly to the shop end of the question of final drives. Many worm constructions have failed, due to several adverse conditions, and hence many engineers condemn them all. It is the same with the successful type. When one proves to be efficient many consider them all equally good.

Where Adjustment Is Needed

In the automobile vehicle many conditions govern worm and worm wheel drives, said Mr. Wingo. If the teeth are adjusted so as to be in correct relation to each other, they very often do not stay where they are placed. The fallacy is in making no provision for permanency of adjustment. It was advised that for best results adjustment should be provided for both members and for locking these after once properly set.

In the design of worms and worm wheels we are governed by conditions on either side of the assembly. In ordinary machinery the design is an easier matter, in that the speed can be governed more readily than in the motor vehicle.

Speaking of the mounting of the members on ball or roller bearings, Mr. Wingo advocated the use of larger sizes than those recommended by hiring salesmen. For taking both the radical load and end thrust it will be found that over-sized bearings are most satisfactory. This applies both to level drives and to worm gearing.

Workmanship is responsible for many worm-gearing failures, assuming that the designer has chosen the most efficient angles and ratios. The tooth forms must be smooth, free from scratches and absolutely true to form. If the surfaces are smooth and properly run in oil, the heat loss is reduced on account of less friction; hence, durability is augmented. This also applies to bevel gearing. Scratches and imperfections tend to breakage and noise and no amount of lapping in will cause them to wear smooth enough.

Methods of manufacture of various types of worm gearing were taken up and the best ways of cutting the members were pointed out. The Hindley and the Lanchester types were discussed and a third design also spoken of. This latter resembles the Hindley, but is really very much different in that the worm and worm wheel, as ordinarily considered, are reversed, the wheel in this case being the smaller member. This combination gives an oiling arrangement, which is said to be satisfactory.

Mr. Wingo is in doubt as to the best efficiency of the three types, but on numerous occasions has found it to be about 92 per cent. in the best cases. The rather remarkable figure of 99 per cent. has been reached by Mr. Wingo with specially constructed bevel gearings having ball thrusts. This, he stated, should be ordinarily nearer 97 per cent., while with machinery of the ordinary type it has been estimated at about 75 per cent.

In closing Mr. Wingo made the rather startling statement that the worm gearing must come for trucks, while for passenger cars it is on the decline, due to the greater perfection of bevel gearing and its less cost of manufacture for equal efficiency. The reason that it is essential to trucks is that these have a lower gear ratio and slower speeds, it being easier to properly proportion the parts and provide for lubrication för this slower running. The passenger car offers the disadvantage of too great average speed.

An open discussion on aluminum alloys for motor car construction was next staged, H. Goldberg, of the Aluminum Castings Co., speaking in favor of zinc alloys in preference to the No. 12 S. A. E. specification, which is a copper alloy. He stated that alloys up to 33 per cent. zinc are just as good as copper and they offer the advantage of cheapness and better machining. They have a higher tensile strength also.

Past zinc alloy failures were attributed to improper pouring temperatures, the alloy being more liable to crack when poured hot than when cold. Hot pouring means larger crystals, which are an evidence of weakness. Mr. Goldberg would like to see the automobile engineering fraternity get over its prejudice against this alloy, which unfavorable opinion was gained because it was not properly produced.

It was pointed out by one of the members that zinc has a strong adherence to oxygen and is, therefore, very easily oxydized, while copper is not nearly so prone to do so.

Several alloys which have been more or less successful were discussed and the advantages and disadvantages of each brought out. Mr. Goldberg stated that the best zinc alloy has the following specification: 19 per cent. zinc; 25 per cent. copper; 3.10 specific gravity; 30,000 pounds per square inch tensile strength.

The final discussion of the evening was that by E. J. Stoddard, member of the Nomenclature Division of the Society. He spoke of the very great importance which the skidding factor has on automobile construction. It was the consensus of opinion that skidding is a much bigger consideration than the average engineer believes. Mr. Stoddard's talk was short, and consisted mainly in the presentation of a problem which, he stated, has obsessed him for some time, relative to the apparently different rates of travel of the forward and rear ends of a motor vehicle in skidding around a curve.

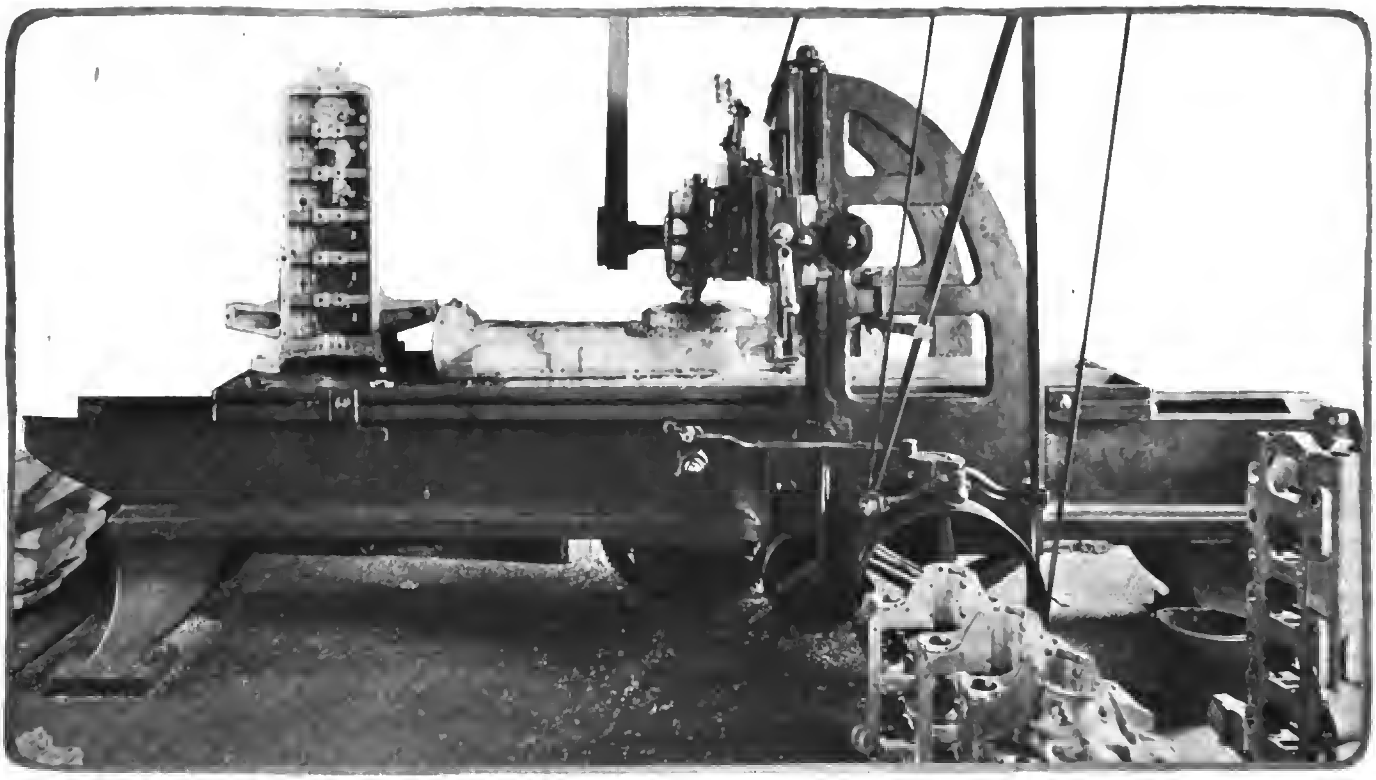
S. A. E. to Standardize Rim Sizes

NEW YORK CITY, April 7—In developing standard dimensions for rims the pleasure car wheel division of the standards committee of the Society of Automobile Engineers has not run against any difficulty which is not surmountable. At the meeting last Wednesday afternoon a report was read which stated that the variations in diameter and felloe width did not exceed .125 inch and .25 inch respectively, and that standard limits of toleration were possible. The work is now in the hands of the sub-committee on the ways and means of carrying on future tests which are necessary before definite action can be taken. This committee is expected to report at an early date.

About seventy-five tests have to be run and a good pressure line needed to make tests on various types of straight side and beaded tires in connection with the different forms of rims. These tests are apt to cost a large amount of time and to be expensive on account of the tubes and casings needed. The specimen rims are now all at the headquarters of the S. A. E. in this city and as soon as the sub-committee has reported the additional work will be taken up.

PHILADELPHIA, PA., April 7—A factory branch of the American Locomotive Co. has been established here, succeeding the Longstreth Motor Car Co., which has heretofore represented the Alco line of pleasure cars and motor trucks for Philadelphia and vicinity.

Factory Miscellany



Special machine used for milling crankcases in the factory of the Kline Motor Car Co., Richmond, Va.

THIS machine can mill twenty-five crankcases in one working day of ten hours. One crankcase is milled at a time and the machine is readily attended to by one man. The gain in factory efficiency so far as this particular branch of the milling work is concerned is 75 per cent over less modern methods of doing the same work. Every piece of work turned out by the machine is uniform and the maximum variation is well within the tolerance limit of .001 inch plus or minus. The accompanying illustration shows the machine at work on a Kline six-cylinder crankcase. This has seven bearings. The four-cylinder crankcases with five bearings are handled in the same manner. The same machine can be used for the five-bearing or the seven-bearing crankcases. The upright crankcase has been placed in this position for the purpose of showing the milling work necessary.

GARFORD Secures American Rights—W. F. Brown recently returned from London, England, bringing with him the American rights for the manufacture and control of some metals of which an alloy of aluminum is the most important. The new metal is called aeromin and is said to have twice the tensile strength of aluminum. The metal has been in use in England for several months and the American rights were secured for the Garford Engineering Co., Elyria, O. In the near future a meeting of the company's directors will be held and a location determined upon for the manufacture of the new product. Mr. Brown is president of the company, which is capitalized at $100,000, and it is believed that the plant will be located in Toledo, O.

Whitehall Wants Apparatus—Whitehall, Pa., is desirous of receiving bids for a motor-driven chemical apparatus.

Butler Tire Company's Salesrooms—The Butler County Tire Co., Hamilton, O., has opened salesrooms and a vulcanizing plant at 105 Main street.

Baker Sales Manager—L. M. Baker has been appointed sales manager for C. N. Peacock & Co., New York City, agent for the Ames shock absorber.

Promoting New Tire Company—W. F. Beasley of Plymouth, N. C., is promoting an organization of a company to manufacture emergency automobile tires, etc.

Bartholomew Sells Out—C. A. Bartholomew, who operated a garage in Peoria, Ill., has sold his business and removed to Knoxville, where he has opened a new garage. His old place in Peoria will be occupied by J. A. Vance & Son.

Cleveland Machine Builds—The Cleveland, O., Automobile Machine Co. will erect a factory addition at its present plant on East Sixty-fifth street. The building will be three stories high, 60 by 200 feet, and will be of the heavy factory type construction.

Trucks for Bell Telephone—Nine commercial cars for the American Bell Telephone Co. have been ordered by the Western Electric Co., from the Stewart Corp., of Buffalo, N. Y. It is probable that another order, for twenty more, will follow.

New Philadelphia Garage—Plans for a four-story-and-basement garage building, 58 by 90 feet and 116 by 90 feet, to be built at 2302 Chestnut street, at a cost of $20,000, were recently filed at that city. Kahn & Greenberg and Murray White are the owners.

Toledo Truck to Move—The Toledo Motor Truck Co., located on Spencer street, Toledo, O., is to be removed to Moose Jaw, Sask., in western Canada, according to the announcement of the owner, Edwin Tait. The machinery is now being packed for removal to the new quarters.

Tire Company Resumes Business—With repairs and enlargements completed, the Iron City & Repair Co., Pittsburgh, Pa., whose building was gutted by the fire started in the storeroom of the Pioneer Automobile Co. last winter, will resume business in the near future.

Automobile Plant to Reopen—More machinery has arrived at the Maxwell plant in Newcastle, Ind., from the Maxwell Motor Co.'s plants at Dayton, O., Tarrytown, N. Y., and Auburn, Ind. The force is being increased every day. A call has been issued for all the former employees of the die-sinking and screw-machine departments to send in applications for positions at once.

Mather Spring Doubles Capacity—The Mather Spring Co., Toledo, O., is planning to double the capacity of its plant.

Vulcan Purchases Plant—The Vulcan Mfg. Co., Painsville, O., has purchased an idle plant and will remodel it. The company will manufacture automobiles.

Secures New Site—The Automobile Mfg. & Engineering Co., Detroit, Mich., has acquired a factory site, comprising 108 acres, in Nashville, Tenn., where it expects actively to commence the production of the Evans truck. The plant will be 60 feet by 200 feet in size.

Another Safe Storm Addition—At the annual meeting of the Safe Storm Shield Co., Fremont, O., plans were adopted for erecting an addition to be 40 by 40 feet, two stories high, to the present plant, the addition being for storeroom purposes and a woodworking department.

Morgan & Marshall Build—With Mayor R. J. Marshall and Dr. Morgan Howell, of East Liverpool, O., as the chief moving spirits, the Morgan & Marshall Co-Operative Tire & Rubber Co., with a capital of $500,000, will soon begin the construction there of a factory for the manufacture of automobiles.

Expansion in Long Island City—Some of the automobile concerns already established in Long Island City, N. Y., are enlarging their plants, while others are building important structures. At the present time the automobile industry is spending more than $1,000,000 in increasing facilities in this section.

May Open Amplex Plant—The Lewis Motor and Engineering Co., Detroit, Mich., is about to take over the Amplex automobile plant in Mishawaka, Ind., and will again open the factory, according to reports. The plant was formerly operated by the Simplex Motor Car Co., composed by Mishawaka men, but has been closed for the last several months.

Rubber Company in Coshocton—The Cuyahoga Falls Rubber Co., of Cuyahoga Falls, O., has submitted a proposition to the Coshocton Board of Trade, Coshocton, O., to locate a plant of the proposed company, to be capitalized at $400,000, if free site were given this company and if the citizens would subscribe to a block of capital stock. The company will manufacture tires.

Pacific Factory Plans Progressing—Plans for the erection of an automobile factory in Seattle, Wash., on the property of the Seattle Car & Foundry Co., are rapidly assuming shape. The buildings necessary to the assembling of the cars are being remodeled and a testing track near the factory is being put in shape for testing the product. The car will be called the Pacific, and will be assembled from standard parts, including Hess axles, Warner gears, Wisconsin motors and Gemmer steering gear. It is to be offered in two models, both sixes.

The Automobile Calendar

Shows, Conventions, Etc.

April 5-19.........Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.
April 21-26........San Antonio, Tex., Annual Show, San Antonio Motor Car Show Co.
June 5, 6, 7.......Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October............Paris, France, Automobile Show, Grand Palais; 10 days.
November.........London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

April 27..........San Antonio, Tex., Track Meet, San Antonio Automobile Club.
April 28-30.......Chicago, Ill., Commercial Vehicle Demonstration, Chicago Motor Club.
May 2.............New York City, Secret Time Run to New Rochelle, Motor Dealers' Contest Association.
May 5-8...........Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14...........New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.
June 7............Philadelphia, Pa., Inter-Club Reliability, Quaker City Motor Club, Automobile Clubs of Delaware County, Philadelphia and Germantown.
June 25-28........Chicago, Ill., Non-Motor-Stop Reliability, Chicago to Boston, Chicago Automobile Club.
July 1............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16.........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 4-5..........Sioux City, S. Dak., Track Meetings, Sioux City Automobile Club and Speedway Association.
July 5-6..........Tacoma, Wash., Road Race, Montemara Festa Automobile Committee.
July 8-16.........Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 27-28........Tacoma, Wash., Tacoma Road Races.
Nov. 24..........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 27..........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign

April.............Barcelona, Spain, International Exhibition.
May..............St. Petersburg, Russia, International Automobile Exposition, Building of Michael Maneze, Imperial Automobile Club of Russia.
July 12..........Amiens, France, Grand Prix Race.
July 18-26........London, Eng., Imperial Motor Transport Conference.
Sept. 25..........Isle of Man, International Stock Car Race.

Battery room in the factory of the Baker Motor Vehicle Co., Cleveland, O.

National test car crossing railroad bridge over the White Water River, South of Connersville, Ind. This car was the first out of Indianapolis into Dayton during the flood.

Two Premier test cars pulling a King road drag over Indiana roads injured by the recent flood

RECORD Contract—What is claimed to be a record contract was closed recently in Boston, Mass., by the R. & L. Co., agent for the Garford, whereby the L. & S. Co. of Providence, R. I., contracted for forty pleasure cars and twenty-two Garford trucks, the total amount represented being $209,850.

Kellam Ohio Electric Manager—J. Kellam has accepted a position as assistant sales manager with the Ohio Electric Car Co., Toledo, O.

Hartford Accessory Store Opened—The Automobile Owners' Supply Co. has opened an accessory store at 284 Trumbull street, Hartford, Conn.

LaFrance Contemplated Building Garage—The LaFrance Motor Car Co., Elmira, N. Y., it is reported, is considering the construction of a large garage near the central part of the city.

Motordrome in Milwaukee—A motordrome with a ¼-mile macadam track will be constructed in Milwaukee, Wis., this year by a company now being organized. The opening is set for July 4.

American Tire Branch Established—The American Tire & Rubber Co. has established a branch office and wholesale stock depot at 252 Fifth street, Milwaukee, Wis., in charge of Albert Weisskopf.

Schweers Purchases Frogner Garage—The Schweers Hardware Co., Shawano, Wis., has purchased the garage and business of the Frogner Auto Co., that city, and will continue it as a division of its business.

American Cars in Majority—Ninety per cent. of the automobiles used in Aguascalientes, Mexico, and in that vicinity are of American makes. Owing to the amount of quartz rock on the roads the life of tires is short.

Edwards with Midland Co.—C. C. Edwards has severed his connections with the Bergdoll Motor Co. branch at Boston, Mass., and will take charge of the Eastern territory for the Midland Motor Co., East Moline, Ill.

New Building for Cadillac—The Cadillac Automobile Co., Providence, R. I., recently signed a lease for 10 years for a new building that is being erected in that city. There will be three floors, all of which will be occupied by the company.

Amphibious Garage Planned—Harry L'Hommedieu, automobile dealer of Buffalo, N. Y., has purchased property in that city for the construction of what he terms an amphibious garage, which is to accommodate motor boats as well as automobiles.

Buys Another Garage—L. A. Vashon, proprietor of the Chestnut Hill garage, Brookline, Mass., recently purchased the Brandon garage in that same town and will conduct the two in future in addition to handling the Ford agency in that territory.

Now in New Building—J. T. Meagher, proprietor of the Mattapan, Mass., Motor Car Co., who has the Chalmers and Ford agencies in that town, has recently moved into a handsome new building 125 feet deep and 55 feet front on the main thoroughfare.

Jefferson Company Builds Garage—The Jefferson Auto Co. of Jefferson, Wis., has started construction work on a new concrete garage building on Main street. The size is 50 by 80 feet, but the building is so arranged that additional space may be taken at any time.

New Location Selected—The United Motors Co., Boston, Mass., the New England branch of the new Maxwell corporation, has moved from Massachusetts avenue and Newbury street to the building first occupied by the Locomobile Co. further along the latter street.

Velie Gets the Contract—The Velie Motor Car Co. of Boston, Mass., was the fortunate one to secure the contract for the runabouts to be used by the district chiefs of the Boston fire department. Seven runabouts will be ordered on the first contract and more may be secured later.

Feps, N. Y., Factory Branch—The Schoen-Jackson Co., manufacturer of the Feps carbureter, has opened a New York City factory branch office in the Thoroughfare Building, at 1777 Broadway. In addition to this the Schoen-Jackson Co., has established installation facilities at 107 West Fifty-first street.

Fenway Garage Opened—The Fenway Garage, the latest addition to Boston, Mass., which is being conducted by the Saunders & Butler Co., that does a taxicab service in that city, was recently opened. It is two stories high, fronting on the park system and adjoining the American League ball grounds. There are 100,000 square feet of space, and instead of elevators specially designed runways are used to move cars in and out of the building.

New Agencies Established During the Week

Memphis, Tenn.	Ohio	Wright Motor Car Co.
St. Louis, Mo.	Ohio	Ohio Electric Sales Agency.

Cooley Prest-O-Lite Manager—S. M. Cooley has been appointed general manager of the Prest-O-Lite Co., Indianapolis, Ind.

Tudhope Moves Hamilton Branch—The Tudhope Motor Co. recently moved its Hamilton, Ont., branch from 280 King street East to 148 King street West.

Hamilton Wants Three Trucks—Hamilton, Ont., is in the market for three motor trucks for use in hauling gravel from nearby towns to that city for use in public works.

Lee Joins Motsinger Staff—Claude Lee has joined the Motsinger Devices Mfg. Co., Lafayete, Ind., and is said to be slated for the position of assistant general manager.

Copeland Sells Interests—W. A. Copeland, a Pontiac, Ill., garage owner, has sold his repair and garage business to John Hardie, of Streator, Ill. He will continue to handle the sales of Cadillac cars.

Albion Opens Toronto Station—The Albion Motor Car Co. of Canada recently opened a service station at 112 Richmond street West, Toronto, Ont., the building occupied by the Consolidated Motors, Ltd.

Building Work Planned—A garage will be built by Wendell & Wright, Philadelphia, Pa., on the south side of City avenue west of Lancaster avenue. The size will be 27 by 21 feet, two stories, and will cost $2,000.

DeSchaum Opens Own Office.—W. A. DeSchaum has opened engineering offices at 608 Wayne County Bank Building, Detroit, Mich. He has resigned as general manager and chief engineer of the Suburban Motor Car Co., that city.

North Tonawanda Wants Automobile—Police Chief J. F. Ryan of the North Tonawanda, N. Y., department renewed recently his application for an automobile for his department. The Common Council is considering the application.

Grand Trunk Installing Service—The Grand Trunk Railroad is considering the advisability of installing motor-car service between Buffalo, N. Y., and Bridgeburg, Ont., for Sunday travel. Definite decision will be announced shortly.

Sproul Increases Garage Capacity—Matt Sproul, who has the agency for the Buick and Maxwell cars in Sparta, Ill., has enlarged his garage facilities and installed a rebuilding and repair station for second-hand cars. He announces that he is in the market for equipment.

New Sales Plan—Martindale and Millikan, who are manufacturing the Continental at Franklin, Ind., have inaugurated a plan for selling cars on payments covering a period of one year. This company recently took over the property and business of the Indiana Motor & Mfg. Co.

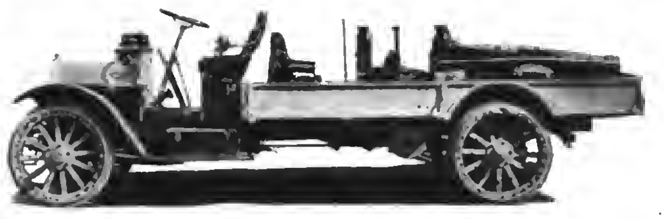
Multibestos Makers to Move—The Standard Woven Fabric Co., maker of Multibestos brake lining, is to move from Worcester to South Framingham, Mass., where larger quarters have been secured, a three-story concrete building having been erected there for the company that will be finished in a couple of months.

Automobile Deal in Newark—A large sale for automobile uses has been made in Newark, N. J. A piece of property on Central avenue near New street having a frontage of 56 feet on Central avenue and a depth of 245 feet with 96 feet in the rear. A four-story automobile building will be erected to cost $80,000. With the land the total cost will be about $125,000.

Bowman Leaves Schacht—F. P. Bowman has severed his connections with the Schacht Motor Car Co., Cincinnati, O. He will be connected with the Norwalk Motor Car Co., Martinsburg, W. Va., in the capacity of assistant sales manager with headquarters at Chicago, Ill. He will take care of the states of Ohio, Indiana, Illinois, Minnesota, Michigan, Iowa, Kentucky and Wisconsin.

Splitdorf Establishes Service Stations—The Splitdorf Electrical Co., Newark, N. J., will establish a European branch and service station at 6 City Road, Finsbury square, London, E. C. The company will also open a similar branch for the Southern territory of this country, with headquarters at Atlanta, Ga., within the next 60 days, and shortly after a branch for the Canadian trade, with headquarters in Toronto, Ont.

Kelly truck used in relief work at Dayton, O. The trucks loaned to the city by the various manufacturers were used in distributing food and in carrying away debris.



Upper—A 1908 Packard 30 equipped with a special squad body in the service of the Brooklyn Union Gas Co., Brooklyn, N. Y. Lower—Truck especially designed and built by the Federal Motor Truck Co. for the Detroit United Railway

Marvel Goes with Fiat—H. E. Marvel, who has been with the J. W. Bowman Co., has gone with the Fiat Sales Co., of Boston, Mass., and will handle that car.

Boston Republic Moves—The Republic Rubber Co., Boston, Mass., has removed to larger quarters at 863 Boylston street, where it has three floors at its disposal.

Fifteen Years Old—Last week brought the fifteenth anniversary of the sale of the first Winton automobile. On March 24, 1898, Alexander Winton closed the sale.

White Appointed Manager—E. W. White has been appointed manager for the sales branch of the Dupont Garage Co., Cleveland, O., agents for the Hudson line.

Manhattan Club Moves—On or about April 25 the Manhattan Automobile Club, Inc., New York City, will be lodged in new quarters in the Gainsborough Studios, 222 West 59th Street.

Rea Opens New Garage—West Philadelphia, Pa., has a new garage and repair shop which is called the Columbia Garage and is located at 421 North Fifty-fourth street. It is the property of A. D. Rea & Co.

Fire Loss at San Antonio—Fire which broke out in the service station of the Staacke Bros. Automobile Co., San Antonio, Tex., destroyed the building and consumed twelve automobiles, causing an estimated loss of $30,000.

Novel Office Organization—More than 100 department heads and employees of the Studebaker Corp.'s automobile division in Detroit, Mich., have banded into a Studebaker club for the purpose of becoming more familiar with each other's work.

Houpt with Elevator Company—H. S. Houpt, who recently resigned as sales manager of the Alco car, was recently elected vice-president of the Gurney Elevator Co. He will have charge of the sales and installations and will have his office in New York City.

New Kissell Service Station—The KisselKar Motor Co.. Chicago, Ill., has opened a new service station in that city at Wabash avenue and Twenty-sixth street. This building contains 70,000 square feet of floor space and is three stories high and occupies a site 120 feet by 192 feet.

Two Cars for St. Louis Line—Official notice of the motor car service between St. Louis, Alton and Chautauqua on the C., P. & St. L. Railroad has been given out to the effect that two cars will be put in service, one between Alton and Chautauqua and the other between St. Louis, Mo., and Springfield, Ill.

Swinehart Opens Buffalo Agency—The Swinehart Tire & Rubber Co., Akron, O., recently opened an agency in Buffalo, N. Y., at 726 Main street. It will be under the management of E. F. Howell and C. A. Couch. This agency will act as a distributor in western New York and northwestern Pennsylvania.

By Way of Correction—In the issue of March 27 of THE AUTOMOBILE, under the heading of Communications from Makers, the letter appearing under P. P. Dean's name formed part of a talk that he presented before an automobile school on engine testing apparatus in general and did not form part of a communication from his company.

Organize New Lamp Concern—H. J. Johnson, W. C. Montie and J. L. Ballash have organized the Cleveland, O., Motor Lamp & Radiator Co., as successors to the repair department of the Guide Motor Lamp Co., which concern is now centering its efforts along manufacturing lines exclusively. The new company has leased the former quarters of the Guide company on the fourth floor of the Graves Building, 2069 East Fourth street,

Bosch Offers Winners $1,000—The Bosch Magneto Co., New York City, will make the following prize distribution to the winners of the 500-mile International sweepstakes to be held at Indianapolis, Ind., on May 30: To the winning driver, $500; second man, $300, and the third man $200. The condition attached to each award is that the driver of the car gaining first, second or third position must employ a Bosch magneto for ignition purposes during the race.

Belgian Bodymaker Visits States—Willy Van den Plas, the Belgian body builder, well known as the creator of the Metalurgique body styles, has arrived in New York City. Mr. Van den Plas contemplates the creation of an American branch which is to supply the makers and owners of automobiles with special body designs. After having spent a few days in New York Mr. Van den Plas will go to the large manufacturing centers of the West in order to feel the pulse of the industry and if possible establish relations with the car makers.

Bosch Appointments—The Bosch Magneto Co., New York City, has appointed the following concerns to act as supply stations and to be of help to the users of its products: The Lemke Electric Co., Milwaukee, Wis.; Miller-Dudley Co., Washington, D. C.; Beverly Garage, Staunton, Va.; Virginia Motor Car Co., Petersburg, Va.; Dan Valley Motor Co., Danville, Va.; Fairchild Auto Co., New Orleans, La.; Ozburn Auto Supply Co., Memphis, Tenn.; Drennan Motor Car Co., Birmingham, Ala.; Chester Motor Car Co., Nashville, Tenn.; Hobbie Motor Car Co., Montgomery, Ala.; Mobile Auto Co., Mobile, Ala.,; Woodside Motor Co., Charlotte, N. C.; American Ball Co., Providence, R. I., and the Bakersfield Garage & Auto Supply Co., Bakersfield, Cal.

Automobile Incorporations

—

AUTOMOBILES AND PARTS

BRONX, N. Y.—North End Coach & Auto Co.; capital, $2,000; to deal in automobiles. Incorporators: A. A. Bertini, Seymour Mork.

BROOKSBURG, N. Y.—A. R. Newcombe; capital, $5,000; to deal in automobiles. Incorporators: A. R. Newcombe, Luella P. Newcombe, M. W. Newcombe.

CHATTANOOGA, TENN.—Hirsch Motor Car Co.; capital, $5,000; to deal in automobiles.

DETROIT, MICH.—Gilmore Motor Mfg. Co.; capital, $35,000; to manufacture motors. Incorporators: George Gilmore, M. A. Shaw.

DOVER, DEL.—Motor Car Sales Co.; capital, $25,000; to deal in automobiles. Incorporators: Newton Gies, G. M. Emory, C. C. Frederick.

GRAND RAPIDS, MICH.—Michigan Hearse & Automobile Co.; capital, $600,000; to manufacture automobile hearses.

LYNN, MASS.—Atlantic Auto Co.; capital, $10,000; to deal in automobiles. Incorporators: C. J. Goldman, W .A. Bishop.

MACON, GA.—Macon Auto Co.; capital, $6,000; to deal in automobiles. Incorporators: C. F. Calhoun, J. P. Stubbs, F. T. Abel, W. E. Henry.

NEWARK, N. J.—Smith Motor Car Co.; capital $25,000; to deal in automobiles. Incorporators: J. L. Smith, L. W. Smith, J. W. Mason.

NEW YORK CITY.—Motor Coach Co.; capital, $500,000; to manufacture automobiles and motor car hearses. Incorporators: Sam Richenthal, Elbert R. Benyunes, Herman Miller.

PINEVILLE, KY.—Cumberland Motor Co.; capital, $50,000; to deal in automobiles. Incorporators: N. J. Weller, A. W. Bryant, M. J. Moss, J. A. Pitman.

RALEIGH, N. C.—Citizens' Motor Co.; capital, $25,000; to deal in automobiles. Incorporators: W. D. Adams, G. C. Glenn.

SACRAMENTO, CAL.—Golden West Motors Co.; to manufacture automobile engines. Incorporators: W. H. Williams, I. Williams, K. M. Robinson, H. Breniser, G. Breniser.

SCHENECTADY, N. Y.—Schenectady Autocar Co.,; capital, $10,000; to deal in automobile buses. Incorporators: Emmett Fisher, A. Langeneuer, L. Buonfigils.

GARAGES AND ACCESSORIES

BOLIVAR, N. Y.—Star and Crescent Oil Co.; capital, $18,000; to deal in automobile oils. Incorporators: J. A. Wilber, R. B. Moore, C. M. Van Buren.

CAMDEN, DEL.—Easy Starter & Speeder Co.; capital, $25,000; to manufacture and sell starting devices. Incorporators: F. R. Hansall, G. H. R. Martin, S. C. Seymour.

DETROIT, MICH.—Crescent Co.; capital, $200,000; to manufacture starting devices. Incorporators: H. H. Potter, F. W. Owen.

DETROIT, MICH.—Tire & Auto Service Co.; capital, $10,000; to operate a garage. Incorporators: R. C. Wanto, W. H. Bishop.

GRAND RAPIDS, MICH.—Auto Tire & Vulcanizing Co.; capital, $3,000; to repair tires.

Babcock Firestone Advertising Manager—E. S. Babcock has been appointed advertising manager of the Firestone Tire & Rubber Co., Akron, O.

Seattle Reo Moves—F. A. Mitchell & Co., Seattle, Wash., distributors for Reo cars have recently moved into new and larger quarters at 1010 East Pike street.

Fall Tire Distributors—Naegee & Lamb have been made northwestern distributors for the Fall tire in the Dakotas and Minnesota with offices in Minneapois, Minn.

Tremme Manager—Arthur Tremme, formerly with Chancler & Lyon, Seattle, Wash., has become manager for John Millen & Son at Vancouver and Victoria. B. C.

Moon Agency in New Home—The J. D. Perry Lewis Automobile Co., St. Louis, Mo., agent for the Moon car, is in its new quarters on Walton and Washington avenues.

Entz Opens Office—The T. B. Entz Automobile and Battery Co., St. Louis, Mo., has opened a downtown office in that city, where it will make a specialty of caring for electric cars.

Columbia in New N. Y. Quarters—The United Motor New York Co. is now settled in its new and larger quarters at 1932 Broadway, New York City. R. L. De Lisser is manager of the company.

Metz Opens Factory Branch—The Metz Co., Waltham, Mass., recently opened a factory branch in Los Angeles, Cal., at 1821 San Pedro street. A. C. Lown is in charge of the service station.

Opens Magneto Station—C. L. Dobbs has opened the Twin City Magneto Exchange, Twin Cities, Minn., at 1018 Nicollet avenue and will test, repair and install electric ignition and starting systems.

Automobile Agencies Combine—The Keystone Auto Co. has taken over the interests of the United Motor Pittsburgh Pa., Co., and in the future the firm will be operated as the Keystone Auto Co.

Whitman Changes—D. E. Whitman, for some time past with J. W. Leavitt & Co., in Los Angeles, Cal., has recently been placed in charge of the Apperson department of the Reo-Pacific Co., that city.

Curt Now Sole Owner—Joseph Curt, Jr., is now the sole owner of the Anthracite Motor Car Co., Scranton, Pa., with offices and salesrooms at 625 Lackawanna avenue. This company handles the Overland car.

Upper—Packard 3-ton truck chassis equipped with a tank body, used by the Brooklyn Union Gas Co., Brooklyn, N. Y., to pump water out of gas lines

Lower—A 5-ton Peerless vinegar truck with an ingenious quick-loading device, which is operated by Alarth & McGuire, of New York City

Automobile Incorporations

HUNTINGTON, W. VA.—Fourth Avenue Garage Co.; capital, $10,000; to do a general garage business. Incorporators: C. L. Hamilton, C. I. Leftwich, J. M. Stark.

NEW YORK CITY.—Normal Automobile Station; capital, $10,000; to conduct an automobile garage. Incorporators: J. F. Bokelman, A. Bokelman, Edward Ganter, John Ganter.

NEW YORK CITY.—Henschel Tire and Rubber Co.; capital, $10,000; to deal in automobile tires. Incorporators: R. Henschel, Anna Henschel, W. A. Wollman.

NEW YORK CITY.—Approved Auto Specialties Co.; capital, $10,000; to deal in automobile accessories. Incorporators: J. B. Brandreth, K. D. Brandreth, E. C. Phelps.

NEW YORK CITY.—Mercer Rubber Co.; capital, $10,000; to manufacture and deal in rubber goods. Incorporators: W. A. Dale, J. C. Dale, W. H. Saijer.

NEW YORK CITY.—Peerless Tire Co.; capital, $15,000; to deal in tires. Incorporators: Michael Schiavone, G. P. Calenda, Louis Schiavone.

NEW YORK CITY.—Ireland Rubber Co.; capital, $25,000; to deal in automobile tires. Incorporators: F. W. Humphreys, Charles Summa, Walter Elrich.

NEW YORK CITY.—G. C. Vaporizer Co.: capital, $50,000; to manufacture vaporizers and carburetors. Incorporators: George Richards, D. W. Richards, Frank Sowers.

NEW YORK CITY.—Seeing New York Automobiles; capital, $10,000; to operate sight-seeing automobiles. Incorporators: G. H. Milligan, Thomas Frost, J. V. Fallon.

ROMAY, W. VA.—Hampshire Garage; capital, $5,000; to carry on a general garage business. Incorporators: J. J. Cornwell, E. V. Parker, D. E. Pugh.

SAVANNAH, GA.—Savell Rubber Tire Co.; capital, $25,000; to manufacture automobile tires. Incorporators: W. B. Savell, W. W. Horndell, Charles Savell.

ST. JOHNS, MICH.—T. C. Beach Auto Turntable Co.; capital, $10,000; to manufacture an automobile turntable for use in garages. Incorporators: T. C. Beach, R. S. Clark, W. J. Moss, R. H. Chapin.

ST. LOUIS, MO.—St. Louis Rubber Mfg. Co.; capital, $10,000; to manufacture automobile tires. Incorporators: J. A. Mulherin, G. P. Dougherty, Paul F. Mulherin.

SUFFOLK, VA.—Suffolk Garage and Machine Co.; capital, $15,000; to do a general garage business. Incorporators: C. C. Parker, G. L. Bower.

WASHINGTON, D. C.—Imperial Motor Tire Co.; capital, $100,000; to deal in automobile tires. Incorporators: F. D. Geraghty, E. A. Garlock, M. T. Wiggins.

CHANGES OF NAME AND CAPITAL

DETROIT, MICH.—Motor Foundry Co.; increase of capital from $35,000 to $100,000.

MEMPHIS, TENN.—Blomberg Automobile Co.; increase of capital to $30,000.

WABASH, IND.—Service Motor Car Co.; capital increase to $250,000.

General Motors Builds Garage—The General Motors Truck Co., St. Louis, Mo., the Missouri corporation of the General Motor Co., Detroit, Mich., has taken out permits to build a large garage and repair plant in that city.

Parker Anderson Manager—E. Reese Parker, formerly manager at Philadelphia, Pa., and elsewhere for the Anderson Electric Car Co., Detroit, Mich., has been made manager at Minneapolis, Minn., to succeed W. R. Jenney.

Murray Transferred—E. C. Murray, manager of the Minneapolis, Minn., branch of S. F. Bowser & Co., has been transferred to the combined headquarters at Chicago, Ill., but will continue to supervise the Minneapolis service station.

Another New Garage—Another new garage will be built in Ridgway, Pa., in the near future. The building will be 50 by 160 feet, of brick construction and probably two stories high. Mr. Curry will lease the building for a period of 10 years. He will repair automobiles.

Plans Thirteen-Story Garage—Plans have been filed with the city building department, New York City, for an eleven-story garage building 100 by 118 feet on Sixty-first street near Columbus avenue. A. Penchot, 60 Broadway, is owner. The building will cost $325,000.

Bennett with Standard Roller Bearing—R. M. Bennett, who until recently has been in charge of the automobile department of the Jones Speedometer Co., New Rochelle, N. Y., has accepted a similar position with the Standard Roller Bearing Co., Philadelphia, Pa.

New Truck Company Formed—A new company, called the Henry Tobin Co., Inc., has been formed to market motor trucks of all kinds. A. H. Chadbourne has been appointed sales manager. The company has leased the building located at 50 West Fifty-ninth street, New York City.

Hupmobile's Hamburg Parts Depot—The Hupp Motor Car Co., Detroit, Mich., has established a parts depot at Hamburg. Germany. Mr. George Chailley will manage the plant. The depot will carry a complete stock of parts of every Hupmobile ever built and will supply stock on a moment's notice.

Edison's Electric Car Garage—Following an address by Mr. W. C. Anderson, president of the Anderson Electric Car Co., Detroit, Mich., to a meeting of the New York Edison Co.'s managers, a special appropriation of $30,000 was voted for the purpose of establishing an exclusive electric car garage in New York City.

AUTOMOBILE CARBURETER—In which throttle needle valve and auxiliary air valve are operated by connections so linked as to be simultaneous in their action on the parts mentioned.

Fig. 1 illustrates the carbureter described in this patent, which includes a vertical tubular mixing chamber M, a float feed F, a throttle valve T between M and the outlet connected to the cylinder and a rotary auxiliary air valve A which is arranged below the mixing chamber M on an axis longitudinally to and within M. A needle valve N for regulating the flow of fuel from the float chamber to the mixing chamber is arranged between A and T at an acute angle to the axes of these valves. Connections Ct, Ca and Cn—corresponding to the three valves—operate the latter simultaneously and conjointly, being provided with means for varying the relative throw of each valve. The connections consist of cranks on the valve stems having a number of holes and two connecting rods with ends adjustable in these holes to or from the centers of the cranks.

No. 1,0578,506—to Elbridge W. Stevens, Baltimore, Md. Granted April 1, 1913; filed June 2, 1910.

Automobile Wheel—Including dash pot spokes.

The wheel Fig. 5 includes a hub H, spoke cylinders S connected with it and containing a fluid rim, a rim R and pistons P connected with it and reciprocating in the cylinders. Each piston includes a head J for dividing the cylinder S into separate chambers and is provided with a valve controlled passage Q connecting the chambers formed in S. The piston is formed with a constantly open passage O of restricted cross area which connects the chambers formed in S.

No. 1,057,907—to Levi B. Wilson, Philadelphia, Pa. Granted April 1, 1913; filed August 5, 1911.

Internal Combustion Motor Valve—Including a piston valve driven by a half-time shaft geared to the crankshaft of the motor.

The subject matter of this patent is an internal combustion motor, Fig. 2 operating on the four-stroke cycle. The design described in this patent includes, in combination with a crankshaft S and a cylinder C, a piston valve V which is adapted to be reciprocated inside of a cylinder communicating with C, for the purpose of regulating the admission and exhaust of gas to and from the cylinder C. A valve rod R is connected to the valve while its other end is connected to a member M so mounted and driven by gearing from the crankshaft of the engine, that the axis of the member connected to the bottom of the valve rod describes, during one complete cycle of the engine a three-lobe hypocycloidal path of movement.

No. 1,057,399—to Daniel Appel, East Cleveland, O. Granted April 1, 1913; filed March 31, 1912.

Automobile Tire—Consisting of elastic cushions secured in place on a rim by flanges fastened to it by means of keys fitting transverse rims.

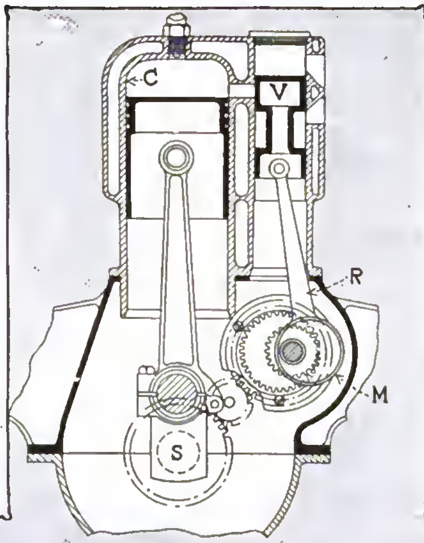
This patent refers to an automobile tire design as that shown in Fig. 3. In this tire the rim R is formed with transverse ribs Q each of which is provided with a keyway K on each side. Elastic cushions C formed with lateral flanges are in position between the ribs. Treads T formed with similar flanges fit over into individual cushions and are formed with keys adapted to engage the transverse ribs on both sides. Means M for preventing the accidental displacement of the key are provided, consisting of teeth and engaging notches on the sides of the key and the adjacent tread flanges.

No. 1,057,672—to Jacob Ruppert, Jr., and Ernest Siegel, New York City. Granted April 1, 1913; filed March 5, 1912.

Pneumatic Tire Design—Including separate inflatable compartments.

The tire described in this patent is illustrated in Fig. 4. and consists principally of a number of inflatable compartments made of rubber or a similarly elastic material, and being permanently connected at their ends and arranged in a sheath S. An air tube communicates with all the individual compartments C and the air for inflating the latter is supplied to the tube through an inflating valve V carried by it. Means are provided for cutting off communication between the tube and compartments C.

No. 1,057,580—to Elbert Charles Rhodes, Chicago, Ill. Granted April 1, 1913; filed February 16, 1911.



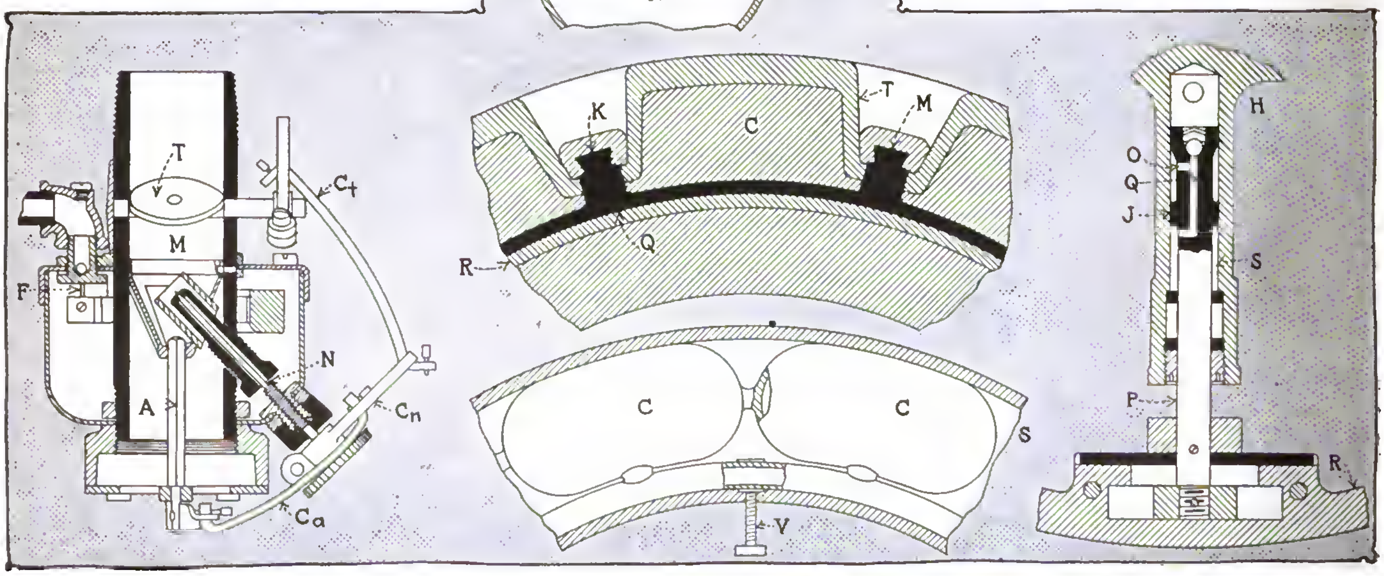


Fig. 1—Stevens carbureter. Fig. 2—Appel valve. Fig. 3—Ruppert-and-Siegel tire. Fig. 4—Rhodes tire. Fig. 5—Wilson wheel

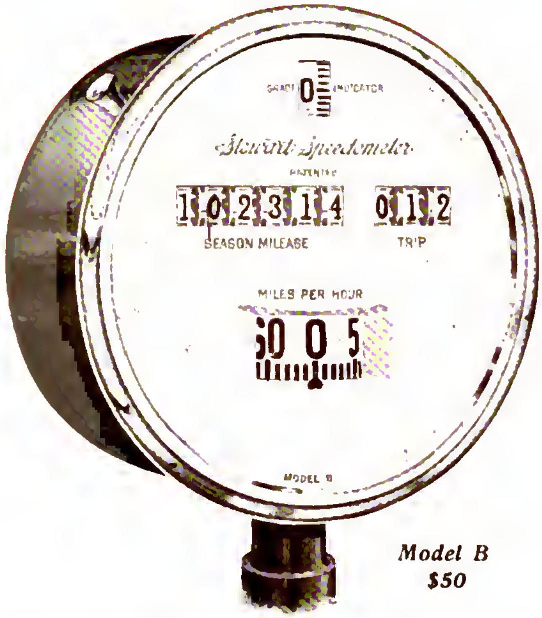
Stewart Speedometer

MAGNETIC PRINCIPLE



Model B
$50

More Practical—More Popular—
More Prestige

It is estimated that about 450,000 cars will be built during 1913. Of this amount 400,000 will be equipped with a magnetic speedometer—like the Stewart.

The point is, that it is much better to have your car equipped with that which is acknowledged to be the most practical and scientific, rather than to have on it something that was considered the best before the magnetic speedometer was invented.

The magnetic speedometer means entire satisfaction and world wide service for all time.

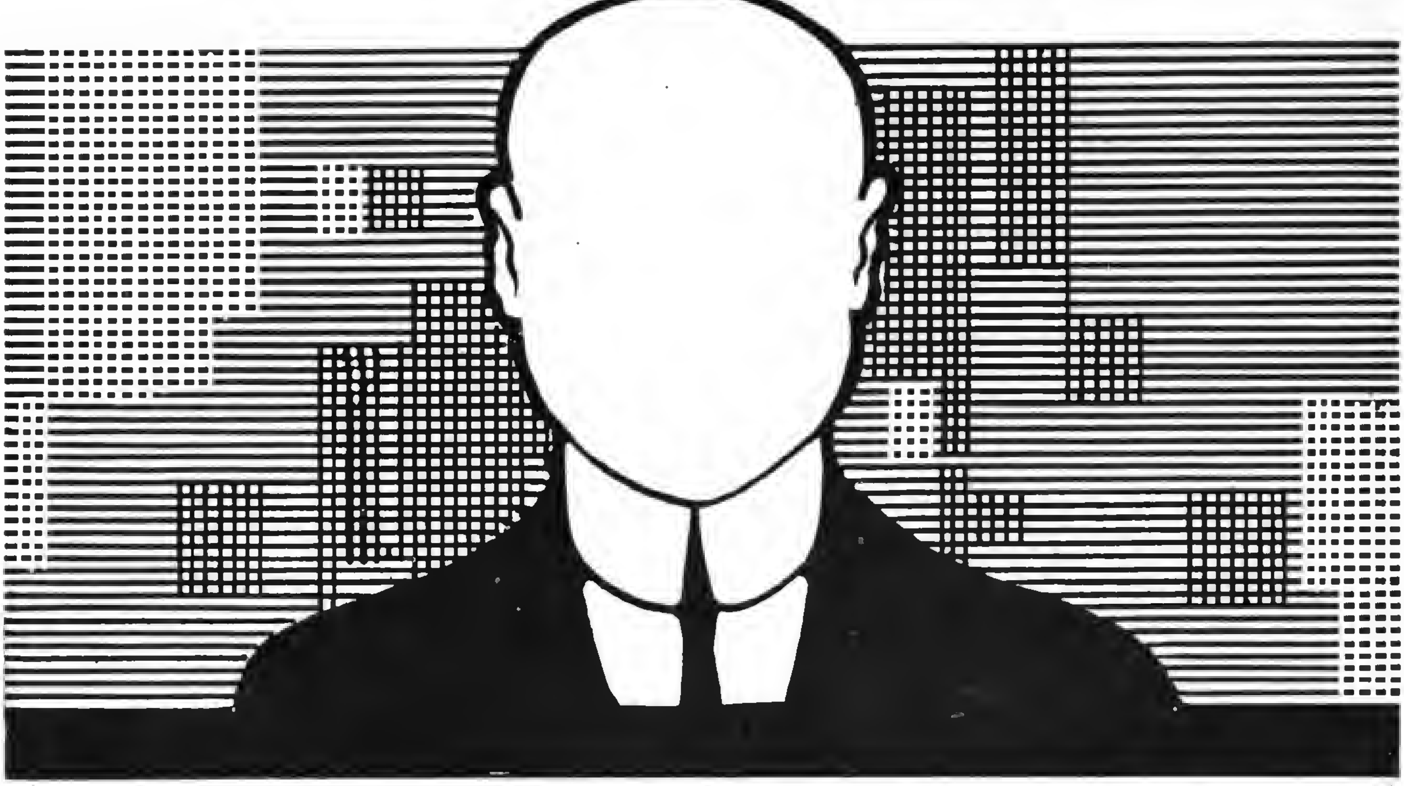
The centrifugal speedometer means all the old inaccuracies such as shaft troubles, etc., and no service.

And the gyroscopic speedometer is, of course, exactly the same as the old familiar and inaccurate centrifugal speedometer in a new dress and design.

Insist on a Stewart—it is built on the magnetic principle.

The Stewart Speedometer Factory,
1930 Diversey Blvd.
Chicago, U. S. A.

Service Stations in every important city in the world



Some big manufacturer needs me

My name or picture would be recognized not only by every car and parts manufacturer, but also by the leading dealers of this country.

So for the purpose of this announcement I wish to be known as X Y Z.

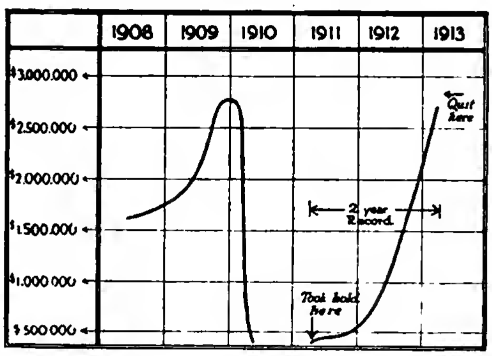
My connection with the industry dates back 15 years. I have a record of achievement that ranks me with the five most successful sales managers in the motoring world.

This record began by importing on a large scale European automobile parts and selling them to America's leading car makers.

I introduced to the American market what was probably the most successful accessory manufactured abroad.

In 1908 I designed and built the most successful vehicle of a certain type, and sold $1,250,000 worth of them from blue prints. This vehicle is still the standard in its field.

My last record as an organizer of sales is best indicated by this chart:



I am a *sales specialist*, and have used my thorough technical training as a basis for my sales work.

I believe I know how to judge the demand of the public and how best to take advantage of it.

There are perhaps a half dozen big unfinished jobs in the motor industry which my long experience and ability equip me to handle.

Is there one in your organization?

If you think it is large enough for a man who can do big things, it will pay you to write to me. I have well-defined views on the art of marketing products in the automobile industry. Perhaps my selling ideas are just what your business needs.

The *right* connection concerns me more than the question of salary. I will stand or fall on the results of my work. All correspondence will be treated with the utmost confidence.

I have adopted this means of announcing myself so that private interviews may be arranged between interested parties and myself without embarrassment to either side.

X Y Z Care of The Class Journal Co., 239 West 39th St., N. Y.

Most Electric Starters Increase Tonnage of Cars

Motor cars are increasing in tonnage at a disturbing rate. Only one or two makers, apparently, are directing their efforts toward lighter weight cars.

Addition after addition has been made until now many cars are under-tired and the additional weight is threatening the safety of the car's design.

Of all equipment to become standard for automobiles the Electric Lighting and Starting System weighs the most. It is natural then, that manufacturers and engineers should turn their attention to the lightest and most powerful electric starter ever offered.

The Hartford Electric Lighting and Starting System *complete* weighs no more than the starting motor *alone* on many other systems.

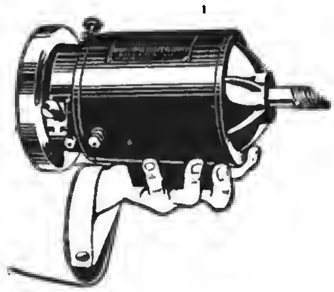
Completely installed, its weight is not enough to seriously affect either the tires, the chassis or any part of the car.

Combined with its wonderful lightness is its unequalled power and noiseless operation, secured by the use of a reduction gear and worm drive.

In view of these facts, is it not to your interest as well as ours to test the Hartford Electric Starter?

Our corps of expert engineers will attach the Hartford System to any car you may have available without a single structural change. Catalog on request.

Hartford Electric Starter



Every Buyer Should Specify the Hartford Starter for His New Car

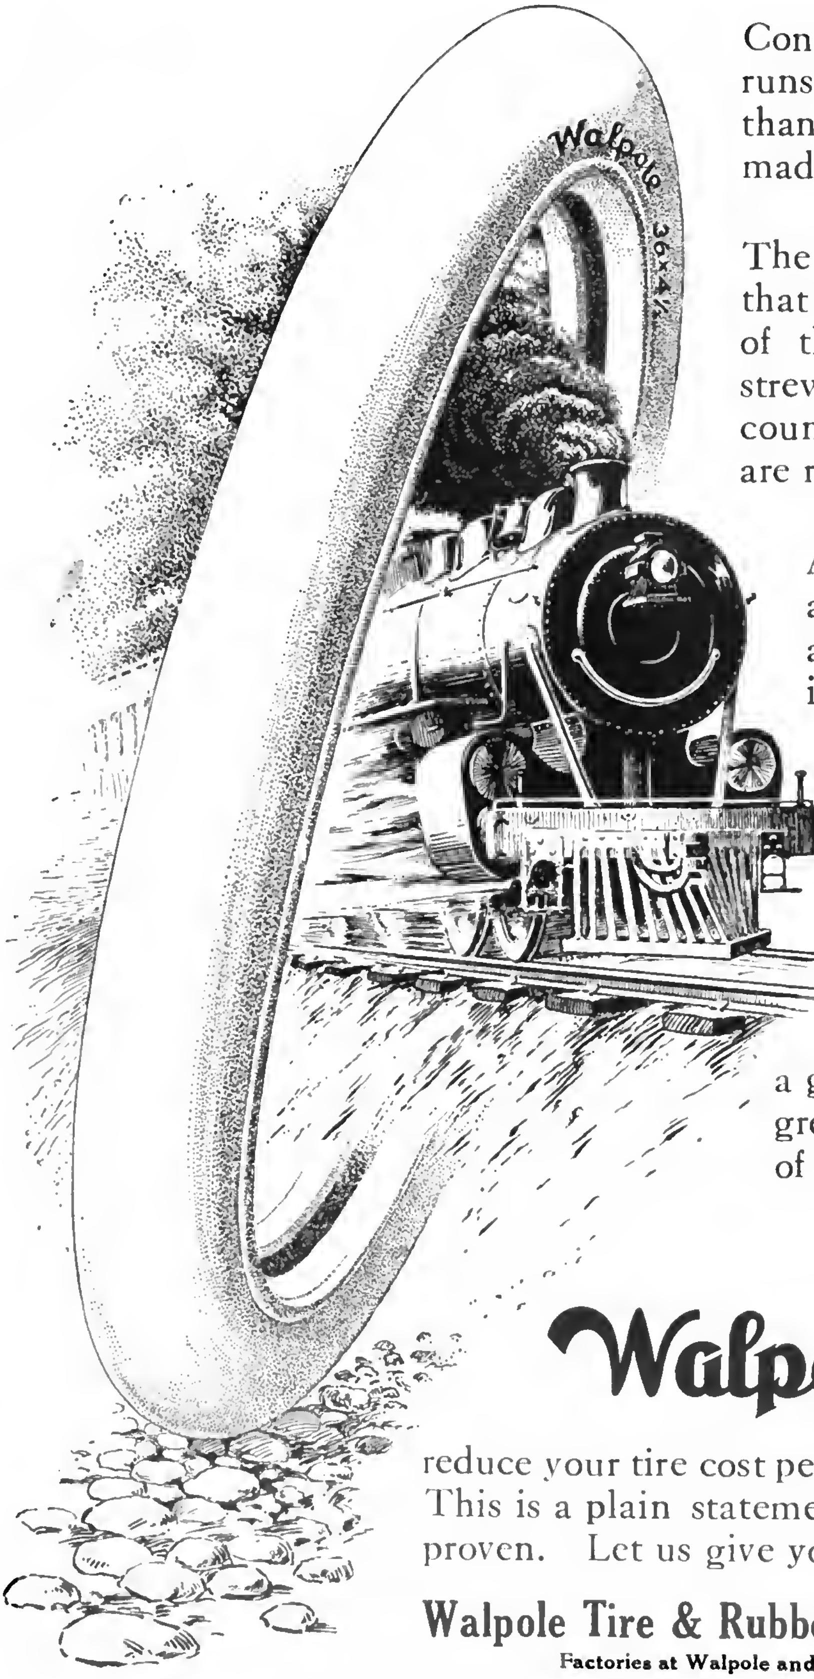
VOL. XXVIII NEW YORK, APRIL 17, 1913. No. 16

THE PATH OF THE LOCOMOTIVE AND THE PATH OF THE TIRE



Consider this:—The locomotive runs on a path that is smoother than a billiard table. Its tires are made of steel.

The automobile runs on a path that varies from the smoothness of the boulevard to the stone-strewn roughness of the back-country road in the hills. Its tires are resilient rubber.

As a matter of fact, the modern automobile tire is a marvel and its efficiency and economy in the face of the task it has are remarkable.

With the improvements found in WALPOLE TIRES — the extra-tough tread and extra-heavy side-walls scientifically designed to protect against stone-bruise—still greater efficiency and reduction of tire cost are attained.

Walpole "NO STONE BRUISE" Tires

reduce your tire cost per mile through longer service. This is a plain statement of fact that can be easily proven. Let us give you the proof.

The Automobile

Detecting Resistance—Saving Fuel

Accelerometer, a New Instrument, Tells What the Motor Is Doing, Indicates Effort Required to Propel Car at Any Speed and Shows the Exact Condition of the Car's Running Gear

By W. C. Marshall

¶ Hundreds of dollars in tires, gasoline and repairs can be literally thrown away by asking the car to overcome unnecessary resistance. It is impossible for the automobile owner to have his motor taken down and tested on the block every little while to see if he is maintaining it at the efficiency it should be. With the accelerometer he is able to get a complete check on the motor and running gear of the car. No flexible shafting or other connection is required. It is merely clamped to a flat surface on the car. The floor will do well enough or a little shelf may be placed on the dash to support the instrument. A small bracket will readily suffice.

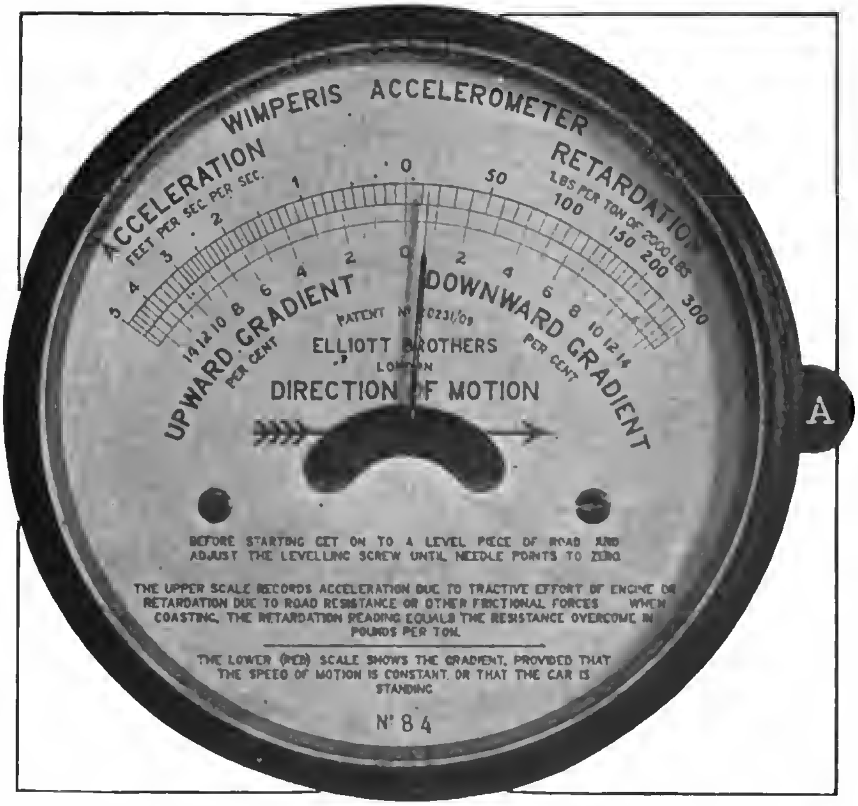
A STEADY effort of 119 pounds is required to drive an average 2-ton automobile along a dry level macadam road at 30 miles an hour. The average touring car weighs very close to 2 tons, therefore if you have a car of this class and it is necessary for your motor to exert a greater effort than this, there is something wrong with your running gear.

A natural question is, "How am I going to know that my car requires too great an effort to propel it?" The answer to this is a mere glance at the dial of the accelerometer, an instrument to be described in this article.

The first idea which would naturally occur to a person would be that an instrument of this kind must be something in the nature of a speedometer, but it is not. It has absolutely no connection to the car in any way except that it is within it or on it. It is just as free of flexible shafting of electric wires as the watch which you have in your pocket. Yet it tells the story of the condition of your car much more completely than the speedometer on the dash or the report of the manufacturer, because the first tells nothing of the effort required to drive the car at any speed and the second offers no proof as to the condition of the chassis after it has been in your hands 10 minutes.

The accelerometer as it appears mounted on a small built-up platform support. The readings can be readily taken as the dial is near the eyes of the operator and can be seen clearly. Note that the instrument is free from any connection to the car other than being carried in a flat place. It is held to the platform in this installation by means of straps. The accelerometer enables the driver to know how many horsepower are needed to drive his car over any road surface at any time. Cars differ amazingly in the amount of power needed for propelling them, and tests have shown that with two cars of approximately the same weight, 20 horsepower more is needed to propel one than the other at 40 m. p. h.

In appearance and in size the accelerometer is very similar to the average alarm clock. The dial is shown on page 834. When carried on the car it can be very conveniently arranged on a Z-shaped support; the bottom arm of which rests on the seat of the car and the



The dial of the accelerometer and directions for its use and adjustment as printed thereon

upper arm of which carries the instrument. This means of carrying the device is illustrated on page 833.

The accelerometer tells the car owner the total resistance offered to the progress of the car at any time. Once set it is independent of grades, curves or rough roads. Since the resistance offered by the car is at any time equal to the power exerted by the motor when traveling at a uniform rate of speed the accelerometer gives a full statement of the power exerted by the motor. It would, therefore, be possible to plot a full set of brake-horsepower curves by utilizing the readings on the accelerometer at different motor speeds. All that would be necessary would be to have a table showing how fast the motor was revolving at any car speed. The combined readings of the speedometer and the accelerometer would furnish sufficient data for a complete set of curves.

The total resistance interposed to the progress of a motor-driven vehicle consists mainly of two factors: A fixed quantity due to the rolling resistance and a variable quantity due to air resistance.

The fixed quantity alone gives the resistance to traction and on the average amounts to about 31 pounds per ton for pneumatic tires. For solid tires the resistance amounts to about 26.4 pounds per ton and for non-skid tires about 40 pounds per ton.

Besides the rolling resistance and the wind resistance there are three other factors which enter into the total resistance. These are, the friction in the vehicle itself, grades and curves. If we propel a vehicle at a certain speed over a level road and suddenly stop the propelling force the speed will decrease with a retardation proportional to the total resistance. If the latter is small the retardation will be small and the time required to change the speed will be longer than if the resistances were large as they would be, for example, if the brakes were applied or a strong head wind were blowing.

Again considering the car weighing 2 tons traveling at the rate of 30 miles an hour against a steady resistance of 119 pounds we find this resistance on analysis to be composed of $47 \times 2 + 25 = 119$ pounds. The rolling resistance is 47 pounds to the ton. For 2 tons it will be 47×2 and the wind resistance against the exposed surface of the car at 30 miles an hour, considering 12 square feet exposed, is 25 pounds.

With the accelerometer even this small calculation which is based on empirical formulae, would not have to be made. The indicator on the dial immediately shows the total resistance per ton of the car. It is only necessary to multiply the weight of the car by the reading on the dial to secure the total retarding force. In this way an accurate check may be made at any time on the condition of the brakes or of the motor.

A study of the dial of the instrument will show that it reads in two directions from the zero mark. On one side of 0 is acceleration and on the other side retardation. When measuring the pick-up of the motor, the needle is first set to zero with the leveling screws A when the car is on a level piece of road. The motor is started and the readings taken directly from the dial when speeding up. It will be noted that acceleration is read in feet per second per second. After any required speed has been attained and it is desired to determine the resistance to progress, the clutch is thrown out and the car allowed to coast. The retarding force will then be read on the retardation side of the dial directly in pounds per ton. The weight of the car in tons and fraction of a ton multiplied by the reading on the retardation scale will give the total resistance to progress. It must be noted that the ton is considered as 2,000 pounds in all of these calculations.

The practical value of the instrument is readily explained. Suppose in the car of 2 tons which we have considered, the resistance instead of being 119 pounds, the normal amount should suddenly show to be 200 pounds. The owner of the car would immediately realize that something was wrong. He would be using 60 per cent. more power than he required before. In other words, for every dollar's worth of gasoline he purchased he would be throwing about 40 cents away in overcoming useless resistance.

Dragging brakes, bearings which are too tight, badly aligned wheels and other faults which go to increase the power necessary to pull the car over the road can increase the cost of automobiling enormously. A light-running car is an economy.

When the operator sees by the accelerometer that the resistance has increased to a noticeable extent he goes over his car and perhaps checks a large amount of damage before it occurs. The instance of badly aligned front wheels may be taken to illustrate. The wear on the tires of the front wheels when they are out of alignment is so great that a new pair of shoes may be worn through in about 500 miles of travel. If this misalignment occurred on a car equipped with an accelerometer it would be detected immediately.

Formerly the measurement of road resistance has been determined by observing the pull on a tow line while the experimental vehicle was being pulled by another car along the road. Another method has been by reading the amount of current used in the motors of an electric vehicle at different speeds on roads of varying surfaces.

The accelerometer, as designed by H. E. Wimperis, an Englishman, measures the road resistance when merely attached to the floor, seat or dash of the car.

The instrument is small, being 4 inches in diameter, 2.25 inches high and of cylindrical form. The general appearance of the accelerometer is shown on page 835. There are three legs to support it on a flat surface, one of them which is shown at A being a leveling screw to level the instrument when the vehicle to be tested stands on a level surface. B is a milled screw used to lock the needle when the instrument is not being used for readings.

The needle is made to stand at 0, when the car is level, by turning the milled-head screw A. The needle swings in a horizontal plane and is not affected by other forces than those acting in the direction of the arrow. When the car is standing on a level, or moving at constant speed on a level, the needle remains at 0. If there is a change in speed, either increasing or decreasing, the needle swings respectively backwards or forwards and this enables the acceleration or retardation to be read on the scale under the needle.

The retardation is read directly in pounds per ton of 2,000 pounds. This is read when the car is coasting, and makes it possible to calculate the resistance of the car by the simple multiplication of the reading by the weight of the car and passengers taken in tons.

This resistance includes road resistances, air resistance and the resistance of the internal mechanism of the car.

If the speed of the car is known in miles per hour the product of speed multiplied by weight in tons multiplied by retardation in pounds divided by the constant 375 will give the horsepower to drive the car at that speed, neglecting tire losses.

This is obvious from the fact that the power lost is equal to the power furnished to drive the car.

As a car will decrease in speed more slowly on a slight down grade, or on a level, than on a rising slope, it will be found preferable to take readings on the former in order to give greater accuracy.

If the instrument is tilted in the direction of motion the needle will move through an angle corresponding to the angle of tilt, and this angle can be read from the graduations at the bottom of the scale. The instrument thus becomes a gradometer and has the power of enabling a slope to be determined while the car is in motion just as well as when standing, provided the speed of the car is uniform.

Although the instrument is sensitive to slopes, it is a fact that the coasting resistance readings do not need correction on account of being made when the car is running either up or down hill. The explanation is, moreover, quite simple. When a car is coasting down hill the slope tends to throw the needle forward while the acceleration, due to the slope throws it in the opposite direction, by just an equivalent amount, so that these two effects neutralize each other. If there were no road resistances the needle would stand at 0. The frictional resistances, due to the motion is practically causing the needle to move away from 0. The needle therefore shows the amount of this resistance, no matter whether the car is on a sloping road or not.

As mentioned, it is better to take readings on a slight downward slope of from 1 in 60 to 1 in 30.

In addition to the longer time thus given for taking the readings, the complicating effect of the change in the momentum, stored in the rotating parts, becomes insignificantly small.

If the rotational momentum is X per cent. of the translational momentum the true road resistance is X per cent. higher than that deduced from the retardation induced by that resistance. This is shown on the dial of the accelerometer when running on a level road.

When the road is not level the instrument reading shows the acceleration or the retardation due directly to the engine, the brakes, the road resistance or to a combination of them, and a knowledge of the slope is unnecessary.

The acceleration scale is useful in measuring the power exerted in accelerating the motor, either from rest or from one speed to another.

The retarding or coasting resistance of the car is first measured at any particular speed. This road resistance in pounds per ton is then added to the acceleration reading at that speed and multiplied by 62.5.

In cases where rubber tires are used the coasting resistance must be increased to find the actual power exerted by the motor at the rim of the driving wheels, on account of the loss in power in the tires.

This amounts to from 20 per cent. to 25 per cent. of the power at the rims. If the front wheels are also included the total tire loss will be approximately 27 per cent. with pneumatic tires, according to Dr. A. Reidler's recent experiments.

Suppose, for example, the coasting resistance of an automobile fitted with pneumatic tires showed 50 pounds per ton reading on the accelerometer. The weight of the car was 2 tons and the speed was 20 miles per hour. If the tire loss were 27 per cent. of the real resistance then the corrected reading would be

$\frac{50}{.73} = 68.5$ pounds per ton.

If this car were running at 20 miles per hour and the acceleration produced by opening the throttle wide was 1.75 feet per second per second then the tractive effort produced would be $1.75 \times 62.5 + 68.5 = 177$ pounds per ton.

(The constant 62.5 is obtained by dividing the number of pounds in a ton by the gravitational constant in feet per second per second.)

This also gives a means for comparing the power of different car engines, or comparing the effect on accelerating power by change of carbureter nozzle diameters, or change of air-inlet opening in the carbureter.

Successive trials of various nozzles with varying air inlets for each nozzle eventually determine which combination is most effective in producing the greatest acceleration from 20 miles per hour or from any other assumed speed.

In the example above the power necessary to accelerate the car 1.75 feet per second per second from 20 miles per hour would increase the speed to 28 miles per hour 10 seconds.

At this rate the horsepower at the rear-wheel rim would be about 21, which indicates a motor power of approximately 28.

It might be that a car was ascending a gradient during the test but, as explained above, this in no way affects the calculation.

This power of acceleration would be equivalent to the power necessary to drive the car at 20 miles per hour up a hill the gradient of which was 1 to 18.4 or a 5.4 per cent. grade.

In making tests on the road the influence of the various internal mechanisms of the car on its speed may be studied by running at different speeds with the various gears in mesh.

The engine friction can be approximately determined by running at a certain speed, then cutting off ignition and coasting.

(To be continued.)

Goux Makes 106.2 Miles in 60 Minutes

Breaks 50 and 100-Mile Records and Establishes New 1-Hour Figure in 30-Horsepower Peugeot

¶ LONDON, ENG., *April 12.—Special Cable.—At Brooklands today Jules Goux on a 30-horsepower Peugeot shattered Lambert's existing 1-hour record of Feb. 15 on the same track by covering 106.2 miles within the 60 minutes. The world's records made by this latest speed performance are 50 miles in 28 minutes 18.65 seconds at a speed of 105.97 miles per hour; 100 miles in 56 minutes 29.93 seconds at a speed of 106.2; and 150 miles in 1 hour 28 minutes 35.67 seconds at an average speed of 105.9 miles per hour. The motor dimensions are 110 millimeters bore by 200 millimeters stroke, cubic capacity, 7,603 cubic centimeters. The weight of the machine is 3,220 pounds.*

THE terrific average speed of 106.2 miles an hour maintained for the entire period of an hour is scarcely believable in so small a vehicle as the automobile. The finest trains of America maintain a much lower average than this when traveling over their specially constructed highway of steel. The Twentieth Century Limited, making the trip between New York and Chicago in 20 hours, averages only 45.6 miles an hour. It would be interesting to note where this train would be as compared to the racing car driven by Goux, could they travel over parallel routes between New York and Chicago at the respective relative speeds of 106.2 and 45.6 miles an hour. A table showing this comparison follows:

City	Elapsed Hours	Distance in Miles from New York	Miles, Covered by Train	Miles, Covered by Racing Car
New York	0	0	0	0
Albany	3	142	142	319
Buffalo	8.9	411	411	947
Cleveland	12.6	575	575	1340
Toledo	15.1	688	688	1608
Chicago	20	912	912	2123

By the time the train reaches Buffalo the racing car will have been in Chicago for several minutes. When the Twentieth Century had reached Chicago the racing car would have been two-thirds the way across the continent of America.

The idea of speed is relative. We compare the speed of a certain vehicle with that to which we are accustomed in our daily travel and which is compatible with safety according to modern methods of construction. On the ocean, we say a vessel is fast that can make the transatlantic trip under 5 days. Let us consider the record of the Mauretania, made in 1910. This vessel made the trip from Queenstown to New York in 4 days 10 hours and 41 minutes. The distance between these two ports is 2,820 nautical miles. Reducing the average speed of the vessel to land miles for the sake of comparison we find that the Mauretania averaged 29.7 miles an hour on her record-breaking trip across the ocean. If Goux had a good track to travel across the ocean and made the same average speed that he made in his record-breaking race against time, it would take him 30 hours to make the trip. Just 6 hours over a day!

The automobile is the fastest vehicle which man has yet found to satisfy his craving for speed. The flights of fancy of a Jules Verne or Baron Munchausen are surpassed daily, even on the streets of the larger cities. Ultimate speed has always been of intense interest to the human mind. The runners at the Olympic games always provoked the greatest interest. The chariot races, horse races, aeroplanes and automobile races have been and are the means of drawing a thrill-loving audience. The history of speed has interwoven itself so closely with the history of nations that it almost may be said to measure civilization.

The accompanying chart gives the records made with some of the fastest methods of transportation in the hands of man.

Goux, in establishing his record for the distance covered in an hour also established new 50-mile and 100-mile records. It is interesting to note that his speed was greater during the second 50 miles than during the first 50 miles. At the end of the first 50 miles he had averaged 105.97 miles an hour. The second 50 miles was made at a sufficient rate of speed to bring his average up to 106.2 miles an hour. In other words, for the second 50 miles the average was 106.43 miles an hour.

LONDON, ENG., April 1.—Following up his successful driving, which appealed so strongly to those who attended the Easter motor-car racing meeting at Brooklands, Jules Goux has been busy attempting records on his 30-horsepower Peugeot in which he won the French Grand Prix on the Sarthe circuit last year. He succeeded in bettering on all the figures in the 40-horsepower class from the flying .5-mile to the ten laps of the track, which is equal to about 27.5 miles. For the flying .5 mile he occupied 16.38 seconds, which is equal to a speed of approximately 110 miles an hour. The flying kilometer was covered in 20.79 seconds, which is equal to 107.5 miles an hour and the flying mile was returned at 33.87 seconds, which is equal to 106.5 miles per hour. The car was then brought to a halt and from the standing start the car covered ten laps of the track, which is equal to 27.5 miles, in 16 min. 4.9 secs., which is equivalent to 102.5 miles per hour.

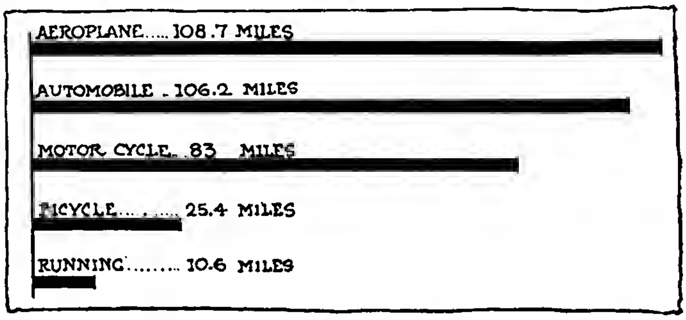
A day later Goux was again in action with the 30-horsepower Peugeot and it was decided that the 6 hours' record should be attempted and a start was to have been made at 9 a. m., but, owing to rain, it was delayed. It is interesting to note that in this attempt, despite the stoppages for tire trouble, for the second time in the history of racing, 100 miles was covered within the hour. He covered that distance in 59 minutes 49.78 seconds.

This 30-horsepower Peugeot is not one of the cars that will compete in the 500-mile race at Indianapolis on May 30, but those that will compete are now undergoing alterations at the French factory and will not be on the roads for 1 week or 2 yet. They are identical to the Peugeot that has been running in England at Brooklands in every respect with the single exception of cylinder capacity. The 30-horsepower Peugeot at Brooklands at the time of writing, has a bore of 110 millimeters and a stroke of 200 millimeters, whereas the racers for the Indianapolis Speedway will have new cylinders cast, measuring a bore of 108 millimeters in order to comply with the regulations laid down for all entrants for this great event.

Sixteen Entered for Decoration Day

INDIANAPOLIS, IND., April 14—Among the sixteen cars entered so far for the Memorial Day race are the following makes: Stutz, Nyberg, Keeton, Mason, Henderson, Smada, Peugeot, Sunbeam.

NEW YORK CITY, April 15—The N. A. A. M. has published a statement explaining that at present there are no plans on hand for the use of a special automobile exhibition building in the 1915 show at San Francisco. The N. A. A. M. some time ago started an inquiry among the automobile makers whether they were sufficiently interested in the Panama show, with negative result, whereupon plans for a special building were dropped.



Comparison of the record distances covered in 1 hour by various means of locomotion

Bill To Tax Trucks $5 a Ton in Bay State

Automobile Interests are Preparing to Fight—Are Now Resolved To Kill All Legislation on Trucks

BOSTON, MASS., April 12—The Committee on Roads and Bridges of the Legislature reported today a motor truck bill calling for a tax of $5 per ton for each ton capacity of commercial vehicles. The motor interests were very much surprised at this for, by agreement in conference between the representatives of the motorists and the Highway Commission, a bill was drawn calling for $5 for the first ton and $2.50 for each additional ton. A meeting has been called by the motor interests for Monday morning to take action on the matter, and the plans of the motorists are now to try to defeat all motor bills on trucks before the Legislature, leaving the law as it is. Interesting developments are looked for as the result of this seemingly uncalled for report after the conferences and compromises that had apparently straightened out things. It will be the best thing all around, however, if all the proposed legislation is defeated.

Lien Law Passed in Indiana

INDIANAPOLIS, IND., April 14—The Indiana Legislature, which recently concluded its biennial session, passed a lien law for motor car interests. This was not generally known, as it passed through both houses without debate.

Within 1 year from the refusal or failure of the owner of any motor car, including trucks, to pay any storage, repair or supply bill, a complaint may be filed to foreclose a lien in the Circuit Court where the car or truck is located. The law allows a lien for storage charges, supplies furnished or repairs done in favor of every person, firm or corporation or others maintaining automobile garages or engaged in storing or furnishing supplies or repairing.

Another important law passed is that aimed at joy-riders. It makes it unlawful "for any person to take possession or to assume control of any vehicles of any character whatsoever, which vehicle is the property of another, and to use, drive, run or operate such vehicle without first procuring the consent of the owner, or to ride with or accompany a person who is so doing, knowing that it is being done without the knowledge and consent of the owner."

For violations the penalty is a fine of from $25 to $500 to which the court, at its discretion, may add imprisonment or from 10 days to 6 months.

Hartford Sues Concrete Bumper

NEW YORK CITY, April 15—Rollie B. Fageol, the inventor of the concrete steel bumper, and the Hartford Suspension Co., Jersey City, N. J., have sued the Concrete Bumper Co. (Ed. R. C. Struthers), New York City, charging infringement of the Fageol patents. The complaint has been filed this week and will come up in the United States District Court, Southern District of New York, on April 18. The complainants are praying for a preliminary injunction to prevent the defendant from manufacturing and selling concrete-filled bumpers or to have him file a bond with the court.

Cut Boston Owners' Insurance Rates

BOSTON, MASS., April 10—Insurance companies in Boston and vicinity that handle automobile insurance announced today that a reduction had been made both on pleasure cars and motor trucks. On the cars used for pleasure a reduction of $2.50 for each automobile will be made, regardless of its horsepower, provided the employers' liability hazard is eliminated. In other words, the reduction affects principally the man who operates his own car. To secure this reduction the following indorsement must be attached to policies: "It is understood and agreed that the policy to which this indorsement is attached does not cover accidents occurring to employes of the assured while engaged in operating or caring for automobiles covered hereby."

Special attention is called to the fact that this reduction applies only to the rate for liability insurance for private pleasure automobiles. No change is authorized for property damage or collision insurance. The reduction in the premiums on commercial cars is more sweeping. Such cars are rated in classes according to the nature of the business their owners are engaged in, and shows the trend of recognizing the growing importance of the truck business. On class 4 the premium rate for liability insurance is reduced from $60 to $45, and for property damage from $24 to $18; on class 5 the liability rate is reduced from $45 to $35, and for property damage from $18 to $14. Class 4 includes all machines used by barrel and box makers, contractors and manufacturers of building materials, carpenters, cleaners and dyers, coal merchants, hay, grain and feed dealers, furniture dealers, gas and water concerns, ice dealers, laundry men, lumber dealers and piano manufacturers. Class 5 comprises all makes of commercial vehicles not otherwise classified.

Batavia Campaign Looks Hopeful

NEW YORK CITY, April 15—According to Holmes, Rogers & Carpenter, attorneys for the Batavia Rubber Co., Batavia, N. Y., the matter of this company's campaign against alleged imitators of its non-skid tread is progressing well. The United & Globe Mfg. Co., Trenton, N. J., has decided to change the design of its tread so as to prevent a possible confusion on part of buyers with Batavia tread. The same holds good of the Stoddard Rubber Tire Works, Worcester, Mass. Several other important companies also in negotiation with the Batavia concern are almost ready to make a similar agreement.

The attorneys of the Batavia company have succeeded in convincing the court that the motion of the Seamless Rubber Co., New Haven, Conn., in the suit of the Batavia Rubber Co. against it, to dismiss the suit was not justified, and Judge Noyes of the United States District Court, Southern District of New York, decided against the Seamless company. The attorneys of the complainant showed to the satisfaction of the court that while Seamless tires were sold in New York under another company's name, payments were made to the New Haven concern.

NEW YORK CITY, April 14—Justice Henry G. Ward, of the United States District Court, Southern District of New York, last week ruled that the Automobile Tire Co., of this city, file a bill of information in the suit pending against it on complaint of the Fisk Rubber Co., Chicopee Falls, Mass. The suit, which is for payment of three notes, amounting respectively to $3,000, $3,000, $3,272.95, or a total amount claimed of $9,305.45 and interest since July 3, 1911, has been brought by the Fisk company through its attorney, Sydney S. Meyers.

Sparton Users Reply to Klaxon

NEW YORK CITY, April 15—The Jackson Eastern Distributors, the Haynes Automobile Co. and the Garland Automobile Co., New York City representatives of Jackson, Haynes and Velie manufacturers, respectively, have filed their answers to the complaints of the Lovell-McConnell Mfg. Co. in the United States District Court, Southern District of New York. In their reply they claim that the Klaxon patents Nos. 923,048, 923,049 and 923,122 were anticipated by earlier patents granted to Woolstock & Ostrander, Edison, Stromberg, Gray and others. The defendants ask the court to dismiss the complaint on the grounds that even if the Klaxon patents are, as is claimed by the Lovell-McConnell company, capable of conjunctive use, the plaintiffs have not stated in their complaint that conjunctive application of the patents has been made in the case of the Klaxon horn.

Gotham Speed Limit Is 25 Miles

NEW YORK CITY, April 16.—The Board of Aldermen of the City of New York yesterday passed an ordinance regulating the operating speed of automobiles. Speed limits of 15, 20 and 25 miles an hour were established for sections of varied density of population. The ordinance also provides for slowing down to 4 miles when turning a corner or crossing a street or highway and prohibits passing a street car within less than 8 feet while the car is standing for the purpose of taking on or letting off passengers. In passing a public school on a school day or a bridge, 10 miles an hour is the limit. Federal and municipal vehicles are exempt from all the foregoing regulations when on duty.

The penalty for a first offense is from $25 to $100 fine, 15 days in jail or both; for second offense committed within 1 year after the first, from $50 to $100, imprisonment up to 30 days or both; for a third or subsequent offense, within 1 year from the first, $100 fine, 60 days in prison or both.

The ordinance which repeals all city ordinances contrary to it, will go into effect on June 1, 1913. It is practically an amendment to the Callan law which is very vague in the points covered by the ordinance and leaves many of them to the discretion of the judge.

Big February Exports

Canada Bought Cars for $1,086,560—International Motors' New Officers

WASHINGTON, D. C., April 15—*Special Telegram*—Canada leads in the importation of American automobiles for February among foreign countries, with 916 machines, representing $1,086,560. The United Kingdom is second with 431 machines, representing $359,779. South America is third with 283 machines, representing $304,630. By comparison with February, 1912, big increases are shown in exports to different countries in each instance.

The monthly summary of commerce issued by the National Bureau of Statistics continues to show a falling off in the value of imports and an increase in the value of exports for the automobile and allied industries. The report herewith on automobile parts, rubber and gasoline shows the figures as compiled for the month of February, 1912, and February, 1913:

Imports	Feb., 1912	Feb., 1913.
Automobile parts (not tires)	$29,241	$17,483
Unmanufactured rubber	10,726,975	9,026,124
Exports		
Automobile parts (not tires)	345,965	444,728
Rubber tires	267,036	276,253
Total rubber, all kinds	1,042,630	1,103,742
Gasoline	560,684	636,578

WASHINGTON, D. C., April 14—The Department of Commerce at Washington has compiled a report showing the comparative value of automobiles exported from the United States, England and France during the past few years. It will be noticed that the export business of the United States has jumped more than $10,000,000 during the past year. The figures from England and France are not as yet available for the past year, but no startling change will be seen when they are published. The comparative table follows:

	—Year Ended Dec. 31—		
Year	United Kingdom	France	*U. S.
1897	....	$121,000	....
1898	....	340,000	....
1899	....	832,000	....
1900	....	1,834,000	....
1901	....	3,070,000	....
1902	$837,000	5,883,000	$950,000
1903	1,674,000	9,898,000	1,207,000
1904	1,747,000	13,825,000	1,895,000
1905	2,637,000	19,568,000	2,481,000
1906	4,228,000	26,833,000	3,497,000
1907	6,725,000	28,098,000	5,501,000
1908	6,423,000	24,779,000	5,278,000
1909	8,141,000	28,541,000	5,992,000
1910	13,460,000	31,510,000	11,190,000
1911	17,246,000	30,795,000	15,509,000
1912	....	....	25,657,000

*Year ended June 30.

Consolidated Lubricants Now Wagner

NEW YORK CITY, April 14—The Consolidated Lubricants Co., maker of Wagner lubricants for automobiles, has changed its name to the Wagner Oil Co. The officers and capitalization of the company remain the same. Fred J. Wagner is president, I. M. Uppercu vice-president and J. C. Nichols treasurer, the capital remaining at $25,000.

A. A. A. Negotiates with W. A. A.

NEW YORK CITY, April 16—Matters are not entirely settled between the American Automobile Association and the Western Automobile Association, the new California body organized to control motor contests in the West. Chairman Schimpf of the Contest Board went West some weeks ago to settle the situation and agreed with the Automobile Club of southern California, through a committee of seven, to administer contest affairs in that territory under the jurisdiction of a contest board. Edward G. Kuster, of the club, was appointed member of the contest board to work with a committee of seven to be selected by the California club. At this point in the proceedings the Western association demanded that the club allow them to name the seven members of the committee, which was refused. Further, the club of southern California has refused to recognize the Western association and continues its membership in the A. A. A. It would appear that what the Western association originally asked for has been granted, but no sooner was such given than a new issue has been taken up by them. The committee of seven is to be made up of four from Los Angeles, one from San Diego, and two from other sections of the territory. It would appear now that if the Western organization does not agree, that its action is simply taken to delay settlement.

S. A. E. to Study Steel's Properties

NEW YORK CITY, April 16—At a meeting of the Iron and Steel Division of the Standards Committee of the Society of Automobile Engineers held at the headquarters of the society here it was decided to delve further into the physical properties of the steels. The manufacturer cannot get satisfaction from an entirely chemical specification and requires definite data on the physical properties. At the same time the steel manufacturer can work better from a chemical analysis. It was decided to amplify the results of the committee's investigation as reported at the January meeting of last year with further reports on the elastic limits and other physical properties to be expected of steels of different chemical constituents. The next meeting of the sub-committee of fuels will be held at the headquarters of the society on April 24.

NEW YORK CITY, April 14.—The vice-presidency of the International Motor Co., vacant heretofore, has been filled by John Calder, with L. H. French and E. C. Fink, first, second and third vice-presidents respectively. Mr. Calder was connected as factory manager with the Cadillac Motor Car Co., while the other two officials were members of the International organization before. R. E. Fulton, formerly assistant sales agent, has been made general sales agent, and George H. Hodges, formerly traffic engineer, is now assistant general agent. J. N. Van Harlingen is manager of the company's transportation-cost department.

Automobile Securities Quotations

The general trend in the stock market this week was down, and as a consequence all automobile securities except Pope Mfg. and Maxwell first preferred either dropped or remained unchanged. Renewed weakness in tire securities seemed to indicate chariness of the public toward the assurances that the industry was again in normal condition.

Miller To Double Stock

Plan To Increase Capital to $2,000,000 —Maxwell Capital Now $37,000,000

AKRON, O., April 15—*Special Telegram*—The Miller Rubber Co., of this city, at its last directors' meeting decided to submit a plan to the company's stockholders, by which the capital stock of the company be increased from $1,000,000 to $2,000,000. The increase is to be half common and half preferred stock, 5,000 shares of each to be issued at $100 a share. A meeting of the stockholders will be called at an early date to decide on the question of this issue. The company means to offer one-fourth, or $250,000 of the new issue, for sale, the present stockholders to be given an opportunity to buy to the extent of 25 per cent. of their present holdings, while the rest of the $250,000 worth of stock is to be disposed of in the open market.

NEW YORK CITY, April 14—The Willys-Overland Co.'s board of directors on April 11 declared the quarterly dividend of 1 1-2 per cent. on the $20,00,000 of common stock to be paid on May 1. A quarterly dividend of 1 3-4 per cent. was paid on the $5,000,000 preferred stock issued on April 1.

Maxwell Sheet Shows $47,000,000

NEW YORK CITY, April 14—The Maxwell Motor Co., Inc., has published its balance sheet, showing its assets and liabilities on January 31. This account shows assets to the amount of $46,753,668.08, of which more than half, namely, $26,849,880.44, is put down as the aggregate value of the company's good will, models, patents, trade marks and trade names. Operating equipment as well as current and working assets amount to approximately $10,000,000 each. On the liability side of the sheet, the capital liabilities, amounting to $37,000,000, take the first place. The current liabilities total only $1,135,592.64. The detailed report follows:

Assets

Capital assets:	
Real estate, buildings, machinery, equipment	$9,026,330.72
Investments—Briscoe Mfg. Co., etc.	680,056.36
	$9,706,387.08
Goodwill, models, patents, trade marks, trade names	$26,849,880.44
Current and working assets:	
Inventories	$5,415,339.26
Account receivable	1,985,355.57
Note receivable	288,648.08
Prepayment	77,866.55
Cash on hand together with $1,552,022.07 from Reorganization Committee	2,430,191.10
	$10,197,400.56
Total assets	$46,753,668.08

Liabilities

Capital liabilities:	
Common stock	$13,000,000.00
First preferred	13,000,000.00
Second preferred	11,000,000.00
	$37,000,000.00
Deferred liabilities:	
First mortgages and purchase obligations	$156,342.50
Current liabilities:	
Notes and accounts payable	$756,688.22
Customers' deposits	131,834.75
Receivers' certificates (paid March 24, 1913)	150,000.00
Accrued interest, wages and expenses	88,069.67
	$1,135,592.64
Reserve for depreciation of capital assets:	
Buildings, machinery and equipment	$2,598,760.70
Reserve for depreciation of current and working assets:	
Inventories	$3,594,621.21
Accounts and notes receivable	1,103,140.43
	$4,697,761.64
Reserve for establishment of business expenses:	
Applicable to prior period and other items	$1,165,210.60
Total liabilities	$46,753,668.08

The capitalization of the company given in this balance sheet as $37,000,000 includes an increase of $6,000,000 over the original capitalization of the company, which amounted to $31,000,000. The new issue of $6,000,000 has been incurred in order to pay for property acquired by the former Flanders interests after the original reorganization plan which provided for $31,000,000 stock had been put into practice. By issuing additional stock it is possible to carry out the original plans of the company practically without alteration.

MILWAUKEE, WIS., April 12—Intimations have come from many quarters that the Allis-Chalmers Mfg. Co., the reorganization of the defunct Allis-Chalmers Co., of Milwaukee, which will take control of the properties within the next 2 weeks, will devote much of the time of its extensive electrical works to the production of electrical apparatus for motor cars and trucks, notably cranking and self-starting devices. The company's electrical business is almost entirely concentrated, for the purposes of production, in Cincinnati, the seat of the Bullock Electrical Co., one of the Allis-Chalmers group. Here there are being manufactured at the present time a large number of electrical cranking devices for the Mitchell-Lewis Motor Co., of Racine, Wis., in conformity to the specifications of the Mitchell engineers. However, it is intimated that the company will bring out an electrical cranking device of its own design and manufacture, bearing the well-known Allis-Chalmers trade mark and name.

COLUMBUS, O., April 12—The Ohio House of Representatives has concurred in the Senate amendments to the Hudson-Hite good roads bill which definitely fixes the system of market roads and inter-county highways to be constructed under the supervision of the Ohio state highway commission. The system of roads is to be built with proceeds from a special tax levy and will amount to approximately $3,350,000 yearly. One-quarter of the fund will be used by the state to construct market roads and the prisoners of the Ohio state penitentiary will be used in that work.

The remainder of the fund is to be used for road construction under the present law and will be apportioned to the eighty-eight counties of the state. An amendment was also made permitting the work to be started earlier in the spring.

A bill has been introduced in the Ohio Senate providing that the receipts of the state automobile department shall be turned into the state treasury without deducting expenses.

NEW YORK CITY, April 14—W. P. Kennedy, head of the Transportation Cost Bureau of the American Locomotive Co., resigned last week. No successor will be appointed. This department will be handled by a member of the engineering force.

Market Changes of the Week

Tin held full sway in this week's markets, rising $1.00 per hundred pounds. Starting at $48.50 it rose to $50.00, the highest during the week, then dropped and closed at $49.50. The demand for lead is fairly active with prices calling at $4.35 and $4.40. Both coppers experienced a slight gain of $.00 1-8, closing at $.15 1-2 per pound. There was an absence of new developments in the petroleum markets this week, both Pennsylvania and Kansas remaining firm with unchanged prices. The market for automobile scrap retains a firm tone. The market for foreign scrap remains unchanged. According to importers the demand from consumers holds up well, and stocks abroad are in some cases said to be inadequate for the supply.

Motor Spirit on Test

Stromberg Finishes a Series of Comparisons with Gasoline

CHICAGO, ILL., April 12—The first complete tests of the new fuel Motor Spirit were completed today when the Stromberg Motor Devices Co. finished a series of exhaustive comparisons of the new distillate and gasoline extending over a period of 3 weeks. Both road tests and laboratory tests in the completely equipped Stromberg testing laboratories were made. The same engines and carbureters were employed with both fuels.

Comparisons of power and economy and response to throttle opening were made at all speeds with each fuel. The results of the tests show practically no difference between the two fuels, either in fuel consumption or power. There was very slight difference also in the picking up of the motor with the two fuels, one being slightly less responsive at some speeds and the other less responsive at other speeds.

What is perhaps the most important feature for those who contemplate trying out the new fuel is that with Stromberg carbureters, at least, no change whatever in the adjustment of the carbureter is necessary. The Stromberg test showed that best results were obtained with the same proportion of air on either motor spirit or gasoline.

Interchangeable With Gasoline

This means that when a motorist's supply of Motor Spirit is exhausted, he can simply fill his fuel tank with gasoline and go ahead without even adjusting the carbureter. This is in contradiction to the results obtained by the Standard Oil Co. of Indiana, which developed the new fuel. This company finds that more air should be given with the Motor Spirit than with gasoline.

Road tests at the Stromberg plant were made on a six-cylinder car weighing 3,700 pounds and showed 15 miles per gallon on both Motor Spirit and gasoline. The fuels used were gasoline of 56 degrees Beaumé and motor spirit of 60 degrees Beaumé gravity.

The official report of the tests follows:

The new fuel, Motor Spirit, was tested in direct comparison with gasoline, first in the laboratory and second on the road. Curves are submitted herewith showing the results of the laboratory tests.

As will be seen, there is practically no difference. However, on the exhaust gas analysis at low speed there is a slightly larger quantity of CO present in the exhaust with the Motor Spirit, but at high speeds combustion is the same as with gasoline. Tests were made for acceleration as well and as far as can be determined the Motor Spirit is slightly "logy" at low speeds, but much snappier above 600 revolutions per minute. On the road the results were about the same. Below 10 miles per hour the car with Motor Spirit was slightly "logy," but at medium and high speeds had about the same snap.

On the fuel consumption test, running with 1 gallon of each fuel over the same course and in the same direction, they both checked the same mileage at 15, 20 and 25-mile rates. This was accomplished with no change whatever in the carbureter, and, in fact, when the carbureter was adjusted for gasoline, could not change the adjustment when using Motor Spirit to make it the least degree better. Starting was accomplished as readily with Motor Spirit as with gasoline in the coldest weather.

With the Motor Spirit there is, however, a faint smoke in the exhaust and the odor is slightly noticeable. The peculiar odor of this fuel would be obnoxious for pleasure driving, as if any is spilled on the car filling the tank the odor remains for several days. Cannot see any reason why this fuel cannot interchange in any car without making any difference whatever in the running conditions. Should say it was desirable for truck work on account of its low price.—EARL A. BESSOM, Engineering Dept., Stromberg Motor Devices Co., Chicago, Ill.

The Fuel Situation in England

By J. S. CRITCHLEY.

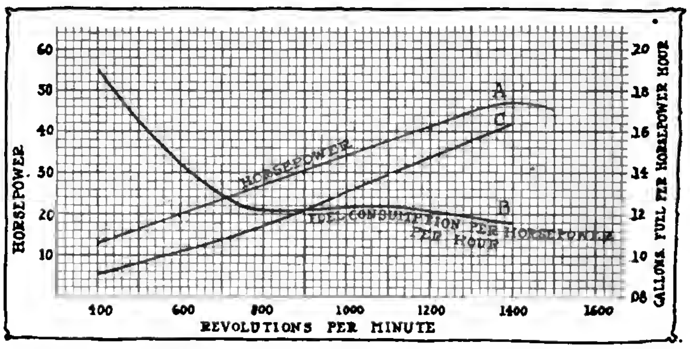
LONDON, ENG., April 1—The fuel question is much more serious in this country than it is in America. The present price of gasoline is 42 cents per gallon and there is every indication that it will go up to 48 cents.

The Society of Motor Manufacturers & Traders, the Royal Automobile Club and the Automobile Assn. have put up together a sum of $5,000 in order to further investigate the question of a gasoline substitute. The three bodies referred to have each appointed three representatives, and it is the intention of this committee to obtain and publish reliable data on the fuel problem.

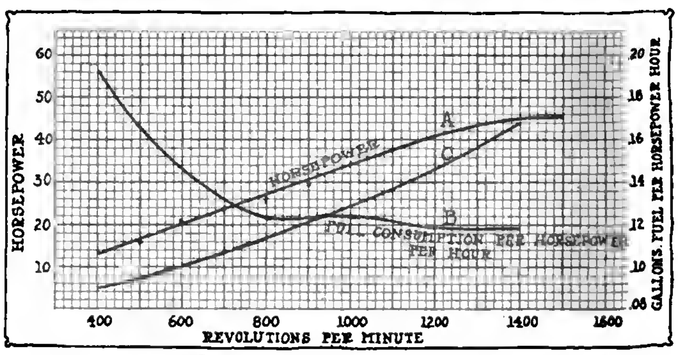
The recent taxicab strike in this city has been entirely due to the increased price of fuel. During the whole of last year the standard price for the gasoline supplied to the cab companies was 15 cents per gallon, which included 3 cents duty. All the contracts ran out on December 31, and the new contracts were fixed by the gasoline distributors at 25 cents per gallon, including the duty. The taxicab drivers were charged by the operating companies cost price, this cost price being agreed to and settled by an award drawn up by an arbitration board appointed by the Board of Trade to settle disputes between the cab owners and the drivers. The award referred to ruled that in the event of any increase in the price of gasoline over 10 per cent. of the then existing price, the increase should be paid by the drivers. In accordance with this award the cab proprietors intimated to the drivers that the future price of gasoline would be raised to the amount of the increased price. The cab drivers then refused to be bound by the award and refused to work the cabs and the whole of the cabs belonging to the Cab Owners Federation were put out of service on January 1 last.

The British Motor Cab Co., which runs about 1,000 cabs and which is composed of members of the Owners Federation, has endeavored to compromise the matter by utilizing a mixture of gasoline and paraffin, the proportion of paraffin being as one to three, and in order to overcome any difficulty in starting, a small gasoline tank was fitted with a direct connection to the induction pipe. This mixture was offered to the drivers at 21 cents per gallon. The drivers refused to accept the fuel at this price whereupon the British Motor Cab Co. offered to supply it at 16 cents per gallon.

This proposition did not meet with the approval of the other members of the federation. Some of them thereupon offered to supply gasoline at the old price of 16 cents per gallon, the result being that the cabs of the federation owners are now again in service and that gasoline is being supplied to drivers at the old price, so that with every gallon of gasoline supplied to the drivers the owners lose 8 cents. As there are some 7,000 cabs



Horsepower and fuel consumption curves on motor spirit



Horsepower and fuel consumption curves on gasoline in London run by companies, and as each cab consumes approximately 3 gallons of gasoline per day, the cost to the cab owners amounts to no less than $1,750 per day, or $525,000 per annum. As the cab companies at the existing rate of fares have only just been able to make ends meet it would appear that with this loss on the sales of gasoline many cabs will have to be put out of service.

With regard to a mixture of paraffin and gasoline, any idea of now running cabs on this mixture is, of course, at an end, as the drivers would resist using this mixture when some of the larger operating companies are supplying gasoline at 16 cents and if one company did attempt to force this mixture on the market the drivers would immediately strike.

There is nothing new in the employment of a mixture of this description, and a large number of commercial vehicles in this country were already running on a fuel of this description.

The most interesting developments in connection with fuel is the treatment of solar and shale oils by the cracking process whereby a light spirit is produced. In order to crack the oil the metal used, namely, iron for heating the oil has been subjected to a very rapid oxidation which has made the process more or less commercially valueless. Recently a new metal has been employed in place of iron which has enabled something like 50 per cent. of light spirit to be obtained from the crude oil. It is calculated that the cost of treating the raw material by this process would be 4 cents per gallon. Bearing in mind the amount of oil-bearing shale in this country it is quite possible that this new process may help to solve the difficulties in connection with the existing supply of gasoline. The only objection to the fuel produced at the present time is its very unpleasant smell.

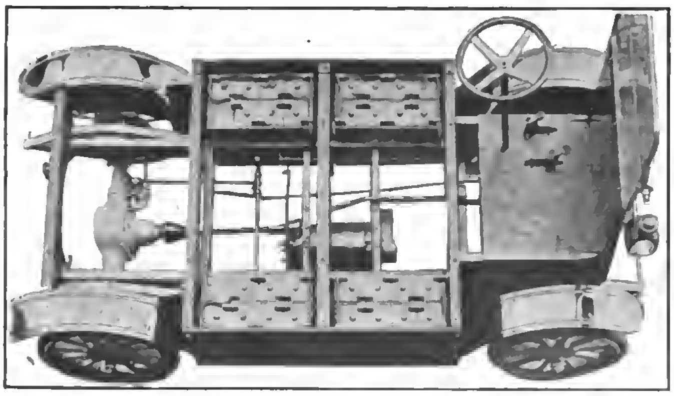
Buick To Produce Six-Cylinder Car

CHICAGO, ILL., April 14—The latest recruit to the ranks of the six-cylinder makers is the Buick Motor Car Co., which is bringing out a six of 60 horsepower, it is stated. The company expects to commence deliveries by the middle of the coming summer. Trial cars are undergoing tests at the factory and complete description of the new product will appear later. The Buick company refuses to give out any details at present.

Motocart Co. To Build Cheap Wagons

NEW YORK CITY, April 15—The formation of the Motocart Co., incorporated at Albany with a capital of $250,000, has been announced today. The officers of this company, which purposes to build a $400 light delivery wagon, constructed on a principle similar to the motorcycle, but with four wheels, are: A. R. Gormully, formerly with the United States Motor Co., president; Wallace Odell, a newcomer in the field, vice-president and treasurer; B. G. Knerr, formerly with the United States Motor Co., secretary.

The company will issue $50,000 of stock as the first move and a factory with over 30,000 square feet of floor space will be opened in Tarrytown, N. Y., in the near future. The offices of the company in this city are located at 1790 Broadway.



Grinnell electric 1,000-pound commercial vehicle chassis

Grinnell Builds Trucks

1,000-Pound Electric Vehicle Has Four Speeds

DETROIT, MICH., April 14—Although not new to the manufacture of electric vehicles, having brought out its first electric passenger car some 7 years ago, the Grinnell Electric Car Co., Detroit, is just entering the business vehicle field, having placed upon the market an electric truck of the light delivery type. Though there is an increasing demand for this class of motor vehicle for all kinds of light delivery service, a brand new field has been opened up with the coming of Uncle Sam's parcel post, and, like a number of other makers, the Grinnell concern has risen to fill the breach, so to speak.

The new Grinnell is styled an "All-Purpose" vehicle and while its rated capacity is 1,000 pounds, it is designed to carry loads 50 per cent. in excess of this amount if desired. Referring to the illustration of the chassis which is shown herewith, it will be noticed that the most distinctive feature is the method of carrying the battery. This is carried in two boxes located amidships and outside of the frame, fifteen cells being placed on a side. This construction makes for even weight distribution and gives plenty of room within the frame for the placing of the motor and drive members.

Motor Hung Under Frame

The motor is made specially for the Grinnell construction and is hung under the upper level of the side frame rails from two cross-members. The motor is not directly connected to the drive shaft, but is mounted to one side of it, connecting through reduction gearing, as shown. In the standard construction a nineteen-plate, thirty-cell W. B. T. battery furnishes the current to the motor. The jars are of the "no wash" type.

The controller is of the drum type, affording five forward speeds and reverse. These speeds are 3, 5, 8, 12 and 16 miles an hour, while the battery mileage ranges from 75 to 95 miles on a charge. Steering is by an irreversihle wheel, it being placed on the left, together with the control pedals.

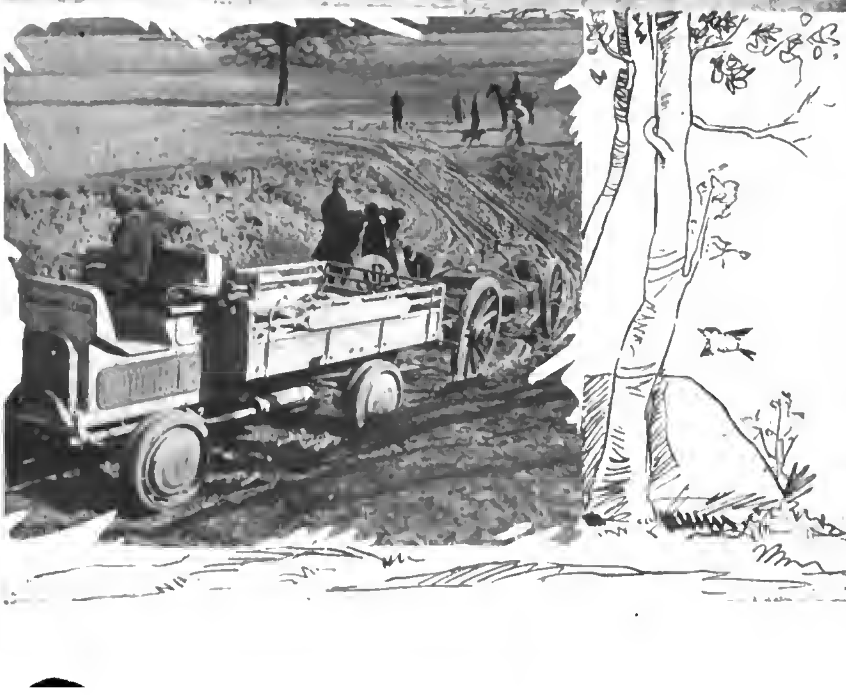
As already noted, the drive is through shaft leading directly back to the rear axle. The shaft is fitted with two universal joints, one just back of the motor and the other at the rear axle connection. Two sets of brakes are supplied, the service pair being operated by pedal, while the emergency brakes, also operated by pedal, are of the regulation internal-expanding type working on the rear hubs. These are 14 inches in diameter and 2 inches in width.

Looking at the more conventional features of the new Grinnell, it is found that the frame is of the pressed steel channel section construction, cross braced with corners reinforced with steel gusset plates. The various parts are carried on annular ball bearings. Springs all around are of the elliptic type, measuring 38 inches in length and having a width of 1 3-4 inches. The fenders are all of the standard metal type.

The wheelbase is 98 inches and the tread standard is 56 inches. As to tires, the option of either the Motz cushion or special electric truck Firestones, 34 by 4 inches, is given.

As to body constructions, the new Grinnell is supplied with either a delivery type or a platform design of any desired dimensions in proportion to the truck size. With the former, the interior dimensions are: Length, 6 feet 6 inches; width, 3 feet 9 inches; height, 4 feet 8 inches. A two-passenger seat is provided which has a comfortable "lazy-back." It is upholstered in machine buffed leather and has a 4-inch hair cushion.

The equipment includes an ampere-hour meter, speedometer, one searchlight placed in the center of the front of the dash, side and tail lights, one interior light, windshield, electric gong and tool kit.



French Army

PARIS, France, March 18.—Horses have been marked down for abolition from the artillery service of the French army. The French, who claim to have the finest artillery in the world, have come to the conclusion that better service can be obtained on the field with motor trucks than with teams of horses.

¶Higher speed and greater mobility is assured with the use of motor vehicles, the degree of reliability is higher, the number of men per gun is less, and all possibility of a battery being rendered useless by a stampede of horses is avoided.

¶Experiments have been carried out for a considerable length of time and such satisfactory results have been obtained that it has been decided to make use of motors in place of horses for all the regiments stationed in Africa. For the time being mechanical traction is being used for the heavy 220 millimeter guns, the lighter arms still being served by horses.

¶Orders have been placed with automobile manufacturers for special types of four-wheel drive tractors and some of these were put through their paces last week on the military grounds at Vincennes, to the east of Paris. The accompanying illustrations show some of the scenes at these demonstrations. The vehicles were supplied by Panhard & Levassor and Messrs. Dalachowsky & Caire.

¶The program called for an ability to haul a load of 12 tons over any kind of ground

Truck Tests

on which horses could operate. The tractors took in tow a line of gun carriages and ammunition wagons, the first carriage bearing the 220 millimeter gun, and was called upon to haul it over every kind of ground on which horses had successfully ventured.

¶The most severe tests consisted in taking the load up very steep banks of soft earth forming the background to the artillery firing ranges. The earth was either so soft or so muddy that there was very little grip for the wheels, yet all these tests were successfully accomplished.

¶In the mud-plugging competition the machines had to go through mud reaching to the hub caps.

¶Another test was the ability to get over the trunk of a big tree which had been laid across the track and pinned in position to prevent it being pushed out of the way by the wheels. This was also done successfully.

¶Finally, there was an immersion test, the Panhard tractor being taken down the muddy river bank under its own power and run into the stream until its wheels were entirely under water, the frame members just being submerged. After remaining in this position for a little while, the machine was brought out under its own power.

¶The Panhard & Levassor tractor is a six-cylinder machine with its motor under a bonnet and a platform body carried behind the driver's seat.

Non-Poppet Motors Influence Poppet Types

Easier valve stem operation secured by use of rockers and lubrication

Part III

By E. P. Batzell

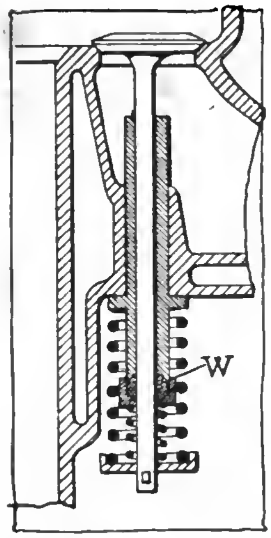


Fig. 5—Method of lubricating valve stem

IT has been mentioned that valve-lifting rockers are used partly with the idea of reducing wear in the tappet bushing by relieving it from the side thrust of the cam action. A very clever arrangement for the same purpose has been brought out recently by Panhard-Levassor, which are the only poppet-valve motors up to the present possessing a special and original construction made solely with the object of avoiding the consequences of worn tappet guides. The method is illustrated in Fig. 6. The tappet bushings have been entirely discarded, and instead, the tappets are guided at their lower ends in specially formed lifting rockers R, and at the upper ones around the ends of the valve stems. The side thrust arising from the cam action is wholly taken up by these rockers through their pivots. These pivots are formed in small circular doors D, which are fitted in pairs to the crankcase by bridge clamps. The tappets proper are quite long, which reduces their possible angularity with the straight vertical direction due to not absolutely perfect alignment and also to the swinging of their lower ends around the rocker pivots. A great angularity in this place, constantly changing with the motion of the valve could have harmful effects upon the valve stems and their guides by working them loose. There is no provision for adjustment of the clearance between the valves and the tappets, except by shimming the bottom of the upper tappet socket into which the valve stem enters. This shimming is easily done here, because by lifting the valve out of the tappet the latter can be directly picked out of the mechanism. Moreover, the method of tappet adjustment by shimming when once properly done generally retains its permanency longer than the common adjustment by screws.

The tappets and valve stems of the Panhard-Levassor motor are inclosed from outside influence, but their compartment is connected with the interior of the crankcase, whereby an adequate supply of lubrication should be assured. This is of particular value to the valve stems.

Valve stem lubrication is just as important as that of any other moving motor part. Thus far it has been grossly neglected, notwithstanding the trouble universally experienced with worn valve guides and sticky valves, both largely due to absence of lubrication. Various means of individually supplying lubricant to the valve stems, as, for instance, by greased washers under spring tension, as seen at W, Fig. 5, have been tried, but these arrangements have not proven to be satisfactory. The mentioned features of the Panhard-Levassor in having the interior of the crankcase open into the tappet and valve space offers a far better and at the same time a very simple solution of this problem, and one which promises to be a big success. Some other motors use the same idea of connected valve tappet chamber and crankcase, and it is difficult to say whether the credit for this arrangement belongs to the Panhard-Levassor or to someone else. In this country the new Garford six has a construction which, although entirely different from the Panhard-Levassor, nevertheless follows the same principle.

In the foregoing are practically covered those means which have been devised and actually employed to silence poppet valve action. They all involve increased cost and complication of the motors, in their construction as well as manufacture, a fact which thus tends to bring nearer in this respect the two motor types, giving the advantage to the non-poppet engine.

This competition between the motors extends over other lines besides that of silent valve action. The constant positive character of valve opening in almost all non-poppet valve motors is a feature that has stimulated improvement in this direction of the poppet valves. A great deal of noise is generated when the positive operation of poppet valves is interrupted, for instance, at high speed when the valve parts cease to follow each other in their motion. This occurrence bears on the strength of the valve spring and the lightness of reciprocating valve parts. Of late considerable improvement can be noticed in the introduction of lighter parts and in cam action giving the least possible change in their inertia motion. The springs are made somewhat heavier benefiting the silent motor range. The camshaft, tappets and valves are more carefully made to withstand the greater amount of work imposed upon them by the heavier lifting to be done without bad effects upon the parts.

Large Valves Affect Operation

This problem of positive valve operation, however, has been hampered somewhat by the present tendency towards larger valve lifts for the sake of gaining a larger valve opening, thereby giving more power and efficiency at high speed. There does not exist a poppet-valve motor which could rightfully claim uninterrupted positive valve operation at its highest speed. Some remarkably good high speed performances with poppet-valve motors have taken place in special instances, but failed to be repeated by the average product. Moreover, the valve gear noise of such motors in action indicates that its motion was far from positive. This field still belongs to the non-poppet valve motor practically undisputed, though it is probable that the poppet valve motion has not yet attained the limit of perfection.

Another feature in which the non-poppet valve motors remain more advanced is their ability to preserve a permanent gas-tight sealing of the valve ports when closed. On the other hand, the poppet valves need more or less frequent grinding-in to keep them tight. Of course, there are also non-poppet valve systems which leave much to be desired in the matter of valve leakage, but generally the rate of their tightness is very little influenced by the amount of service rendered by the motor.

Hardly anything has been done to improve the poppet-valve motor so as to render its valves tight for a long time. Better selection of material for the valve heads has been made, the size of the valves has been decreased to prevent their warping, double inlet and exhaust valves have been used, special self-seating valve heads have been tried, but the results have not encouraged a widespread use of these improvements.

A marked change in the improved exterior appearance of poppet-valve motors is noticeable of late, which purely and simply has been made under the influence of the non-poppet type. In the non-poppet valve motors the cleanliness and simplicity of the exterior is due to the generally complete absence of exposed valve mechanism parts, to the simplicity of the valve drive construction, the absence of caps and other small paraphernalia attached to the poppet-valve motor.

External Appearance Simplified

An important improvement brought about by the introduction of the non-poppet valve is a desirable simplification of the motor exterior. This is due in a large measure to the extensive use of valve covers for the purpose of protecting the mechanism from dust, etc., and the outsider from the noise of operation.

More motors are built now with separate cylinder heads from the main cylinder casting, which also helps materially towards a simple, clean upper structure, when the design is properly worked out. Their upper structure closely resembles that of the non-poppet valve motors, being free from valve caps and small details. The casting integrally of the main cylinder block with the upper half of the crankcase goes parallel with the separation of the cylinder heads from this block. This eliminates the unsightly flange fastening of the cylinders to the crankcase, still so common in the majority of motors. Although this last trend cannot be attributed solely to the influence of the non-poppet valve motors, nevertheless it can be traced back to that source.

In the matter of power development, endurance and efficiency the poppet-valve motors have advanced a marked extent. The details of construction affecting these items all underwent a number of improvements, so as to bring the motors close to the results obtained with the non-poppet valve type. It is difficult to distinguish present superiority of either of the motor types over the other, except in the matter of endurance, where the non-poppet valve motor succeeded to pass through more severe tests than the poppet-valve. Nevertheless it should be mentioned that in single instances with particular care the poppet-valve motor has been able to demonstrate equal ability with its competitor. The poppet-valve motor lacks in minor details of the valve mechanism, like valve springs, sticking or leaking of the valves, etc. Its power output and efficiency have been increased even in the average product by the extensively used large valves and valve lifts, the value of which has been disclosed to

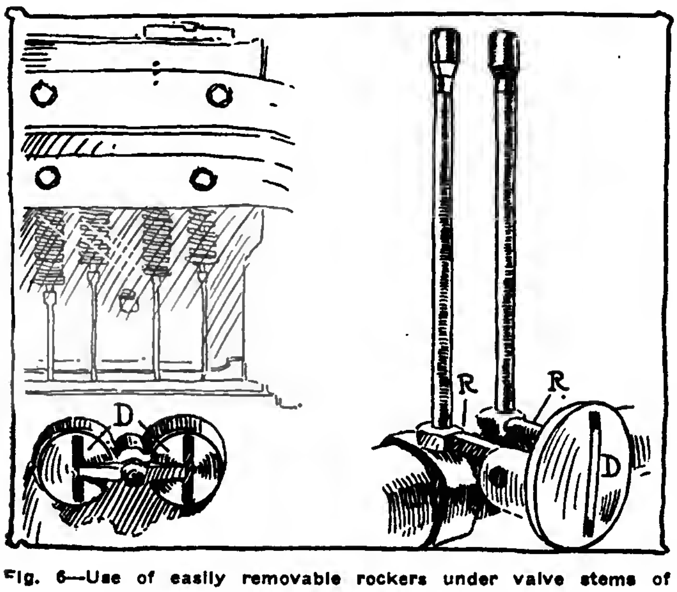

Fig. 6—Use of easily removable rockers under valve stems of Panhard-Levassor motor

the public practically simultaneously with the publication and general discussion of the early performances of the Knight motor in 1908-1909.

Concerning compression pressure the poppet-valve motor undergoes a turn at the present time, namely, towards somewhat higher pressures than that of a few years ago when the tendency was to lower it. The higher compression is essential for competition with the non-poppet valve motors, which generally are of such a construction that high pressures are permissible without causing harm to their action.

Referring to constructive simplicity, this point has not presented itself as an immediate requirement for an advantageous comparison between the two motor types. The fact that the really successful non-poppet valve motor, like the Knight, cannot boast simplicity has given encouragement to the appearance of the poppet-valve lifting mechanisms of increased complication over the common arrangement and, although the greater complication of some poppet-valve systems may be serving some good purpose in the perfection of their action, it remains undesirable, particularly in view of the continued development and improvement in the simple type of non-poppet valve motors.

This could serve as an explanation why only few motor makers have followed the tendency to obtain a somewhat better valve performance at the cost of simplicity. The majority of motor makers are trying to improve their products while retaining its simplicity. Should they fail by those means to approach the existing advantages of non-poppet valve motors, the appearance of practically successful and at the same time simple types of the latter should become the moment of a general turn in the industry and in the public towards adopting and using them.

Transverse Vibrations in Stationary Shafts

¶ From a paper read before the Society of Automobile Engineers by J. M. Thomas.

Consider the case of a long, slender stationary shaft supported at the ends by bearings which exercise no restriction on bending. Let the shaft be loaded in the center. Let the load be suddenly removed. The elastic forces are now unbalanced and transverse vibrations are set up; the frequency, or number of vibrations per second, being termed the "natural frequency" of the shaft.

If left alone, all the energy in the shaft will ultimately be dissipated in internal friction and in friction between the shaft and the air; but considering one complete vibration we may say that the total energy in the system is constant. In the mean position the energy is wholly kinetic. At the ends of the path of vibration the direction of motion is changed, the shaft is for an instant stationary and the energy is wholly potential, or strain energy. The stress in the shaft has now its greatest value, and the greater the amplitude of vibration the greater will be the stress.

Moreover, the stresses are of an alternating character and we know from the researches of Wohler and others that the stress intensity, when of the alternating kind which will produce permanent distortion, is less than under static conditions. When a periodic force acts upon the shaft forced vibrations of the same frequency as that of the force are set up, the amplitude of the vibration depending upon the relation between the frequency of the force and the natural frequency of the shaft.

As an illustration: The vibration of a headlight, or mud guard, which may frequently be observed on cars standing with the engine running at a slow speed, are forced vibrations of this type. If the frequency of the force is the same as the natural frequency, it then at each application acts in the direction of motion and increases the amplitude of vibration, or greatest deflection; the kinetic energy of the system, and what is more important the stress at the extreme points of the path of vibration. The continued action of the force under these conditions will evidently result in stresses beyond the elastic limit and the shaft will either fracture or become permanently bent.

The Engineering Digest

A Digest of Technical Information from the Engineering Journals

Some Principles in the Action of Tires and Vehicle Springs Succinctly Expressed and Limned by Celebrated German Authority—Short-Circuiting Magneto Current Against Car Thieves—Two Motor-Starting Devices, One by Maybach

RIEDLER on the Action of Springs.—Among writers on technical automobile subjects *Geheimer Regierungs Rat* Professor Dr. Riedler of the Technical Highschool at Charlottenburg, Berlin, has attracted universal attention by his books on Scientific Automobile Valuation, in one of which he published very elaborate test data relating to different modern motors and presented the conclusion that the double-sleeve valveless motor was intrinsically unfit for further development because it could not be cooled easily enough for a continued maximum development of its power without an uneconomical excess of lubrication and other heroic means. His unreserved expressions gave rise to heated polemics between him and the producers of Knight motors in all European countries and these have continued until now since last summer and have contributed to a close examination of all the intricate questions involved in the subject. Meanwhile Dr. Riedler has taken pains to show his versatility by sending interesting descriptions of an automobile trip in the Balkans and recently by writing a relatively popular treatise on automobiles for the encyclopedic work *Die Technik im Zwanzigsten Jahrhundert.* Some of the terse technical ginger which abounds in his more strictly scientific publications crops out also in this work. He does not take the motor as the factor which must first of all be understood by one who desires to study automobile requirements, but the relations between a wheeled vehicle and the actual roads. Some extracts from his presentation are given in the following.

The traction resistance of a vehicle on a good level road amounts to about 20 kilograms for each 1000 kilograms of load and on rails only to about 4 kilograms. On account of this single advantage, the entire transportation traffic, including goods and passengers, has been condensed in an unnatural manner upon a few already greatly overloaded steel rails. [Riedler underrates perhaps the importance in this respect of automatic steering, by rail, and of the relative independence of weather and seasons.]

Knowledge of automobiles can be gained only by studying the fundamental conditions for their work and not from a hodgepodge of machine-technical details which moreover, to be understood, call for specialized knowledge, while the foundations are intelligible to every person with a general scientific education.

In contrast with the railway, the automobile may be characterized as a power vehicle for the common road, but this a road which is not built for it and therefore poorly adapted for speed. Nevertheless the motor vehicle must be driven over it three times as fast as a horse-vehicle of the same class. And in all cases the load is greater in the motor vehicle, and the time for its operation is not limited by fatigue. The tripling of the speed is therefore an enormous demand to make and can be realized only by a highly developed specialization of the means.

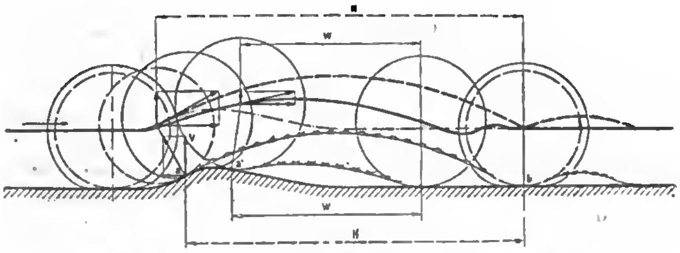

Fig. 1—Movements of running-gear with hard tires and with soft tires occurring when vehicle strikes road obstacle

[Dr. Riedler here goes on to show that the great differences in the construction of automobiles of the different classes are necessary and natural, all being due to the need of compromising with the very severe requirements; a compromise which of course must vary in its nature according to what is most important in each type of vehicle, considering its purpose in each case.]

The running, the steering and the driving are the most fundamental functions of an automobile to be looked into, and, with regard to the running, the actual condition of roads makes it a first consideration how a vehicle may be driven as fast as required over numerous obstacles without injury to it and its occupants. The object must be to reduce the force of impacts to a minimum and to control them by a successively acting spring resistance. For this purpose it is indispensable to subdivide the acting masses by means of the springs and to reduce the mass which is not spring-suspended through the use of very high-class materials. Wheels and axles, which constitute the unsuspended weight, must be made as light as possible. While the careful driver who avoids shocks and circumvents obstacles is the principal factor in lengthening the life of a car, the use of high-class materials to reduce weights and masses stands as the most important factor of progress so far accomplished in automobile construction. These materials—the alloy steels in forgings and castings—have fitted the automobile to survive normal wear and tear at the required speeds.

The springs between axle and body divide the entire vehicle bulk into an unsuspended running-gear and the larger spring-suspended mass of the body and load. The springs must take care of the equalization of impacts between these two masses. Springs cannot absorb or anul impacts but can only transform them and at once transmit them or return them in subdivided form. The impact places the spring under tension, but it cannot remain in this condition. It must give up the energy stored in it by a rapid spring-extension, and the object is to have it return this energy to the running-gear and not to the vehicle body. In a correct spring suspension the force of impacts travels therefore to and fro, from the road to the wheels and the springs and back again to the road, the wheels and axles swinging rapidly, while the wagon body remains at an almost undisturbed level. Only when the spring is prevented from at once reacting upon the axle, the spring rebound must take effect upon the wagon body, which is never desirable.

For fast driving the force of an impact must be reduced at once at the spot where it is received; that is, by a spring action at the circumference of the wheel. The time between impacts is too short to admit of any other method. Springy tires are therefore an indispensable requirement for speedy driving.

When a hard tire (see Fig. 1) is driven against an obstacle and the vertical component of the impact is greater than the axle load, the wheels and axle are thrown upward from the road. The actuated mass follows the parabolic curve H and the wheels reach the road again at *b*, whereafter there follows a series of diminishing reflex bounds, unless a fresh impact intervenes. But if an elastic tire is driven against the same obstacle it is locally compressed and operates as a first element in the cushioning of the shock. Consequently the curve W of the bound becomes shorter and the wheel returns quicker to contact with the road. Only that portion of the impact which has not been transformed in the tire reaches the vehicle springs, which return it to the running-gear.

The spring is before the beginning of the impact under its normal load, as represented under I in Fig. 2. By the impact it is compressed (II) and immediately rebounds. When the wheel again hits the road, the spring is again extended. The larger mass of the vehicle body participates only very little in this movement, because the short time of the spring action suffices only for accelerating the small mass of the running-gear but not the larger one of the body and load.

From these few kinetic principles it is possible to assign rational causes for many important experiences in driving, and by reasoning from them many arrangements of springs and tires may be recognized as correct or faulty.

For example, vehicles not provided with cushioning devices must necessarily either rise above every road obstacle or smash it; a large amount of lost work, resulting in the destruction of both the road and the vehicle. Motor vehicles without a spring suspension of some kind are therefore impossible. Hard tires on otherwise correctly spring-suspended vehicles answer only for speeds up to about 12 kilometers per hour. At highest speeds the impacts of the unsuspended running-gear become too severe, and likewise the destructive effect upon the road surface, because the cushioning at the locus of the impact is missing. [Here follows an exposition of the great and indispensable advantages of air tires for all fast driving and also of the unavoidable economical drawbacks, power losses and inconveniences in their use.]

The second element in the spring suspension is the real vehicle springs. These can operate correctly only for one given load and speed. By reason of the transformation of energy in the springs vehicles run more quietly fully loaded than partly loaded, if the springs are designed for the full load. On good roads fast driving is steadier than slow driving and heavy vehicles steadier than light ones, but on a poor and rough road this is reversed. Heavy vehicles run smoothly over cobble stones and similar surfaces when driven fast, but not otherwise, while light vehicles never run steadily over such a surface. All of this may be inferred from the time required for accelerating the large mass of the vehicle body and load. In running over a ridge or a furrow the wheels no longer hit the road level but the higher or lower surface of the obstacle, and the vehicle

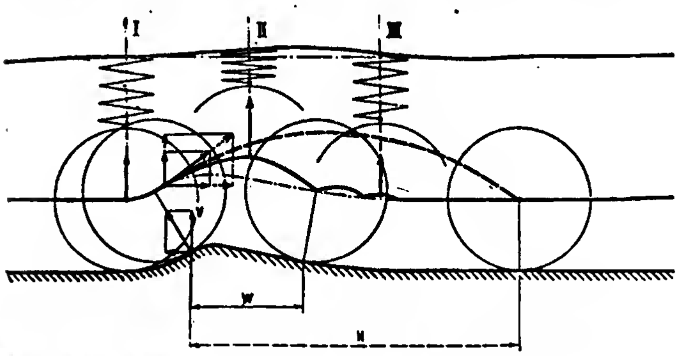

Fig. 2—Successive positions of running-gear and of vehicle springs when fast-driven vehicle strikes ridge in the road

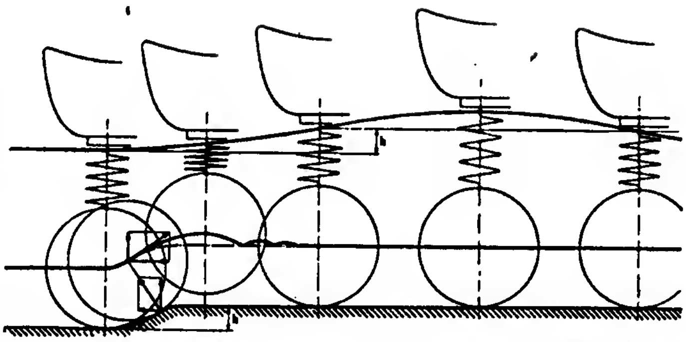

Fig. 3—Effect on vehicle springs and body when the springs are prevented from extending downwardly after a jolt

spring, after being compressed by the first impact, has no chance to rebound toward the ground but must spend its stored energy upward against the heavy vehicle body, which is thrown upward until the springs are entirely extended, as shown in Fig. 3. By this action the vehicle body is unavoidably thrown up so high that, when it comes down again by gravitation, it compresses the springs till the frame comes down hard against the axle. Such excessive oscillations of springs can only be avoided by cautious driving. Something similar occurs on undulating roads. Here, too, the springs get time to accelerate the vehicle body upwardly, and intolerable swinging movements are set up, sometimes.

A stepwise distribution of the spring action is recommendable also in the case of the vehicle springs. For this reason auxiliary springs are secured at the ends of the leaf springs. These enlarge, when properly designed, the range of the spring movement and take effect first, in advance of the slower-acting leaf springs. By this means it is possible to make a closer compromise in suiting the suspension to different loads, speeds and road conditions. Dampers on the spring action can be justified only when they guard against excessive upward movements of the vehicle body. They should therefore take effect only at the moment when such movements begin but not before. Most dampers, and particularly all the elbow-joint dampers work on just the opposite principle and are therefore valueless. Hydraulic dampers can be made to operate correctly but are too complicated [*umständlich*]. Elastic wheels with interior springs can work only like vehicle springs but can never supplant elastic tires, being unfit for absorbing an impact locally. Moreover, such springs work only in the wheel plane, while the shocks come from all sides.—From *Automobil-Rundschau*, March 15.

STARTING on the Spark.—In order to be able to start a motor on the spark, the mixture contained in the combustion chamber must be ignitable in the immediate vicinity of the spark plug terminals. Owing to the higher specific gravity of gasoline vapor as compared with air, a mixture left standing in a cylinder will stratify, the air going to the top, and only the middle strata will be in a proportion that makes it inflammable. The first condition for being able to start easily on the spark after the motor has been at rest for some time is therefore that the spark plug extends well down into the mixture. When the gases are churned by cranking, this favorable location of the plug is less urgently required. As the relative amount of vapor to air is small, as rich a mixture as possible should be left in the cylinder when the motor is stopped, so as to raise the inflammable portion to the highest possible level. The longer it is intended to stop, the richer the mixture should be, as every minute of delay makes the vapor sink to a lower level. It is the wrong method to open the gas wide when stopping the motor, as a wide-open carbureter does not give the richest mixture. Assuming that the plug is well located and that the carbureter is normal, the procedure can be varied according to the length of the intended stop. For one of five minutes it is enough to throttle down somewhat and effecting the stop by cutting off the ignition. For a stop of fifteen minutes, close the air-shutter after cutting out the ignition and open it again before the motor is stopped, but don't race the motor. If the stop is to be for two-three hours, speed the motor to about 800 revolutions and close the air-shutter. For a still longer wait, as for over night, race the motor and block the air. These rules are of course subject to variation according to the type of motor and the weather. The mixture left in the cylinders should be richer for cold than for warm weather. At zero temperature it may be impossible to start without cranking first, but one turn will generally churn up a well-prepared mixture sufficiently.

With carbureters which have no additional air inlet to be operated, the mixture can be enriched, even to excess, by speeding the motor up and then throttling down tightly and suddenly. —Henri Petit in *La Vie Automobile*, March 22 and April 5.

—

MECHANICAL Motor Starter.—While the mechanical type of motor starter may be destined to give way in course of time to one which is more intimately built into the motor system, rather than constituting an accessory mechanism, it still has advantages in the way of low cost and reliability—though only the same limited kind of reliability which the old starting-crank offers—and these appeal to a portion of the public. One such device, known as the Rofill, is now being pushed in the Belgian market and is illustrated in Fig. 5, in which the portion to the left represents the parts close to the driver and that to the right the parts located in front of the motor. The operating

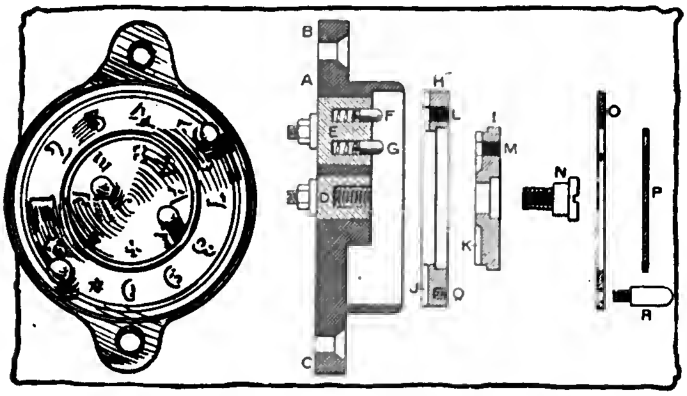

Fig. 4—Combination lock on the ignition current

lever 24, when pushed forward, actuates another lever 18 by the mesh of gear sectors 22 and 20, the motion being resisted by the spring-rod 21, which is attached to lever 18, and the cable 14 extends through or under the motor hood to the pulley 17 and, around it, to the end of arm 12 of the free-wheel device 9, being always kept taut by the tension of springs 21 and 13. The starter-shaft 2 has a bearing in front in the piece 1 usually supporting a starting-crank [the whole device being intended for application to old as well as to new vehicles] and is connected to the motor shaft 4 by a ball clutch inside of sleeve 6 which is pinned to the motorshaft. But this clutch ceases to operate when the motorshaft is turned fast, as the balls are then, by the centrifugal action, thrown into recesses formed in sleeve 6. The operation now consists in pushing the lever 24 forward, thereby extending spring 21 and detending spring 13, the latter taking the free-wheel into the position, with the arm 12 downward, in which the cable acts most favorably, and thereafter pulling sharply back upon lever 24 with the assistance of spring 21. If the motor should backfire, the shock will be absorbed for the greatest part in spring 21, the strength of which is calculated for this eventuality. A side view of the interior of the free-wheel, in which 10 is the ratchet and 11 the pawls, is given in one corner of the illustration.—From *Automobile-Aviation*, March 20.

—

COMBINATION Lock on the Ignition.—The device shown in Fig. 4 serves to short-circuit the magneto, as a protection against automobile thieves when the owner has left his vehicle at the curb, and it also affords some protection against other unauthorized use of a car. The dial is composed of two concentric disks O and P, the outer one bearing 12 numerals and the inner one 8 letters. Both can be turned by means of small knobs, like R, which also secure them to the corresponding interior disks H and I which are mounted together on the shoulder of the assembling-screw N. The body A is made of ivorine, an insulating hard-rubber substance, and the metallic plug D is wired into the primary magneto current, a terminal post being provided for the wire attachment, while the other metallic plug, E, is grounded. Unless the spring-knobs F and G are opposite to and in contact with the fiber plugs L and M rather than with the bodies of the disks H and I, the magneto is thus short-circuited. To change the combination the dial-disks O and P are brought in different relations to disks H and I—a new numeral opposite to plug L and a new letter opposite to plug M. This, it is said, may be done by loosening the knobs R and re-securing them in new positions. [There must therefore be a series of threaded holes, similar to the one marked Q in the drawing, in both the interior rings.]—From *Omnia*, March 8.

—

STARTER for Airship Motor.—In connection with a six-cylinder motor designed by Karl Maybach for a new German air-cruiser, a patented starting device has been installed, and it is reported to have worked perfectly at trials of the airship. By means of a single lever all the valves of the motor are raised at the same time, and by the same lever action, a rotary valve is operated which closes the exhaust exit from the muffler and opens instead a conduit leading to a vacuum pump. A few pumping strokes send rich explosive mixture from the two carbureters to the cylinders, whereafter the motor valves are closed again and the exhaust is opened. The motor is then started by actuating a Bosch magneto-booster.—From *Allgemeine Automobil-Zeitung*, No. 12.

—

Properties of Benzol.—Gasoline contains 85 per cent. carbon, 15 per cent. hydrogen and boils at 70 deg. centigrade, while benzol contains 92 per cent. carbon, 8 per cent. hydrogen and boils at 80 degrees. As the hydrogen content makes for rapid flame propagation and increased power but also for easy ignition, the compression used with gasoline cannot be as great as that which is practicable and desirable with benzol, and as in turn the higher compression makes easier ignition and increased power, the question of the relative efficiency of the two fuels depends largely upon the construction details of the motor—the shape of the combustion chamber, the nature of the ignition and the design or adjustment of the carbureter. As, however, the larger carbon and smaller hydrogen content of the benzol militates against much variation of the proportions of the explosive mixture, while practically all modern carbureters do change these proportions with the speed, the flexibility of the motor cannot be so great with benzol, if by flexibility is understood, as usual, that increase of torque at lowered motor speed which renders it possible to avoid gear-changing to a considerable extent.—From *Allgemeine Automobil-Zeitung*, March 21.

The Engineers' Forum

Horsepower as Basis For Tax Discussed

Part III

Automobile Engineers Express Dissatisfaction with the Principle of Levying Fees According to Horsepower of Car

Cunningham Satisfied with S. A. E. Power Rating
Apperson Says Rating Should Be Lowered, if Anything
R. P. Henderson Is Satisfied with S. A. E. Rating
Creighton Considers S. A. E. Formula Accurate

SO many letters have been received by THE AUTOMOBILE from prominent automobile engineers, expressing their opinions as to the ideas embodied in the article entitled "Cars Taxed on Unused Horsepower," which appeared in THE AUTOMOBILE for March 27, that the Engineers' Forum for next week, and perhaps for the week following, will be devoted to the discussion of this timely subject. Some of these letters are given herewith:

Base Tax on Cylinder Development—Cunningham

ROCHESTER, N. Y.—Editor THE AUTOMOBILE:—The tendency on the part of state legislatures to provide new horsepower ratings seems to me to be entirely called for. The present S. A. E. rating certainly is fair enough. It represents, as a matter of fact, a great deal higher horsepower than the average developed by automobiles on the road. A car whose motor rates 30 S. A. E. does not develop more than 15, as an average, in ordinary touring, and considerably less than this for ordinary city driving. If automobile taxation is to be based upon a horsepower rating, the S. A. E. formula should be in every way adequate. If any change is made it should be to base taxation on actual cylinder development.—JAMES CUNNINGHAM, James Cunningham, Son & Co.

Rating Should Not Be Increased—Apperson

KOKOMO, IND.—Editor THE AUTOMOBILE:—I am glad to have an opportunity to express myself on the movement which seems to be on foot among many of the secretaries of the different states to force a change in the horsepower rating of automobile motors. I have been watching with interest the reports that have come through the press of the agitation on this subject which is being stirred up in different localities as a result, undoubtedly, of the publicity which is being given just now by many manufacturers to long-stroke motors.

Realizing that such action would be in direct opposition to the service which the majority of public officials seek to give the people—that is, it would be inimical to the interests of the motoring public at large—we are anxious to set forth what our experience in getting the horsepower out of gasoline motors has been.

At the start, when the A. L. A. M. horsepower rating was first promulgated, I was of the opinion that it was too high. But as we continued to apply it to engines as we built them and tested them out here we found it was a very accurate formula for the determination of the horsepower of a motor on the block. It does not give the maximum horsepower our engine will develop under the block test but as an indicator of the power which will be obtained by the driver on the road it is in our estimation, far too high. In making a statement of this kind I mean that the average user of a car is not sufficiently educated mechanically to keep the mechanism of the motor in such condition as to enable it to develop 100 per cent. efficiency at all times. In my opinion, the majority of cars in the hands of users, owing to changes in adjustments which are made by them, do not develop anywhere near the horsepower shown by the block test when they are tested before shipment. This loss, therefore, would bring the horsepower down below that given the engine by the standard A. L. A. M. formula. So by increasing the rating and thus boosting the license tax to the user, you would be asking automobilists to pay for something which they do not get.

It is my opinion that the formula should either be left as it is or revised downward if it is to be changed at all.—EDGAR APPERSON, Apperson Bros. Automobile Co.

Change Would Bring Confusion—R. P. Henderson

INDIANAPOLIS, IND.—Editor THE AUTOMOBILE:—I am inclined to believe that in designing laws to provide a graduated tax or license for all automobiles, basing on horsepower, influence should be brought upon the law-making bodies to adhere to either the A. L. A. M. or the S. A. E. formula.

It would lead to confusion of the worst kind should the states attempt to work out a new horsepower rating other than the above, which are recognized as standard throughout the country.

I recently met with a committee representing the Hoosier Motor Club at our state legislature at which time the above views were expressed and seemed to represent the general feeling of all present.—R. P. HENDERSON, Henderson Motor Car Co.

Makers Should Not Over-rate Cars—Creighton

PERU, IND.—Editor THE AUTOMOBILE:—My opinion is that while the block test of a motor generally shows higher horsepower than the S. A. E. rating, if the loss in power from motor to rear wheels is taken into consideration the actual horsepower of the car will about correspond to the S. A. E. rating. Some motor builders claim an excess rating which may be obtained by a few seconds' pull on a dynamometer and is not to be compared to a constant pull of several hours' duration, such as a car would be subjected to in long trips under unfavorable road conditions.

In regard to the length of stroke altering horsepower rating, as it is being discussed so much at the present time, I would not care to enter into discussion regarding it. If automobile manufacturers in general will not over-rate their cars to more than the actual block test of the motor, I think there would be no criticism to the S. A. E. rating of the different secretaries of the states.—P. L. CREIGHTON, Great Western Automobile Co.

Design for Runabout Body with Doors

Ventilation of Interior Secured by Oppositely Hinged Doors—Rear Emergency Seat and Luggage Compartment Incorporated

A VERY seasonable type of body design for consideration at this time of the year is the runabout. With the beginning of warm weather comes the call for outdoor exercises and the open air and for purposes of business or pleasure there is no handier type of vehicle for the owner who drives his own car.

The runabout has the advantage over other body types, in being very light, and therefore can be adapted to any chassis. In common with other body types it has adopted the foredoor and it is a body with this door included in the design that is illustrated in the accompanying scale drawings. The particular chassis shown, on which the body is mounted, is the Moon, model 39, having 116-inch wheelbase, 34 by 4-inch tires, left drive and center control and four cylinders, 4 by 5.75 inches.

Fig. 1 shows the side elevation completely worked out in detail. The primary idea of the design is to give comfort and therefore no attempt is made to include features of the racy type. The steering wheel retains the standard angle of the stock chassis, and as it is well back, plenty of leg room can be allowed between the front of the seat and the dash. The left hand drive also adds to the ease of entrance from the right side.

As shown, the body is roomy and comfortable and affords protection in any kind of weather. It has been developed in a thoroughly practical manner to suit the chassis on which it is mounted, and the lines of the design are harmonious and in conformity with general standard practice.

Taking up the design in detail, the accommodation is for two but there is an addition or folding seat at the rear which can be used for a mechanician when touring or as an emergency seat for a third passenger.

The body is made with rounded corners at the rear, and the sides and back are high enough to afford protection and comfortable rest support. The windshield is capable of being turned to any angle desired and in addition to having the storm visor, the shield in its entirety can be folded down over the cowl and be out of the way, in which latter position it also offers the minimum wind resistance.

The body at the dash is made rounded, both from the sides as shown in Fig. 3 and from the top, Fig. 1. The cowl is carried well back and is elevated slightly. A straight line effect is preserved as much as possible, curves only being used where absolutely necessary. The distance from the dash to the door is 10.5 inches and the doors are 19.5 inches wide.

These doors are hinged at opposite sides, that is, the left door is hinged at the rear and the right door is hinged at the front. In warm weather they are held partly open, and the theory is that the pressure of air entering through the door that opens toward the front, will expel the air through the opening on the opposite side and in the opposite direction. This current will assist in cooling the compartment.

Folding Seat Fitted at Rear

The emergency seat is shown by dotted lines in Figs. 1 and 4, the dimensions being included. It is supported at the back by a folding leg that engages in a socket at the rear of the luggage compartment. This socket, although a permanent fixture, is not unsightly on account of its inconspicuous position at the back of the tires. When this folding leg is engaged in the socket, the top ends press firmly against the side supports of the folding lazyback and prevent this latter from swinging with the motion of the car, a condition of things which would not add to the comfort of the rear passenger. When folded down this seat does not extend very far into the compartment, and if it is desired to carry luggage the space occupied by the seat will hardly be noticed. Luggage space is provided at all times at the rear of the seat even when this latter is in commission. The gasoline tank is located under the driving seat and the space allotted will accommodate a tank of approximately 20-gallon capacity.

The top is made of dark colored mohair supported by three bows which are rounded. The front bow revolves on a center below itself as indicated by the arrow, Fig. 1, when the top is being folded down. The arch of the roof or dip at the front and back from a horizontal is greater than usual. This is done to make the front and rear bows short, so that when the top is folded down it will not interfere with the occupant of the rear seat. This folded down position is indicated by dotted lines on Fig. 1. The top is made very light and the front end is secured by straps that fasten to the front fenders. Side curtains are provided for stormy weather and by referring to the rear view in Fig. 3, it will be noted that the celluloid light in the back curtain is larger than is customary practice and is strengthened by running bars of the top material across both horizontally and vertically. In the plan view the top is removed to better illustrate the interior.

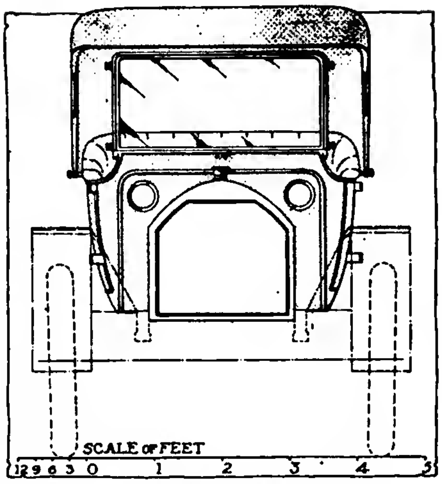

Fig. 2—Front view of runabout with hood in raised position

The construction of this body is aluminum sheet of 16-gauge for the panels throughout, except the perpendicular side and rear panels of the luggage compartment, which are made of steel and joined to the deck sheet under the moulding that runs along the side and back near the top edge. Very few mouldings show on this body, as the main body panels are butted to the panels of the luggage compartment at the rear and on the lower line these panels are turned under and fastened to the body framing. At the front the panels are fastened under a metal moulding that is fastened to the wood dash.

No difficulty is experienced now in shaping up aluminum sheets to the shape required for this design, and a body of this description can be constructed by any bodybuilder having only a simple organization.

Parts To Be Specially Made

Most of the parts of this design will have to be specially made, as for instance the ironing of the emergency seat and the ironing of the front windshield. The fixtures for the hinges for this latter can be purchased, also the curved pattern hinges and the locks for the doors. These latter should have inside or concealed handles. The tubular bow sockets for the top can also be purchased.

The cover of the luggage compartment is hinged with a strong piano hinge at the rear and at the front, each corner is locked and the keyhole covered with a flap. This cover is made watertight by being provided with a flanged edge which fits over a raised coping on the deck.

The standard equipment is used throughout except the rear fenders, which are made to suit the lines of the design. The front fenders are standard as well as the front and dash lamps. Both of these are electric and the dash lamps are set in flush. The tail lamp and tire carriers are standard equipment and remain in their regulation place.

A suitable color combination for this design would be to retain the Bavarian blue used on the stock touring car, for the chassis throughout, with white striping and black fenders. For the body a rich, very dark blue with white striping and white mouldings. All metal parts including lamps either black or nickel and all exposed wood finish to be mahogany.

The trimming material to be black, soft luster, hand buffed leather and the trimming to be luxuriously thick. The pleats to be held in place by small straps in place of buttons, in the same manner as adopted on the standard Moon cars. The seat cushion can be 7 inches deep and still leave 9 inches under the steering wheel rim to the top of the cushion, and the width and length of the body are sufficient to permit of plenty of thickness to the side and back trimming. The covering of the floor boards and the runboard to be cork linoleum trimmed with aluminum.

Quick Painting of Metal Bodies

For cars that are required to be painted and finished in the shortest possible time the following system of applying the coats is recommended: First see that the metal is perfectly clean and free from foreign substances. Then apply an approved make of metal primer, which bake for 3 hours at 200 degrees. In the afternoon of the same day apply a coat of knifing surfacer, thinning the material with turpentine to a brushing consistency, and apply with a brush, working the material out very thin and fine. Oven bake for 3 hours at 225 degrees.

The next morning sandpaper thoroughly and apply second coat surfacer and bake the same as first coat. Follow same day with third coat surfacer baking as before. Sandpaper each coat of surfacer. The third day apply sealer coat, a thin material which seals the surface against subsequent sinking in. Bake 3 hours at 190 degrees, then apply coat of japan color.

The following morning apply coat of color varnish which bake for 6 hours at 170 degrees. Next morning rub lightly with water and pulverized pumice stone. Clean up, stripe, and later in the day flow on a quick finishing varnish, which bake for 6 hours at 140 degrees. Next morning the car is ready for service having taken 6 days to paint. The above method produces a satisfactory though not strictly high-grade finish.—From *The Carriage Monthly* for April.

Stearns Model Service and Inspection

Inspectors Look Over 400 Cars in New York Territory Once in 3 Weeks—Service Plant System

SERVICE, comprising prompt repair of automobiles requiring it, has become an almost general feature with most automobile companies of any standing, especially in the large cities. New York City, for instance, contains fully two dozen service stations where cars are adjusted and repaired in the shortest possible time and at the least possible cost to their owners. This service, which signifies the gradual extinction of the old-fashioned city repair man, has in the case of many commercial automobiles been supplemented by an inspection service. Various schemes of periodical truck inspection and making what immediate repairs and adjustments are necessary, together with a letter to the truck owner, have been described repeatedly in THE AUTOMOBILE. Now, inspection service is being introduced in the passenger-car field as well. The F. B. Stearns Co.'s New York branch is the first to install such system in New York.

The scheme of the Stearns company, which has about 400 cars operating in New York City, is as follows. Three inspectors attempt to see every car once in a fortnight, although often 3 weeks pass between two inspections. It is thought best not to molest the car owners with the inspection service, even though the latter is in force to benefit them; but the inspectors try to get into and to remain in communication with the chauffeurs driving the cars. From them they get information as to how the cars are used ordinarily. For instance, a car may take the children to school in the morning, the master of the house to his place of business, miladi on her shopping trip, etc. On the basis of this information the inspectors can form their ideas of what the cars require, in what respects they must be looked over, what instruction should advantageously be given to the chauffeurs, etc. When an inspector finds that it is time to look over a certain car, he runs up to the garage where the car is stationed at the time of day he knows it is there. He looks over the mechanism, sees whether all parts are properly lubricated and adjusted, then asks the chauffeur to drive him for a few blocks so as to develop what trouble escaped the garage inspection. He makes notes as to the status and requirements of the car and for the purpose of a report fills out the form, Fig. 3, which is typewritten in blank on a white sheet of office paper, 8.5 by 11 inches. He also has the chauffeur sign the form, to witness that the inspection has been made. Then the inspector repairs to the service department and dictates a letter to the owner, calling his attention to the state of his car, etc.

It stands to reason that an inspection conscientiously carried out every 3 weeks must nip in the bud every growing misadjustment and other trouble, and consequently reduce repair and maintenance cost to a minimum.

The repair service of the Stearns company is likewise of interest, as it utilizes a record system which practically excludes every oversight and mistake, as long as its conditions are closely followed. This system comprises eight blanks, several of which are filled out in more than one copy.

The following forms are used by the Stearns company:

1. Job order.*
2. Job-supplement order.*
3. Working tag.
4. Operation time card.
5. Material requisition.*
6. Purchasing order.*
7. Return-goods order.*
8. Daily time report.
9. Job cost record.

The forms marked with the asterisk (*) are made out in more than one copy.

1. Job Order.—This form, Fig. 1, is made out when a car is brought into the service department to be adjusted, looked over or repaired—in short, whenever it enters the department. The form is 14.25 by 9 inches and all blanks are kept in the main office of the superintendent. In making out the order, all spaces on the blank are filled out, and, by means of carbon

Fig. 1—Job order used in Stearns service department. Fig. 2—Accountant's cost record form

paper, four copies in all are made out, all of which bear the same serial number printed on the form. The jobs are numbered consecutively, but independently. Of course, every number of the blanks must be accounted for. As to the duplicates, one copy goes to the shop, the second to the stockroom, the third remains in the office and the fourth goes to the accountant. The last copy is 14.25 by 18 inches deep, for reasons explained below. All the work to be done having been entered on the order signed by the owner authorizing the repair operations, the order copies are distributed and the work is started, the various departments receiving the car in turn.

2. **Job Supplement Order.**—This form, Fig. 9, which is 5 by 9 inches, is used when an owner orders repair work after his car has already been delivered to the shop. As its name implies, this order supplements the job order, Fig. 1, and it, too, is made out with an original and three duplicates, going to office, shop, stockroom and accountant respectively. All these forms are of different colors—white, heliotrope, pink and yellow. In making out this order the number of the original job to which this form is supplementary and the owner's name and the number of his car are entered on the form. The owner or his agent signs the order (all four copies) and action is then taken as quickly as possible to carry out the supplementary order.

3. **Working Tag.**—When the car is sent into the shop a tag is attached to it. Fig. 5 shows this form in blank. It is printed black on white, thin cardboard of 4 by 7 inches, and on it the owner's name, the car and job number, as well as the date, are entered. On the reverse side there are spaces for enumerating the repair items to be carried out and spaces for checking the items when the work has been done. This tag is attached by means of thin wire to the steering wheel of the car and is not taken off until the repair job is finished and the car is ready to be re-delivered to its owner. As Fig. 5 shows, the tag is numbered; all tags form a series and each of them must be accounted for.

4. **Operation Time Card.**—In the shop it is of course necessary to keep track of the time spent by the various men on the various jobs in order to make correct charging possible. For this purpose the operation time card, Fig. 4 is used. This is a form 3.375 by 7 inches, printed black on red cardboard. The front side is seen in Fig. 4; it affords space for entering the name and number of the workman, the job number and the number of the account, as well as the car number and the name of the car owner. The rest of the card is designed much in the same fashion as the card for time clocks, so that the form, Fig. 4, may be used for recording time by means of such a clock. If a man spends a whole day and overtime on a job, he must stamp in and out, three times each, during 1 day. The first line is used on the first or sixteenth of the month, the second line on the second or seventeenth, and so on. There is a last column for totaling the time spent working every day, and the total time spent on one repair operation is noted at the foot of the blank, together with the wage rate of the man and the total wages earned by doing the job, or rather, the working operation. For, as indicated by the reverse side of the blank—not shown here—the card is used for only one operation or item of a repair job. On the reverse side the number and name of the employee are entered and the specific operation on which he is busy is named. Also, if the man requires material from the stockroom for doing his work, the number of the requisition used for this purpose is written on the card. Of course, this card is not the only means for checking the time of a man in the shop, but it merely serves as a time-distribution record and the total of a man's weekly operation card must check against his ordinary weekly clock card.

Fig. 4—Working operation card filled out by each workman when carrying out a repair operation on a car. The time spent on only a single operation is accounted for on this card

5. **Material Requisition.**—When a man working on a car requires a part for the repair work he goes to his foreman with his operation time card, and the foreman on the reverse side puts down the name and quantity of the part required. The man then goes to the stockroom clerk or foreman, and the latter makes out the requisition, Fig. 7, which is 7.25 by 4.25 inches. The original of this form remains in the stockroom, a copy is forwarded to the superintendent's office and a triplicate to the accountant. The requisition gives the quantity and nature of the material drawn from stock and details about the job for which it is required. The accountant later on enters the list and net price on the requisition and this information is transferred to the superintendent's copy of the requisition for future reference.

6. **Purchasing Order.**—When materials are required to replenish the stock of the service department or to supply parts, etc., not on hand in the stockroom but needed to carry out a repair, the purchasing department is notified by the stockroom foreman and thereupon a purchasing order, Fig. 6, is filled out. This order is a blank, 10.5 by 7.25 inches, made out with two duplicates in different colors. The purchasing order, when being filled out, is addressed to the dealer who is to furnish the material, and a note is made of the stockroom requisition number, to which the purchasing order has reference. The white original of the order is sent to the dealer, the blue duplicate to the accounting department and the yellow triplicate remains in the purchasing department for reference. Space is provided for exactly stating the nature and quantity of the material required, and the terms of delivery and payment are printed on the form. When the material is received the shipping department—which also acts as receiving department—checks the goods against the invoice accompanying them, and then forwards the latter to the purchasing department for checking against the purchasing order. This being done, and everything being straight, the invoice is forwarded to the accounting department for repeated checking and settlement.

7. **Return-Goods Order.**—It may hap- that specific repair jobs are sent out of the service departments into special shops. This applies to windshields and other parts, in the cases of which the repairing facilities of the service department shops are inadequate to make a good or economical job. If, say, one pane of a windshield is to be replaced and the shield is sent out, a purchase order is made out for a pane and a return-goods order, which is attached to the shield, is sent with it. The job having been completed, the goods are sent back to the Stearns place, and the instructions given on the form, Fig. 8, are checked against the invoice to see whether they have been properly carried out. After this has been done, purchase, return-goods order and invoice are turned over to the accounting department like the data referring to an ordinary purchase.

8. **Daily Time Report.**—The Stearns company uses a specially-designed blank,

Tag No 1 997

Fig. 5—Working tag used in the Stearns service department for outlining the work to be done on a car which is sent into the shop. This tag is securely attached to the automobile as soon as it is received by the superintendent of the department. The tag is fixed to the steering wheel and must not be removed therefrom before all repairs have been finished and the car has left the shop ready to be turned over to its owner, whose name appears on the tag. The reverse side of the tag enumerates the various items of repair work to be carried out and there are spaces for checking these items, so as to prevent the shop men from overlooking necessary work which was ordered by the owner when bringing the car into the service department. This record tag positively prevents errors on the part of the shop workers and also loss of time which would arise if the men would have to go to the foreman or his assistant for instruction as work is progressing on a job

Fig. 7—Stockroom requisition used at the service department

Fig. 10, to check its total labor expense against the distribution among the employees. This form is 4 by 13 inches, printed black on white paper and is filled out on a typewriter. On the first line the date of the day is entered and the remainder of the page is divided into two sections, the first having five columns and the second two. The first section is used for recording the time spent by the various shop workers on the various jobs, and the second for giving the total time each man worked on that day. In the first section each job which is worked upon in the shop is taken up. The job number, the car owner's name, number of the employees who worked on the job during the day and the time spent on the job by each of them are given, as is the total number of hours spent in the shop on that particular job until the evening of the day for which the report is made out. In the same way, paint labor, general work around the building (non-productive, so called) and what small productive work is occasionally done, are recorded. The total time spent by workers on that day is thus found—being compiled from the operation cards. In the second section of the report the total hours spent in the department by every man are copied from the weekly time-clock cards and the total must be equal to that of the time-disribution column. It is stated that as a rule, the total time given by the clock cards and that accounted for by operation cards coincide within a margin of 2 per cent.

9. **Job-Cost Record.**—This form, Fig. 2, is printed on the reverse side of the accountant's copy of Fig. 1, on a sheet 18 inches deep, to afford plenty of space for all labor and material expense items on a job. As Fig. 2 indicates, the cost-record side of the accountant's job order copy is so ruled as to permit of entering the following points of information: Requisition number, number of parts or quantity of material required and the pattern number; then follows the name of the part and the unit list price, the total list and net prices, charges for outside work and the price of materials used in the paint shop. Under distribution the accountant makes a note of whether the paint job—if such has been done—is to be charged at a flat rate arranged for when the car is taken to the service department, or whether the various materials are itemized on the bill. The date on which the parts have been replaced or the repair made, together with the time spent on the job; the total cost of repair and paint labor to the company and the special accounts—if charges are made to such—are also noted. There are some cases, when work is done without charge to the customer, and the work must then be charged to one of the many accounts provided for such purpose: guarantee, repair, etc. Miscellaneous is a column that is hardly ever used, as the others cover almost all possibilities of charges. The amounts billed are also given.

Fig. 8—Return-goods order used when outside repairs are made

As mentioned before, the weekly clock card must very closely coincide with the daily time reports, and the workmen, knowing this, make very exact records in ringing their working times on the operation cards. Of course, the various men are paid at different rates and on different bases, but the time spent on service jobs is charged to customers at a fixed rate.

Practically the only man specially required by this system is the time-keeper who compares weekly and operation time records and makes out the daily reports. The men of course know that exact records work out to mutual advantage and that they are getting a square deal when they exactly account for their time spent in the department.

It stands to reason that the use of such a blank as the daily time report greatly facilitates the economical conduction of the service department. The reason is that while parts and materials are bought at a certain price and sold at a certain price—so that there is almost no chance for loss here and a possibility of a small gain which may serve to pay part of the service expense—it is only by full utilization of the time of all the laborers employed that it is possible to conduct a service department without loss or even with a small profit. It is by this economy that a company is enabled to give its customers the best possible service for a minimum of expense to them. It is due to this consideration that service systems are becoming more and more common with the branches of most large automobile manufacturers.

Coming back to the original subject of passenger car inspection and the single example here quoted, it is important to recognize than an inspection scheme of this nature benefits the car maker fully as much as the user. The principal advantage, of course, goes to the latter, inasmuch as the careful inspections, combined with report letters to the owner, help the latter in reducing the repair expense of his car. Incidentally, such work as carbureter adjustments made by the inspectors go to minimize the fuel bill, so that an all-around profit arises to the owner. But here the maker's advantage comes in. The owner who perhaps had one or two cars before that, the makers of which give inspection service, sees that this institution makes for cheaper car maintenance and consequently is most apt to buy his next car from the same company; and what is more, when advising friends and other prospective purchasers, will influence them, and in many cases finally, to buy the car with which the best service goes. As a matter of fact, passenger-car inspection at this state of the game has distinct advertising value to the maker introducing it. Its cost is comparatively negligible and the advantage immense. This is one of the principal arguments in favor of passenger-car inspection, if not the very largest, and on its strength it is safe to predict that 2 years hence the car inspection will be as common as the service building itself.

How To Adjust the Winton-Stromberg Carbureter—Correct Steering —Explanation of the Pressure System of Fuel Feed—Schebler Curves— The Way to Quebec—Adjustment of the Overland Planetary Gear

Maximum Weight Carried by Car

EDITOR THE AUTOMOBILE:—Will you kindly let me know the maximum weight that can safely be carried in a model T Ford car?

Easton, Pa. WILLIAM S.

—In designing this car. the Ford company allowed for a weight of 750 pounds. The car could probably carry double this weight if the owner wanted to take risks of wearing out the tires and drive parts at an exceedingly rapid rate. For ordinary running about the weight of 750 pounds should not be exceeded. The average weight of a person is generally taken in engineering practice to be 150 pounds. Thus in the five-passenger car, five passengers would give a weight of 750 pounds. As 150 pounds is above the average weight of a human being, and since the car is often run with from one to four passengers, the excess allowance readily takes in the baggage that may be carried. Should five heavy men get into the car, however, the total weight would not impose any noticeable strain because the car is designed with sufficient margin of safety to take care of any loads of this nature which may occur from time to time. The maximum weight that could be carried before the frames or any other members of the car suffered permanent distortion is impossible to state and doubtless would even vary with different Ford T cars, since the elastic limits of two pieces of metal are never the same.

Theory of Correct Steering

Editor THE AUTOMOBILE:—What is the correct method of designing a steering gear? Do the front wheels swing about in concentric circles or not? What is the relation of the movement of the rear wheels in relation to the front wheels in turning a curve?

Detroit, Mich. DRAFTSMAN.

—This is well explained in an English book *"Petrol Motors and Motor Cars,"* by T. H. White, which states that the steering gear of the present-day automobile is identical with that patented by Ackerman in the eighteenth century for use on horse-drawn vehicles. Unfortunately, the original intentions of the inventor are too often overlooked by motor car designers, with the result that undue wear is imposed on the steering wheel tires as well as strain to the wheels themselves. When correctly designed and constructed, the Ackerman gear allows all four wheels of the car to move with a purely rolling motion without any tendency to a lateral, or scraping movement. With incorrectly-designed gear, the relative angles of the steering-wheels will not correspond to the direction in which the car is traveling (unless this be in a straight line), consequently, one, or perhaps both, steering-wheels will scrape the road more or less to the detriment of the tires. A further evil is that the sensitiveness of the steering is impaired and side-slip encouraged or even initiated.

To illustrate the difference between correctly and incorrectly designed gear, the diagrams, Figs. 1 and 2, are presented These are purposely exaggerated to make the principle more clear. In Fig. 1 we have the steering arms, A and B, at right angles to the axles upon which the wheels revolve. So long as the car is traveling in a straight line, the front and back wheels will be parallel, and all four will have a rolling motion only. Let us see what happens when it is required to turn a corner. The dotted lines in Fig. 1 show the new positions of the steering-wheels and gear. The arms, A and B, will remain parallel, being coupled together by a rigid connecting link, hence each of the steering wheels is deflected through the same number of degrees. We will assume the vehicle to be traveling along a curved path struck from the center O. If the axes of the steering wheels are produced to intersect the axis of the driving wheels (also produced), as in Fig. 2, we shall obtain the points O and X. To have a purely rolling motion the steering wheels should run along curves struck from O and X as centers. It is obvious that this is not possible, and probably the outer wheel will follow the arc RR struck from center O, whereas its natural path would be along SS, struck from X. The difference between these two paths will be made up by the type sliding laterally on the road.

From this it will be seen that the outer wheel should be deflected through a smaller angle than the inner one, and this is accomplished by setting the steering arms inwards, as A and B, Fig. 1. We now find that the produced axes of the steering

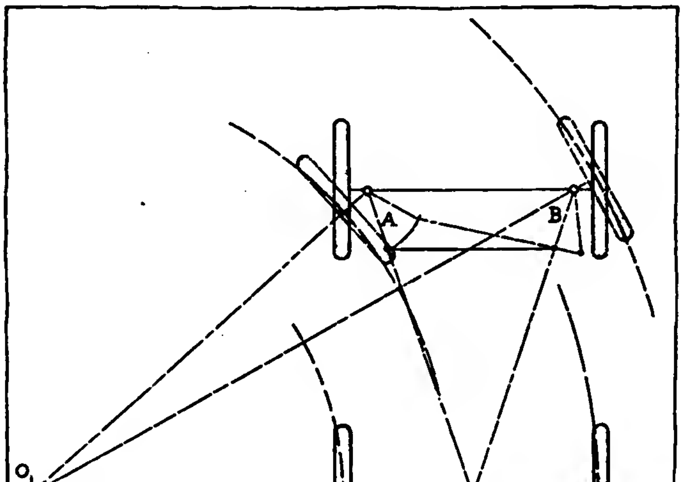

Fig. 1—Showing the concentric circles about which the four wheels of a car swing with a correctly-designed steering gear

wheels both intersect the produced axis of the back axle at the same point O, hence the wheels of the car will have a purely rolling motion.

It is to be regretted that there is no formula for obtaining the correct angle for the steering-arms; a process of trial and error is the only solution. The angle will vary with the distance between the front and back axles, and with the distance from center to center of the steering pivots. It is also slightly affected by the distance from centers of steering wheels to the centers of their respective pivots. The gear cannot be made correct for all inclinations of the steering wheels, but if made right for the extreme inclination it will be sufficiently correct for all practical purposes at all angles. This extreme position will be determined by the radius of the smallest circle the car has to travel around, or by the limitations imposed by the design of the frame of the vehicle. The present practice of giving a long wheelbase to a car tends to reduce the angle of lock of the steering wheels even when the frame of the vehicle is made narrow to give clearance for the wheels.

The method of designing the steering gear is as follows: The center lines of the two axles are first drawn in their correct relative positions, and to as large a scale as convenient; generally quarter size. The centers of the steering pivots are then marked, and the bare outline of the two steering wheels drawn in. The frame of the car, so far as it is likely to interfere with the wheels, is also indicated. The centers of the steering pivots should be as close to the wheels as possible, as this tends to reduce the strains on the steering gear. Strike an arc from each steering pivot center with a radius equal to the effective length of the steering arm. Draw the wheel on the inner side of the curve in the position of extreme lock, and produce the center line of its spindle to intersect the produced center line of the back axle. From this point draw a line through the steering pivot center of the other wheel. This will give an angle through which the outer wheel must be deflected. The two wheels are now traced on small pieces of tracing paper, which are pinned to the drawing board in such a maner as to allow them to be turned about the steering pivots in the same way as the wheels would be in actual practice. Assume a position for the extremities of the steering arms, and with the dividers see if the distance from arm to arm is the same with the wheels parallel, and when they are inclined to their extreme positions as obtained above. If not, the steering arm angles must be modified until this condition is fulfilled. It need hardly be mentioned that each steering arm should be inclined at the same angle. The gear need only be made correct for one direction of inclination; it will then be right for both.

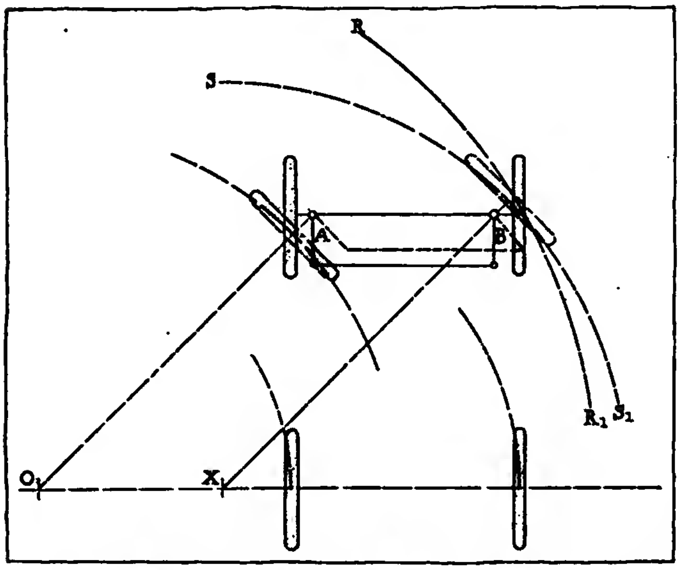

Fig. 2—With an incorrectly-designed gear, the circles through which the wheels swing when turning are not concentric

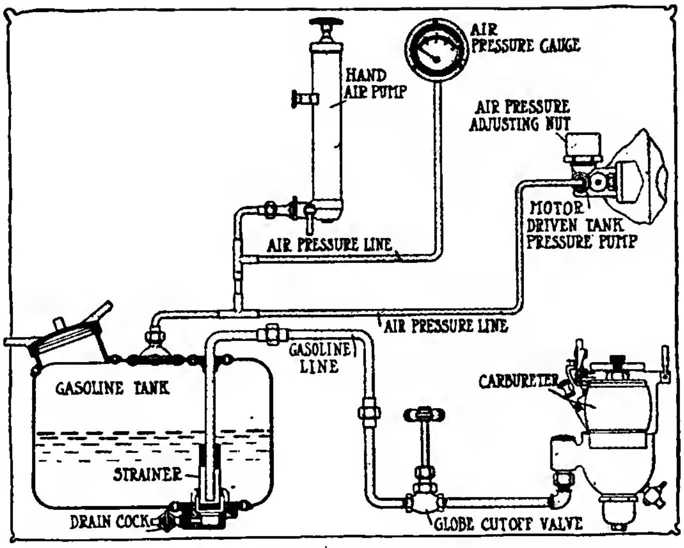

Fig. 3—Diagram of the pressure gasoline feed system used on the National 40, which is typical of practice in this direction

The practice of many designers is to so incline the steering arms that their center lines, if produced, would meet at a point at the center of the back axle. This will only give a correct steering gear when all the conditions of wheelbase, gauge, or track of wheels, centers of pivots, etc., are suitable. It is recommended that the gear be set out for each different size and type of car. Whether the steering arms project in front of or behind the axle depends on the fancy of the designer for the most part; the principles remain the same. If they project forwardly, they will diverge to the same angle as rear arms would converge.

Many designers hold the opinion that forwardly projecting steering arms are preferable, in that the connecting link is then subjected mostly to tensile stress. Rearwardly-projecting arms are held to cause the stress on the link to be mainly compression. In point of fact, the stresses caused in the link are both tensile and compressive, whether they project in a forward or backward direction. The forward arms have the disadvantage that they cannot always be made to diverge far enough to obtain the correct angle, without coming in contact with the spokes of the wheels. With the arms arranged behind the axle there are no such restrictions. In designing the gear, it is well to remember that long steering arms tend to reduce the stresses on the connecting link and its joints. The practice of curving the link connecting the steering arms cannot be too strongly condemned; it should always be straight.

Adjusting Carbureter on Winton

Editor The Automobile:—I have a six-cylinder Winton car, Model 16C. The carbureter on this car is a specially made Stromberg, known as the Winton-Stromberg. I understand. This has not been functioning as it should of late. Please tell me how to adjust it.

Buffalo, N. Y. READER.

—1—The Winton-Stromberg carbureter is illustrated in Fig. 6. As may be noted there are two gasoline jets. The main jet H, is located in the main venturi passage and forms the ordinary method of spraying the fuel at low speeds. At higher speed an auxiliary jet Z comes into play. As will be seen, this second jet is located close to the auxiliary air valve passage. To adjust the carbureter, turn the lock nut N till the auxiliary air valve seats lightly. This may be determined by pressing the finger down upon the valve through the opening above it. When the valve just seats, turn the nut from two to five notches further up for additional tension. See that the nut M, at the top of the auxiliary clears the secondary nozzle lever P. There must be more than 1-64 inch of a space between the two and it will usually be found that between this figure and 1-32 inch clearance will exist when the auxiliary valve is correctly ad-

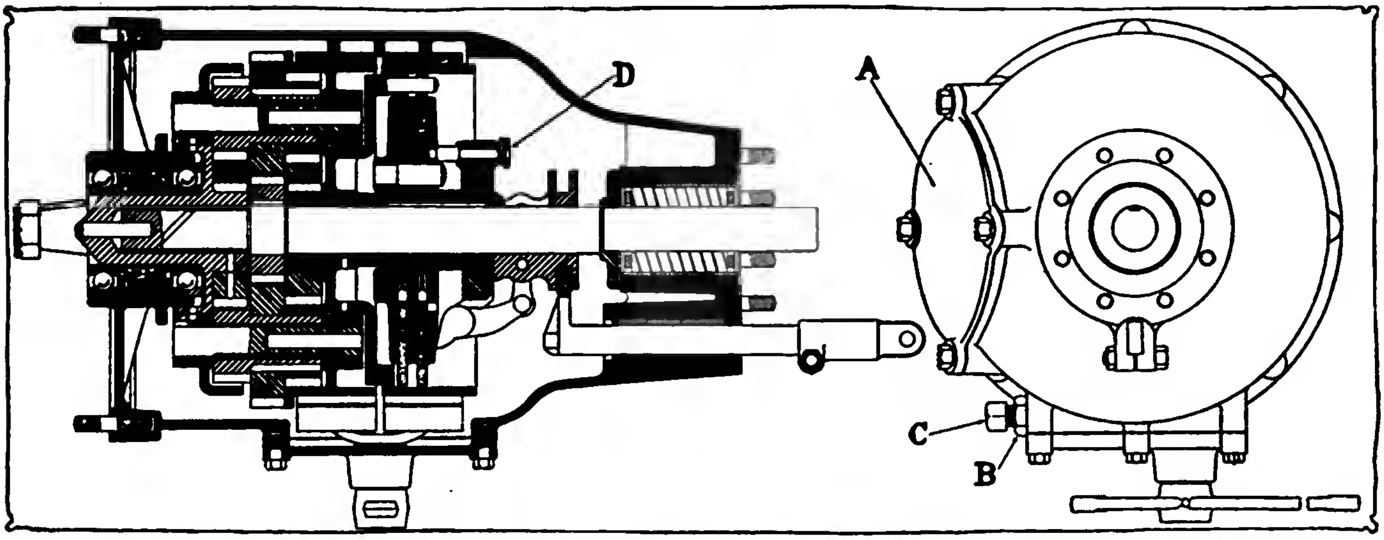

Fig 4—Planetary gear used on the Overland, showing the points which are essential to the making of an adjustment

justed. Turn the adjustable nozzle stem G, to the right as far as it will go without trying to force it when resistance is felt. This will seek the adjustable needle valve H. The stem G, is then turned back from one-quarter to three-eighths of a turn. Now start the motor and turn G, to the left or right until the motor idles properly. Advance the spark and open the throttle wide and if the motor backfires, move down the adjustable nut M, on top of the auxiliary air valve stem. This makes the mixture richer at high speeds. If the motor smokes and the mixture is too rich, move the adjustable nut M up. It would be a good plan to move this nut M up until the motor backfires and then move the nut down until the motor runs smoothly without backfiring.

The gasoline lever in this carbureter is adjusted by the lock nut L on the top of the float chamber. Turning the nut down lowers the level and turning it up raises it. This nut rarely if ever requires attention as the gasoline level is correctly set at the factory. An easy starting device is placed on this carbureter. The valve A shuts off the air supply and allows all the suction to fall on the jet H. In very cold weather the priming attachment on the top of the float chamber may be used. When the motor starts the starting valve A is immediately opened, allowing a free air passage.

Pressure Gasoline System Explained

Editor THE AUTOMOBILE:—Please give me some idea as to the proper layout of a pressure gasoline system, showing proper piping and relationship of gauges, valves, etc.

New York City. SUBSCRIBER.

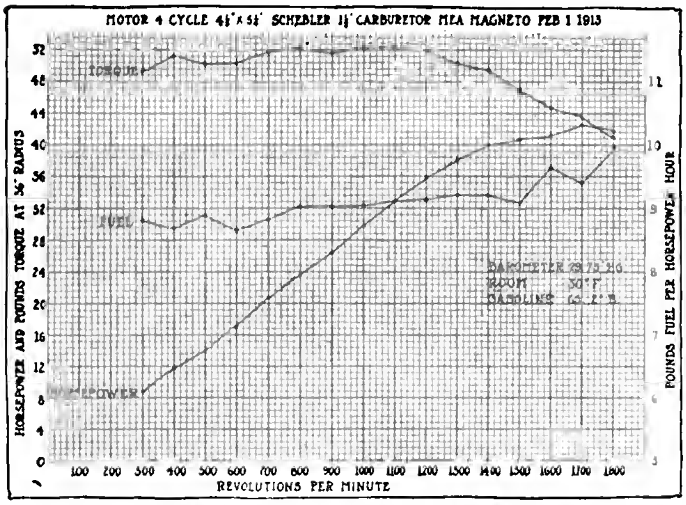

Fig. 5—Curve of Schebler carbureter adjusted for maximum power delivery

—The pressure gasoline is best explained by taking a concrete example. Fig. 3 shows that employed on the model 40 National cars. This is a very complete layout and is typical of practice in this direction. Directly driven from the camshaft or any other moving part of the motor there is a small pressure pump which is so regulated as to produce under moderate speeds a pressure of about 2 pounds in the air line. The air pressure line pipe indicated in the illustration is led directly to the tank. From the air pressure line a pipe leads to the air pressure gauge which shows the pressure in the line of which the gasoline pressure tank is a part, and pounds above atmospheric. It is a law of nature that the pressure at any point in a receiver holding a gas is the same. Therefore the pressure in the tank and piping is the same and the reading on the gauge will be correct and express the pressure in the gasoline tank. It is evident that if the car has been standing some time the pressure will have leaked from the tank in various ways and it is necessary, in order to get the gasoline to flow if the car is standing uphill, to force pressure into the tank by some outside means. The outside means provided on the National car is a hand air pump which is indicated in the illustrations. A few strokes on this pump puts sufficient pressure into the tank to secure a flow of gasoline to the carbureter and start the motor. After this of course the pressure is maintained automatically by the motor-driven tank pressure pumps. The pipe to the carbureter issues from the strainer at the bottom of the tank and carries the gasoline to the flow chamber. Between the tank and the carbureter a cut-off valve is inserted for shutting off the gasoline when removing the carbureter or draining it.

Interested in Trip to Quebec

Editor THE AUTOMOBILE:—1—If I desire to go to Quebec, Canada, say from Bilton Woods, is it possible to go to Newport, Vt., and start from there?

2—If so, can I reach Quebec in 1 day from Newport in comfort?

3—If not, can good accommodation be secured?

4—How are the roads?

5—Is there a better starting point than Newport, Vt.?

Boston, Mass. THOMAS PERKINS.

—1—It is entirely practical to start this trip from Newport, Vt., and, in fact, this is the best way of doing it. The distance from Newport, Vt., to Quebec is 178 miles. Leaving Main street, Newport, and traveling east you pass through West Derby and then at 5 miles on the odometer reach Derby. Turning left into this village and following the main road north you pass across the international boundary into Stanstead, Can. It is at this point that the customs bond must be secured. This is based on the value of the car, as appraised by the customs officials. A fee of $5 is required for the machine and $5 for the chauffeur. The customs bond is returned upon leaving the country.

Passing straight through Stanstead on the main road, you come to Caseville at 17 miles out from Newport. The road becomes hilly at this point with some beautiful views of lakes and mountains. At 32.3 miles there is a fork in the road at which you should keep to the right passing right through a covered bridge and into Lennoxville. Beyond Lennoxville there is another covered bridge and at 40.8 miles there is a fork at which you will have to keep to the left. At 41.6 take the left hand road and keep to the left for the next three forks. At 48.1 you cross a bridge keeping to the right of a saw-mill. Another bridge is located at 51.6 and a fork at 52.8 at which it is necessary to keep to the left. You now pick up a line of telegraph poles which carries you through Ascot village, South Dudswell, Marbleton, Weedon, and taking the branch road to the right at 85.0, into Garthby and 5 miles beyond at a reading of 91.6 on the odometer into D'Israeli. At this point your gasoline tank may be refilled.

Again taking up the journey, leaving D'Israeli by taking Main street along the railroad track and passing out through Colraine Station along the shore of Lac Noir over a stony winding road and then at 103 miles, taking right hand road up hill turning square left at 103.2 and bearing to the left at the fork just beyond. Gasoline may be secured at the offices of the Beaver Asbestos Co. Thetford Mines is then entered at 108.1 and following railroad tracks you come to Robertson Station, turning left to Reedham and keeping left to Kinear's Mills, Leeds village, St. Sylvester and Parkhurst. Keep straight ahead on good gravel road through St. Giles, following poles along Beaurivage river through Chaudiere, turning right at end of road at 166.7 and then left on good dirt road. Turn right on the river road, passing under the railroad at 170 miles and across the iron bridge beyond. Follow tracks to Levis-Quebec Ferry and after crossing ferry turn right and then left of steep hill direct into Quebec.

2—This largely depends on your car. If you have a high-powered car with comfortable suspension you may make a 1-day trip of this, but it would be far more comfortable to break it into two trips, stopping for the night at Thetford Mines.

3—Accommodations are largely a matter of taking the best thing available, but you can probably secure good accommodations at the place mentioned.

4—The roads are of dirt and on the whole not so bad if the weather has been good. There are no heavy grades.

5—Newport, Vt., is the best starting point. A full description of this route is given in Volume II of *The Automobile Blue Book.*

Adjusting Overland Planetary Gear

Editor THE AUTOMOBILE:—I have an Overland car using a planetary transmission. It does not seem to work right and needs adjusting. Will you please tell me how to go about it.

White Plains, N. Y. SUBURBANITE.

—Remove the cover A, Fig. 4. This will expose the clamping bolt on the spider and you may see if it is loose. By pulling out the pin D it is possible to turn the spider and this may be turned to the right until it is tight. It is not desired that the adjustment here be too tight and experience alone will enable you to tell the correct tightness. A moderate degree of tightness will give you an approximate idea as to about what is required. After you have made this adjustment the clamping screw should be tightened. This is visible through the opening and cannot be mistaken. If it is not possible to reach the clamping screw with the cover A off, open the compression box on the cylinders and have someone turn the motor over slowly while you watch the spider until the screw comes where you want it. To adjust the reverse loosen the lock nut B and turn the set screw C to the right till the desired adjustment is attained; then tighten up the lock nut again. The low speed is adjusted in the same manner as the reverse except that the rear set screw is used. Be sure to tighten the locknuts sufficiently in order that the adjustment will be permanent.

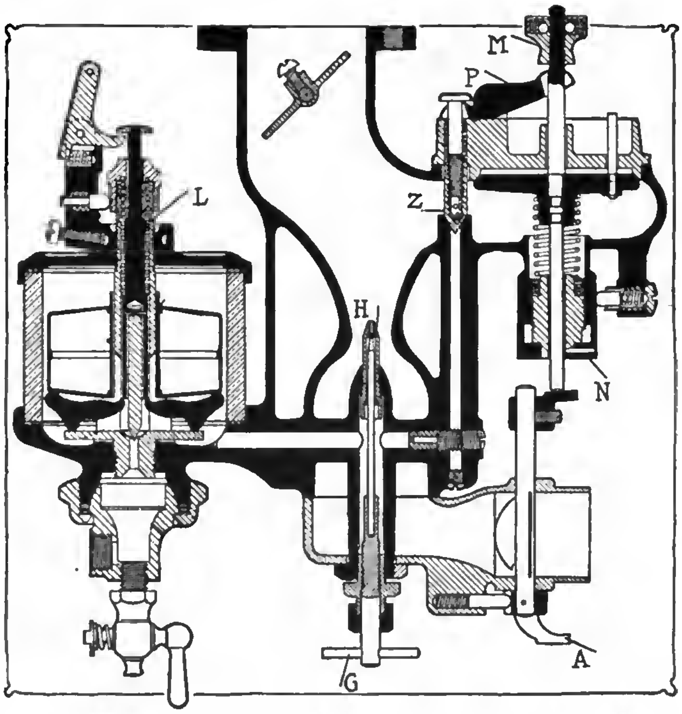

Fig. 6—Section through the Winton-Stromberg carbureter

Schebler Carbureter Curves

Editor THE AUTOMOBILE:—Would you kindly explain the difference between a carbureter adjusted for maximum power or maximum economy?

Kindly show this on a Schebler carbureter if possible.

Newark, N. J. CARBURETER.

—The difference between the two adjustments is better shown by curves than by a descriptive explanation. Figs. 5 and 7 give the results obtained with the same carbureter, one adjusted for maximum power and the other for maximum economy. The one adjusted for maximum economy as will be seen from the curve uses for instance .6 pound fuel per hour at 1,400 revolutions per minute, while that adjusted for maximum power uses .9 pound of fuel per hour. The maximum horsepower attained with the fuel adjusted for economy, 1,600 revolutions per minute, is 34.5. With the carbureter adjusted for maximum power about 41 horsepower is attained at this speed.

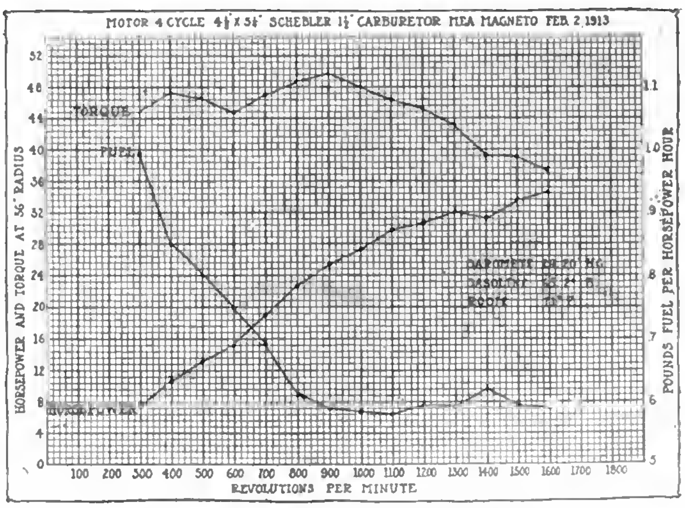

Fig. 7—Curve of Schebler carbureter adjusted for maximum economy

The Rear Axle Gearbox

Light Weight and Efficiency Two Reasons In Its Favor

By S. E. Aulton, Vice-President
Packard Motor Car Company

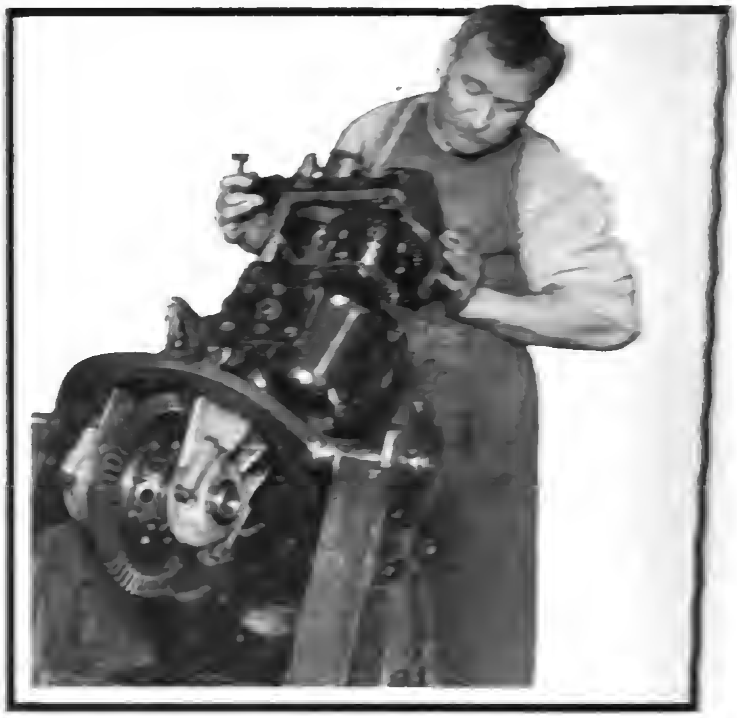
THE present Packard rear axle gearbox was conceived and first built to be a part of the Gray Wolf racer in 1902 at a time when we desired to—and finally did—equal the world's mile-record of 46 2-5 seconds, with an engine having a bore and stroke of 4 and 5 inches, respectively.

We wanted the lightest, simplest, most efficient and most dependable method of delivering every ounce of power developed by the engine to the rear wheels. The combination of the gearset with the bevel gearset in the rear axle accomplished all this.

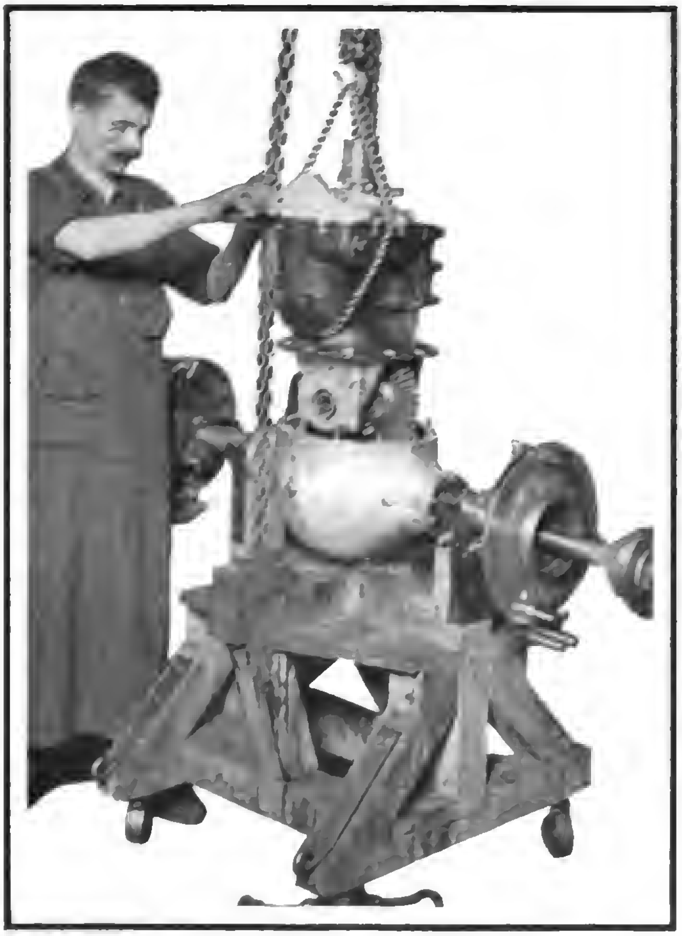
When, in 1904, we departed from the up-to-that-time American practice of a single-cylinder engine under the body and adopted the so-called French practice of a four-cylinder engine under the hood, we unhesitatingly included the Gray Wolf gearset as being the most desirable for American conditions. We had previously built four-cylinder cars with sub-frame and four-speed gearset under the body, and consequently knew both sides of the question when our decision was reached.

The logic of carrying the gearset on the rear axle applies with equal force to cars with six-cylinder motors.

The use of specially-designed machines and appliances enables us to manufacture the housing containing the differential and gearset with great accuracy. The alignment remains absolutely unchanged, and from actual figures obtained from the best cars of this country and Europe, our rear axle with its gearset combined weighs no more—and in many cases weighs less—than the rear axles in cars of similar power and capacity, which contain the differential and bevel gears only, and in which the gearbox is supported on the frame.



The front end assembly is assembled on the bench and then fitted to the gearcase, as shown in the illustration



The axles are placed in the rear axle housing, and when the front end assembly has been fitted to the gearbox the workman assembles the gearbox and rear axle units

Part of this saving in weight is in combining the two assemblies into a single compact unit and part is in the use of materials and design giving great strength with minimum weight. The design of our combination rear axle and gearset has, by reason of its lightness and strength, acquired for itself the characterization of bridge.

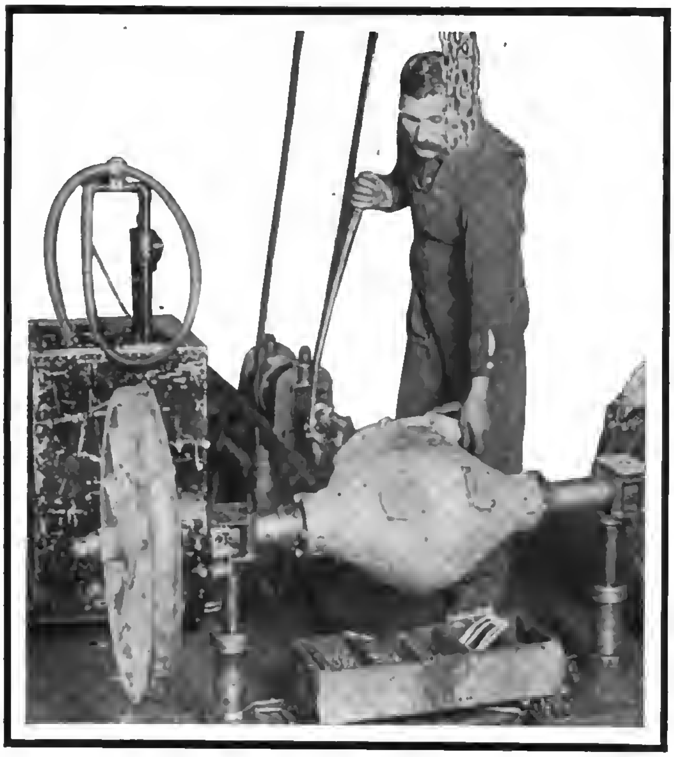
Single Universal on Shaft

Our chassis consists of two major units: One is the power plant forward and the other the transmission unit aft; both connected by a single universal joint shaft. The chassis may be warped and twisted over the most severe inequalities found in any kind of travel, with all the flexibility necessary contained in the one universal joint shaft. This shaft, on account of the fact that it has only to transmit the power of the motor, and not that power geared down for hill-climbing by a gearbox in the frame, can be made lighter and with ample bearing will last longer than if made the other way. Our construction necessitates only two universal joints, whereas the other requires four; that is, two in front of the gearbox and two between the gearbox and the rear axle.

The combination of the gearset with the rear axle leaves more room forward of it for a universal joint shaft. The longer this shaft, the less will be its angle of inclination and the less will be the wear on the joints.

The absence of a gearset from behind the motor makes the clutch more readily accessible and a front cover on the forward end of our gearbox makes all the gears readily removable through it in 20 minutes' time, and without disturbing the body or any other part of the car.

Six-cylinder construction increases the weight on the front axle, which not only brings greater stress on the axle and steering parts, but interferes to some extent with making turns at high speeds. Taking the weight of the gearset away from the front axle produces a better-balanced car.



After brakes and wheels have been attached, the completed bridge assembly is filled with oil and tested under belt

The combination of the gearbox with the rear axle in the Packard produces in the body practically one-third of the reaction from torque, on the low and intermediate speeds, that would be exerted with the gearbox forward. The total of power going into our rear axle unit is only the amount that the motor can develop. The reaction, therefore, from the propeller shaft trying to turn the driving pinion tending to rock the body over to the right, is only equal to the power of the motor.

In the case of a gearbox attached to the chassis instead of to the rear axle, the power of the motor is geared down on lower speeds, and the universal joint shaft back to the rear axle has a tendency approximately three times greater to rock the body to the right with consequent discomfort to the passengers whenever the clutch is jerkily used on these speeds.

No Heat Is Near To Thin the Oil

Gear noise can be reduced to some extent by proper consistency of the lubricating oil, but all lubricating oils get very much thinner with an increase in temperature and this tends to increase the gear noises. With the gearbox on the rear axle, there is no hot exhaust pipe, muffler or motor near it to thin down the lubricating oil. Therefore, if the proper oil is supplied in the first place it retains its consistency and insures uniformly quiet running of gears.

The gearbox being combined with the rear axle permits an insulating current of air to pass between it and the body of the car. The same gears and the same gear sound are about four times more noticeable and objectionable when up in the chassis, as compared with being on the rear axle. This explains to a large extent the greater absence of noise and the increased comfort to the person riding in an inclosed car of our construction.

Considering all the important features of simplicity dependability, lightness of construction, permanence of alignment, facility of manufacture and repair, greater accessibility of all working parts, lessened strain on the universal joint and lighter and longer universal joint shaft, freedom from torque reaction on low speeds, flexibility of the whole car, and the greater satisfaction when used in connection with inclosed bodies, has caused us to retain and perpetuate this construction because it was best and not simply because it was traditional.

Bennett Rear Gearbox

Gearing Situated Between Pinion and Differential

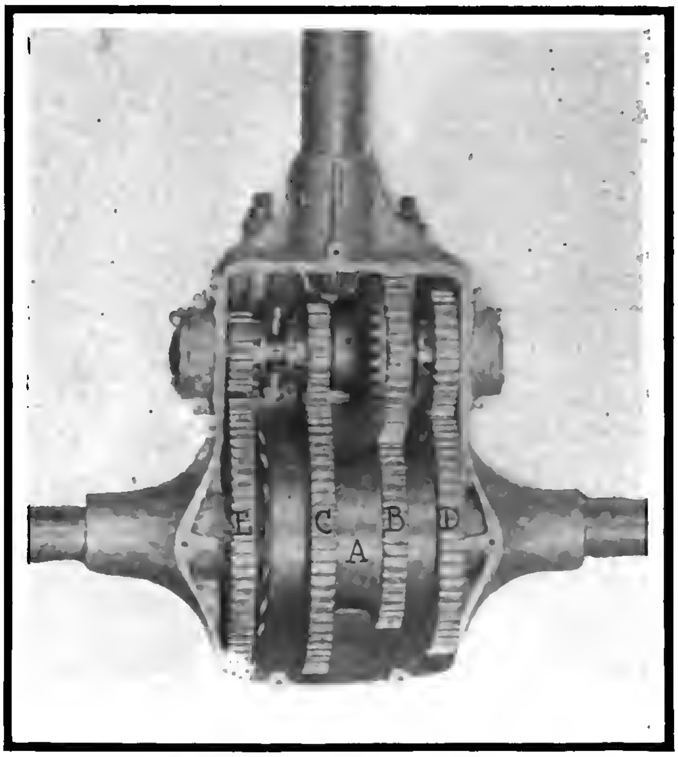
IN the ordinary type of change gearset. the various speed change gears are located forward of the driving pinion and its bevel gear. The latter is usually of the ring type and mounted on the rear axle shaft, carrying within it the differential gears.

S. S. Bennett, Highland Park, Mich., a suburb of Detroit, has invented a rear axle unit, which reverses the position of the pinion and bevel gear and places them forward of the change speed gears, thus causing the driving pinion to be always rotated at the same speed as that of the crankshaft of the motor.

In the illustration herewith a general idea of the Bennett construction is brought out. The change gears are always in mesh, any speed combination being obtained by the use of tooth clutches, the toothed parts of which slide on their shaft, while their mating members are integral with the change gears. To aid in the shifting of these clutches, the jaws are given a worm effect of .125 inch. The gears have six jaws each.

With the Bennett arrangement, the driven gears are all made larger in diameter than the driving gears, with the view of equalizing the strain between the driving pinion and its gear.

The differential gear is carried within the drum, which surrounds the rear axle, its approximate location being indicated by A in the illustration. It is claimed for this arrangement that since the gearset is back of the driving pinion and rotates one-third to one-quarter as fast, there is less shock to the mechanism. This speed difference is also said to render the gearing noiseless while running on the lower gears, as well as when changing speeds. The driven gears are all unhardened, which is a manufacturing consideration. Referring to the illustration, the direct drive gearing is shown at B; combination C gives low speed, while intermediate is obtained by D. Gears at E give the reverse through the use of a small pinion inter-connecting the two main gears and back of them.



Bennett rear axle gearbox, showing drive on differential drum

Different Tire Prices

THE recent announced cut in tire prices made by one of the largest tire producers in the country, and which was soon followed by similar reductions by several other concerns, naturally suggests the thought, "Is it necessary to sell all tires of approximately the same size at the same price?"

¶ *There are differences of quality in tires, the same as in cars of the same horsepower and passenger capacity. Each rubber company has its own secret processes which are carefully guarded by the respective factories, and on these processes naturally must depend much of the value of the tire.*

¶ *Each factory has its own percentages in the compounding of the rubber which goes into its tire. It is rare that the percentages in this work with one company are the same as those with another.*

¶ *The grade of fabric used in different tires of the same make varies. One concern uses a genuine Sea Island cotton which costs 62 cents per pound or thereabouts, and another concern uses an Egyptian fabric which may be purchased at 42 cents per pound, and in view of the fact that there are about 10 pounds of fabric in a tire there should be here sufficient reason why tires should be of different price.*

¶ *The sooner car owners realize that there are differences in the wearing qualities of tires, the better for the entire industry.*

Welfare in Factories

THE announcement by a leading manufacturer that he is erecting a club house for his workmen in which they can enjoy their luncheons, hold business meetings, have athletic contests, enjoy reading room facilities at a very nominal annual fee, suggests the value in these days of acute labor situations of such measures in which the personal uplift and welfare of the workmen are taken into consideration.

For example: the workman belonging to a factory which has a workingman's club with its reading rooms, gymnasium, spray baths, base ball diamond, etc., generally puts more concentration into this work than the artisan in the factory which is without all of these humanitarian departments.

This workingman's uplift movement is not new, although the erection of workmen's club by a factory is new, and its results will be watched with particular interest. Employers of large numbers of workmen are beginning to realize that frequently there are other things as efficient in production as time. Two workmen paid on the same scale and working the same number of hours per day are of varying value to the employer. In one the activities are solely confined to the few hours of labor, and may be none too intelligently directed; whereas with the other working but the same number of hours a greater intelligence enters into the work from which the employer benefits directly. This suggests the necessity of getting the best effort out of the workman without any thought of introducing longer hours, or other sweatshop practices. It is true that the mind of the workman has a definite effect upon the job; and it is further true that the factory conditions play a big part in determining the mental condition of the workman so far as his relationship towards the work is concerned.

One of the largest German industries, and one which enjoys international repute, is conspicuous by its welfare arrangements, all of which are controlled by the workmen. These organizations have done much to improve the workman's conditions, and also his efficiency to himself and to the factory without expense to either party. Such a German organization, by voting that all workmen drink milk or buttermilk at the midday lunch instead of the native beer, showed the extent to which welfare organizations promoted entirely by the workmen can work towards benefiting his own conditions and also improving factory conditions.

A few of our automobile and accessory factories have done much to develop welfare work by way of organization among the various departments covering sick benefits, accidents, etc. The organization departments of other factories have discovered the value of opening noonday kitchens in the factories where unmarried help can secure at a nominal fee a satisfactory luncheon of wholesome food, and where married men who bring their luncheons can enjoy them in comfort at a table, and for a penny extra secure a cup of hot coffee or a glass of fresh milk.

Much more can be done in this workman's welfare movement, and those factories that are quickest to take it up in its various ramifications will discover in it a good investment.

The House Organ

Its Object—When Published—Made to the Hour

BUILDING up an *esprit de corps* and intensifying sales efforts should be one of the primary objects of the house organ, that local publication which the publishers frankly acknowledge is published "once a month when we can get it out" or "every once in awhile as occasions seem to demand."

While building up an *esprit de corps* among dealers and intensifying sales efforts are supposedly worthy objects of attainment yet it is a difficult task to discover just why certain makers publish these "every-once-in-awhile" organs. Look for a moment at what the makers themselves have to say: One maker says "the house organ we publish every once in awhile is in the interests of ——— owners and for the promotion of ——— motors." Another maker sums it up thus: "We publish a monthly house organ for distribution among our dealers and such of our owners as are interested in factory news." Another maker remarks "The circulation of our house organ is limited entirely to our dealers and in each issue we feature some particular dealer."

Another maker, of a more economic turn of mind and apparently with a desire for intensified effort, publishes two house organs—"one for the salesmen and one for dealers." With a maker who hopes for a general uplift of his owners and dealers we find the house organ "issued monthly and intended for circulation among ——— dealers and owners." And lastly, from a maker with an apparently unsystematic publication center comes the announcement that "This house organ has appeared at very indefinite periods, the last one having been published in July, 1912."

Judging from the policy of makers selling approximately the same commodity, as automobiles constitute the commodity referred to, it is quite impossible to determine just when house organs are published, whether monthly, semi-monthly, weekly or "every-once-in-awhile." Naturally, if house organs are to be of value, in brief, an investment to the company, they should at least have a regular time of issue, once a month, fortnightly or weekly. The intermittent, once-in-awhile type is of little value. It is so spasmodic that it never is taken seriously and it always fails in its purpose.

It is a debatable point whether in the best of regulated families a little once-in-awhile logic cannot be interjected to advantage. In seasons of greatest sales effort the house organ should come out at least once a week, even twice a week would not be an injury if made sufficiently brief and brim full of terse graphic paragraphs to aid in selling cars and meeting the exigencies of the moment. Once a week is not a bit too frequent in the busy season, and the maker who brings his organ out once a month the year round is missing much by his failure of intensifying effort at the busy season.

Sometimes intensified sales effort is carried to the extreme, to a point where sales effort is injured, where the capacity of the workman is injured by overwork. Such is the opposite to the desultory method, both of which are to be avoided.

What should the house organ contain? Not to be dictatorial, it would seem but logical that it should act as an asset to the selling organization, because, if what all of the makers publishing them say is correct, these little publications are to help the dealer, and incidentally go to the owner if he is interested in factory work.

Taking it then for granted that the dealer with his salesmen is the person to be aided then the house organ should be timed to the seasons and not published as a "tale that is told." The publisher then, must breathe the atmosphere of the manufacturer, of the sales organization and should reflect the atmosphere of the dealer. When summer and autumn come round the house organ should feature an analysis of the car—analysis from the salesman's viewpoint rather than from the engineer's. The salesman must see the car as it must eventually be presented for sale; he must see the warp and woof that make the arguments with which he is going to make the sales.

This analysis cannot be accomplished in a single issue; it is a fairly long story, and if there is only one issue a month the salesman will find himself poorly informed on his new car by Christmas. Then, during the period when cars are to be announced, the house organ can be published weekly to the greatest advantage. This period may embrace 2 months.

There are other seasons in the year when weekly issues may be published to advantage, one is that period through which we are passing at present and through which we have been passing for the last month, namely the season of maximum selling effort. The warm spring days are here in many parts of the country; in colder sections they will be on hand soon and the greatest sales efforts of the year must be made.

As a means of stimulating sales too often the house organ is published from inside the factory and only reflects factory conceptions of closing business, whereas the views collected from dealers in representative sections of the country are more up-to-the-minute and are flowing over with practical methods of business that pass the factory conceptions into the background. A much greater interest among dealers can be developed when the "ways and means" of the fellow dealer are analyzed than when everything is a sermon from the general manager of sales or the president. News from the firing line is always welcome; it generally contains the real kernel. But it takes work to get it; good speedy, hustling work, which when done, has proven to be worth while.

Then there are the mid-seasons, between sales and between manufacture, when the house organ is at low tide. Once a month is often enough. It may rarely be read then. But it is needed, the continuity must be kept up, the salesman must not be left to himself, and the interest of the dealer may be kept at the 100 per cent point. At such times it is foolish to talk sales, foolish to talk mechanics. These inter-periods are opportune times for other subjects. At such moments interject a little on scientific management for the coming months. Methods for managing forces of salesmen; methods for managing repair departments; methods for managing the tire repair department; methods for managing the accessory department; and methods for a score of other minor departments. Most valuable work can be done at these between moments, work which will prove a welcome relief from the intensity of sales or the analysis of the car.

Not a few publishers of house organs think that they must bring out special editions for any special event in the motoring world, events, perhaps, in which they are not at all interested, and events which every dealer can become conversant with through his class journal or the daily press. The issuing of such specials rarely accomplishes much value, rather it is apt to take away from the general atmosphere of the publication than add to it. It is poor policy to go out of your legitimate field. Cast the seed on fertile soil rather than wasting it.

Maxwell 25 Is Out

Latest Five-Passenger Car Has Four-Cylinder Block Motor on Three-Point Suspension — European Body Lines

Left Drive and Center Control Are Features

DETROIT, MICH., April 15—The much-heralded Maxwell small touring car which is to sell at the rather startling figure of $725 has at last appeared. This week it is being exhibited to the dealers of the new Maxwell Motor Co., although deliveries will not commence until May 1.

Generally speaking, the car is up to the 1913 standard in every respect and reveals a slightly foreign look, as far as the hood is concerned at least. This slopes slightly from the dash to the radiator.

The body is of the usual five-passenger type with wide doors and black leather upholstering. Mechanically there is nothing out of the ordinary about the new 25, although it involves a number of features in accordance with the latest engineering dictates.

Fig. 3—Front view of Maxwell 25 touring car

Fig. 4—Rear springs suspension, showing springs shackled to spring horns bolted to frame

Motor Is of L-Head Type

The motor develops 25 horsepower and is of the block-cast type of compact design. It is of the four-cylinder, L-head type with a bore of 3⅝ inches and a stroke of 4.5 inches, giving a stroke bore ratia of 1.24.

The valves are all on the right and are inclosed by easily removed cover plates. They are 1⅞ inches in diameter. A removable plate gives access to the valve heads.

The cooling is by the thermo-syphon system with a large water outlet at the top of the motor integral with the head and extending the entire length of the top.

Both the crankshaft and the camshaft are mounted on two bearings each. The pistons are provided with three eccentric rings each, and are of ample length.

The power plant is carried at three points, two supports connecting directly with the main frame at the rear and a swivel support at the forward end resting on the front cross member just back of the radiator. The various motor bearing dimensions are as follows:

Camshaft bearings: Front, 1 inch diameter by 2 inches length:

rear, 1 inch diameter by 1¾ inch length. Crankshaft bearings: Front, 1⅞ inches diameter by 25 inches length; rear, 1⅞ inches diameter by 3 inches length; connecting-rod, lower bearings, 1⅞ inches diameter by 1.5 inches length; wristpin bearings, ¾ inch diameter by 2¾ inches length.

The lubrication system is of the conventional splash type, employing a plunger pump located at the front in the timing gearcase. This pump is actuated by a small connecting rod which is really an eccentric. The oil is pumped from the lower part of the crankcase up to the individual troughs and after it has been thrown to the various contact surfaces by the travel of the connecting rods it finds its way back to the reservoir where it is strained before being recirculated.

The ignition system is of the single type high-tension employing Simms magneto without the use of batteries. The magneto is placed on the right side of the motor and has regulation spark control. The carbureter is located on the left and is of the Holley make.

The cone clutch is not inclosed but located within the flywheel in the regular way. It is Raybestos-lined and has a diameter of 12.5 inches.

Central Gear Shift Lever

The transmission is placed amidships and has three forward speeds. It is a selective sliding gear type and the gearshaft lever passes directly upward for center control. This shift lever is of the swivel type.

From the gearbox the drive passes to the rear axle through a standard propeller shaft inclosed within a torque tube which is provided with a ball universal joint at the forward end just back of the gearbox. There are no radius rods, the tube taking the entire drive.

The rear axle is a three-quarter-floating design in which no load is carried by the driving shafts which are inclosed within the axle tubes, on which the wheel bearings are located.

The brakes operate on drums on the rear wheels and are of the internal expanding (emergency) and external contracting (service) type. The diameter of these brakes is 10 inches and the width is 1¼ inches.

The frame is of the regular pressed-steel channel section construction, and is provided with three cross-members to brace it. One of these is at the forward end and also forms the front motor support, while the second is in line with the rear spring front hanger, and the third member is at the extreme rear.

Both front and rear springs are half-elliptic, the sizes being: Front, 32 inches length; 1¾ inches width; rear, 40 inches length; 1¾ inches width.

The rear springs shackle at their rear ends to spring horns which in turn bolt to the rear corners of the frame.

The wheels are of the wood artillery type and carry 3 by 3.5-inch clincher tires. The tread is 56 inches for standard roads, although an option of 60 inches is given for Southern driving. Wheelbase is 102 inches and clearance 9 1-2 inches.

The control features are standard, and include pedal for operating the service brakes and for the clutch. The steering wheel is on the left, while the gearshaft lever is in the center together with the emergency brake lever. The ratchet for this brake lever is not placed above the floorboards as usually seen but is mounted underneath, fastening directly to the gearcase. On the dash a small handle is provided for carbureter adjustment.

The body is very roomy and seats five comfortably. A special feature of the model 25 body design is the absence of a door at the left front side. The driver enters from the other side. Standard colors for this car are dark blue with narrow black stripe. The equipment includes top and side curtains with top boot, windshield, gas head lights and gas tank, oil side and rear lamps, horn mounted on the motor and under the hood, Stewart-Warner speedometer.

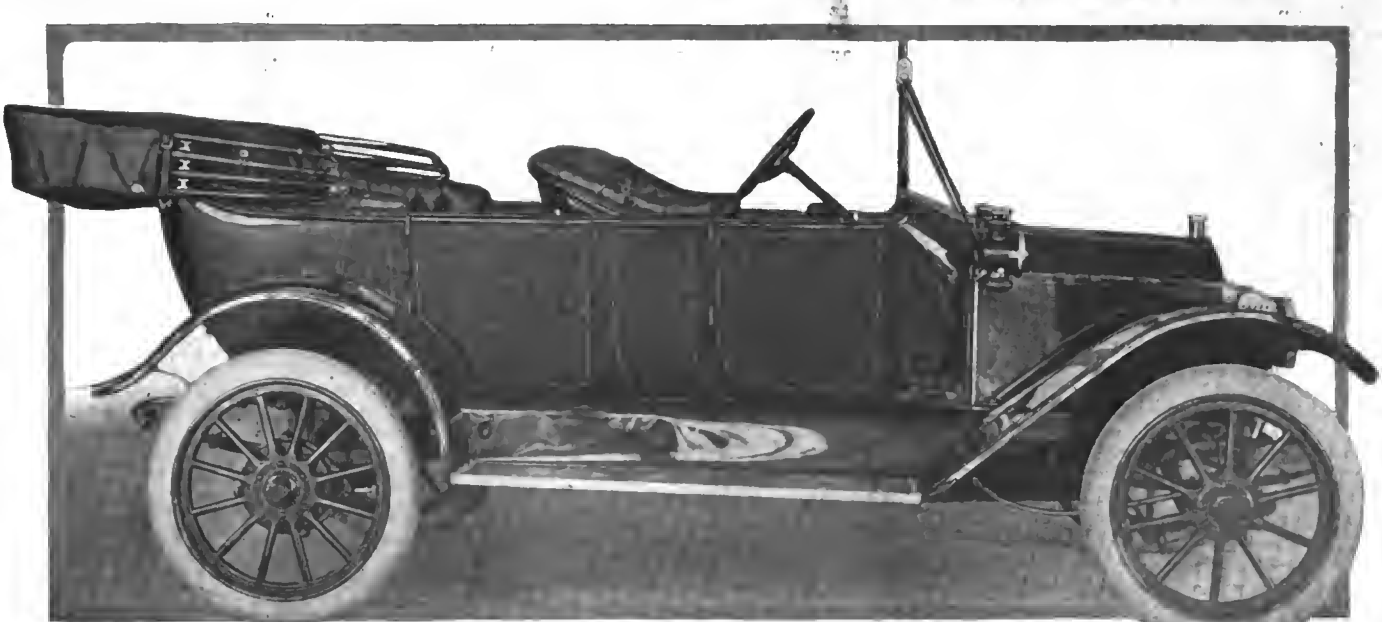

Fig. 5—Side view of new Maxwell touring car, a characteristic 1913 design, with straight, clear lines

Accessories for the Automobilist

THE recent automobile shows at New York, Chicago and Boston included so many exhibits of accessories that it was impossible to describe them in the show issues of THE AUTOMOBILE. Some of these devices for the comfort of the automobilist are mentioned herewith:

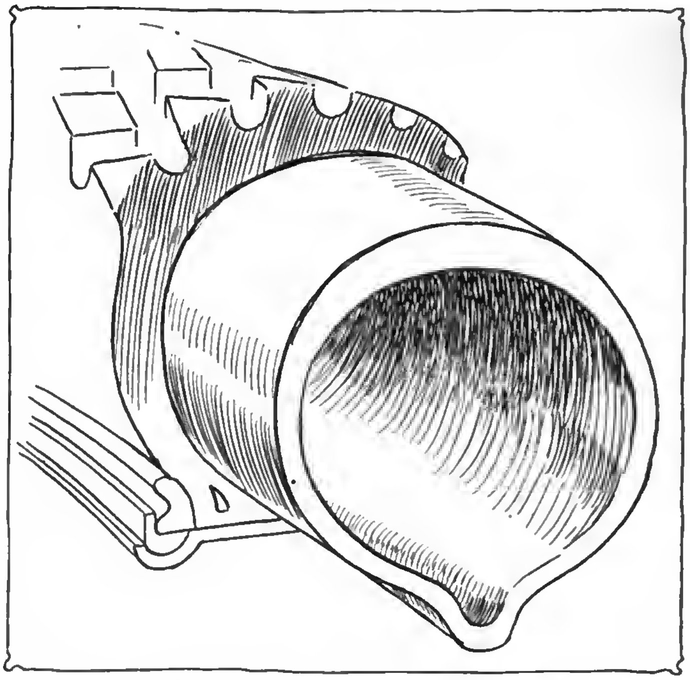
Vail-Osgood Tire Tube—A puncture-closing inner tube is being manufactured by the Vail-Osgood Rubber Products Co., Chicago, Ill. The mechanical principles utilized and applied in the tire are as follows: Pure rubber of sufficient thickness, when confined by side pressure, will hug a nail tightly. If this pressure is increased by the weight of the car and its load, the side pressure mentioned will permit the withdrawal of the nail and will close the cut and hold it closed, maintaining the air pressure. The method of manufacture consists in first laying a strong foundation strip on the form used for making the tinner tube, then building up on the form a layer of pure rubber, .38-inch thick, tapering off at the side or rim edge. After vulvanizing the tube is removed and turned inside out. When placed in the casing aand inflated the thicker portion of the wall of the tube is so confined and under pressure that in the event of a puncture it closes automatically.

Tuthill's Titanic Spring, which has been on the market for some time, has been designed to replace those on standard makes of cars. It is guaranteed against breakage between the clips. According to the makers, the advantages of this spring are that 90 per cent. of the breakages are eliminated and that, owing to the fact that there is no hole through the center of the spring, 25 per cent. is added to the strength. The material of which the spring is composed is a silico-manganese composition of special analysis. It is made by the Tuthill Spring Co., Chicago, Ill.

Detroit Force-Feed Oil—The oiler and tank are combined in a rectangular box. The oil is drawn up from the bottom of the box which forms the oil reservoir by a series of small pumps actuated by a shaft passing through the length of the box. The number of these pumps depends on the number of leads required by the particular motor to which the oiler is fitted. The shaft has a worm upon it for each small pump which gives a reciprocating drive to this part of the mechanism. The oil is taken up through the vertical lead and dropped down to the tubes which carry the oil through the motor. The ends of the lead running up from the bottom of the box project through the top of the box and are curved over to allow the oil to drop down into the heads of the motor leads which are cup shaped. The top of the box is covered with glass to allow the operator to observe the flow of oil. Each pump can have the length of its stroke regulated so that the flow of oil is under control. The action of the lubricator is shown on page 867. The device is made by the Detroit Lubricator Co., Detroit, Mich.

The Campbell All-in-Mesh Gear Transmission is always in mesh. This principle is secured by the use of a tilting or rolling key which forms internal contact with the gears. The transmitting action is obtained by merely sliding the key or keys along the groove in the shaft until they slip under the rings of the desired gear after which the key automatically and with positive action tilts into contact with a series of lugs placed on the inner circumference of the gear. The gear becomes a part of the shaft, turning with it and transmitting the power from the motor to the rear axle. The gear is illustrated in Fig. ??, in which the tilting keys may be observed. This gear was designed by the Economy Equipping Co., Chicago, Ill.

The Boston Starter is a mechanical starter which is operated from the seat. A cable projects through the dash which, when pulled by the operator, turns the wheel in turn connected by chain to the crankshaft. A pull on the cable spins the motor at a sufficient speed for starting. An auto-



Vail-Osgood puncture-closing inner tube

matic release is provided as a protection in case of backfire and as a further precaution the spark is automatically fully retarded before the engine is turned over. The starter can be attached without interfering in any way with the car and does not change the appearance of the latter as the whole device, with the exception of the starting handle, is located beneath the hood. A big advantage of this starter is that it is ready for use whenever the car becomes stalled. It is made by the Auto Appliance Co., Boston, Massachusetts.

Dependo Gasoline Gauge attaches to the dash and indicates at a glance the amount of gasoline in the tank. It operates up-hill or down and is of simple construction. The needle is swung from the top of the dial and the scale, reading in gallons, is at the lower part. At any moment the amount of gasoline in the tank can be determined from the gauge. This gauge can be fitted to any car using a gravity feed tank. It is made by C. F. Roper & Co., Hopedale, Mass.

O-Tak-A Jr. is a special tool for removing punctured tires. As shown in the illustration, page 867, it is similar in form to a pair of pliers, with curved hooks. One end slips beneath the rim and the other pushes up against the tire. When the handle is squeezed the point of the instrument pushes the tire away from the clincher rim. After the tire is loosened the tool can be raised, thus lifting the bead away from the rim, allowing the tire to be easily removed. It is made by O-Tak-A Tire Remover Co., LeRoy, N. Y.

Ko-Nek-To Battery Terminal Blocks—Many wires are broken because the installation chafes across the edge of the battery box. This results in short-circuits and broken leads. The Ko-Nek-To apparatus changes the terminal points to the exterior of the battery box and renders it possible to disconnect wires rapidly and to remake the connections without the necessity of soldering joints. The Ko-Nek-To battery terminal blocks are designed to be used with all electric cranking and lighting systems and since the connections are securely made they greatly assist in maintaining the required efficiency and output. The inside installation is permanent and is vibration proof. The blocks are made by the Detroit Electrical Appliance Co., Detroit, Mich.

Halladay Steel Goods—Automobile specialties manufactured by the L. P. Halladay Co., Streator, Ill., include automobile bumpers, tire holders, baggage carriers, license brackets and gear-shifting sets made to any design. The Halladay Imperial bumper is made of Channel steel. It is entirely self-contained, adjustable to all styles of cars. The tire holders, which are also manufactured by this company, are made of malleable iron, designed to attach to frame and of sufficient size to hold two demountable rims or wheels. The set consists of two frame arms and running-board cup, finished in black japan. The baggage carrier is designed to be attached on the step or running board of the car. It consists of a clamp, attached to the running board, with two upright attachments with eyelets through which there are two straps. The baggage is held to the running board by these straps. The company also manufactures special parts, such as gear-shifting sets, foot pedals, rods and connections, according to any design.

Heco Primer Spark-Plug—The advantage of this priming plug is that the cup is directly over the plug. The priming part can be used for cleaning the plug as well as for priming the motor. When cleaning the plug it is only necessary to open the cup while the engine is running and allow the oil and soot to be blown off the points. When used for priming it is operated in the usual manner by opening the primer with the handle and pouring in a few drops of gasoline. It is made by the Heinze Electric Co., Lowell, Mass.

Vanguard Positive Shields—The Vanguard Manufacturing Co., Detroit, Mich., manufactures four types of windshields, all of which are of the two-pane type, and two of which have double-acting panes. Nos. 74 and 75 are of the latter class. They are actuated by means of a loop attached to a hinge, which is of the ball-bearing type, and each of the shield panes may be placed in any desired position. Nos. 77 and 78 are different from the first two in that only the upper pane is movable. The position of this pane is obtained by the loosening of the loop at one of the hinges, as in the first two types, and the tightening of it to keep the shield rigid.

Illinois Tire Filler—The Illinois Tire Filler Co., Chicago, Ill., makes a filler for tires which is injected into the tube in liquid form by a gun. It is claimed that after the liquid has performed its work inside the tube it is impossible to depress the tire by any pressure. The company claims that the pressure in the tire may be reduced but the tire will not be affected.

Aull-Sides-Klean Polish—The Aull-Sides-Klean Co., Cincinnati, O., is turning out a brass and nickel polish which is waferproof. This product will polish under water. The same company is producing an automobile body and furniture polish, which cleans and polishes at the same time. Both of these products go under the trade name of A-S-K.

Columbus Two-Pane Shields—The Columbus Auto Parts Co., Columbus, O., manufactures five different windshields. They are all of the two-pane type, and are so constructed as to move in an entire circle. The action of both panes of the shield is positive and simultaneous. The frame of the pane is of round section and is held in place by two grip members attached to a double-acting, compensating-gear hinge. The frame and hinges are made of heavy-gauge brass.

Mesinger Rebound Check—This shock absorbing device which is manufactured by the H. and F. Mesinger Manufacturing Company, New York, consists of two coiled springs attached at their upper ends to the car frame through suitable brackets, one a little forward of the axle and the other just to the rear of it. A leather strap passing under the axle connects to each of these springs at their lower ends. Thus the rebound is checked by the action of these two springs working against the upward jerk of the frame after depression through the agency of the connecting strap. The strap is provided with a buckle so that its length may be made to conform with the required spring tension and with the distance between axle and frame.

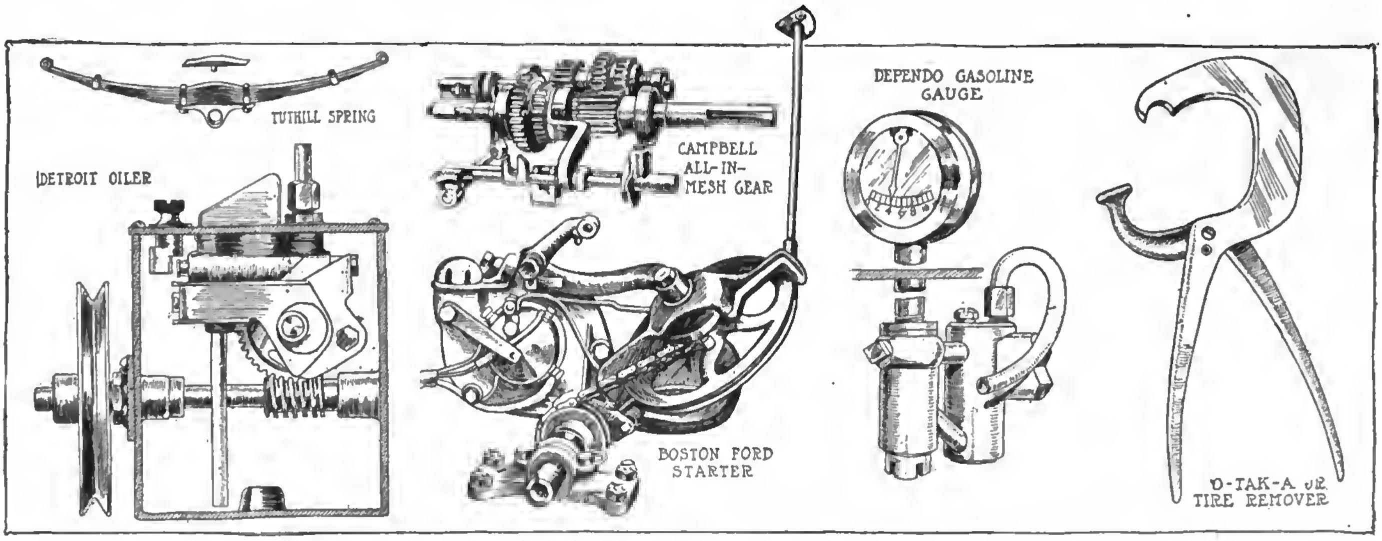
Weaver Garage Jacks—The Weaver automobile twin-jacks are manufactured by the Weaver Manufacturing Company, Springfield, Ill. It consists of a triangular pressed-steel frame the ends of which are mounted on three caster wheels, containing ball-bearings. Two of the side members are connected by a horizontal cross member, at the ends of which two nuts carrying bevel-gear faces are mounted on ball-bearings. The bevel faces are engaged by bevel gears fixed to the above-mentioned cross member, which latter is in turn agitated by a bevel gear mounted on a shaft having a crank at its end. The gear ratio between the crank and the gear carrying the jack is 400 to 1, so that very heavy loads are easily elevated. The combined use of two outfits may take the place of a turntable. It has a double-reinforced steel tube with a brass tube drawn over. It is clamped to the frame of the car and connected thereto by a .75-inch cold-rolled steel rod, which has an oil-tempered spiral spring around the same. The latter is connected to the clamps by four bolts. The clamps are of solid brass.

Grinnell Automobile Glove—The Morrison-Ricker Manufacturing Co., Grinnell, Ia., manufactures an assortment of gloves for the automobilist and cyclist. A ventilated or unventilated glove called the Grinnell is one of the types designed for the automobilist. It is made of colt-skin and is washable in soap and water or gasoline. It fits the wrist tightly and has a quick-adjusting slide fastener and a stiff leather-lined cuff. A short-wrist glove made of colt-skin hide and one specially made for the cyclist, with a new double palm, also of colt-skin, are manufactured. A glove called the Grip-Tite has just been manufactured. The Grip-Tite has an extra palm, sewed so that the leather puckers between the stitches to form corrugations which permit a firm grasp on the handle bars or steering wheel.

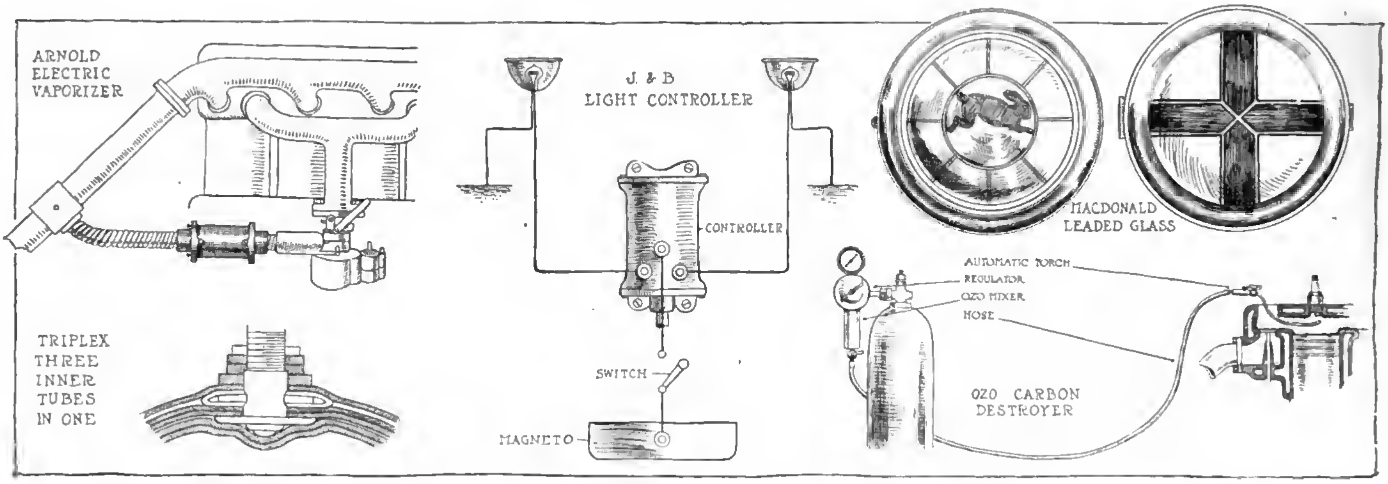
Pratt Automobile Jack—The W. E. Pratt Manufacturing Co., Chicago, Ill., manufactures malleable-iron castings, automobile jacks and accessories. The Pratt jack is made of malleable iron, finished in aluminum bronze. There are only six parts, held together by two bolts in a one-piece frame. The standard is so made that it cannot leave the upright support; it raises the load one notch at a time on every downward stroke. A small trigger, at the base of the frame, determines whether the jack is being raised or lowered. The company also manufactures a spring bumper.

J. H. Tonneau Shield—The J. H. Tonneau Shield Co., New York City, manufactures a windshield designed to protect the occupants of the rear seats of an open car. This shield is collapsible and consists of three sections hinged together at the vertical members of the frames which hold the edges of the transparent panes. To the two hinges connecting the three sections, two horizontal arms are secured the other ends of which are fastened to the rear of the driver's seat. The two small side sections or either of them may be folded over the large main section, and the whole arrangement may be turned about the axis formed by the two joints, so that the shield may be used as a table. The shield frame is made of brass and oxidized steel, and a waterproof curtain is attached to the lower edges of all sections, so as to protect the legs of the passengers against rain.

Herroline Fuel Enricher—Herroline, a gasoline improver,



Sketches of the Tuthill spring, Detroit oiler, Campbell all-in-mesh gear, Boston starter, Dependo gauge and O-Tak-A Jr. tire tool



Arnold vaporizer, Triplex inner tube, J. & B. light controller, Ozo carbon destroyer and MacDonald leaded glass

is manufactured by the Improved Gasoline & Oil Co., Chicago, Ill. It is the discovery and invention of W. H. Herron. Herroline consists principally of hexane and iso-hexane, with a very small quantity of sulphur. The chemical formula is approximately C_6H_{14}.

Arnold Electric Vaporizer is an electric heating device placed in the air intake of the carbureter in order to secure hot air for starting purposes. The vaporizer consists of an electric resistance coil, battery and switch. When the switch is thrown on the vaporizer becomes hot in 30 seconds. The carbureter is then flooded in the usual manner and the motor started. The switch controlling the vaporizer is not shut off until the motor becomes sufficiently warm to run without the aid of the preheated air. This is made by the Arnold Electric Co., Boston, Mass.

The Triplex inner tube is, as its name suggests, in reality three different tubes, three being used so that in case one is punctured it calls for a second inflation to bring the second tube into use and in case of its puncturing an additional inflation will bring the third tube into service. A three-way valve arrangement is used so that each tube can be inflated separately. When the outer tube is being used the two inner ones fold against the inside half of the outer tube so as to be away from the tread of the tire in case of puncture. Inflating the second tube simply causes it to fill all the space within the first one. Inflating the third tube, which is the innermost of all, acts in a similar manner. The tube is made by the Triplex Tube Company, Boston, Mass.

J. and B. Light Controller—This switch controls the output of the Ford magneto so that when this instrument is used to generate current for the lights the bulbs are held at their full incandescence, regardless of the motor speed. When the motor is running at high speed the bulb goes beyond its full incandescence and the filament is fused out. The controller is installed directly forward of the carbureter. It is operated by the lever which controls the throttle. The use of the device enables the current to be controlled to such an extent that it can never burn out from excess current. The only labor necessary is to drill three 3-16-inch holes between the motor base and frame. The connecting levers are arranged to fit the present carbureter and the wiring is according to the diagram given in the accompanying illustration. This is made by the J. and B. Mfg. Co., Pittsfield, Mass.

MacDonald Leaded Glass is used in leaded glass headlights which, while not appealing to those using the car for country travel, make excellent distinguishing marks for the automobile when used in city work. Town cars are especially adapted for these lights. The side and tail lights are greatly beautified by the use of these distinguishing designs which are made up in the form of monograms, crests, emblems, initials or devices in desired colors and set in the automobile lamp. Red Cross marks for physicians are particularly appropriate in leaded glass. This glass is made by Donald N. MacDonald, Boston, Mass.

Ozo Carbon Remover is a garage outfit consisting of an oxygen tank and burner for burning out carbon from the cylinder by the aid of Ozo. Ozo is a flameless gas which consumes the carbon without the use of fire. The outfit is operated by leading the tube from the gas tank and regulating apparatus through the spark-plug or valve cap of the cylinder. The use of this apparatus does not require the motor to be dismounted further than the removal of the spark-plug. The work can be done on an ordinary four-cylinder motor in 20 minutes. It is operated by one man who merely holds the nozzle of the hose through the opening of the cylinder until the carbon has been completely burned from the cylinder. The temperature of combustion is not high enough to fuse the plugs or to do any other damage. This device is made by the Ozo Co., Boston, Mass.

Cook's Automobile Oils—The Albany Lubricating Co., New York City, manufactures the Cook's lubricant and Albany automobile oils and greases. The company claims that its greases will not gum or clog up or will not run or leak out of the gear case or cannot be thrown off the gears by centrifugal force or affected by changes of temperature.

Head-Light Glare Remover—It is difficult to drive against the glare of approaching headlights. In order to rob these of dazzling power this device has been designed. It consists of an amber-colored glass clipped to the windshield in such a position that the driver can see through it by merely inclining his head. When a car is approaching and the glare becomes too dazzling it is merely necessary to look through the colored glass. It is made by William L. Toby, East Boston, Mass.

The New Era tire casing, a product of the New Era Tire & Rubber Company, Boston, Mass., is made up of five layers of para gum alternating with layers of coarse Egyptian cotton fabric. Outside of these is placed the cushion and breaker strip made of pure gum and of liberal thickness in the tread portion. Outside of this comes the binder formed of compounded rubber, thickened slightly at the tread and extending clear around the fabric and forming the outside lower wall of the tire. Lastly comes the tread of white rubber. These casings are made in standard clincher sizes.

Whitney differential roller bearings are interchangeable with the standard series of ball and roller bearings now on the market.

They are adjustable tapered cup and cone bearings, but without the objectionable feature of tapered rollers having restraining shoulders and guiding members to keep them in position.

All loads, both radial and thrust, resolve themselves into forces delivered at right angles to the axis of the rolls; which consequently transmit their loads normal to the contact surfaces without tendency to creep, either one way or the other.

The containing cage is simply a floating guard member, and is not subjected to any of the load forces carried or transmitted by the bearings or rollers.

Motorol, a lubricant produced by the N. Y. & N. J. Lubricant Co., New York City, is made in six grades. It is claimed to be non-carbonizing, made from the selection of the crude oil to the last process of refining. This company also manufactures a product called Non-Fluid Oil, in two grades. This oil varies in consistency, according to what gravity of mineral oil is used, and it is claimed will not drip or cause a waste.

The A. W. Harris Oil Co., Providence, R. I., is this year producing several grades of oil, also a metal polish called Scouree. The light grade of oil is especially adapted for high-speed motors, having a high fluidity and being practically carbonless. A heavy bodied oil of exceptionally high flash test is also made. Two grades of transmission oil are also produced by this company.

The Albany Lubricating Co., New York City, is manufacturing four grades of lubricants. The extra-light, of golden yellow color, is especially adapted to closely fitted pistons and high compression water-cooled engines; the light, a medium body and high flash point adapted for compression, splash or gravity feed systems in any type of water cooled motors; the medium, heavier than the previous and of best use with loose pistons as an aid for retaining the compression; and the heavy, of use only where the piston is badly worn and where extreme heat is developed. These oils are put up in barrels ranging from 30 to 50 gallons.

The Texas Co., New York City, is producing Texaco, a motor oil, which it claims has a zero cold, remaining fluid in mid-winter.

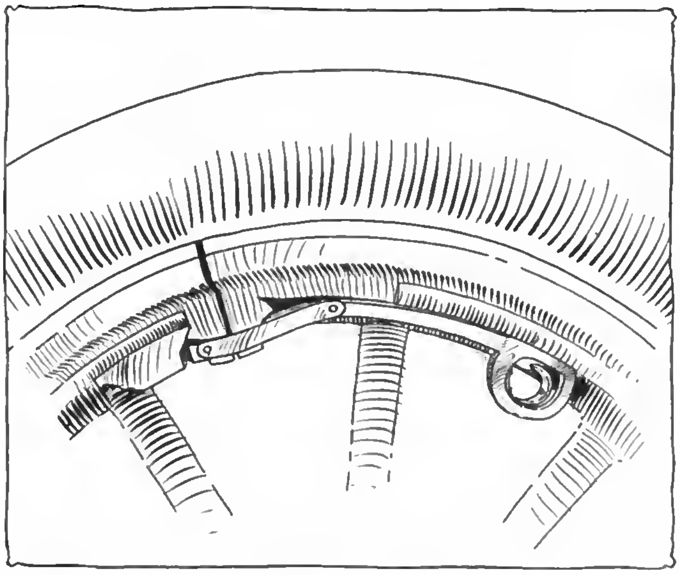
Gargoyle, a product of the Vacuum Oil Co., Rochester, N. Y., is made for the lubrication of all parts of internal combustion engines used for marine purposes. Mobilubricant, another product, is a grease prepared for use in compression cups and gearcases.

Oilzum is a trade-mark of the White & Bagley Co., Worcester, Mass., signifying several grades of oils and greases. These oils, it is claimed, are absolutely carbonless and especially adapted for winter uses. A smooth mineral grease of proper consistency for packing axles, ball and roller bearings, etc., is also produced. Washzum and Cleanzum, the former for cleansing the car and the latter for the hands, are also made.

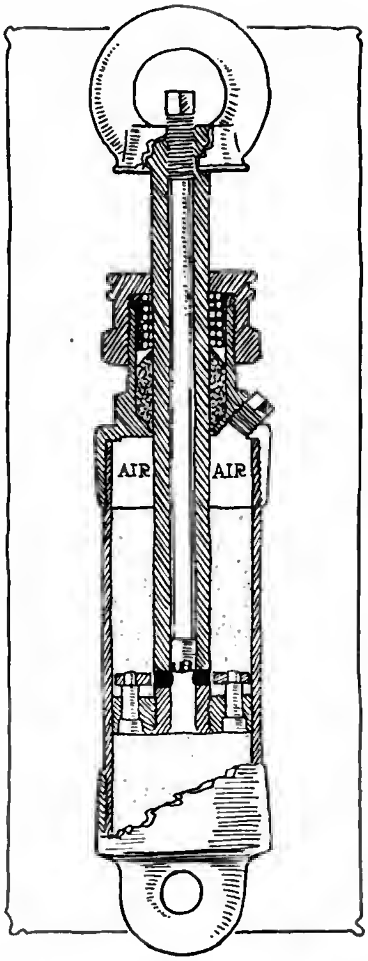
The Turner Brass Works, Sycamore, Ill., is manufacturing motor washers. These are made in three sizes, 1 quart, 2 gallon and 5-gallon tanks. The 1-quart tank is a small hand machine made of drawn brass, with the bottom brazed into place and fitted with a Turner non-leaking filler plug. The handle is an automatic pump, which forces the liquid through an adjustable nozzle. The 2 and 5-gallon tanks are of drawn steel, equipped with a pressure gauge registering up to 100 pounds, having large hand pumps, also connections so they may be attached to a pressure tank or to a power-driven pump in garages where such are used. These washers are fitted with 10 feet of cloth insertion rubber hose and adjustable nozzle. Kerosene may be used and the same results obtained as by using gasoline and is much cheaper. By merely turning the nozzle either a finely-divided spray or an intense needle stream may be obtained.

The Presto demountable rim, the product of the Presto Inter-Rim Co., Boston, Mass., consists of a split side locking ring which rests in a V-shaped groove in the outer edge of the wheel felloe. Each end of this split ring has a hook-shaped piece which is caught between a toggle mounted on the permanent band on the wheel felloe. After positioning the demountable rim and tire on the felloe it is only necessary to position the split locking ring and press the toggle locking device up into position against the wheel felloe. There is not any nut or other locking arrangement used.

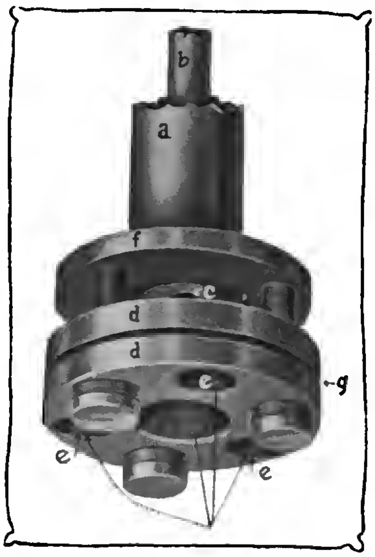
Bair Auto Top Holder, made by the Auto Specialties Mfg. Co., Chicago, Ill., is designed to do away with the unsightly strap device. It is a mechanical device consisting of a rigid separator and a clamp which holds the bows tightly in place and does not permit the weight of the top to be carried entirely by the bottom bow but distributes it equally etween each of the bows. The top holders are sightly and can be manipulated quickly.



Locking device on the Presto demountable rim



General assembly of the Flentje shock absorber, showing how the liquid and air are distributed undes normal conditions, that is to say, when the car on which the device is mounted is traveling over a smooth and level road surface. Under these conditions the action of the spring is not interfered with



Flentje piston. The hollow piston rod a, contains a valve b, for regulating the opening c. There are three bevelled holes, e, through which the liquid passes unless checked by the non-return valve g which covers the holes

The Flentje shock absorber is a hydraulic recoil absorber. The energy of the recoil is absorbed by making it do work in forcing a liquid called oil-o-mica through small openings in a piston rod. A sectional view of the device given in the accompanying illustration shows it to be of plunger formation, a movable piston being carried in a cylinder about 80 per cent. full of liquid. The weight of the car is carried by the car spring, but a movement of the car causes a corresponding movement of the piston through the liquid. At the top of the cylinder is a packing box stuffed with braided expansion packing held in place by a spiral spring. This prevents leakage past the piston rod.

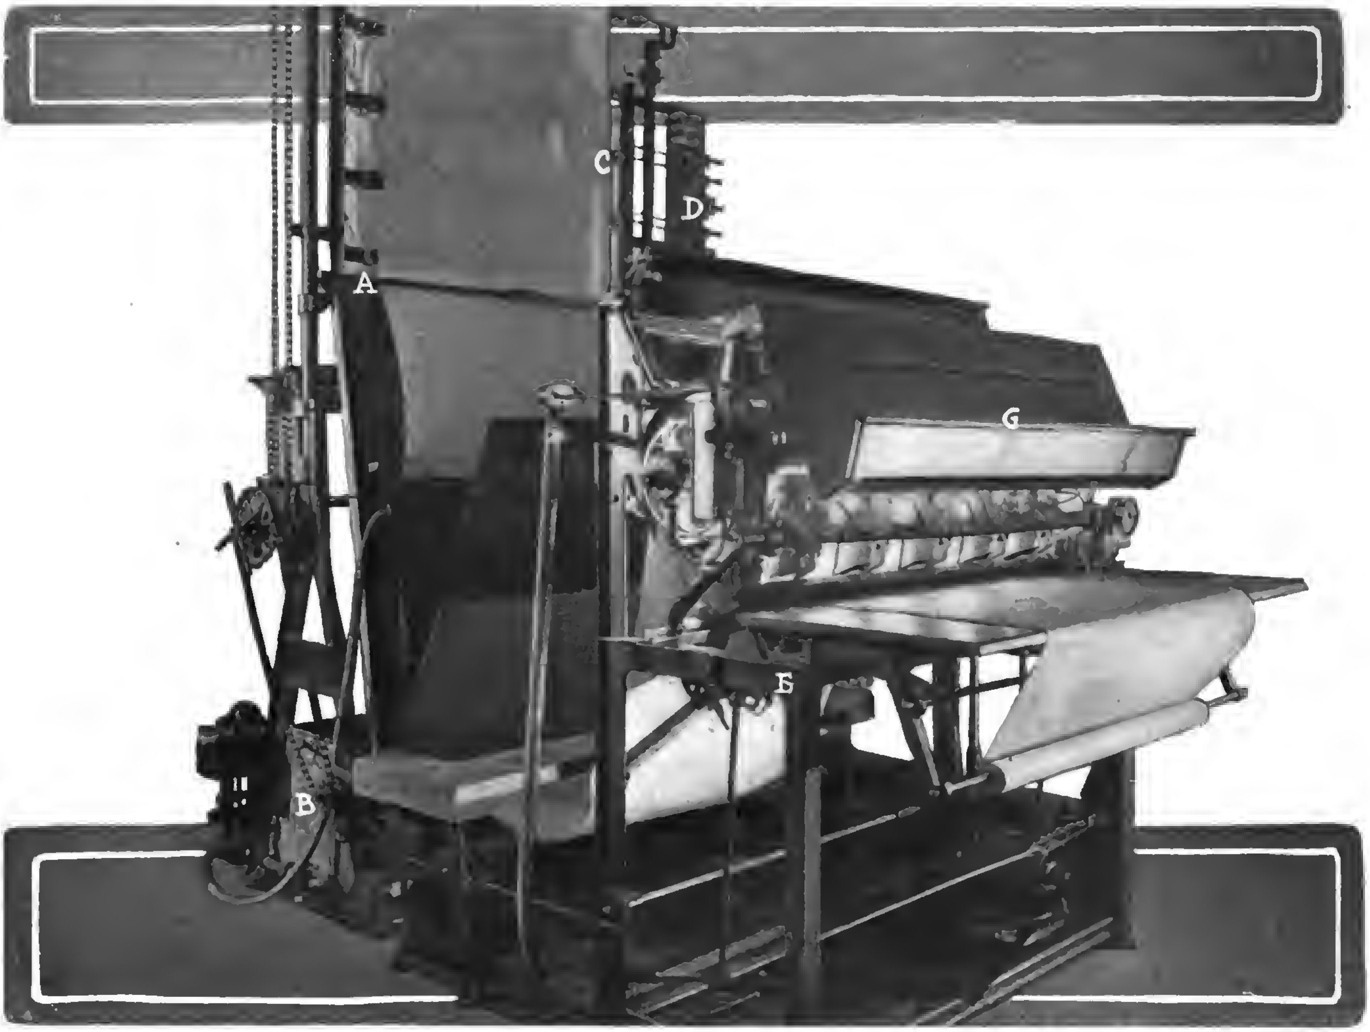
A glance at the piston will show that it is of unique construction. Through it there are three beveled holes which form the relief passages for the fluid on the down stroke. A check valve rests upon the piston which closes the three holes on the recoil stroke. When these coil holes are closed the only passage available for the fluid is through the small hole in the hollow piston rod. The entrance to this opening in the piston rod can be controled by a needle valve regulated from the top of the rod. This forms the only adjustment required to regulate the action of the device.

When passing over smooth roads the action of the spring is not interfered with as the amount of work given up in passing the liquid through the recoil opening is very slight. On a severe jounce, however, the air on top of the liquid mixes with the latter and expands it, checking the violent recoil.

The Edmunds & Jones Mfg. Co., Detroit, Mich., is this year producing several grades of lamps, including gas and electric, and also a generator. This company produces a special lamp with parabolic reflectors, guaranteed to give highest efficiency, having an adjustable device.

The B. & L. Auto Lamp Co., New York City, is manufacturing automobile lamps and generators suitable for large touring cars, runabouts and motorcycles. All the lamps are soldered and riveted, standing the constant vibration of large cars and all sort of hard service.

Factory Miscellany



Special blueprint machine used in the factory of the Willys-Overland Co., Toledo, O.

AT the gateway to the shop stands the hlueprint machine. Before the parts are turned out the tracings must pass through this machine so that reproductions of the drawings showing the details of each part can pass to the workmen. The machine shown herewith is the improved instrument used in the Overland factory. The machine is designed to produce the largest possihle number of prints at the lowest possihle cost. It is in daily operation at the factory in Toledo. The machine is fed from a 42-inch roll of hlueprint paper, and its output of finished prints is about 100 yards an hour. The speed of the machine can he increased up to 200 yards an hour if desired. The tracings are fed past a hank of arc lamps and are returned to the tracing tray marked G, at the operator's hand as he stands at the front of the machine. A canvas helt with tension springs is used to convey the paper and tracings through the machine. From the printing machine the paper passes automatically to the washing and drying machine. These machines can he arranged to work independently or as a unit. In the above illustration A is the spray pipe feeding the water over the paper which runs by gravity to the washing tank B. C is the electric drier composed of a series of resistance coils. D is a set of switches providing eleven gradations of heat, enahling the operator to regulate the temperature according to the speed of output at which the printer E is operating.

GRAY & DAVIS Plan Factory—Gray & Davis, Boston, Mass., manufacturers of automobile accessories, will establish a factory at Cambridge, Mass. The proposed building will be five stories high, 381 1-2 feet long by 81 feet wide on the first floor and 61 feet above that, and is designed to allow for future additions and a power house. It will be absolutely fireproof throughout, being constructed of reinforced concrete. There will be a large showroom on the first floor, while the offices will be on the second floor, occupying the full width of the building for a length of 200 feet. The architects have given the windows 70 per cent. of the wall area. Work is being rushed at present.

Alston Saw Company's Factory—The Alston Saw & File Co. will build a factory, 4 by 103 feet at Folcroft, Pa.

New Automobile Factory—C. H. Lambert, formerly with the W. J. Gillette Mfg. Co., Louisville, Ky., will establish an automobile factory there. Final details have not yet been determined.

Bent Rim Company Builds—The Bent Rim Co., Lowell, Mich., will build a 50-foot square addition to its present plant.

Alliance Mill Factory Planned—The Alliance Rubber Co., Alliance, O., has made plans for the erection of a two-story brick mill factory building, 50 by 150 feet.

High Point Company Adds—The High Point Motor Co., is building an addition to its plant at High Point, Tenn., and contemplates the installation of new equipment.

Fire Damages Oliver Plant—Fire recently burned out the storage room of the Oliver Motor Truck Co., Detroit, Mich., with an estimated damage to the stock of about $15,000.

Gibson Looking for Site—The Gibson Motor Car Co., Pittsburgh, Pa., is looking for a site for an automobile plant. It contemplates manufacturing a commercial truck adapted to Pittsburgh's topographical conditions.

Tire Plant in Jacksonville—Jacksonville, Fla., will have a big industrial plant, employing some 500 hands and turning out 300 tires per day, together with other automobile accessories in which rubber is used, to be known as the Seminole Rubber Co., a concern with a $1,000,000 capital.

Racine Company's Factory—The Chicago Rubber Clothing Co. recently dedicated a large new four-story factory building, forming the largest unit in the factory group at Racine, Wis., where the company has its main works and headquarters. The new building will be devoted exclusively to the manufacture of motorists' apparel of all kinds.

Detroit Steel Products Adds—The Detroit Steel Products Co., Detroit, Mich., has taken steps for the establishment of a branch plant in Windsor, Ont., and has acquired a 5-acre site for its factory. The general plan of the plant will be along the lines of the Detroit factory, and it will be equipped for the manufacture of automobile springs, steel windows, etc.

Falls Machine Starts Building—The Falls Machine Co., Sheboygan Falls, Wis., a large manufacturer of motors for the car-building trade, has commenced work on a large addition which will increase the capacity about 40 per cent. The building will be 140 feet long and two stories high, of brick and steel construction. It will contain a large assembling and testing floor.

Building to Cost $100,000—It is announced that W. J. Hughey, of William J. Hughey & Son, Chicago, Ill., manufacturers of limousine and automobile bodies, who recently purchased the 124 feet by 125 feet plot of ground at Prairie avenue and Thirty-third street for $40,000, plans to improve with a concrete four-story building, to cost about $100,000, to be occupied by the company.

Grant-Lee Enlarges—Ground has been broken for a new addition to the factory of the Grant-Lee Machine Co., of Cleveland, O. The additional space will enable the company to increase its production facilities by 50 per cent. and to still further improve its output of transmission gears, timing and bevel gears, worms and differentials. The new building will be constructed of brick and concrete.

Wants Factory Equipment—The Four Wheel Drive Auto Co., Clintonville, Wis., which recently increased its capital to $250,000 and has broken ground for a large group of motor truck shops, is in the market for a 150-horsepower Corliss steam engine, with direct connections; a 175-horsepower boiler; and a long list of tools, including turret lathes, milling machines, grinders, engine lathes and other equipment.

Motor Foundry Company Extends—The capital stock of the Motor Foundry Co., Detroit, Mich., has been increased from $35,000 to $100,000 to provide funds for extensions of plant, necessitated by greater business activity. Several new buildings are to be erected adjoining the present plant. The company employs 265 men and does a grey iron casting business of from 40 to 50 tons a day. The additions will raise its capacity to 80 tons.

Ohio Electric Expands—The Ohio Electric Car Co., Toledo, O., has prepared plans for the building of two additional buildings, one 60 by 240 feet and the other 60 by 240 feet. The first will be two stories and the second three. Both buildings will be erected on the modern daylight plan and will double the capacity. When the buildings are finished the company will increase its force and manufacture many of the parts now purchased from other concerns.

Plan Large Aluminum Works—The Southern Aluminum Co., Whitney, N. C., has given contracts for the erection of a hydro-electric plant. In the construction of this plant about twelve steam shovels, an electrically driven air compressor developing 5,000 horsepower, a plant with a daily capacity of 1,500 cubic yards of stone and concrete, and twenty steel derricks with masts 115 feet high and booms 110 feet long for a 20-foot lift, etc., will be used. About 600,000 yards of masonry will be required, and the contract calls for excavating the aluminum factory site and the spillway and building a dam and power house at the narrows on the Yadkin River, the dam to be about 200 feet high and develop a 177-foot head, generating 220,000 horsepower. All of this energy will be used by the aluminum factory, lighting the plant, and industrial city to be built, etc. It is understood that about $6,000,000 will be invested for the dam, power house, water power, machinery, electrical equipment, aluminum works, industrial city, etc.

The Automobile Calendar

Shows, Conventions, Etc.

April 5-19.........Pittsburgh, Pa., Annual Show, East Liberty Market House, Dealers' Association.
April 21-26........San Antonio, Tex., Annual Show, San Antonio Motor Car Show Co.
June 5, 6, 7.......Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October ....Paris, France, Automobile Show, Grand Palais; 10 days.
November ....London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

April 23-27.........San Antonio, Tex., Track Meet, San Antonio Automobile Club.
April 28-30.......Chicago, Ill., Commercial Vehicle Demonstration, Chicago Motor Club.
May 2.............New York City, Secret Time Run to New Rochelle, Motor Dealers' Contest Association.
May 5-8..........Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14...........New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 30............Indianapolis, Ind., 500-Mile Race, Speedway.
June 7............Philadelphia, Pa., Inter-Club Reliability, Quaker City Motor Club, Autombile Clubs of Delaware County, Philadelphia and Germantown.
June 25-28.......Chicago, Ill., Non-Motor-Stop Reliability, Chicago to Boston, Chicago Automobile Club.
July 1............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16.........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 4-5..........Sioux City, S. Dak., Track Meetings, Sioux City Automobile Club and Speedway Association.
July 5-6..........Tacoma, Wash., Road Race, Montemara Festa Automobile Committee.
July 8-16.........Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 27-28.........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 27...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

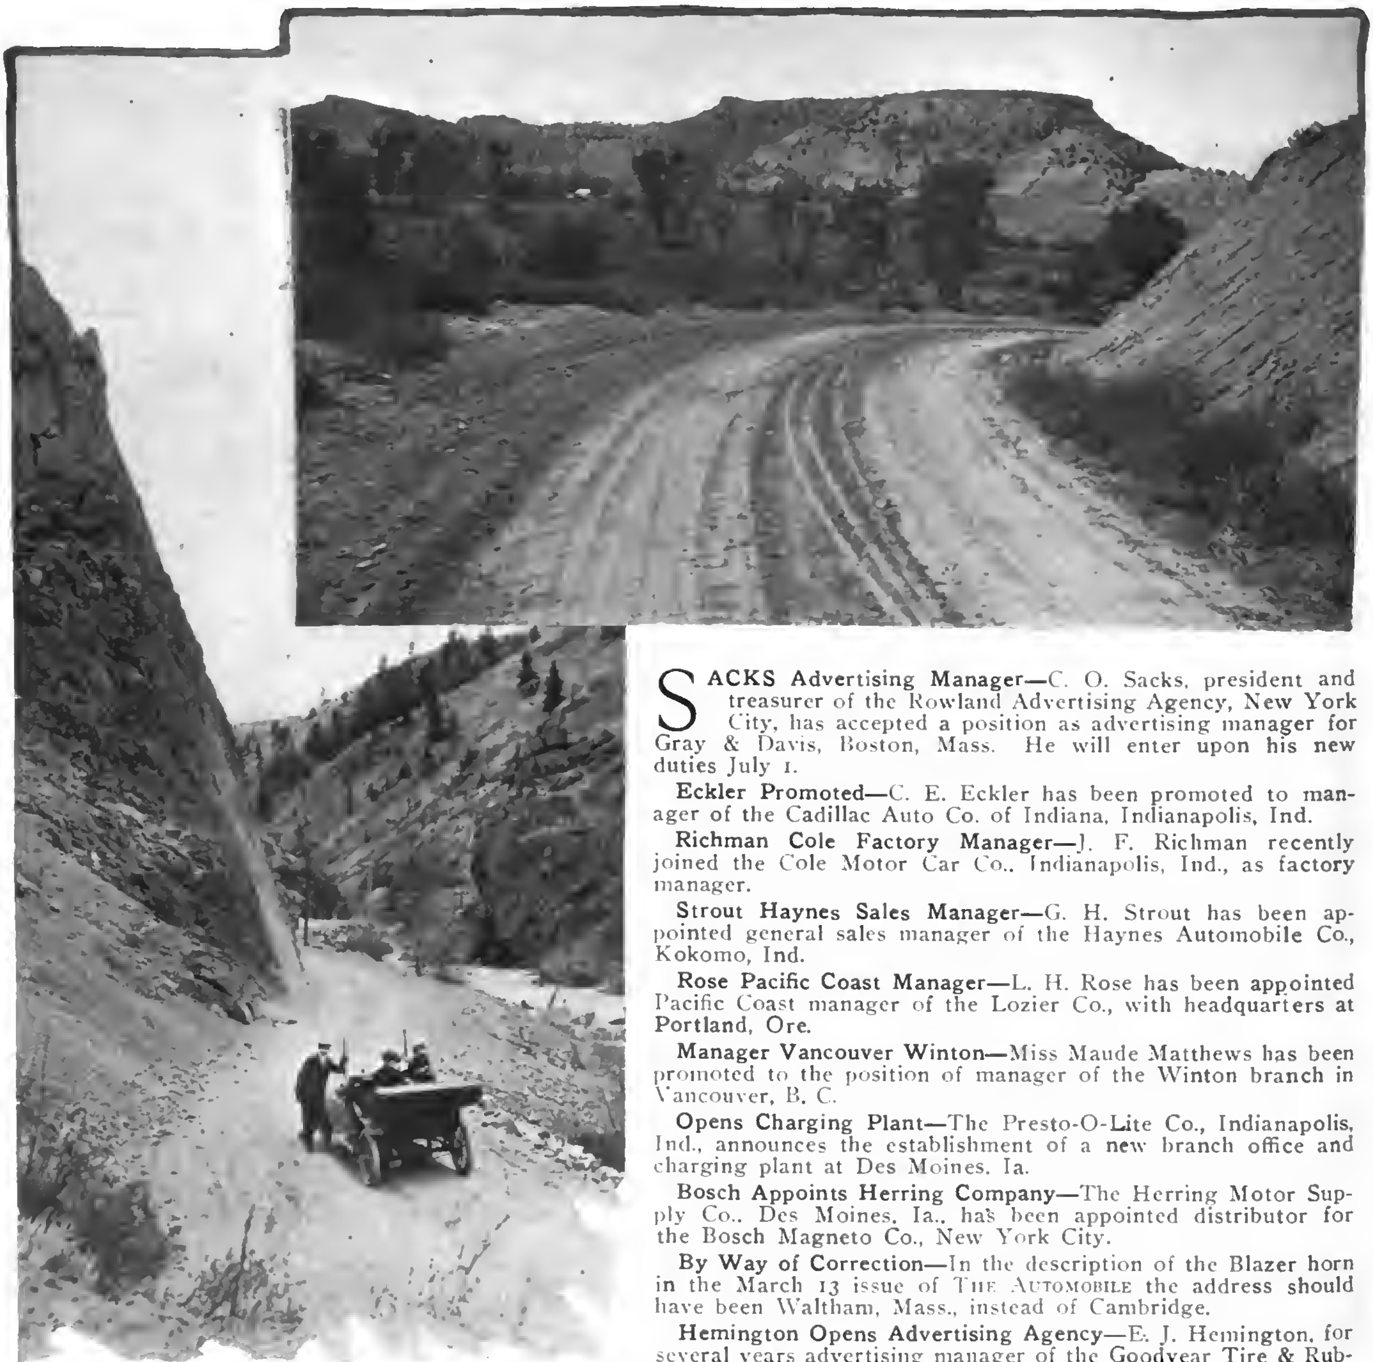
Foreign.

April ....Barcelona, Spain, International Exhibition.
May ....St. Petersburg, Russia, International Automobile Exposition, Building of Michael Maneze, Imperial Automobile Club of Russia.
May 7-10-11.......Paris, France, Sarthe Automobile Meeting and Speed Hill Climbing.
May 11-12.........Palermo, Sicily, Targo-Floria Race.
June 23-28........London, England, International Road Congress.
July 12............Amiens, France, Grand Prix Race.
July 13............Paris, France, French Grand Prix Cyclecar Race.
July 18-26.........London, Eng., Imperial Motor Transport Conference.
Sept. 21...........Boulogne, France, 3-Litre Race.
Sept. 25...........Isle of Man, International Stock-Car Race.
October ....Paris, France, Paris Automobile Show.

The Esterline Co., Lafayette, Ind., has outgrown its present quarters and is now occupying a new three-story factory on South street in Indianapolis, and by May 1 will have increased its working space to over double its present size. The factory in Lafayette is operating to capacity and will be continued until fall, when it will be merged with the Indianapolis factory

The Week in the Industry

Engineer — Dealer — Repairman — Garage



On the Lincoln Highway

Plans for the development of a great transcontinental route through central Colorado to form a link in the national highway are being carried out by the Lincoln Highway Association of Colorado. The upper illustration gives an excellent idea of the good roads in the Pike's Peak region, being a section of the Colorado Springs-Canon City state highway. The lower illustration is from a photograph taken in Ute Pass, just west of Colorado Springs and Manitou

SACKS Advertising Manager—C. O. Sacks, president and treasurer of the Rowland Advertising Agency, New York City, has accepted a position as advertising manager for Gray & Davis, Boston, Mass. He will enter upon his new duties July 1.

Eckler Promoted—C. E. Eckler has been promoted to manager of the Cadillac Auto Co. of Indiana, Indianapolis, Ind.

Richman Cole Factory Manager—J. F. Richman recently joined the Cole Motor Car Co., Indianapolis, Ind., as factory manager.

Strout Haynes Sales Manager—G. H. Strout has been appointed general sales manager of the Haynes Automobile Co., Kokomo, Ind.

Rose Pacific Coast Manager—L. H. Rose has been appointed Pacific Coast manager of the Lozier Co., with headquarters at Portland, Ore.

Manager Vancouver Winton—Miss Maude Matthews has been promoted to the position of manager of the Winton branch in Vancouver, B. C.

Opens Charging Plant—The Presto-O-Lite Co., Indianapolis, Ind., announces the establishment of a new branch office and charging plant at Des Moines, Ia.

Bosch Appoints Herring Company—The Herring Motor Supply Co., Des Moines, Ia., has been appointed distributor for the Bosch Magneto Co., New York City.

By Way of Correction—In the description of the Blazer horn in the March 13 issue of THE AUTOMOBILE the address should have been Waltham, Mass., instead of Cambridge.

Hemington Opens Advertising Agency—E. J. Hemington, for several years advertising manager of the Goodyear Tire & Rubber Co., Akron, O., has opened the Hemington Advertising Agency, Akron.

Borland-Grannis Moves—The executive offices of the Borland-Grannis Co., Chicago, Ill., have been moved from their Chicago retail sales rooms on Michigan avenue to their factory at 310 East Huron street.

Martin Resigns—H. F. Martin, who has been general sales manager of the Pennsylvania Steel Co., has recently resigned and has taken a similar position with the Eveland Engineering & Mfg. Co., Philadelphia, Pa.

New Agencies Established During the Week

St. Paul, Minn.	Sternberg	E. F. Morgan

Automobile Tire Station Opened—A tire salesroom and repair shop known as the Auto Tire Station has been opened at 9 Park street.

To Build Birmingham Garage—The contract has been let for the erection of a garage for the Birmingham Motor Co., Birmingham, Ala.

Krit Philadelphia Agency Moves—The Philadelphia, Pa., branch of the Krit Motor Car Co. has moved to larger quarters at 256 North Broad street.

Buys Out Business—Arthur H. Chandler has purchased the garage business of David Brown, Jr., at Plymouth, Mass., and will continue it on a larger sacle.

Supply Station Established—An adjustment depot, supply station and office have been opened at 107 Albany avenue by the B. F. Goodrich Co., at Hartford, Conn.

Miller Heads Alco Sales—E. Spencer Miller has been placed in charge of sales of Alco pleasure cars at the Philadelphia, Pa., branch of the American Locomotive Co.

Decker Penn Sales Manager—G. W. Decker, for several years the general manager of the Erie Rubber Co., is now the sales manager of the Penn Auto Co., Erie, Pa.

Russell Establishes Taxicab Line—W. E. Russell has established a taxicab and transportation line at Fond du Lac, Wis., and will soon be in the market for additional cars.

LaCrosse Dealers Association Formed—Fifteen motor-car dealers of LaCrosse, Wis., have banded together for mutual benefit and organized the LaCrosse County Automobile Dealers Assn.

Will Cost $50,000—The Packard Motor Car Co., Detroit, Mich., is erecting salesrooms and a service station in Milwaukee, Wis., which will cost $50,000. H. P. Robinson will be manager.

Back on the Job—C. T. Lawton has resumed the position of sales manager of the Bi-Motor Equipment Co., at Boston, Mass., after an absence of some months spent in developing the business elsewhere.

Has His Own Garage—A. E. Riggs, formerly with the Harvard garage in Cambridge, Mass., has just gone into business for himself and he has opened the Austin garage and repair shop at 139 Austin street.

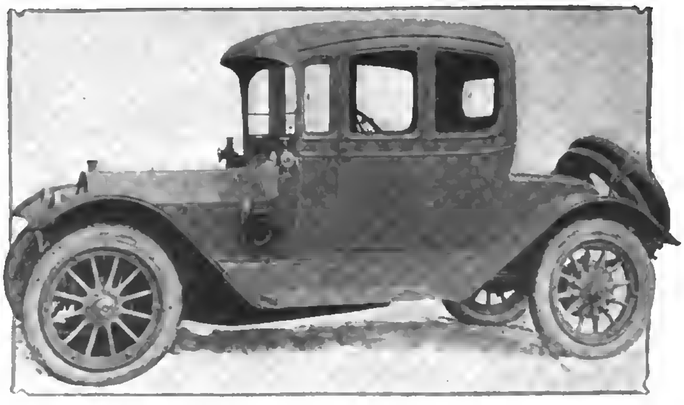
Continental Truck Moves—The Continental Motor Truck Co., Superior, Wis., has been obliged to move into larger quarters to cope with its growing business. The company has leased for a term of years the Carey building at Tower avenue and Nineteenth street.

Baltimore Wants More Automobiles—The purchase of two additional automobiles was authorized by the Baltimore, Md., board recently. One is to be bought by Building Inspector Stubbs and the other by Electrical Engineer Thomas. Each department is to get a Studeaker car at a cost not to exceed $1,290.

Harrisburg Automobile Field Growing—Automobiles have added forty-five buildings, worth about $45,000, to Harrisburgh, Pa., during the past year according to figures secured from the office of the building inspector. From April 1, 1912, until April 1, 1913, permits for the erection of garages valued anywhere from $50 to $20,000 have been issued.

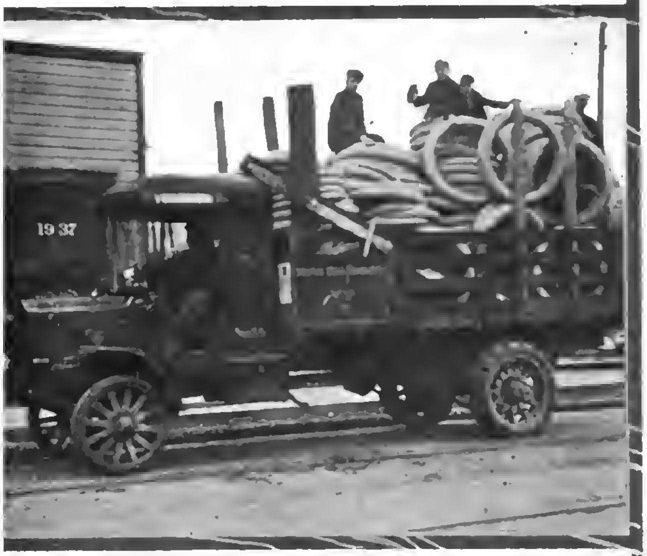
Receives Stewart Patrol Wagon—Delivery has been made in New Orleans, La., of a new motor-driven patrol wagon. The new car will accommodate eleven passengers. The car was furnished by the Stewart factory, Buffalo, N. Y.

Alterations Double Goodyear Space—Alterations now in progress will on completion provide nearly double the present space of the Hartford, Conn., branch of the Goodyear Tire & Rubber Co. An adjoining store formerly used by Kilby & Barrett, the Matheson representatives has been acquired.



Locomobile coupé mounted on little six chassis, adapted from the seven-passenger Berline. Shows close adherence to the current foreign style, which for this year presents all closed car with roof lines unbroken by dormer effects and with no angular breaks at the sides or back. All windows may be readily lowered, giving the advantages of an open car in warm weather

Typical scene in Dayton, O., during the flood, showing house which has been set loose from its foundation



Tires were donated liberally for relief work cars during the flood which recently devastated Dayton, O.

Another use to which the Packard truck was applied during the Dayton flood. Carting away dead animals

Firestone Tire Moves—The Firestone Tire & Rubber Co. has just moved into a new fireproof garage on West Central street, Boston, Mass., 55 by 90 feet.

Hotel Garage Now—F. W. Trowbridge, proprietor of the Knox House at Thomaston, Me., has just bought the Stackpole buildings on Green street which he will convert into a garage to run in connection with his hotel.

With Republic Company—H. E. Parent, formerly in charge of the repair department of the Cadillac agency in Boston, Mass., has resigned to take a similar position with the Republic Motor Co. there, that handles the Chevrolet Six and the Little car.

Harris Goodrich Washington Manager—F. L. Harris has been appointed manager of the Goodrich tire branch in Washington, D. C., succeeding B. A. Thurin, who has been transferred to the Goodrich factory. Mr. Thurin is to be appointed the Goodrich manager in one of the Middle West cities within the next few weeks.

New Salesroom Opened—The Myer Abrams Co., agent for the Lauth Juergens trucks, has turned a portion of its store on Portland street, Boston, Mass., into a salesroom for trucks and it has two machines there now. The reconstruction of its service station in Cambridge, on Vassar street, that was destroyed by fire a few weeks ago, has been finished and the company is now occupying it again.

Bowman Assistant Sales Manager—F. P. Bowman, formerly Eastern sales manager of the Schacht Motor Car Co., Cincinnati, O., has become assistant sales manager for the Norwalk Motor Car Co., Martinsburg, W. Va., with headquarters at Chicago, Ill., and will have charge of the sales in the States of Ohio, Indiana, Illinois, Minnesota, Michigan, Iowa, Kentucky and Wisconsin.

Automobile Incorporations

AUTOMOBILES AND PARTS

Berlin, Conn.—Berlin Auto Co.; capital, $25,000; to deal in automobiles. Incorporators: J. C. Lincoln, R. O. Clark, E. G. Robbins.

Boston, Mass.—M. B. M. Motor Co.; capital, $30,000; to deal in automobiles. Incorporators: G. W. Bollinger, E. H. Marsters, C. A. Malley.

Boston, Mass.—Curtis Motor Repair Co.; capital, $2,000; to deal and repair in automobiles. Incorporators: G. E. Crampton, A. W. Crampton, R. W. Curtis.

Buffalo, N. Y.—Ivey Motor Truck Co.; capital, $10,000; to deal in motor engines, etc. Incorporators: C. A. Ivey, A. L. Rusling, F. S. Heller.

Chicago, Ill.—Haynes Motor Car Co.; to deal in automobiles. Incorporators: A. E. Starbuck, Webb Jay, A. G. Seiberling.

Cleveland, O.—Standard Tire & Repair Co.; capital, $10,000; to deal in and repair self-propelled vebicles, machinery, etc. Incorporators: G. G. Moisey, O. A. Erb, L. T. Fay, R. F. Moisey, F. V. Brady.

Cleveland, O.—Krit Motor Sales Co.; capital, $10,000; to deal in automobiles. Incorporators: R. Scott Smith, C. A. Smith, M. A. Sell, C. B. Tenpler, D. Hakes.

Datroit, Mich.—Gilmore Motor Mfg. Co.; eapital, $35,000; to manufacture motors. Incorporators: George Gilmore, M. A. Sbaw.

Lowall, Mass.—Lowell Buick Co.; capital, $15,000; to deal in automobiles. Incorporators: F. B. Emerson, M. W. Hale, Jr., D. D. O'Dea.

Montraal, Que.—Canadian Drednot Motor Trucks, Ltd.; capital, $250,000; to deal in motor trucks.

Newask, N. J.—Smitb Motor Car Co.; capital, $25,000; general automobile business. Incorporators: J. L. Smith, L. W. Smith, J. W. Mason.

Naw Yoak City—Indiana Motor Truck Sales Co.; capital, $10,000: to manufacture and repair automobiles. Incorporators: W. A. Schwarzkoff, Rosalind Lovy, L. C. Knoegel.

New York City—Still's Automobile & Accessories Co.; eapital, $10,000; to deal in automobiles and accessories. Incorporators: J. H. Still, G. M. Still, G. E. Still.

Poatland, Oar.—Oregon Motor Car Co.; capital, $10,000; to deal in automobiles. Incorporators: E. R. Winchell, Robert Tucker, F. F. Griggsby.

Poatland, Ore.—Ford Taxicab Corp.; capital, $100,000; to manufacture, sell and deal in automobiles. Incorporators: N. R. Dexter, J. B. Reed.

Toledo, O.—Stewart Auto Sales Co.; capital, $10,000; to deal in automobiles. Incorporators: J. A. McMichael, L. E. Flory, E. A. Hudson, J. H. Baumgardner, J. W. Lane.

Yonkers, N. Y.—Yonkers Auto Renting Co.; capital, $3,000; to rent automobiles. Incorporators: William Lowa, Jr., Carl Lowa, Carolyn Lowa.

Naw York City—Normal Automobile Station; capital, $10,000; to carry on a garage business. Incorporators: J. F. Bokelman, A. Bokelman, Edward Gantner.

New Yoak City—Cox's Pneumatic Cushion Co.; capital, $1,000; to manufacture rubber goods and devices used by automobiles. Incorporators: C. H. Cox, Henry Seibel, F. R. Hoopes.

New York City—Allied Motor Accessories Co.; capital, $10,000; to deal in accessories. Incorporators: Annie Minford, G. X. Melbourne, A. K. Harroun.

New York City—Paul's Used & Rebuilt Auto Co.; capital, $5,000; to repair automobiles. Incorporators: G. W. Miller, August Paul, Jr., Albert Sigel.

New York City—National Tissue Advertising and Novelty Co.; capital, $50,000; to deal in automobile tires, axles and other patented articles. Incorporators: Josepb Berkowitz, Eugene N. Sanctuary, C. D. Stillman.

New Yoak City—East Side Auto Co.; capital, $3,000; to earry on a garage business. Incorporators: Morris Eder, Morris Levine, Bertha Levine, Joseph Truck.

Creditors Receive Checks—Creditors of the Flanders Mfg. Co., Pontiac, Mich., received on April 16 checks from the Detroit Trust Co., receiver for the Flanders concern, for 25 per cent of their claims.

Lasher Advertising Manager—H. P. Lasher, formerly with the Beckwith Advertising Agency, Detroit, Mich., has taken the position of automobile advertising manager of the Philadelphia, Pa., Press.

Robartes and King Transferred—F. W. Robartes, manager, and E. W. King, assistant manager, of the Locomobile branch in Washington, D. C., have been transferred to the Locomobile branch in Atlanta, Ga.

Springer President Insurance Company—W. H. Springer is president of the Auto Mutual Insurance Co., Omaha, Neb. This concern is based on the Ohio plan, insuring members against liability from fire or theft.

Blakely with Tribune—H. H. Blakely, former assistant purchasing agent for the Abbott Motor Co., Detroit, Mich., and previous to that holding a similar connection with the R-C-H Corp., Detroit, has been made purchasing agent for the Tribune Motor Co., that city.

Garage Changes Hands—The garage business conducted at Great Barrington, Mass., for the past 2 years has been sold by George M. Bullock, its proprietor, to Elton S. Jones of Riverton, Conn. It is one of the largest garages in the western part of Massachusetts.

Open Repair Shop—Fred Leonhardt and G. A. Woodward have opened a repair shop under the firm name of Leonhardt & Woodward at Toledo, O. The plant has been well equipped with machinery and appliances to handle the repair work and adjustments on all makes of automobiles.

At the Dayton Electric Laboratory Co., Dayton, O., after the flood. Donkey engine and fire engine pumping

Effect on Dayton property of the flood. Steel tank left in the street. Note condition of street

Relief work with a Speedwell. This car was courier for the military authorities between Dayton and Miamisburg

Automobile Incorporations

SCHENECTADY, N. Y.—Tri-City Auto Transit Co.; capital, $5,000; to carry on an automobile bus line. Incorporators: W. L. Coolidge, Bert Carl, J. R. Parker.

WORTHAM, TEX.—Wheatham Auto Supply Co.; capital, $600; to deal in accessories. Incorporators: A. N. Weaver, Roy Simmons, K. W. Sneed.

CHANGES OF NAME AND CAPITAL

LOS ANGELES, CAL.—Brown-Symonds Co.; change of name to the Walter M. Brown Co.

SAN ANTONIO, TEX.—San Antonio Auto Club House Co.; capital increased to $20,000.

TOLEDO, O.—Rapp Mfg. Co.; change of name to the Toledo Spark Plug Mfg. Co.

GARAGE AND ACCESSORIES

BROOKLYN, N. Y.—Haslup Brass Mfg. Co.; capital, $25,000; to deal in hardware, automobile accessories, etc. Incorporators: E. W. Haslup, F. D. Glover, Joseph Scholl.

BROOKLYN, N. Y.—Self-Generating Motor Co.; capital, $250,000; to deal in automobile appliances. Incorporators: O. G. Holzhausen, R. T. Maul, H. B. Wood.

BROOKLYN, N. Y.—Sumner Garage and Sales Co.; capital, $5,000; to repair automobiles. Incorporators: R. W. Katban, C. J. Gillem, E. H. Schmidt.

CHICAGO, ILL.—Specialty Sales & Mfg. Co.; capital, $5,000; to manufacture automobile and motor-cycle accessories. Incorporator: William Klein.

COLUMBIANA, O.—The Columbia Rubber Co.; capital, $100,000; to manufacture and deal in crude rubber and automobile tires and supplies. Incorporators: E. L. Henderson, A. E. Albright, H. J. Richards, J. H. Richards, T. Price.

DETROIT, MICH.—Crescent Co.; capital, $200,000; to manufacture automobile starting devices. Incorporators: H. H. Potter, F. W. Owen.

EAST PALESTINE, O.—McGraw Tire & Rubber Co.; capital, $1,000,000; to manufacture and deal in rubber tires and rubber goods and materials and products of every kind and automobile and motor vehicle accessories. Incorporators: J. C. Chaplin, C. H. Bolton, J. S. Wilson, George Flaccus, E. G. McGraw, L. H. McGraw, John Morgan, R. F. Taggart, R. B. Taggart, J. C. Chamberlin, H. C. Fraser, C. L. Merwin.

KANSAS CITY, MO.—Liquid Tire Co.; capital, $125,000; to manufacture a tire filler. Incorporators: C. S. Wright, G. L. Schofield, C. W. Prewett.

LORAIN, O.—Troike Muffler and Mfg. Co.; capital, $20,000; to manufacture mufflers for gas and gasoline engines. Incorporators: Ernst Troike, Paul Troike, George L. Deeher, G. L. Clitsch, A. H. Babcock.

LOUISVILLE, KY.—Mindease Co.; capital, $100,000; to manufacture and distribute Mindease, a composition of chemicals and ingredients, as a substitute for air in tires. Incorporators: M. J. Hickey, W. C. Broh, T. A. Peake.

MARION, O.—Marion Punctureseal Co.; capital, $5,000; to manufacture and deal in a substance for mending rubber tubing. Incorporators: S. J. Martin, F. P. Beck, I. C. Millison, J. B. Gunder, C. C. Miller.

MOUNT VERNON, N. Y.—Mount Vernon Co-Operative Garage Co.; capital, $3,000; to carry on a general garage business. Incorporators: Martin Lifgren, Robert Jacobsen, Lucy Jacobsen.

MOUNT VERNON, N. Y.—Brennan's Auto Garage; capital, $2,000; to carry on a garage business. Incorporators: A. J. Brennan, C. F. Renning, W. C. Clark.

NEW YORK CITY—Peerless Tire Co.; capital, $15,000; to manufacture automobile tires. Incorporators: Michael Schiavone, Louis Schiavone, Antonio Caropreso.

Automobile  Patents

SHOCK Absorber Construction—In which an air-bag between the axle and the body assists the spring suspension in absorbing the effects of road inequalities.

Fig. 1 shows the subject matter of this patent, a shock absorber, which consists principally of an air-bag A placed on the axle of an automobile. A cross-bar C engages the air-bag and presses it against the axle when it is moved. By means of members M the cross-bar C is connected with the body of the car in such a manner that the bag A must absorb shocks which tend to be transmitted from the axle to the body. A rebound absorber R is in place near each end of the cross-bar C, consisting of a piston connected with C through M and moved by it. A cylinder is provided for each of the pistons to work in, being open to the atmosphere at one end. A valve is arranged at the opposite end of each cylinder, this valve being formed with a vent and adapted to open freely when the piston is moved in one direction and to close in response to opposite movement of the piston, the only possible escapeway for the air being through the vent.

No. 1,058,253—to Thomas J. Mullen and Thomas F. Brennan, New Brighton, N. Y. Granted April 8, 1913; filed July 19, 1911.

Tire Tube and Signal—Consisting of an inflation valve and a sound signal which is operated when the air pressure in the inner tube falls to a certain point.

The device described in this patent is seen in Fig. 2. It consists of a pneumatic tire and a rim for carrying the same. A tube T extends radially through the rim and communicates with the interior of the tire. A plunger P extending through the tube is movable longitudinally through it. Means are provided for rendering the plunger airtight with relation to the tube T. The plunger carries a valve V to prevent the escaping of air when the latter is forced into the tire through the plunger. The plunger also carries a signaling device acting when the tire is deflated to a certain degree.

No. 1,058,571—John Emerson Featherston, Valley City, N. D. Granted April 8, 1913; filed September 27, 1912.

Tire-Deflating Tool—Being in place in the inflation-valve tube and operable from outside by pressure upon an arm.

In Fig. 3 the tire-deflating tool described in this patent is illustrated. This tool consists of a pair of spring-tensioned jaws J which are pivoted together and end in handles so formed as to be able to clamp the threaded extension E of a valve casing of a pneumatic tire. The jaws J have threaded linings of a material softer than the valve substance, insuring the firm gripping action of the jaws on the casing. One of the jaws has an aperture A in which the angular end of a spring arm S is secured, its free portion terminating into an offset extension O formed with threads. A socket member T is threaded to the extension O to receive an extension stem W of a valve in the casing mentioned, thereby holding the valve unseated. An eye-loop L is secured to one of the jaws for guiding the arm S. When the latter's angular end which protrudes through A is depressed, the valve is unseated, permitting the inflating air to escape.

No. 1,058,557—to Michael Lewis Connor, Pony, Mont. Granted April 8, 1913; filed September 12, 1912.

Automobile Shock Absorber—In which the main springs are assisted in their action by a cross spring and a cushion between the latter and the body.

In this shock absorber, Fig. 4, the main springs S are combined with a cross spring T connected to it by universal-joint means which consist of a pair of pivotally connected links at each end of T; the upper links hang from the ends of S and are movable in the planes of these springs, while the lower links are connected to the spring T and are movable in its plane. A cushion element C bearing against the car frame assists the springs and a shock-transmitting element E works between C and T; E consists of a transverse spring bar which is secured at its center to T and is connected at its ends by the car frame by means of links.

No. 1,058,413—to Walter H. Cook, New Orleans, La. Granted April 8, 1913; filed September 10, 1912.

Automobile Muffler—Consisting of a conico-helically formed exhaust pipe.

This muffler, Fig. 5, comprises a cone-shaped discharging chamber open at its base, so as to form an ejecting mouth larger than the area of cross section of the exhaust duct connected to its inlet. A receiving chamber has an ejecting mouth which opens axially into the apex of the discharging chamber mentioned, and an exhaust pipe P which is coiled conico-helically to form the curved inclosing wall of the discharging chamber. The exhaust duct communicates with the receiving chamber so as to discharge the gases tangentially into the same.

No. 1,058,393—to Louis Vaughan, Blair, Neb. Granted April 8, 1913; filed August 14, 1911.

Air-through-Fuel Carbureter—In which the air is forced through the gasoline in a variable number of streams.

This carbureter consists of a carbureting chamber to which liquid fuel may be supplied, in combination with means for driving a number of air streams into the fuel. The chamber has an outlet duct or chamber for receiving the mixture so produced in the carbureting chamber. An obstruction or mixer is interposed between the two chambers and a relief valve in the outlet duct forms also an auxiliary air valve.

No. 1,058,407—to William J. Candlish, Chicago, Ill. Granted April 8, 1913; filed March 6, 1908.

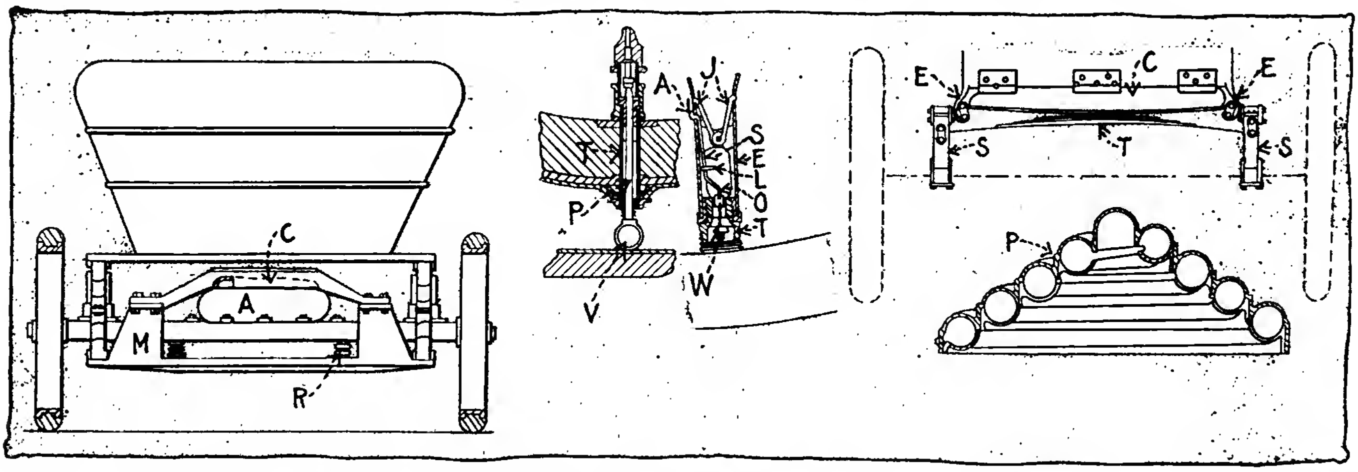


Fig. 1—Mullen-Brennan shock absorber. Fig. 2—Featherston tire-deflation signal. Fig. 3—Connor deflating tool. Fig. 4—Cook shock absorber. Fig. 5—Vaughan muffler

The Automobile

A Transcontinental Hodge-Podge

Part I

By Ernest L. Ferguson

A Photographic Story of Road Conditions from Chicago to California.

Between Windy City and Omaha Are Many Road Activities That Work for Good.

IT is 4,000 miles from New York to 'Frisco. Making this trip by automobile over the transcontinental highway you have six stages of travel. The first is New York to Chicago, 1,100 miles. This is so well known that it may best be described as a tale that is told.

From Chicago to the California line is the section of the transcontinental highway that everyone has more or less concern about. The California line is 300 miles from the Pacific Ocean, and when you once cross it the remaining run to the Pacific is a boulevard.

It is the 2,600 miles between Chicago and the California line that I want to describe with reference to road conditions.

For convenience it logically divides itself into four divisions: One, Chicago to Omaha, 550 miles; two, Omaha to Denver, 650 miles; three, Denver to Salt Lake City, 600 miles; four, Salt Lake City to the California line, 800 miles.

I purpose in this and three succeeding articles giving a close analysis of the various kinds of road building used over this 2,600 miles. This information was obtained during my transcontinental experiences last year on a truck which covered the route familiarly known as the transcontinental one. To be certain to understand this the following is the general itinerary: New York, Albany, Buffalo, Cleveland, Toledo, Chicago, Clinton, Cedar Rapids, Omaha, Kearney, North Platte, Sterling, Ft. Morgan, Denver, Cheyenne, Rawlins, Salt Lake City, Ogden, Wells, Eureka, Austin, Reno, Carson City, Sacramento, Stockton, Oakland and San Francisco.

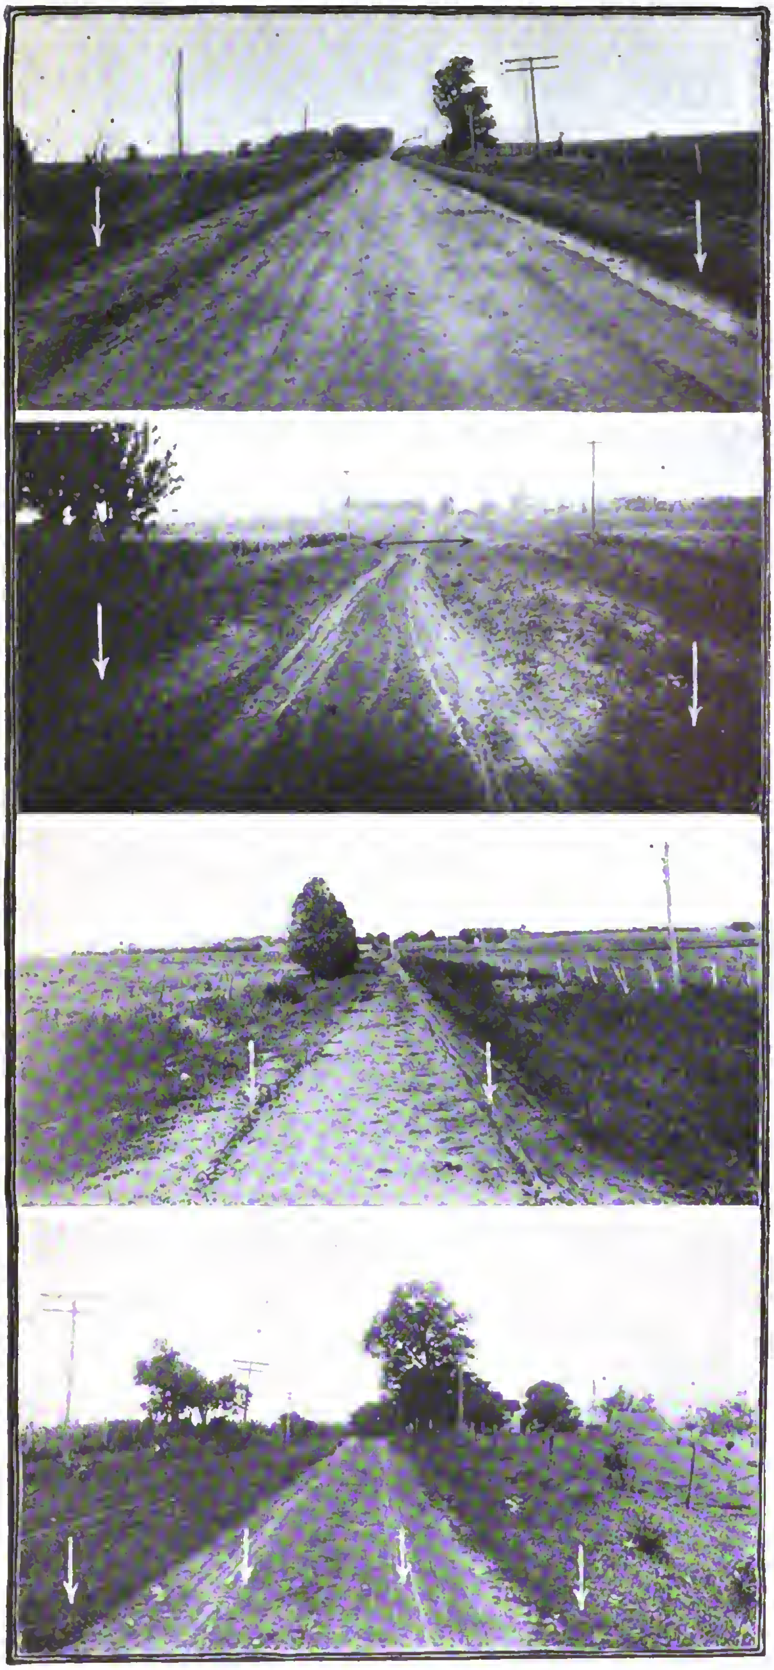
The photographic reproductions herewith are from photographs taken during the route, and which are especially intended to show the variety of roads met with. Those this week are of the roads from Chicago to Omaha, and the captions underneath them tell the variety of roadbuilding carried on in this 550 miles.

That there is necessity for increased transcontinental highway roadbuilding is more apparent to the Westerner than to the Easterner. From direct knowledge more than 300 touring cars made the trip last year over the route outlined. Twenty-five per cent. of this number I met between the Mississippi River and the Sierra Nevada Mountains.

All transcontinentalists do not follow this particular highway. Some prefer the Old Trails highway, some the Southern route, a few the Midland and some the Northern routes. All told, it is conservative to esti-

Upper—A finished macadam highway adjoining a loose stone roadway that has the material merely thrown on with a shovel. The soil underneath has been well crowned and side ditched, but no side retaining earth curb has been cut to hold the stone

Lower—A stone road recently resurfaced. Traffic has done most of the rolling to bind the stone. One rut starting to develop on right side



Top—Stone carelessly placed on top of a soil base. The only ditch is a narrow one on extreme left. All water drainage from the high field and bank on the right has to cross the road to get to ditch, wearing away the road surface.

Upper Middle—Sometime in the past the side banks of this dirt road were cut to fill in a hollow place (middle foreground), but the work was done in an aimless manner. The same effort and time would have given a graded roadway needing only occasional dragging. The general carelessness has forced travel into one line of meandering travel.

Lower Middle—Some years ago this roadbed was raised above the side levels by throwing the ditch excavations into the center. Later crushed stone was put on with a shovel. Traffic eventually depressed the stone, thus forming a ridge at each side of the one line of travel. The result is a trough that holds rain and melting snows.

Bottom—No side drainage. The stone roadway is of the usual spread-with-a-shovel type. Vegetation on each side prevents water from rapidly flowing away from surface.

mate that 500 motorists made the cross-country trip last year. This year the number will nearly double, and next year, with the exhibition at San Francisco, the number will undoubtedly reach well into the thousands.

Crossing the continent in an automobile always brings up two problems in the minds of the novice—one is the hotel facilities en route, and the other is the paraphernalia needed to extricate the car from bad places on the road. After making the trip you invariably find that you overestimated the bad road sections and underestimated the frequency and facilities of the hotels. Such paraphernalia as transcontinentalists have used they have found is sometimes needed in their home sections. The hotel situation en route is illustrated by the experience of a group of tourists which recently started out on the trip with an elaborate camping outfit and high priced chef. In desperation the party finally stopped outside of a town near California and used the combination in order that some returns could be had on the investment.

With malice toward none the criticisms made in this series so far as road and other conditions are from a mileage experience now nearing the 90,000 mark, over an itinerary embracing forty-five states of the Union, together with a considerable section of Canada and a dip into Mexico.

Now comes the Chicago-Omaha section, 550 miles. This is through two states—Illinois and Iowa—with the Mississippi the boundary line between them. The roads in these states make traveling hard.

Bad Roads in Illinois and Iowa

From Chicago to Omaha the route does not present the high quality of roadway conditions that is warranted in the states of Illinois and Iowa when we consider their wealth and their important manufacturing and agricultural communities.

The lack of suitable roadbuilding material is not a claim to be made for Illinois in excuse for its poor roads. In fact the rock removed in constructing the Chicago drainage canal, thousands of cords of which remain as placed at the time of construction, would serve as the foundation of a system of state highways for all northern Illinois.

In crossing the two states every quality of roadway is to be found. Starting at Chicago and its western suburbs, modern construction and upkeep of roads prevail for many miles. Later there are encountered stone roads of more or less quality, but varying in the method of using the crushed stone—lack of method would often be better terminology. The method has a characteristic seemingly peculiar to northern Illinois. This is to haul perfectly good road material onto the prairie roadway and there spread it, a shovel being the only tool used, and then let traffic do the rest.

Effect of Traffic on the Road

Traffic, however, does not let it rest; instead, it is constantly moving the material outwardly at the sides. Where there is side ditching or the stone has been piled as a blanket on the old roadway, or the roadway is higher than the grass sides—such as at fills if an attempt at grading has been made—two deep ruts are soon formed. These become water troughs with every rain and disintegration rapidly takes place.

Then there are long expanses where there is no side ditching, or where the stoneway is level with the grass sides. This latter sometimes comes from previous subgrading and sometimes from the heavier stone blanket, under the weight of traffic, sinking into softer soil. Also there will be found stretches where the stoneway has sunken below the grass sides. Under these circumstances the sides keep the entire surface flooded in rain periods and chuck holes rapidly develop.

Repairing methods, of any of these, generally consist of merely hauling on more crushed stone and usually of the finer sizes. As in the first making the only tool used is a hand shovel. The fresh supply is not only used to fill in the ruts of the first mentioned and the chuck holes of the second, but frequently enough more is added to resurface the entire width.

No attempt is made at binding, under any method, or are there any retaining edge-walls. Neither is there a determined contour, grading or packing, traffic alone being the only rolling-out that the stone receives. These conditions continue as an endless chain, but always with that same weak link and the consequent rapid breaking down of the so-called construction.

During the process of filling and resurfacing traffic is permitted. This at once crowds the new material away at the wheels and ruts are reformed in a few hours. Plus this the stoneway is generally so narrow that only one trackway is possible, thus augmenting the conditions of rut and other destructive penalties. This method, where it is used, is continued year after year and to the writer's knowledge, from direct experiences, has been going on for the past 20 years in some sections of northern Illinois. It can be safely asserted that enough money and crushed stone are and have been used, in the sections where this method prevails, to build a permanent and substantial highway from the lake to the river, together with many laterals.

Earth Roads Show No Care

Some earth road is traveled over and this carries the usual criticism that generally goes with that condition. Even where a measure of care is given, it is generally not of the comprehensive type and is then, at its best, not worthy the title. Even the King drag seems to be an unknown quantity despite its quality for just such sections; turning prairie soil into very good highways.

Through it all there prominently stands out that one big neglect which is constant in most road work not done by highway engineers—drainage, surface and side, and then more drainage. Very little side ditching is to be seen. Crowning on safe and sane lines is equally conspicuous by its absence. When the roadway has not two parallel water troughs, more generally known as wheel ruts, then it has one central water trough the entire width of the traveled portion. The cross-section top line is concave instead of convex.

Now look at Iowa: Crossing the State of Iowa in fair weather is delightful touring where the log-dragged roadway prevails.

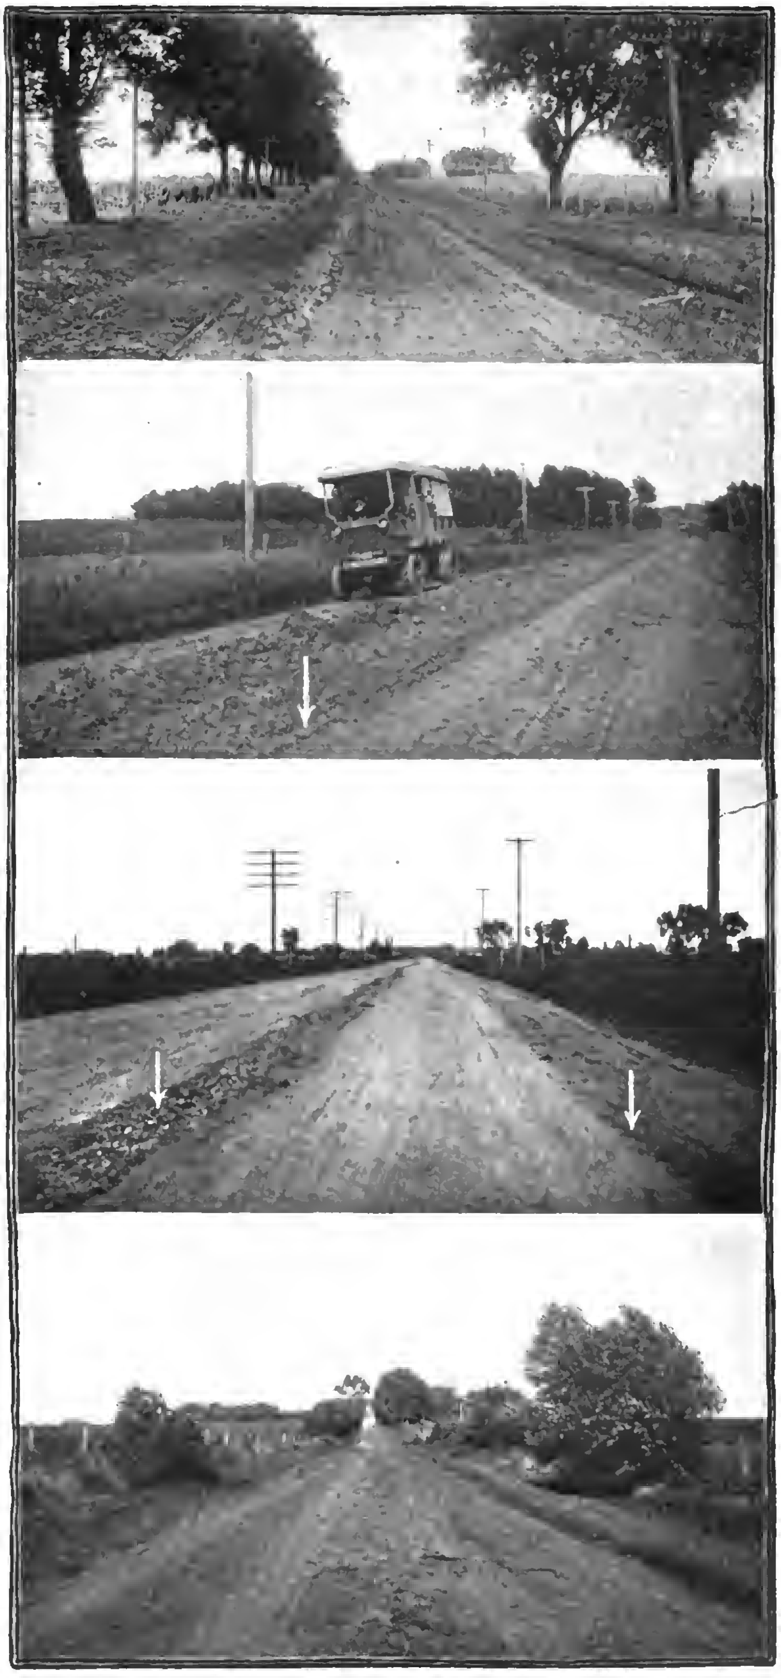
During a rain period it is always safer, when not obligatory, to abandon any attempt at further progress. This applies to nearly all of any route taken, with the obvious exceptions of in or near some of the larger cities.

Mutual road associations in the farming sections, throughout the state, are doing much excellent work to overcome the troubles that are inherent with Iowa's gumbo—clayey—roads. Dragging is the one and chief means used. Where intelligently applied this gives the contour of an engineered stone highway, with its reasonable crown and side drainage, thus taking care of rain precipitation within the limits of the soil.

Soil Limitation Delays Travel

It is this soil limitation that delays and at times suspends travel during and for a time after a heavy rainfall. The length of time varies in different localities. Where there is some grit, such as an admixture of disintegrated lime rock, travel can generally be resumed in from 1 to 3 hours, depending on the amount of precipitation. Where vegetable mold makes up the soil in entirety then the time of hang-up is extended by a large multiple.

However, it is to be understood that proper grading and immediate dragging after each rain does wonders and any analysis of the situation can only be approximate by just so much as either or both of these items of caretaking are applied. **Be it remembered that gumbo has the peculiar quality of quickly drying out from sun and wind. The rapidity with which the surface loses its slippery qualities depends almost entirely on the amount of previous dragging, combined with crowning and side drainage, and the least loss of time in redragging after the rain has ceased.**



Top—A loose stone roadway of many ruts and pockets. On the right there is some side drainage that is intermittent. At some time a crushed stone coating has been so carelessly put on that wheel traffic started zig-zag ruts.

Upper Middle—A wheel scraper has torn the vegetation and roots from each side, piling them into the center. The elements may some day flatten the center but only by washing it back to the sides. In the meantime two rut roads are formed in each side.

Lower Middle—The loose stone center gives a double highway not needed for the amount of traffic along here. The uncertainty of the earlier travel, when the surface material was first put on, as to what part of the extreme width to use, is well portrayed in the tortuous loose center of the background. Enough material has been used to give at least 50 per cent. more mileage at the same cost.

Bottom—Another instance of scraping the sides to the center. In the foreground are two soft earth (gumbo) roadways. In the center of the illustration the two converge and become a single roadway on the left of the scraped surface.

With this hill too much work has been put into widening the cut and not enough into reducing the grade. The grade is so stiff that local traffic cuts back and forth from side to side to relieve the horses, as shown by the various and curving ruts.

This is not a hill but a sharp cross ridge that has all the effect of a two-way grade. It will be noticed in the left foreground that a lot of labor has been expended without definite results. The same amount of work would have cut off the cross ridge, with consequent improved going in both directions.

A plain dirt road good only in dry periods. There are side drains but they are heavily grown with grass and weeds along the edges of the road prevent a quick discharge of surface water. Only little work has been put onto the road, but none of it lost in trying for overwidth. That it is wide enough is shown by the positions of the two vehicles, their separation being more than needed for safe driving.

One of the puzzling factors that forces itself upon the automobile tourist is the opposites encountered in the use and non-use of the King drag in adjoining sections of the state. You travel along on a natural soil road that is kept up to the minute by dragging. It is well crowned and side drained. Driving over it is a joy and a new delight in experiences to those who have only known macadam roads. It is wide enough for three or four teams and by virtue thereof there are no defined ruts of wheel or animal travel.

Old Methods Prevail in Country

Soon there is encountered a roadway that has marginal limits of enough width, but the old-time methods of country road making prevail. All the soil and growth along the sides has been placed in the center of the roadway. Here is always the constant condition of two parallel roads divided by a barrier and each showing all the ill effects of travel in one path.

As likely as not the next experience is with the highway well kept, by dragging, that immediately adjoins one that is the veriest frontier trail. This latter comes down to being just two ruts through the grass and weeds, often with a high bank on one or both sides and never with a side ditch. If the soil is gumbo this condition of roadway might have one advantage. During or after a rain one could travel along the grass sides, provided there were not frequent high banks or low sides.

South Has No Frosts to Fear

Not all natural roads in Iowa are gumbo or gritty clay. There is now and then found stretches of sand. With these, so far as experienced, little has been attempted in the art of bettering. To any who have motored over sand-clay roads of the Atlantic coast states, in the South, the thought comes, cannot a lesson be taken from them? The application of the query has to do with both the sand and the gumbo sections, so treacherously slippery from rain.

The usual answer given is that the South has no frosts of moment to contend with and that Iowa's deep frosts would mean an upheaval and general disturbance each spring. The reply may seem well based and fairly logical, but it can never be a perfect answer until the scheme of construction has been well tried. Even then not a definite answer could be rendered until a number of experiments had been conclusively tested.

Frost can only come from moisture and then in direct proportion to that moisture. Given a sand-clay construction with snow to cause moisture and assume frequent thawings to bring about the cause. First we must so proportion the sand and gumbo that the former will not be in large enough quantity to readily absorb the snow water. Next the roadway must be crowned to properly shed the results of the thawings. A further refinement could be inaugurated by blanketing, or roofing, the highway as is done in Massachusetts, with an oil binder. This would insure a rapid shedding of all moisture, rain or snow water, and prevent surface disintegration.

With either there must be side ditching of correct proportions to carry away the water that it may not, by standing, finally seep through the ditch sides and under the roadway there to freeze and cause an upheaval in the spring break-up. This might particularly occur at the sides of the newly made road section.

Slimy Quality of Gumbo

Whether or no a definite sand-clay construction is entered into it would be well worth the doing that a sandy section and a gumbo section exchange their superfluous quantities. Certainly the gumbo sections would be the gainers in rainy weather by just so much as they reduced the impassable slime surface of their roads by the admixture of grit used in their construction.

With it all there ought to be no let-up in the applied use of the log drag. It will continue to be the best means to keep the roadway in a most excellent condition by maintaining the surface of the mixture of sand and gumbo, whether the mixing is done as an engineering condition or as an impromptu affair.

No attempt of any kind ot road making; travel alone defines the roadway of two ruts divided by o grass center. In wet weather all the water from the high fields on the right crosses the road to the low fields on the left. The rank growth in the left foreground shows how long the water stands. During wet periods the road is more or less flooded and becomes passable only after long dry periods.

Abbott Strengthens Finances

DETROIT, MICH., April 23—*Special Telegram*—Negotiations which have been under way for some time are progressing very satisfactorily for the strengthening of the financial position of the Abbott Motor Co. by the taking in of some of the larger creditors as stockholders. This plan will provide additional working capital for the carrying on of the business. It is substantially a co-operative proposition whereby the assets are placed in a trust, and making the creditors amply secured. According to M. J. Hammers, general manager of the Abbott company, the concern has always been hampered by lack of working capital and the present scheme will remedy this difficulty. The concern is on a paying basis and at the present time marketing about 250 cars a month, orders coming in as they should although no definite statement of the new interests involved in the Abbott company has yet been made. The officers and present management will be left substantially the same under the new plan. The creditors taken in will of course be represented on the Board of Directors. With this trust agreement it is stated that the creditors will take practically no risk since it is a going concern.

A gumbo road just commencing to dry out two doys after a rain. On the extreme right and left are deep side droins, but the lock of crowning prevented the woter from running off as it fell, making heavy going in the meontime. The right hand side is yet miry. Travel on the left has squeezed out most of the moisture, at the same time forming deep ruts to hold the next roin. Travel will then keep to the right which has become sunbaked in the meantime. And so it goes.

This gumbo road hos been scraped and a slight attempt made at crowning, but has no side drains. Rain cannot readily run off and the surfoce becomes treacherous. Too much attention to width has not only cut down the work on the first making, but also presents quick dragging after rain

Receiver for Schacht

Creditors of Company Spring Surprise—Assets Exceed Liabilities by $400,000—Alleged Wrangle of Officers

CINCINNATI, O., April 21—After a wrangle between directors and stockholders, previous to which the participants of a stockholders' meeting had tried to put the business of the Schacht Motor Car Co., of this city, into the hands of a creditors' committee, Wallace M. Gray and Attorney Dwight Marfield filed suit in the Common Pleas Court asking for a receiver and a judgment for $10,000. John H. Miller, holding a note of $8,551.74, payable February 2, 1913, and notes aggregating $11,000 and payable February, 1914. Miller is also the indorser of a note for $20,000, due on April 9, 1913. Creditors demand payments of their claims and Miller alleges that differences which have arisen between the directors of the company indicate a possible squandering of the assets unless a receiver were named. Arthur Stem, secretary of the company, answered the petition. The suit was presented to Insolvency Judge Warner, who appointed John F. Deitz receiver, fixing his bond at $50,000.

While it was known for some time that the Schacht company was in difficulties, the action of the creditors came as a surprise. The recent floods made things worse for the company, tying up material to be received and shipped.

The capital of the company is $500,000, $350,000 preferred and $150,000 common stock. Of the preferred $314,000 has been issued, while $98,100 of common stock are outstanding. The real estate assets are about $136,000, but mortgaged to the extent of $110,000, while machinery and equipment on hand are worth $200,000; accounts amount to about $60,000, and notes to $6,000. Miller states, however, that a fair valuation shows the assets to exceed the liabilities by about $400,000.

Morgan Sued by Bryant Spring Remover

PROVIDENCE, R. I., April 19—Justice Brown, in the U. S. District Court here heard arguments in the case of the Bryant Spring Remover Co., New York City, against Bernard Morgan, of this city, alleging infringement of the complainant's patents and demanding an injunction. The court gave the parties 3 weeks in which to file briefs.

No Oral Hearings on Tariff Bill

WASHINGTON, D. C., April 19—That the Senate finance committee will not hear oral arguments on the Underwood tariff bill when the measure comes to the upper house of Congress is the admission made by Democratic leaders. The matter was debated at length in the Senate this week at which time many Republican senators declared they were in receipt of thousands of requests from manufacturers all over the country asking for permission to be heard on the tariff schedules. It is possible that the finance committee will permit manufacturers to file briefs, but this is doubted by close followers of the tariff measure.

To Sell Columbus Buggy Co. May 14

COLUMBUS, O., April 19—The Federal Court at Columbus has ordered the sale of all of the property of the Columbus Buggy Co., Columbus, O., May 14, excepting bills receivable and consigned goods. The property will be sold at public auction upon that date in four parcels known as A, B, C and D.

Parcel A consists of all real estate and leases both at Columbus and in Minneapolis, where a branch house was operated. The real estate in Columbus is on the tax duplicate at $218,000 and the upset price on this property is $100,000.

Parcel B consists of all machinery and merchandise, including equipment and plans, and the upset price is fixed at $75,000.

Parcel C consists of the Los Angeles branch, which is consigned goods only, and the upset price is fixed at $30,000. Reports show that this parcel has already been sold.

Parcel D consists of the San Francisco branch of consigned goods and the upset price is fixed at $6,000.

It is said the creditors' committee has completed arrangements for bidding in the property at the upset figures in case there are no other bidders. The plant on Dublin avenue is now in shape for operation and most of the damage caused by the recent flood has been repaired.

NEW YORK CITY, April 21—The Appellate Division of the Supreme Court here affirmed the decision of the court, in the case of Thomas Muller against the Pope-Hartford Auto Co., which was the local agent of the Pope Mfg. Co., at that time.

Fedders Incorporated with $400,000

BUFFALO, N. Y., April 23—*Special Telegram*—The Fedders Mfg. Co., Inc., filed papers of incorporation yesterday. It will manufacture automobile radiators and other sheet metal products. The officers of the company are: Theodore C., Christian W., John M. and Louis F. Fedders of this city.

AKRON, O., April 19—Another reduction of truck tire prices took place during this week, when the Goodyear Tire & Rubber Co., announced a 10 per cent. cut on the quotations of its commercial tires. This is the second reduction of this nature during 1913, the first having taken place at the time of the National shows.

Automobile Securities Quotations

The general tone of the market for the past week was steady. Only fifteen quotations showed any difference at the end of the week as compared with last week, while twenty-eight maintained their level. The biggest change for the week is to be found in Goodyear common which jumped 30 points. Next to this is Firestone common which is 10 points higher on the bid price and 15 on the asked. Pope preferred dropped 7 points and the common dropped 3. The rubber stocks continue to be the most variable but are exceedingly steady in these as compared to conditions during the recent strike. Swinehart gained 4 points during the week while Fisk and U. S. Rubber each fell off 2 points.

One Thousand Cars a Day

Detroit Manufacturers Ship Over 250 Freight Carloads of Automobiles Daily —Dealers Plan National Organization

DETROIT, MICH., April 19—Detroit manufacturers are shipping from 250 to 300 freight carloads of automobiles per day at the present time. This is the busiest shipping season of the year and the output shows a material increase over January and February shipments. During January some 20,000 automobiles were sent out, while for February somewhere in the neighborhood of 25,000 were shipped.

It is rather difficult to arrive at an average for the number of automobiles contained in each freight car, but, considering both large and small machines, the average number per freight car is about four. On this basis the probable daily output now runs from 1,000 to 1,200 machines.

If the present rate of shipment were continued throughout the month, April would show a total in the neighborhood of 30,000 machines going out to meet the world's demands from the center of the industry. But greater daily shipments are expected, and doubtless the figure will run close to 40,000.

So far, railroads and the Detroit office of the National Association of Automobile Manufacturers' Traffic Bureau have been able to supply the freight cars necessary for the automobile shipments, and while a few weeks ago it was thought that a freight car famine was imminent, the present rolling stock supply appears to be able to take care of the situation.

It seems to be the general sentiment of the manufacturers and also of the railroads that there will be no shortage this year after all. The Detroit Traffic Office is receiving the hearty co-operation of the car makers and its records show that through its efforts the freight cars are being returned to this territory after taking the automobiles to their destinations.

Plan National Dealers' Organization

NEW YORK CITY, April 20—An informal meeting of motor car and accessories dealers was held in this city today for the purpose of discussing the advisability of a national dealers' association to look after the best interests of motor car and supply dealers throughout the country. It was a general consensus of opinion that such an organization would be of inestimable value and it was definitely decided to take up the matter of such an organization with dealers in all sections of the country. Providing there is a satisfactory response it is purposed to call a meeting in Indianapolis, on Thursday, May 29, the day previous to the 500-mile race at which dealers from all parts of the country would attend and discuss ways and means of perfecting such an organization. Frederick H. Elliott, who has been connected with organization work with the American Automobile Association and the Touring Club of America, is working up the plans for the May meeting. He has already taken it up with many dealers' organizations and has met with favorable reports from practically every section of the country.

Such an organization would have a wide field of activity which would include a system of credits, the regulations of local shows and scores of other problems which the dealer is confronted with.

McCue Co. Adds $300,000 in Reorganization

BUFFALO, N. Y., April 21—The McCue Co., Buffalo, N. Y., completed a reorganization and a refinancing last week, adding $300,000 in cash for working capital.

The following prominent business men of Buffalo have been added to the directorate: Ralph Plumb, vice-president and general manager of the Buffalo Bolt & Nut Co.; R. G. Wright, president of the Reed Mfg. Co., Erie, Pa.; Samuel Ellis, of the Manufacturers' & Traders' Bank, Buffalo, and Edward McM. Mills, of the law firm of Rogers, Locke & Babcock.

These four gentlemen, together with C. T. McCue, form the directorate. The officers elected are: C. T. McCue, president: Ralph Plumb, vice-president; Samuel Ellis, treasurer; Edward McM. Mills, secretary. C. H. McCullough, Jr., vice-president and general manager of the Lackawanna Steel Co., becomes one of the heaviest stockholders in the reorganization.

W. T. Evans was secured as production and general manager of the new company. Mr. Evans was formerly with the Metal Products Co., of Detroit., which concern he has managed since its inception.

Orders have gone forth for machinery and equipment sufficient to place the plant on a 1,000 wheels per day production capacity by the first day of August. Arrangements have been made at this writing to practically double the August capacity of 1,000 wheels within 3 or 4 months from that time.

CHICAGO, ILL., April 21—The Standard Oil Co. of Indiana announces that the trademark name for its new fuel will be Stanolind Motor Spirit, although it will be familiarly known as Motor Spirit. It was found that in England "motor spirits" is used to designate fuel, which prevents the use of the name here as a trademark.

RACINE, WIS., April 19—At the annual meeting of the board of directors of the J. I. Case T. M. Co., of Racine, Wis., the following officers were elected: President, Frank K. Bull; vice-president, Frederick Robinson; secretary, Richard T. Robinson; treasurer, F. Lee Norton.

NEW YORK CITY, April 22—Three companies have declared stock dividends during the past week. The Chicago Pneumatic Tool Co. will pay 1 per cent. on its common stock on April 25, the Russell Motor Car Co. will pay 1 3-4 per cent., the regular quarterly dividend, on May 1 and the Vacuum Oil Co., 3 per cent. payable on May 15; the last dividend declared by the Vacuum company was 3 per cent. paid on October 31, 1912.

Market Changes of the Week

MORE active trading pervaded the markets this week. Tin experienced a decline of $.18 per hundred pounds. The demand has decreased, speculative interest and dealers alike complaining of the extreme dullness. In the London market trading was of very fair volume, with closing cables reporting a net decline of $.30 on spot, and an advance of $.10 on futures. The copper markets are dull, and the demand of very small proportions. The great display of strength and predictions of further advances in copper appears to have been dissipated. Even the statement of a leading authority that consumption is surpassing production, and which is scouted in well informed circles, appears to be of non-effect. The lead market is firm and increasingly active for some days. Lead is calling at $4.35 per hundred pounds. Both the Pennsylvania and Kansas petroleum prices remained constant this week and firm. Pennsylvania calling at $2.50 per barrel and Kansas at $.88. Cottonseed oil rose $.12 per barrel. The consuming demand is very good. Lard oil rose $.01.

Massachusetts Motorists Score First Point

Prevent Senator Johnson from Recommitting Truck Bill

BOSTON, MASS., April 21—The committee representing the motor truck users and dealers, which has been working on the proposed legislation to increase the fees on commercial vehicles to $5 per ton, was successful yesterday in its first move in opposition to the measure when Senator Johnson, chairman of the committee on roads and bridges, moved in the Senate today to have the bill recommitted to his committee.

During the past few days the truck representatives have been very busy working up opposition since they learned that instead of the bill calling for $5 for 1 ton and $2.50 for each additional ton, that was agreed upon in conference with the highway commission, and later agreed upon before the legislative committee, had come out of that body to the Senate calling for $5 for every ton.

With practically but 1 day in which to secure signatures against the measure, the committee got more than 1,000 names from all classes of people from all over the state, and these petitions were brought to the state house today to be put in if the bill came up for consideration as it was scheduled. Meanwhile letters were sent to some of the members of the Senate calling their attention to the matter.

A committee, comprising President Day Baker, of the Electric Vehicle Club, and John B. Sullivan, Jr., counsel for the Boston Commercial Vehicle Dealers' Association, met the officers of the Central Labor Union Sunday and had a conference on the matter. The labor officials took the matter up and agreed to lend their opposition to the measure.

Today Mr. Baker, Mr. Sullivan, James B. Fortesque, of the Massachusetts State A. A., James T. Sullivan and G. S. Draper visited the state house and talked with some of the members of the Senate. Chairman Johnson then agreed to have the bill recommitted to the committee for a further hearing. He said that the hearing would be held either May 6 or 8, as the committee is going to make a tour of the western part of the state next week.

That was satisfactory to the truck representatives. It was then decided to call a meeting next Thursday of all those interested in the commercial industry at the Boston City Club at which plans will be made to attend the legislative hearing and give facts and figures to support the contention of the motor interests that the proposed legislation is a blow at the indusry.

The National Association of Automobile Manufacturers last week took a hand in the Massachusetts fight against increased taxing of commercial vehicles by circularizing the state with its resolutions, as follows:

"We are emphatically of opinion that the enactment of any legislation increasing taxation of commercial vehicles or imposing any restrictions other than present police regulations and existing general state automobile laws is unnecessary in the public interest and will retard the development of motor trucking and the growth of the motor truck industry.

"As other states have a habit of copying the legislation of Massachusetts and other Eastern States, a very dangerous and pernicious precedent will be established if these bills are allowed to become laws, and, as a result, years of agitation along this line throughout the country may confidently be expected.

"A critical situation confronts the motor truck industry at this time. Every legitimate means should be employed at once to forestall the entering wedge by preventing all objectionable legislation during the development stage of the industry.

"Any fee imposed on motor trucks in excess of the cost of registration as a police protective measure, is double taxation, class legislation and therefore unconstitutional.

"There have been 'wide-tire' laws in these states for years to limit the weight per inch of tire width but which never have been enforced. The motor truck should not be singled out now for attack and another law placed in the statutes to become a dead letter.

"No reliable information has been advanced to show that motor trucks, with their broad rubber tires, do any damage to streets and roads independently of other vehicles and in undue proportion.

"The proposed laws will tend to restrict commerce and industry by destroying part of the economic advantage of the commercial automobile.

"The greatest factor in the progress of the United States has been rapid and cheap transportation by rail and water; the next great forward step is quicker and cheaper transportation by highway.

"Obstacles placed in the way of the motor truck will prevent further reduction in the cost of haulage and delivery and tend to maintainn the high cost of living, thus affecting all the residents of the commonwealth.

"Economic conditions and commercial competition must eventually determine the capacity of motor trucks, which will be governed by the relative cost per ton mile of operation.

"Instead of putting sticks in the wheels of progress by limiting traffic to present road conditions, the roads and bridges should be improved to meet traffic conditions, just as the railroads after adopting heavier locomotives and larger cars to move greater tonnages in single trains, found it necessary and economical to reconstruct their road beds and tracks to bear the heavier traffic.

"Legislation that tends to decrease the demand for motor trucks and automobiles will affect adversely one of the largest and best industries of the country. Estimates based on the United States Census of 1910 show that more than 340,000 employees are engaged in the manufacture of motor vehicles and their parts today. Only 1.2 per cent. of these are under sixteen years of age, and only 1 per cent. are women. The rate of wages is unusually high in the trade, and working conditions are the best, most of the factories being of the newest and most approved construction, and the occupations healthful. An industry of this kind should be encouraged as much as possible for the benefit of the working people, instead of being discouraged by objectionable legislation."

Smoke Law Held Constitutional

CHICAGO, ILL., April 21—The Supreme Court of the State of Illinois on Saturday handed down a decision which upholds the constitutionality of the smoke law. There is nothing in the state code which enables the authorities to arrest drivers whose motors are emitting smoke. The city of Chicago passed such a law, but one of the municipal judges held that the city had no right to enact such a measure. Since that time the police have kept their hands off, but now that the Supreme Court has handed down its decision it is anticipated that the city law will be rigidlv enforced. The case was one against the Walden W. Shaw Co., operating taxicabs. The local liverymen, fighting the law, used Shaw for the test case.

South Dakota Has New Law

PIERRE, S. D., April 17—The new motor law for the state has some peculiar provisions which place the instrument in a class by itself. It becomes operative July 1. Applicants for automobile licenses must file registration blanks with the county treasurer, who is to file the applicatioos with the secretary of state, who will forward to the owner two license tags for each application, one to be displayed in front and one in the rear of the machine. Duplicates to replace lost tags may be obtained for $1 each.

The license fee from July 1 to December 31 is to be $3. Thereafter the annual fee shall be $6. After a vehicle shall have been licensed for 5 successive years, the fee is to be one-half the regular rate. Vehicles registered any time between July 1 and January 1, 1914, will cost the owner the full $3 each for tags.

Usual speed and signal requirements are included in the law, excess of 25 miles an hour being presumptive evidence of fast driving in case of an accident. When a passing animal is seriously frightened, the owner of the motor vehicle must stop his engine. Drivers must be more than 15 years old, unless accompanied by the automobile owner. A maximum of $500 or imprisonment of not more than 2 years is provided for first conviction on the charge of leaving an injured person without giving name and address, or in case a police officer is not there, or failing to report to a police or peace officer. Upon conviction a second time for this offense or of the misdemeanor of being intoxicated while driving, the charge is felony and the penalty is imprisonment from 1 to 5 years. Upon recommendation of the trial court, which must report all convictions, the secretary of state may revoke the license of the offender's car.

Kansas to Tax Automobiles

TOPEKA, KAN., April 19—The new Kansas automobile tax will yield about $120,000 a year for use on the rural highways of the state, according to the estimates of Secretary of State Charles H. Sessions. The law becomes effective July 1 next, and it is expected that most of the money will be in the hands of the county treasurers before that time. The tax amounts to $5 a year on automobiles. Of this amount the secretary of state, under whose direction the administration of the law is placed, receives 75 cents for the expenses of administration, providing number tags, etc., and the clerical work required in registering the machines.

There are about 26,000 automobiles in the state.

The tags will be ready for distribution June 1. Information required by the state upon which number plates will be furnished includes the name and address of the owner, the name, style, year of manufacture and horsepower of the machine licensed.

Twenty Entries for Indianapolis Contest

Mercedes-Knight and Mercer Team Latest to Enter

THERE are now twenty entries for the Indianapolis Speedway 500-mile Race May 30. The formal entry of three Mercer cars, with De Palma, Bragg and Wishart driving, has been received. An unexpected entry is that of a Mercedes-Knight made by E. C. Paterson, the Chicago sportsman, who entered the Mercedes driven by De Palma which won the Elgin National a year ago. The Mercedes-Knight, known as the Belgium Grand Prix racer of last year, will be driven by Pilette, the Belgian agent for this car, who is expected to leave Brussels early in May for America. The car is now being overhauled in the Mercedes plant.

The Mercer entry includes two cars of 447.9 cubic inches piston displacement with a bore and stroke of 4.8 by 6 3-16 inches, and one car of 299.7 cubic inches, with dimensions of 4.37 by 5. Caleb Bragg and Ralph De Palma will pilot the first two, while Spencer Wishart will handle the third. All of them carry four cylinders. The delay in the entry of the Mercer team was made necessary by the fact that the factory engineers first wanted to give the 447.9-inch motors a thorough try-out before definitely pinning their faith to them. The largest the Mercer people have raced heretofore have been cars of the 299.7 classification. This is the size Hughes piloted to a third in the Indianapolis race last year.

Valuable cash prizes have already been offered by the accessory people. The Bosch company has posted $1,000, $500 to the winner, $300 to second and $200 the third. The money being given conditional that Bosch magnetos are used.

The Hartford Suspension Co. have offered three prizes: $250 to the winner, $150 to second and $100 to third, conditional if they are fitted with Hartford shock-absorbers.

Homer & Motsinger has offered $1,000 each to every driver finishing inside the money with its carbureter.

SAVANNAH, GA., April 21—Entry blanks for the Grand Prix race have been put in the mails, and as soon as the blanks for the Vanderbilt Cup, and the other small races are approved by the A. A. A. these will be distributed. This year the numbers of the entrant in the different races will be determined by the order in which the entries are received. No. 1 entry running No. 1 in the race. Where more than one car is entered by the same concern they will not receive consecutive numbers.

CHICAGO, ILL., April 21—The Elgin Automobile Roadway Association has already begun work of improving the 8-mile circuit on which the Elgin National and other races will be handled August 29 and 30. One of the latest entries received is the Belgian Grand Prix Mercedes-Knight, entered by E. C. Paterson, of this city, whose entry won the National Trophy last year.

There is at present a total of eight entries in the Chicago-Boston non-stock reliability, June 25 to 29.

Official A. A. A. Reliability Itinerary

MINNEAPOLIS, MINN., April 21—The official itinerary for the A. A. A. national reliability tour from the Twin Cities to Glacier Park Station, Mont., issued by Chairman C. E. Dutton, of the touring board, showed a distance of 1,233 miles between those two points. Leaving Minneapolis on July 11, the next stop will be Alexandria, 144.4 miles. Starting out from here the next day the tourists will cover 123.8 miles, in all 268.2, reaching Fargo. On July 13, the next station will be Devil's Lake, about 66.5 miles. From here the tourists will start out on July 16 and go to Minot, averaging about 68.8 miles. Williston is to be the next stopping place after Minot, a mileage of about 89 miles, reaching this place on July 17. After Williston comes Glasgow, about 63.9 miles, which will be reached on July 18. Havre is the last town, about 98 miles from Glasgow, ending the tour on the 19th.

Louis W. Hill, chairman of the Board of the Great Northern Road, is planning a spectacular finish of the tour. He will have stationed on the mountain peaks along the picturesque Rocky range just back of the world's unique log hotel at Glacier Park station, a score of men who at a given signal will touch off tons of red, white and blue Roman fire. The striking illumination of the mountain scenery will be a spectacle without question the greatest thing in connection with the tour, with the possible exception of the reception by 3,000 Blackfeet Indians as the motorists enter the reservation. After driving days over the prairies, the last night of the tour at the entrance to the Rockies is expected to be an event long to be remembered.

Chicago Truck Run Abandoned

CHICAGO, ILL., April 21—The motor truck demonstration which the Chicago Motor Club undertook to promote for April 28-30 has been abandoned, it was announced today, because the concerns which handle the larger commercial vehicles were lukewarm on the proposition and the prospective entry list was not representative of the industry.

INDIANAPOLIS, IND., April 21—Members of the Indiana Automobile Manufacturers' Association met at the Claypool Hotel in Indianapolis on the evening of April 15 to discuss arrangements for the Indiana-Pacific Tour, which will start from Indianapolis July 1. There have been fifteen entries for the tour and many more are expected.

COLUMBUS, O., April 21—Because of the damaged condition of the bridges in many parts of Ohio and Indiana due to the recent floods the Ohio State Journal Reliability contest, which was scheduled for April 29 and 30 and May 1, has been postponed until June 16, 17 and 18. The route has also been changed owing to the flood and the tour will be from Columbus to Detroit, to Cleveland, to Akron and back to Columbus.

Many Dealers at Pittsburgh Show

PITTSBURGH, PA., April 19—The pleasure vehicle and commercial truck show which opened in the big East Liberty market building April 5 and which closed tonight has been in many respects one of the most successful shows ever held in Pittsburgh. It was put on by the Automobile Dealers' Association of Pittsburgh, Inc., of which W. N. Murray is president.

Dealers report an unusually large number of out-of-town agents were represented in the crowds.

The officials of the show gave out the following data:

The number of exhibits was 150. Individual pleasure cars displayed numbered 160 and trucks fifty.

Number of high-powered electric lights, 8,000.

Square feet of mirrors in chandeliers and set in lattice work, 500.

Square feet of lumber used as ground work for decorations, 75,000.

RACINE, WIS., April 21—Every motor car and motorcycle dealer in Racine County was represented in the 2-day motor show given under the auspices of Racine city dealers in Lakeside auditorium on April 18 and 19. It was the first motor show to be held in Racine, and the attendance was much larger than anticipated.

Ohio Senate vs. I.W.W.

Radical Practices Condemned—Strike Could Have Been Averted by Confabs

COLUMBUS, O., April 17—Condemnation of the teachings of the I. W. W. and criticisms of practices of employers in the rubber industry form the keynote of the report of the Ohio Senate investigating committee on the Akron strike. Sabotage, as taught by the Industrial Workers who conducted the strike, is declared by the committee to be alarming and dangerous and closely akin to anarchy. Criticism of the employers is concerned especially with the "speeding" of employees and with the air of aloofness maintained by employers toward their employees. The committee opines that if the rubber companies had been willing to confer with their employees at the beginning of the controversy the strike might have been averted.

The committee, comprising Senators Green, Seward and Howard, is unanimous in its findings, excepting only in reference to the tariff on manufactured rubber goods. The two Democrats on the committee hold that the present duty of 45 per cent. is prohibitive and should be greatly reduced. Senator Howard dissents from this.

The committee begins by commenting critically on the attitude of the employers originally in refusing to treat with the employees and to confer with the State Arbitration Board. It finds that in the rubber factories there is a general fear on the part of the employees to make complaint owing to the belief that dismissal might result. The committee members hold that rules should be posted in all the factories advising employees to report their grievances. It is held that the failure of the rubber companies to correct grievances is the cause of a general feeling of discontent among the employees.

The committee finds that employees at night are required in some cases to work as long as 13 hours and this practice it holds unjustifiable. Women employees are paid between $5 and $12 a week, in exceptional cases less or more than this amount. The wages generally paid in the rubber factories are found to compare favorably with other industries and in the tire finishing department to be better. On the other hand, the earnings of the rubber companies are found to be large and to warrant high wages. The rubber factories themselves are found to be airy and well ventilated.

No conclusive evidence of the existence of blacklisting was found by the committee, although there was evidence showing that before employing applicants, the companies take a minute physical description and then call by telephone the company where the applicant was previously employed. The committee found instances wherein an applicant was rejected after the employer had telephoned to the company of last employment.

The condemnation by the committee of the principles of the Industrial Workers is scathing. However, the committee finds that a large majority of the rubber workers joined the I. W. W. solely to win the strike and that they did not believe and in many cases did not even know the principles taught. The committee tells the senate that the I. W. W. do not believe in contracts between employers and employee and that they encourage "sabotage," or the principle which teaches the workmen to shirk his work, turn out a poor product or injure machinery when he cannot remedy his condition by other means. The committee holds this teaching dangerous and a matter of grave concern to both the state and nation. It finds also the I. W. W. teaching against labor contracts is a menace. It holds that the interference of the I. W. W. injured rather than helped the cause of the rubber workers.

Postal Truck Contracts Held Up

WASHINGTON, D. C., April 19—The fact that the contracts for furnishing the Post Office Department with 100 motor cars for use in the parcel post service are being held up is causing some little uneasiness among the successful bidders. Approval of the contracts was one of the latest official acts of Postmaster-General Frank H. Hitchcock before turning over the office to his successor, former Congressman Oscar Burleson.

The reason given for holding up these contracts is that at the time they were awarded there was no purchasing agent in the Post Office Department and the soundness of the transaction is now before the Department of Justice. It is believed, however, that the contracts as originally made will be sustained.

Philadelphia Automobile Mart Proposed

PHILADELPHIA, PA., April 19—The Philadelphia Automobile Trade Association has under consideration comprehensive plans for the establishment of a huge automobile mart—a co-operative automobile station of sufficient proportions to handle practically all makes of used cars and also built to accommodate the annual automobile shows conducted by the association.

The project as proposed and outlined by an active member of the association, E. C. Johnson, comprehends the purchase of a tract of ground and the erection thereon of a building sufficiently large to house the cars taken in trade by members of the association, who comprise a majority of the dealers and branch managers in Philadelphia. A fixed schedule of prices for these cars would be determined, each car to be under jurisdiction of the trade body.

HARTFORD, CONN., April 19—At a meeting of the incorporators of the Automobile Insurance Co., of this city, held today, it was voted that the first capital stock of the company be fixed at 3,000 shares, par value $100 per share, with stock to be offered for subscription at $200 per share, $100 to be capital and $100 surplus. The entire amount of capital stock was subscribed for and paid in cash. This new company will write automobile insurance and will begin business at once. The following officers were elected: Morgan G. Bulkeley, president; Morgan B. Brainard, vice-president; J. Scofield Rowe, secretary; Charles H. Remington, treasurer; Herbert R. Clough and J. C. Barden, assistant secretaries. Morgan G. Bulkeley, Samuel G. Dunham, John O. Enders, Morgan B. Brainard, Joel L. English, J. Scofield Rowe and Walter C. Faxon were elected directors.

Owen, Defendant, Wins $31,315

BUFFALO, N. Y., April 22—R. M. Owen & Co., sales agents for Reo automobiles, was awarded a verdict of $31,315.33 against Gustave Poppenberg, plaintiff, by a jury in the supreme court here last Saturday, Justice Wheeler presiding. Mr. Poppenberg, of the Poppenberg automobile firm sued for alleged violation of a contract to handle Reo cars made by the defendant company. The defendant had a counter-claim against the Buffalo motor car concern, also alleging violation of contract, which claim was granted. Gustave Poppenberg will make motion for a new trial of the action.

MILWAUKEE, WIS., April 21—Milwaukee oil distributors and refiners have won a victory in their fight against increased freight rates on petroleum and products from oil fields in the vicinity of Emlenton, Pa., to Milwaukee. The Interstate Commerce Commission has heard their petition and suspended the advanced rates until August 9, pending investigation. The advanced rates were claimed to form a discrimination in favor of Franklin and Oil City producers, as the rates from these points were untouched, while a boost was given the rates from Emlenton.

WASHINGTON, D. C., April 19—The Imperial Motor Co., through its president, E. A. Garlock, has filed suit against the Motz Tire & Rubber Co. and F. C. Fickling, its branch manager here, to enjoin them from attempting to establish a branch store in this city for the sale of Motz tires throughout the District of Columbia. The plaintiff claims it has the exclusive right to sell Motz tires here under a contract made in December, 1911. An injunction and accounting is asked by the plaintiff.

Connecticut Has 3,815 Building Cars

HARTFORD, CONN., April 19—According to latest reports 3,815 men are employed in the manufacture of cars and parts in the state of Connecticut with an annual value of $11,668,000. The automobile industry represents a shade more than one-half of the silk industry, one-sixth of that of foundry and machine shop products and a little more than one-half of the valuation of arms and ammunition manufactured in the state. Under the circumstances, Connecticut when compared with other states figures small as a car-producing community.

WASHINGTON, D. C., April 19—The district commisioners have under consideration a proposed regulation establishing an annual license fee of $2 for motor vehicles in place of the present perpetual fee of $2. This change in the license arrangement for Washington motorists would add $40,000 annually to the revenues of the District of Columbia, it is claimed. It would also enable the license clerk to keep an accurate list of the cars owned here, something that now is out of the question.

Increase in Trucks—Figures compiled by the Electric Motor Car Club, of Boston, Mass., show that for the first 15 weeks of the present year, the registrations of electric motor trucks show an increase in sales of 27 per cent. over the sales of the same type of vehicles registered during an equal period in 1912. The electric pleasure car registrations exceeds the total registered up to August 1, 1912.

Illinois Motor Law Invalid

New Bill Introduced Also Provides for Disposal of $600,000 Fund

SPRINGFIELD, ILL., April 22—*Special Telegram*—Measured by the pattern by which the Supreme Court knocked out the omnibus appropriation bill in the Neiberger case against the University of Illinois, the motor car license law of Illinois, under which approximately $600,000, has been collected by the state was found today to have been passed unconstitutionally and is therefore declared invalid, after an investigation in which it was found that the motor car bill was left out of the three remedial bills which went to the three special sessions under the Deneen administration. Representative Homer J. Tice, chairman of the House Goods Roads Committee, declared this morning that the motor car license fees in his judgment and according to his legal advisers had been collected under an unconstitutional act and argued it was highly important that an emergency bill be passed at once.

Mr. Tice introduced a new bill carrying all the old law and in addition providing that the $600,000 lying in the state treasury which cannot be expended without specific appropriation be paid out to the respective counties for "State Aid" roads, the latter to be specified by legislation now pending. No opposition was made until the bill had been advanced to the second reading. Then the opponents of the Tice Good Roads Bill got into action and had the emergency license act recalled and referred to the proper committee. The consensus of opinion is that there is no chance for any persons who have paid into the $600,000 fund to regain their payments unless protests were filed when payments were made.

WILMINGTON, DEL., April 18—Following out a wish expressed by Governor Miller at the banquet which was held by the Delaware Automobile Association, several months ago, the New Castle County commissioners today took the initiative toward the construction of a continuous public road through Delaware, and it is expected that the two lower counties will follow suit.

Alabama Tax Is Constitutional

BIRMINGHAM, ALA., April 18—By a ruling of the Supreme Court of the state of Alabama automobile tax has been declared constitutional. Justice Pelham, representing the court, handed down the decision, which holds that section 7 of the automobile regulations, which provides for the privilege tax, does not conflict with section 221 of the constitution, which forbids double taxation.

ALBANY, N. Y., April 22—The Assembly Rules Committee reported today on the bill recommended by the secretary so amended as to provide for the licensing of all operators of motor cars without fee or examination, and authorizing the secretary to revoke or suspend licenses for cause, after a hearing, subject to a review by the courts. No license-fee change has been proposed.

McAneny Bill Framed for Cash

NEW YORK CITY, April 21—At the last meeting of the Motor Truck Club, Deputy Consulting Engineer Gregory, of the city department of highways, explained to the members the reasons for the McAneny proposed ordinance of taxing vehicles which use the city streets, ranging from $75 to $1,000 per vehicle per year, for cars having capacities between 6,000 and 10,000 pounds. A brief review of historic taxes of this nature showed that from $5 to $30 was levied by various municipalities on trucks of various capacities.

The opposition, represented by a number of truck experts, brought up the point that the McAneny measure left speed entirely out of consideration, which, however, is fully as important in determining street depreciation as truck weight. Furthermore it was argued that if a score of municipalities in Long Island, New Jersey, Westchester county and southern Connecticut—where many trucks do regular work—would levy similar taxes on vehicles, such a course would prove a serious obstacle to truck operation in New York City.

COLUMBUS, O., April 18—The Warnes automobile license bill was enacted into a law by both houses of the Ohio General Assembly and now goes to the Governor for signature. While there was a large amount of opposition in the house, it was not sufficient to defeat the measure, which had the support of Governor Cox, who made it an administration matter. The aggregate fees, which is expected to be in excess of $600,000 yearly, will go into the general fund and will not be used for the repair of the roads of the state.

Fees fixed by the measure are: Motorcycles, $3; electrics, $3; gasoline or steam automobiles up to 20 horse power, $5; from 20 to 30 horse power, $6; from 30 to 40 horse power, $9; from 40 to 50 horse power, $12; from 50 to 60 horse power, $15, and above 60 horse power, $15. Manufacturers and dealers are compelled to pay $10 for each license to be used only on one make of car.

TRENTON, N. J., April 21—Beginning May 1, every applicant for a driver's license, whether chauffeur or owner, will have to undergo an examination before being granted permission to operate an automobile in the state of New Jersey. The purpose is to increase the safety of public highways, and as the legislature this year has granted a much larger number of inspectors than before, it will be possible to devote more attention to this new branch of the automobile department.

New York's Taxi Situation To Be Cleared

NEW YORK CITY, April 23.—Mayor William J. Gaynor's committee presented to him a report yesterday in which the taxicab situation as it exists in New York at present is sized up and numerous radical improvements are suggested. These include a cut of the rate schedule to practically one-balf of its present height, the abolition of private hack stands in front of hotels, a fixed penalty eode for overcharges to passengers and license fees varying with the class and carrying capacities of the taxies.

The recommended rate schedule follows:

One or Two Passengers:	
First balf-mile or less	$0.40
Each succeeding balf mile or less	.10
Three or More Passengers:	
First half mile or less	.50
Each succeeding sixth mile or less	.10

The now existing schedules of two leading taxicab companies of the city are as follows, compared with the new schedule:

Schedule	Yellow	New York	Proposed New
First mile	$0.80	$0.80	$0.80
Each following fifth mile	.10	.10	.04
Standing time per hour	1.50	1.50	1.50
On time rate:			
First two hours, each	....	3.00	No bourly
First three hours, each	3.00	....	rates for
Each hour after these	2.00	2.00	taxicabs
Closed cars, time:			
Per hour, week days	4.50	....	Ordinary
Per hour, all days	....	5.00	provisions
Per hour, Sat., Sun., holidays	5.50	(Standing	apply to
Limousines, week days	5.50	time at	larger mo-
Limousines, S. S. & H	6.50	$2 p. br.)	tor taxis

It will he readily seen that while 1-mile trips or other snort jaunts will cost almost as much as before, longer trips will show a saving to the passenger.

It is proposed to have hackstands in the streets, open to all cabs alike, whether company-owned or independent.

All cabs will bave to get eity licenses for $5, and owners or drivers operating cars not properly licensed are liable to a penalty of $50 fine or 30 days in prison or both. An overcharge of more than 5 per eent. may result in $50 fine for every such offence; improper lighting after sunset may incur a fine of $10 and operating a meter from a wheel, driven by power, $25.

NEW YORK CITY, April 23—At a meeting of the Electric Vehicle Association last night in the Engineering Societies building, a paper by Daniel J. Tobin, president of the International Brotherhood of Teamsters and Chauffeurs was read in the author's absence by William H. Ashton, general organizer of the same body.

Mr. Tobin's paper was chiefly devoted to explaining that the teamsters' organization fully recognized the inevitability and commercial value of the power truck and was therefore not opposed to its introduction. With reference to the transfer of drivers from horse drawn to motor vehicles it was stated that "90 per cent. of our chauffeurs in every city and town who are members of our organization were formerly teamsters or drivers. We are thoroughly satisfied with the change, and the work in nearly every instance is becoming easier."

The meeting was addressed by Arthur Williams, president of the Electric Vehicle Association, who dealt with the problem of the education of drivers taking up the new calling. An educational committee of the association has been formed to consider the possibility of providing training facilities for these men. In the discussion on this matter which followed it was the general opinion of the meeting that the teamster who showed some aptitude at picking up a knowledge of the mechanical side of truck operation proved a more efficient man in the driver's seat than one whose knowledge was confined to the motor itself.

Detecting Resistance—Saving Fuel

PART II.

Construction of the Accelerometer and Some of the Results Actually Secured from Its Use Are Explained in This Article—Comparison of Three Touring Cars on Road Shows Wide Differences of Resistance

By W. C. Marshall

THE first of Professor Marshall's articles on the accelerometer appeared in THE AUTOMOBILE for April 17. In that issue the use of the accelerometer and its value to the automobilist were discussed. This week the construction of the instrument is explained and some of the results of tests made upon actual cars are given.

The accelerometer is an instrument used to measure the acceleration and retardation of the car. Its readings are given in pounds per ton for the retarding force and in feet per second per second for the acceleration. The gradient in per cent. of the road is also indicated by the instrument. The dial is arranged so that the single needle indicates grade and acceleration. A clear conception of the appearance and method of operation of the instrument may be gathered from a reading of Part I of this series.

The general internal construction and principle of the accelerometer are illustrated in Fig. 1.

A copper frame A moves in a plane perpendicular to a vertical spindle B. The spindle forms the axis of rotation of this mass of copper and supports it. The center of gravity of the mass of the copper frame is to the left of the axis. The spindle B carries a gear wheel C, meshing with a second gear of the same size fastened to another vertical spindle D, which is attached to a hair spring E.

Any acceleration in the direction of motion tends to make the mass of copper lag,

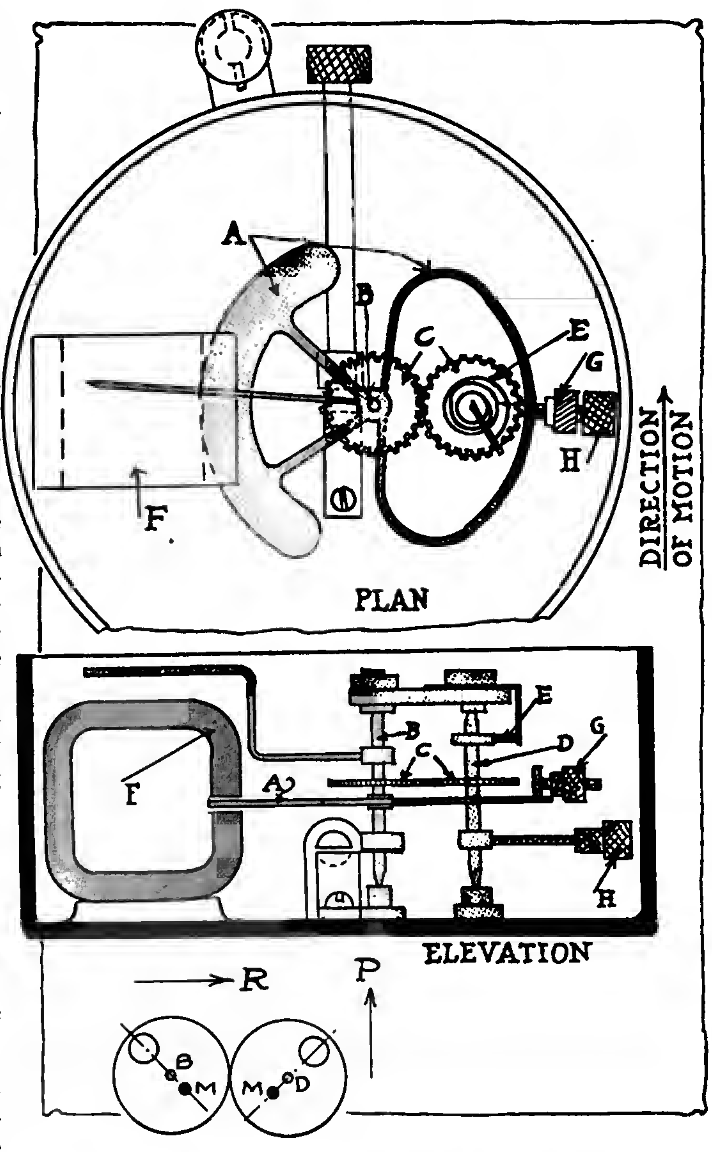

Fig. 1—Sectional elevation of the Wimperis accelerometer showing its construction. Below is given a plan of the instrument and a diagram showing the action of the counter-balance eliminating the effect of changes of level or curves upon the readings. The readings are given by the lag of the weight A, in rotating about the vertical axis B, when the car is speeded up or retarded. The action of the weight, which consists of a copper framework, is controlled by a hair spring similar to that in a watch. It is indicated in the illustration by E, and is shown in plan and elevation. The magnet F prevents the movement of the frame A in a vertical direction and gives the metal steadiness in a horizontal plane.

due to the posiiton of its center of gravity to the left of the spindle B.

This lag rotates the spindle B, which, through the co-relation of the gears, rotates also the spindle D and winds up the hair spring E. It is evident that the greater the lag of the mass of copper the greater will be the amount that the spring is wound up, and hence the acceleration is measured by the degree to which the spring is wound up.

The needle is not affected by any changes of grade because the downward acceleration is neutralized. This can be explained mathematically.*

---

*Let the slope be α and the weight of the moving parts of the accelerometer be w.

Let the distance traveled be x and let g be the acceleration due to gravity.

Then the acceleration of the car is $\frac{d^2x}{dt^2}$ and the forces acting to produce acceleration of the car in the direction of motion are $+ (w \sin \alpha + F)$, supposing the slope downward, but F = mass times acceleration, or $w \sin \alpha + F = \frac{w}{g} \frac{d^2x}{dt^2} - g \sin \alpha \therefore \frac{d^2x}{dt^2} = \frac{g}{w} (w \sin \alpha + F)$.

On account of the slope the needle will not rest at zero, but at a reading denoting the slope as $- g \sin \alpha$.

The needle has to move through this amount before it shows any reading beyond zero on the opposite side.

The actual acceleration will therefore be $\frac{g}{w} (w \sin \alpha + F) - g \sin \alpha$, or an acceleration of $\frac{Fg}{w}$ feet per second per second.

To find F multiply this reading by $\frac{w}{g}$.

If we wish to read F in pounds per ton multiply the acceleration by $\frac{2000}{32} = 62.5$. This multiplication is avoided by graduating the dial directly in pounds per ton of 2000 pounds.

A permanent magnet F, whose vertical field tends to check any oscillation of the copper frame A in a horizontal plane, may be seen in both the elevation and plan view given in Fig. 1. In order to make the instrument measure correctly when traveling around curves or on a heavily crowned road two compensating balances G and H are fitted in the manner shown in the accompanying illustration.

The forces acting at the center of mass of the copper frame of disk are directly proportional to the impressed acceleration, but, as the disk rotates through angles of 30 degrees, 40 degrees, etc., the lever arm of the force grows less. This decrease of moment produces less twisting effect on the hair spring, causing the angle of rotation to decrease in proportion to the increase in acceleration. The scale has to be graduated in accordance with this fact, which gives closer divisions at the end than at the center of the scale.

A study of the compensating balances shows their method of actuation to be as follows: While the disk is deflected by a certain amount of acceleration, say in the forward direction of the car, and a second acceleration, such as would be caused by a slope in the road, acts at right angles to the first, it would tend to add or substract from the force, causing the hair spring E to wind up, which, of course, would give a false reading on the needle.

The gear wheels are so arranged by their connection to the balance weights G and H that they are, in effect, disks. The moments of the mass of these disks about the axes B and D are equal. The centers of mass of the disks, if at M equally distanced from B and D, will produce revolution of the disks about the centers B and D when a force acts upon them in the direction of the arrow P. A force, however, acting in the direction of the arrow R will produce no effect on them. Forces perpendicular to the plane of the page will have no tendency to cause or produce rotation. Therefore the only acceleration recorded will be that which is produced by a force acting in the direction indicated by the arrow P or opposite.

In taking the acceleration readings no effect is produced by a down grade. This is so, because the gravitation effect on the needle on account of the slope is neutralized by the acceleration due to gravity acting upon the car when the latter descends a slope.

In Fig. 2 a series of curves made from accelerometer readings on a five-passenger touring car with a torpedo body are shown. The car held two persons and weighed, during the tests, 3,925 pounds. The road surface was of macadam and was in good condition, being hard and level.

Curve 1 was obtained from the readings taken on the accelerometer at speeds varying from 10 to 40 miles an hour. In each case the clutch was thrown out and the retardation noted at each speed on the instrument.

After taking these readings the horsepower was calculated and plotted by taking ordinates as horsepowers, with the abscissæ representing speed in miles per hour. The spots on the curve were first laid down as per the calculations and a fair curve, representing an approximate result of all the calculations, was run through. This horsepower is the actual horsepower developed by the motor and required by the car when actually upon the road.

Horsepower Obtained from Accelerometer Readings

In this set of curves given in Fig. 2 the curve marked 2 was obtained by bringing the car up to various speeds and then cutting off the ignition. The horsepower was then calculated from the readings given on the accelerometer. The curve was plotted through average spots and indicates the trend of the resistance.

The vertical distance between curves 1 and 2 represents the difference between these curves and hence indicates the frictional horsepower loss in the motor and clutch.

This is approximately 1.5 horsepower at 15 miles per hour and 4 horsepower at 30 miles, showing an increase in friction with increase in speed. This agrees with the laboratory experiments on motor friction in internal combustion engines.

The revolutions per minute of the motor are given on the line above the miles per hour. The wheels in this case were 36 inches in diameter and the gear ratio on direct speed was 3.5 to 1.

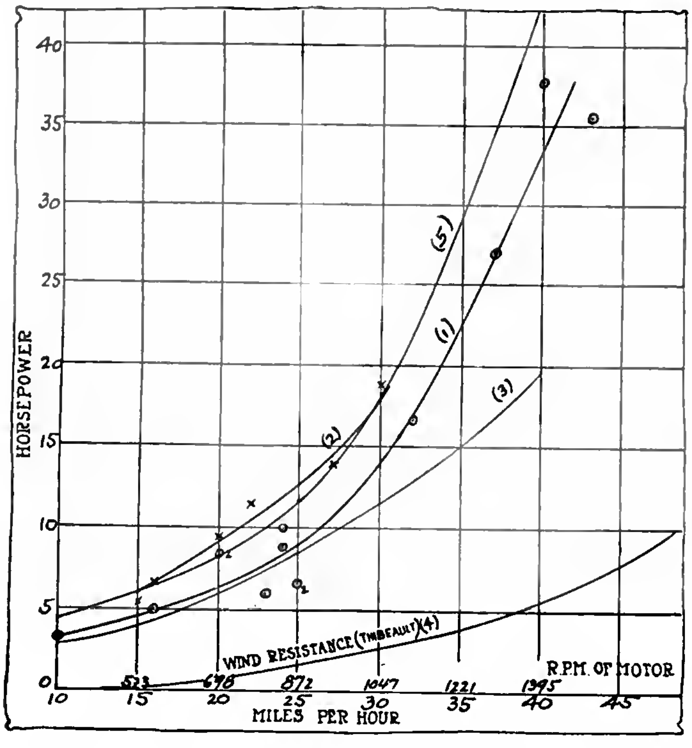

Fig. 2—Curves from accelerometer readings taken on touring car

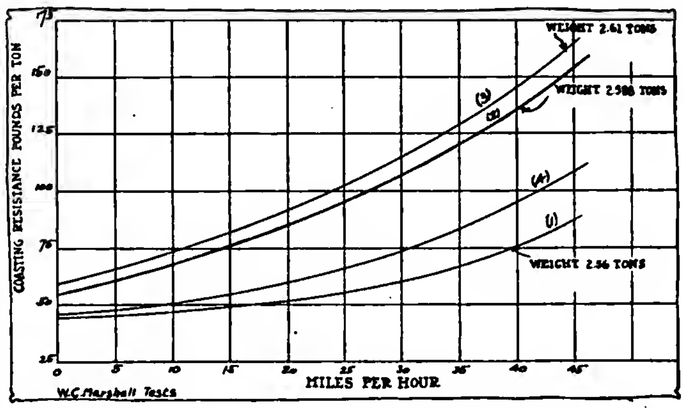

Fig. 3—Coasting resistance curves of cars at various speeds

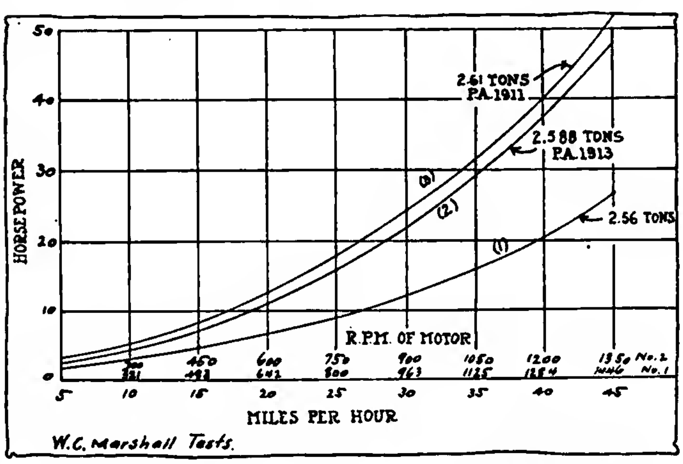

Fig. 4—Horsepower curves of three six-cylinder cars tested

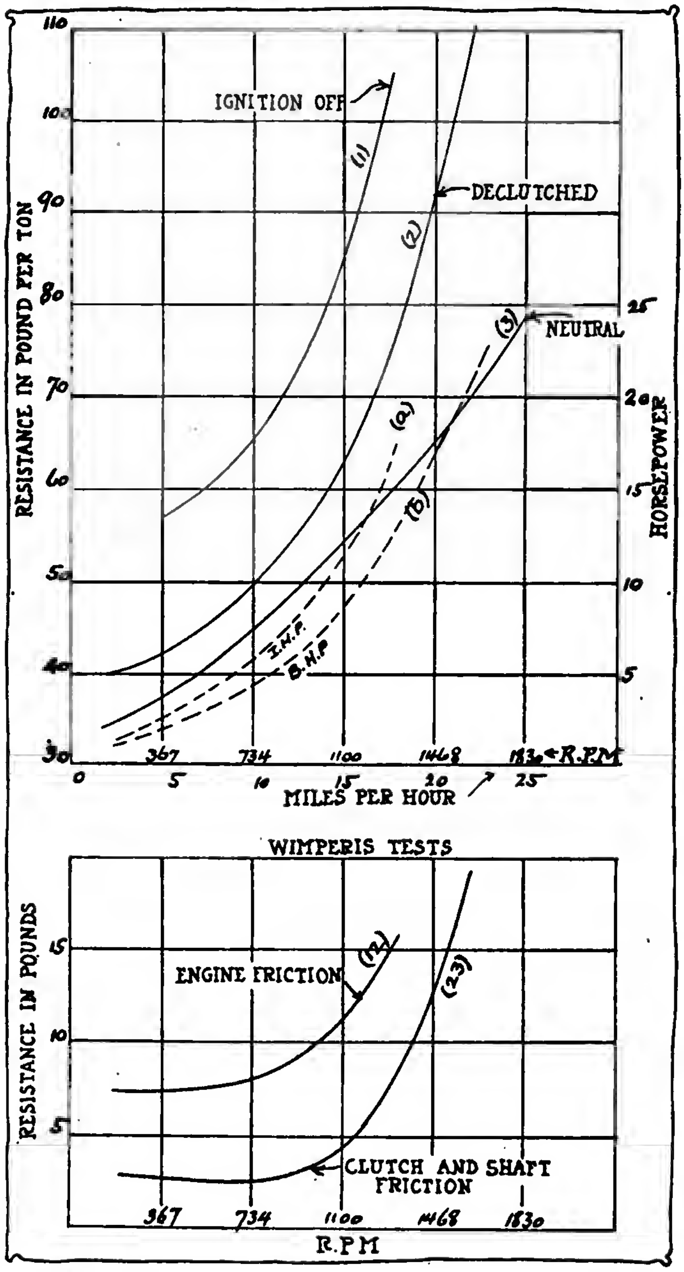

Figs. 5 and 6—Coasting resistance curves of 3-ton wagon at various speeds. Engine and clutch friction curves

Curve 3 is the theoretical curve of resistance of the car plotted from the formula $R = 47 + 12\left(\frac{V}{20}\right)^2$ and the equation $HP = \frac{R \times 1.96 \times V}{375}$ **

This equation has been derived from experiments which show that the resistance per ton to rolling is 47 pounds and that the resistance due to wind resistance would be $\left(\frac{12\,V^2}{20}\right)$. The horsepower formula is deduced from the fact that 33,000 foot pounds per minute make 1 horsepower and therefore the pounds per minute exerted by the motor in overcoming the car resistance divided by 33,000 give the equation for the horsepower. This simplifies itself to the expression given above.

**Thibeault's experiments on wind resistance resulted in this formula: $R = \Theta\,EAV^2$ where Θ is a constant .0625; E is the length of the car in proportion to its front area; i.e., 1.1A is the area in surface of car presented to the wind in square meters. R is the resistance in kilograms. V is speed of the car in meters per second. Reducing this to English measure gives $R = .014A \left(\frac{V}{28}\right)$. A is in square feet and V is velocity in feet per second.

The resistance of the wind is shown by the curve marked 4 on Fig. 2. The rolling resistance is the difference in vertical height between the curves taken with the clutch thrown out from readings on the accelerometer, or, in other words, curve 1 and the curve of wind resistance 4. On this car it will be noted that below 25 miles per hour the resistance is low.

To obtain the horsepower curve which shall show the true horsepower at the clutch it will be necessary to divide the ordinate by the percentage which the coasting resistance bears to the power resistance at the clutch. That is, to be specific, 70 per cent. at 30 miles per hour. Curve 5, Fig. 2 shows the horsepower at the clutch.

Comparative tests to demonstrate the easy or stiff running qualities of a car are given in Fig. 3 by curves 1, 2 and 3. Curve 1 shows an easy running car as compared to that in which the resistance is higher. See curves 2 and 3.

Curves 1, 2 and 3 are coasting resistances of three six-cylinder cars weighing respectively 5120, 5176 and 5225 pounds. Curve 4 is the theoretical resistance curve. The low resistance shown by curve 1 is remarkable and far above the average, denoting excellent condition regarding frictional and air resistance. These curves were made over the same stretch of road having good hard macadam, curves 1 and 2 being plotted from tests made the same day.

The high resistance of car 3 was found to be due to dragging brakes which produced excessive friction. The car would have undoubtedly been run without any knowledge of this trouble had it not been tested by the accelerometer.

Horsepower Required for Driving

The difference in horsepower required to drive these three cars can be easily seen by referring to Fig. 4. At 20 miles an hour car number 2 requires 72 per cent. more horsepower than car number 1. At 30 miles 83 per cent. more and at 45 miles 81 per cent more. Reduced to actual horsepower this amounts to 4.5 at 20 miles an hour, 10 at 30 miles an hour and 21 at 45 miles an hour. This is enough to produce a large increase in car mileage costs of gasoline, oil and tires. The gear ratios on direct were 3.43 to 1 on car 1 and 3.3 to 1 on car 2.

The tires were 37 by 5 inches on the rear wheels of both cars and on the front wheels of car number 2. Car number 1 had 36 by 4.5 inch tires on the front wheels.

The motor dimensions of both cars were the same as regards stroke, but in diameter car number 1 had a bore .25 inch smaller than car number 2. The revolutions per minute at the various car speeds for 1 and 2 is placed above the speed in miles per hour on the chart given in Fig. 4.

In Fig. 5 the coasting resistance of a 3-ton wagon are plotted with reference to various speeds, under running condition, marked on each curve. The horsepower curve a is calculated from the resistance with the ignition cut-off. Curve b representing the resistance at the clutch can be called the brake horsepower. The sharp rise of the curves in Fig. 6 show the increased power required at high speeds.

The remarkable variations in coasting resistances shows that this part of the design, while carefully worked out theoretically, has never been subjected to actual test. The accelerometer offers a method of comparison between different cars and also for the same car at different speeds. In a series of tests recently made the coasting resistance of twelve different pleasure cars, all having pneumatic tires and windshields, and two trucks with solid rubber block tires, was measured. The tests were made on smooth wood block pavement in New York City at speeds of from 10 to 25 miles an hour. The results were as follows:

Speed, miles per hour	Maximum resistance	Minimum resistance	Average
10	50	40	45
15	60	45	50
20	70	56	60
25	100	65	80

This shows a difference of 35 per cent. between the highest and the lowest at the common speed of 25 miles an hour.

MOTION Pictures from the Shops.—Kinematograph views now play a notable part in manufacturing operations, being useful for two very different purposes. One is to assist in the study of the motions of both men and machines, and the other is to furnish captivating and up-to-date advertising material, the latter mainly for use in connection with lectures and conventions and of course mostly of value for industries, like the automobile industry, whose output and methods of production are in the public eye. With regard to the use of the pictures for motion study and the improvements of methods and machinery which should be the result of such study, it is becoming recognized that observation of the views is more fruitful of results than direct observation of the work, even if it may need to be supplemented and verified by the direct observation in some cases, partly because the successive views, which may be unrolled before the screen or the eye with any desired slowness, naturally dissect the movements, and partly because they may be filed and indexed and taken out at any convenient time when the subject which they illustrate is under debate.

G. A. Fritze writes on this subject with special reference to the details of the electric lamp installation which must be provided in a factory, if the management prefers to operate its own kinematograph outfit or wishes to be in a position to call in an operator for quick special work at any time and with short notice. The more usual situation is that the kinematograph firm provides the necessary portable artificial light equipment for the interior views and that the manufacturer plans to have all the processes which he wishes to investigate or advertise covered in motion pictures consecutively during one short period. In some places, however, such as rolling-mills where the camera cannot be placed very close to the subject, on account of the progression of sputtering red or white-hot strings of metal which interpolates the space, or as drop-forge plants, where the intermittent concussions call for special suspension methods to protect cameras against shocks, the burden of providing a suitable installation for kinematograph work will largely fall upon the works-management.

In the choice of subjects for the motion-camera there is room for judgment and experience. Not all processes or machines are rendered well in films. Wheels with spokes, such as flywheels, or machines whose operative movements are merely rotary, show too little motion or even may seem to run backward if the wheel movement happens to coincide in speed with that of the films. The observation of a large number of machines in whose operation the attendant plays only an inconspicuous part is usually tiresome to a lay spectator. Machines of this kind should be singled out for separate views, showing the movements of the parts of one machine only and on a large scale, which means a nearby-view with carefully directed illumination. Strongly reflective surfaces are likely to spoil the whole effect of a film, and it is often necessary to paint them over in lime colors or cover them with dark paper in some inconspicuous manner. Large black parts, on the other hand, leave an inpenetrable blotch of nothingness in a picture and are better painted gray. A color atomizer serves these purposes. Step ladders should be on hand to facilitate high views.

It is a considerable advantage of kinematographic work, as compared with ordinary photography, that it need not interfere with the daily manufacturing routine, if the preparations are made in advance, the night before or during the noon hour. Workmen are not temporarily turned away from their machines and tools; on the contrary, they must continue at their tasks if good films shall be produced. In practice the work must, however, be laid out with some reference to the pictures, in order to get everything into them that is wanted. Articles like oily cotton waste in odd places, lunch cans and bottles may be lifelike, according to the customs of a factory, but they rarely look well in pictures. Like the actions in a drama, these should be confined to essentials. The appearance of any person who seems to be idle in motion-views of a shop, even if he is a foreman or an inspector, is a mistake.—From *Werkstattstechnik,* April.

DR. RIEDLER'S Science Popularized by Riedler.—The complete popular review of automobilism given by Professor Dr. Riedler in the latest German technical encyclopedia continues to attract attention, because it is understood that the facts and views presented in it agree completely with the large stock of technical data which have been sifted out through several years of scientific testing of cars and their parts, on the road and in the laboratory of the author at the Technical Highschool at Charlottenburg, and because it brings these data into relations with questions of wide general interest. Some extracts from this review, in addition to those presented last week, speak for themselves in showing to what extent the conclusions of the foremost German specialist on the subject agrees with the American development, in which respect it may be noted, however, that Riedler cannot be fully acquainted with the very latest improvements in such things as motor-starters and is inclined to push to one side as too cumbersome (*umständlich*) any device which seems to him too costly and elaborate for the importance of the special purpose it serves, particularly if that purpose is not yet fully and infallibly served by any of the devices in the market. He thus takes cautious distance, for the present, from wire wheels, new valve systems, silent chains and motor-starters while refraining from judgment on other points such as the relative values to the public of small motors with high piston pressures and larger motors with lower pressures and greater flexibility (meaning by the latter term a wider power range under the throttle without recourse to gear-change). The extracts follow:

Noiselessness.—The silent running of a car depends upon the machinery as a whole, upon the distribution of forces and masses in the vehicle, upon the oscillations and vibrations of machine and vehicle parts, upon the balancing of motor forces and finally, in relatively small degree, upon the valve movements. Details of a motor, such as the magneto-drive, the pump-drive, etc., may cause more noise than the motor proper. Silence can be secured with poppet valves, if they are raised gradually with short lift and are closed gradually, which is only a matter of correct design [including larger valve dimensions, other things equal—Ed.]. The main cause of noisy running at high motor speed lies in the vibrations of machine parts. Every part has its own radius and period of vibrations and a critical vibration at which the noise becomes maximum. When the critical vibrations of several parts coincide, the noise can become intolerable. The principal means for securing noiseless running is therefore: To avoid or to break up and muffle the vibrations of individual parts. Subsidiary means for the same purpose consist in: The use of slide valves (sleeve or rotary) instead of poppet valves, the encasing of valve action, etc. The main causes of the noise are entirely independent of the system of valve control. It is one of the results of the introduction of sleeve valves that now noiseless running is demanded of all automobiles, and this demand can be met with any correctly designed and built poppet-valve motor. But there are many experienced drivers who do not wish complete silence, so far as the motor is concerned, and on the contrary much prefer that the motor shall have something to tell them of its inner workings during the running.

Motor-starters.—Cranking of large motors may become a very laborious task in cold weather. Injection of gasoline into the cylinders or other expedients must then be employed. Hence the many efforts at perfecting motor-starting devices. All of them, including those operated with compressed air, have however so far proved too cumbersome. In many cases, for that matter, the difficulties in cranking are not to be ascribed to the motor but to the carbureter; to the faulty gas mixture produced in it at low-speed suction, particularly to over-saturation of the mixture.

Brakes.—Front-wheel brakes are dangerous because they suddenly change the resistance to rotation of the steering wheels [Dr. Riedler here takes distance from certain theories to the contrary, which are advocated in France and practiced to a very limited extent in British cars—the Argyll, for example—and not unsuccessfully, it seems—Ed.]. . . . By driving in the mountains, extensive use of the rear-wheel brakes may result in overheating and even in the failure of the brake action, but the driver can always avoid this effect by timely use of other means for retarding the car. The motor especially can serve this purpose. By closing the throttle and letting the motor be dragged idly by the car, a certain brake effect is produced, and this can be increased by throwing the high gear into mesh, so as to force the idle motor to run faster [the reader will readily correct the slip in Riedler's statement on this point—Ed.], thereby easily reaching a degree of resistance by which the brakes may be dispensed except for an occasional equalization of the forces where the gradient of the slope changes. No water-cooling of brakes is then required. No objection to the use of the motor as a brake in this manner can be raised on account of any alleged tendency to overheating, as the cooling water in the motor disposes of the heat generated by the brake effect. Arrangements are also in the market by which the carbureter is so transformed as to make the motor act as a compressor-brake.

If in many cars the motor is not utilized as a brake, it is because the automatic lubrication continues unabated and fouling of the spark plugs easily ensues. But this can be avoided by a correct lubrication system. Failure, excessive wear and overheating of brakes are always the result of unsuitable construction or unskilful handling. Sprags are always an unsafe means for arresting a moving car, and should be used only to permit the previous release of brakes at the starting of a car uphill—like a stone chocked under a rear wheel.

Speed.—Fast driving is a mere matter of sport and brings no average gain in transportation results. With a small car, an average of 40 kilometers per hour can be attained; with a powerful car perhaps 50 kilometers. To reach a materially higher average it is necessary to drive at times as fast as 80 kilometers, and road stretches fit for this speed are not commonly available. Even speeds of 60 kilometers usually result in a waste of time, as the delays incidental to tire troubles caused by such speed should be taken into the count.—From *Automobil-Rundschau*, March 30.

—

HELIOS Demountable Wire Wheel.—The many new wire wheels now offered in the French market are said to differ mainly in the means employed for locking the demountable hub, to which the wire spokes and the rim are secured, to the inner hub, which is mounted by ball-bearings upon the axle-end and remains there when a wheel is replaced. A description of the Helios wheel, which is of this type, is limited to the locking mechanism used in it, and it is mentioned as a notable advantage that the parts of this mechanism belong to the fixed and not to the demountable portion of the wheel, by which provision the spare wheel becomes simpler and cheaper. The time required for mounting or demounting is represented as 30 seconds. The construction, as shown in the sketches (drawn from half-tones) in Fig. 1, seems to apply to front wheels only; at least no means for keying a wheel-shaft to the interior of the fixed hub or to the locking-device are explained or indicated.

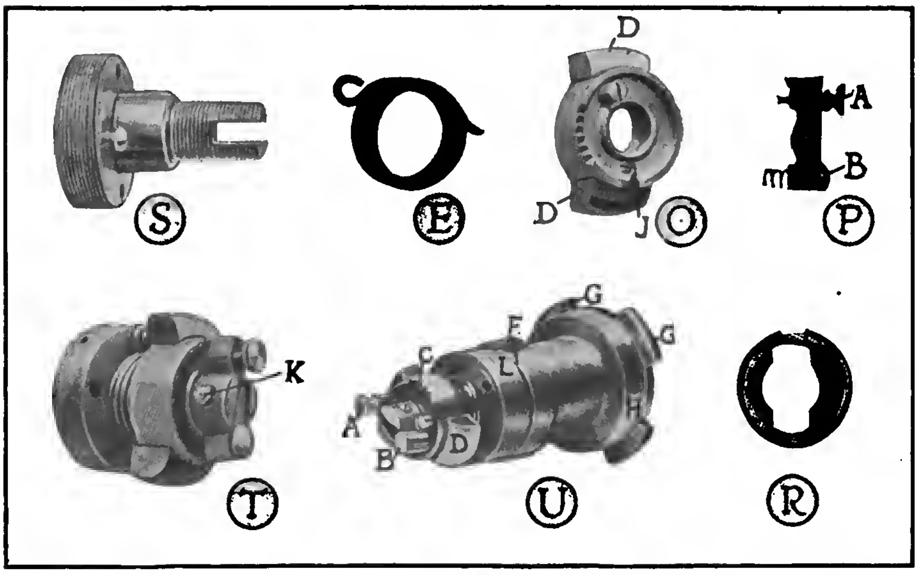

Fig. 1—Parts of fixed hub and locking-mechanism of Helios demountable wire wheel

Among the sub-figures, U represents the fixed hub with the locking-parts secured upon it in the position they occupy when a wheel is to be placed upon it or removed from it; T represents the pieces S, E, O and P put together, and R represents the design of the outer end of the demountable hub, the keyplate having an opening admitting of passing the locking-parts through it in one position while locking against them by a quarter turn.

The fixed hub has four lugs G interlocking with four corresponding lugs on the inward flange of the demountable hub. This constitutes the rotation-lock. Otherwise the demountable hub is seated upon the two conical zones H and F of the fixed hub. Outside of F there is a short cylindrical extension of smaller diameter upon which the part S is threaded, and upon the latter there is in turn threaded the ring L which serves as a locknut. The coil spring E is passed over the slotted shank of S and mounted loosely upon the cylindrical boss of the same piece, one end being looped and secured under a screw-head. The lock-piece O is screwed upon the slotted shank and when nearly home engages the bent-out free end of spring E by means of a hole in its inward face. If the lock-piece O is now turned to the left, the movement must be made against the strong torsional resistance of the spring E. The piece P may be looked upon as a key to the locking-device. It rides in the slot of the threaded shank of S, and a spindle K permits it an oscillating movement therein. At one end it has a small coil-spring attached to a screw-button B, at the other a setscrew with a knurled head A and, beyond this, a projecting beak adapted to engage one of the notches C in the raised edge of O or else the deeper notch J in the same circumference. The spring at B serves to tecter the key around spindle K so as to engage the beak in one of the notches. The setscrew A, on the other hand, serves to release this engagement.

When the key-piece has been placed in its position, with the setscrew tight, the lock-piece O is turned with a spanner against the resistance of spring E until the beak of P is opposite notch J. Then A is released and the beak falls into the notch, holding the lock-piece in the position given it. The keyplate R in the demountable hub is now passed over the locking-mechanism, so that the jaws D come on the outside of the plate, registering with the aperture in it. When now the setscrew A is applied, the beak is released from notch J, and spring E snaps the lock-piece around about a one-quarter turn, locking the jaws D against the segments of the keyplate and forcing the demountable hub firmly against its seat. By releasing the setscrew A again, the beak of the key drops into one of the small notches C. Demounting takes place by reversing this order of operative movements.

The customary screw-cap upon the outside of the demountable hub adds the usual protection.—From *La Vie Automobile*, March 22.

—

HOME News—about Lubricants—from Abroad—Owing to a peculiar mix-up of scientific data and commercial conditions, news relating to the experiences which makers and owners of automobiles are gathering with reference to lubricants must frequently be obtained from European sources, although the lubricants themselves are generally of American origin and manufacture. Thus *Omnia* has lately received a number of communications relating to the practice of mixing 3 to 7 per cent. of lubricating oil with the gasoline supply while at the same time reducing the splash feed to the cylinders and piston pins to a minimum, the object being four-fold; namely, (1) to have the quantity of oil deposited on the cylinder walls proportionate to the force and heat development of each explosion, (2) to make sure of having fresh oil for each explosion, (3) to economize and (4) to avoid smoky and nauseous exhaust. The practice is admitted to be of American origin and is said to be especially in vogue for small two-cycle boat motors in which the explosive charge is transferred from the crankcasing to the combustion chamber. Nearly all of the reports by French experimenters to the journal mentioned above are decidedly favorable. Only one of them complains that a marked gain in the sweetness of the running of his motor was followed by a stubborn clogging of the carbureter nozzles, and this is tentatively ascribed to the presence of resin oil in the lubricant employed.

With regard to the use of deflocculated graphite in the lubricant, notes of commendation and even of enthusiasm are frequently seen in the European automobile and engineering journals and in scientific periodicals of wider scope. Colonel Kurt Bilau devotes to the subject a lengthy article in *Automobil-Rundschau* of March 30, based in part on tests made by the Automobile Club of America and by the Automobile Club of France, the results of which were published in THE AUTOMOBILE at the time when they were made. But Col. Bilau adds information derived from other sources and which may be considered as important if true. He says:

"The poorest oil is good enough for carrying deflocculated graphite to the point of lubrication. Kerosene, for example, will do, although it has scarcely any lubricating value. Nay, where it is practicable to use an ungreased bearing, even water can be employed. A little preparation of the graphite with tannin enhances the stability of its emulsion in oil. There is only this to be observed, that the oil or water which acts as a vehicle for the graphite must be free from acid, as otherwise the graphite does not remain entirely in suspension. But the requirement consisting in freedom from acidity is met in even the poorest automobile lubricating-oil, so that the automobilist, by adding this grade of graphite, may reduce the quality of his lubricating-oil without worrying. He may freely employ any oil which he can buy at the roadside; and this is an advantage not to be underrated. It will surely take the graphite to all the bearings."

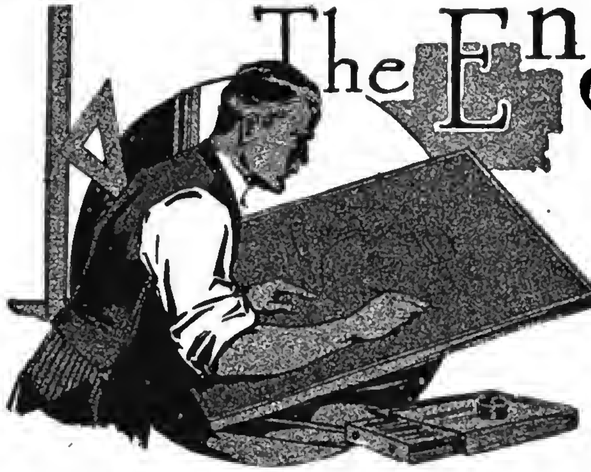
—

SPURWHEELS of Muslin.—A great many sheets of muslin—the number depending on the width of gear teeth that is wanted—are piled in a stack and soaked in machine oil, whereafter round blanks are stamped out of them. Each of these is placed between steel disks of equal diameter and powerfully compressed to the required thickness, then riveted or bolted. The gear teeth are then milled in the usual manner. The method is American, and the gear wheels so produced are 20 per cent. stronger than rawhide gears, according to data furnished *Werkstattstechnik* (April issue) by Otto C. Reymann of Pittsburgh, Pa. The durability of the muslin gears is said to be extraordinary and due to (1) the elasticity of the teeth (the confining steel plates taking no direct part in the work), (2) their indifference to mineral oil which is injurious to rawhide, (3) a certain self-oiling property derived from the oil used in their production and (4) their indifference to such overheating as may be caused by overloading and neglected lubrication. On the last point, it is claimed, the superiority over rawhide is marked, with the result that the dimensions of a muslin gear—and therefore also those of its metallic mate—may be figured without the large allowance for possible overheating which is necessary with other silent gears. Similar gears made from textile material are made in Germany by F. Stolzenberg & Co., of Berlin-Reinickendorf, adds the editor of *Werkstattstechnik*.

—

ONE More Elastic Wheel—The industrious inventor has again evolved and materialized a new idea in elastic wheels. In this case the wheel contains no element which in itself would be recognized as elastic, but a certain and not inconsiderable degree of elasticity is obtained, anyway, by having very many elements, each almost rigid, and coupling them together in such manner that a pull on one of them is transmitted at once to all of the others. Thus, if each of 100 elements is made to yield under a shock 1/10 of one millimeter the total cushioning effect which may be produced in one spot may approximate 10 millimeters or 2/5 of one inch. In addition, the rim has a slight yield of its own. Imagine forty round steel links secured pairwise by twenty clips to the inner circumference of a loose rim with a tire band, each clip holding two links, and imagine further that the pairs of rings so suspended are joined by twenty other clips which are pivotally secured to a wheel rim considerably smaller than the loose rim with the tire band. The rings supplemented by the two opposite sets of clips, one fixed and the other capable of pivoting in the plane of the wheel, now form a complete chain anchored inwardly to the wheel rim and outwardly to the rim with the tire. At one point of the wheel rim the pivoted clip is replaced by a very substantial fixed one, so that the mere traction resistance shall not make all the pivoted clips lie down. The contacts of each clip with its pair of rings are designed to afford a rolling action and 160 places where wear may be taken up by eccentric adjustment.—Illustrated and described in *Omnia*, April 5.

The Engineers' Forum



Horsepower As Basis For Tax Discussed

Part IV

Prominent Engineers Agree in Opinion That Taxation of Cars Should Not Be Based on Horsepower of the Motors

Watts Favors Basis of Weight and Power
Schimpff Points to Power and Speed Variation
Schnitker Considers Conditions on the Road
Metz Finds S. A. E. Rating Manifestly Unfair
Brockway Wants Taxation on Horsepower Used
Nutt Says Engineers Should Get Together
Kelsey Doubts Power of Long-Stroke Motor
Wadsworth Proposes Combustion Chamber Basis

THERE is a widespread interest among the automobile engineers today in the problem of horsepower rating in general and in the question of basing of taxation on automobiles on the rated horsepower of the motor. The article entitled "Cars Taxed on Unused Horsepower" which appeared in THE AUTOMOBILE for March 27 called forth a great many letters on this subject, so many, in fact, that the discussion will be continued in THE AUTOMOBILE for May 1.

S. A. E. Horsepower Rating Is a Joke—Watts

DETROIT, MICH.—Editor THE AUTOMOBILE:—It would seem as though both horsepower and car weight should be considered for taxation purposes, as probably both of these have their effect upon the rate of wear of the road. If, on the other hand, taxation is to be based upon money invested, it should certainly vary with the year in which the car was produced.

From an engineering standpoint the S. A. E. horsepower rating has been a joke for some years past. There is only one logical method of rating horsepower for general purposes and that is a classification based solely on piston displacement.—F. E. WATTS, Hupp Motor Car Co.

Little of Available Power Used—Schimpff

CINCINNATI, O.—Editor THE AUTOMOBILE:—Taking motor block test, Sprague dynamometer, as a basis and assuming the different rates of speeds that people will drive, we arrive at the following:

Our car has a motor rated at 45-50 horsepower, and at 1,625 revolutions per minute actually develops 45 horsepower. But show me the average owner that drives his car with a motor turning over at this speed. Consequently, assuming he drives at different speeds, we can give the highest horsepower in proportion possible by taking it off of our shop chart. For instance, at 20 miles an hour with our car his motor could be turning over 660 revolutions per minute, which would show a motor equivalent at that speed to only 20 horsepower. At 25 miles per hour it would be equivalent to a motor of only 26 horsepower, and even at a speed of 35 miles per hour, very seldom traveled at by the average driver, it would only be equivalent to a motor of about 36 horsepower.

Of course, it is a boon to the automobile dealer to be able to rate his motor at a high horsepower. It is a pride of the car owner that he have a high powered motor and very few people ever stop to reason or think that the horsepower lowers or increases according to the speed, thereby using more or less gasoline, being more or less wear to the road, and being more or less liable to accident with the traveling public.

The above figures we consider are very high, as the average owner never drives over 15 to 18 miles per hour, so that the horsepower would certainly be much less than any of the above.

If necessary we can give actual figures and duplicate bench tests showing horsepower curve at different speeds.—H. SCHIMPFF, Schacht Motor Car Co.

Bench Test Not a Fair Driving Test—Schnitker

CHRISMAN, ILL.—Editor THE AUTOMOBILE:—Every builder of motors knows that a bench test is not a fair driving test and that the horsepower developed in the actual work of pulling a car on the road is far below the bench test, being very similar to theory and actual practice.

Everything is favorable to a test of horsepower in the factory, because you have no road conditions to contend with, so that we know and feel that there is no comparison with that kind of a test and the actual test of developing the horsepower on the road.—A. E. SCHNITKER, Rayfield Motor Co.

Consistency Is Imperative—Metz

WALTHAM, MASS.—Editor THE AUTOMOBILE:—It is manifestly unfair to rate a motor such as ours, which is a four-cylinder, 3.75 bore and 4-inch stroke, at 22 horsepower, and a four-cylinder, 3.5 bore and 5-inch stroke under 20 horsepower.

There is no sense in the manufacturer claiming to the public that he has a 30-horsepower motor, then going to the highway commissioners and arguing that he has only 19 horsepower for the sake of a lower cost in his license. In order to get fair treatment we must be consistent in our claims. If the total revenue is considered too high then let us work for a reduction on a fair and sensible basis.

You will never accomplish anything by trying to pull the wool over the eyes of an intelligent commission. You can only accomplish results by placing the matter before them in its true light.—CHAS. H. METZ, Metz Co.

Motor Could Not Continue at Rated Power—Brockway

MUNCIE, IND.—Editor THE AUTOMOBILE:—I wish to say on the subject of automobile motor horsepower, that I believe the S. A. E. rating to be very fair and I do not consider that the maximum horsepower which can be produced from a motor should be its rating. We do not rate a horse by what he is able to exert but by the amount of work which he is capable of doing consistently and stand up under the load.

I do not think that a long-stroke type should be rated as giving greater horsepower than the ordinary stroke motor, since in order to gain this extra horsepower the piston speed has to be increased. A long-stroke motor that is developing horsepower greater than is usually obtained in the ordinary stroke motor could be compared with a trotting horse and the ordinary stroke motor could be compared with a trotting horse and the ordinary stroke motor to a horse walking. One will last longer than the other if this demand is made on the motor by increasing the piston speed.

A motor in a car on the road very seldom develops anywhere near the S. A. E. rating but the ordinary speed the horsepower develops is only a small per cent. of what the motor is capable of doing. We all know that a motor could not live long working at its rated horsepower.

I believe that an automobile should be taxed according to the amount of power it takes to run it in ordinary use rather than taxing it for power it may have in reserve, that is, if horsepower is to be considered at all by the secretaries of state.—C. P. Brockway, Inter-State Automobile Co.

Stroke Should Be Considered—Nutt

Kokomo, Ind.—Editor The Automobile:—I do not think that the S. A. E. rating is proper on account of the stroke not being taken into consideration. I think all engineers should get together and work out a formula that would take into consideration not only the stroke, bore and revolutions per minute, but also mean effective pressure. I realize that to work out a formula that would be fair to all would be quite a task. Perhaps it could be done in this way: Take five or ten motors of each size and get the dynamometer pull at different speeds, and strike an average. This would involve a great deal of labor, but would enable us to work out a formula that would be an average or comparative formula for all motors. Of course, this would make it unfair for the companies having a very efficient motor on account of proper valve sizes, proper compression ratio, etc., so after all is said and done a formula made up, taking into consideration valve size, ratios and other details which have an important bearing on power would perhaps be the best and only way to work it out.

On the other hand, we are up against the laws of the country regarding license fees for operating automobiles. Here is also an opening for somebody to get busy and determine the average horsepower that is used for legitimate road driving, especially when you realize that when a car is driven over the road at a speed of 20 miles an hour, it only requires from 5 to 8 horsepower to do the work, so you can see that the horsepower rating is a problem not easily adjusted.—F. N. Nutt, Haynes Automobile Co.

Should Rate Motors Under Normal Conditions—Kelsey

Hartford, Conn.—Editor The Automobile:—The horsepower of the various automobiles as advertised, ourselves included, I think is deceiving. In our own case we list our car at 10 horsepower, the A. L. A. M. rating being 11 1-4. Under most favorable conditions, such as never pertain to automobile practice, we could for a few moments show more than the 11 1-4 horsepower. Actually in practice we doubt very much whether our motor shows over 8 horsepower, and as our motor is built with extremely large intake and exhaust valves, with well-proportioned timing, with the valves themselves arranged with an angle with reference to the opening of the cylinders, so that a very free intake and exhaust is had, we are convinced that our motor will give equal results with any motor with similar piston displacement.

Any test for horsepower, to our minds, should be taken with the normal work the motor can stand for 10 hours already running. The writer has seen a great many tests made of cars which are catalogued at high horsepower, and these tests are generally made in the following way.

The motor is put on a block, circulation of the water is arranged by the water being run through from outside sources, so that the pump of the motor is not employed; the fan is not used. This alone on high speeds on a motor of 45 horsepower will consume from 1 to 2 horsepower. Lubrication is the very best. Every possible arrangement is made for speeding the motor up. The motor is brought to its maximum speed, and the brake applied for a few moments, possibly 5 minutes. Under these conditions, you are able to get an enormous horsepower. Actually, with even all these conditions perfect, if you will allow the motor to go down to its normal load, it would drop fully 33 1-3 per cent.

The maximum amount of horsepower that can be squeezed out of a motor under abnormal conditions, to our minds, is not the legitimate horsepower of a car, although this is the rating most American cars use. The normal working horsepower is what should be used.

If we have not been improperly informed, our term horsepower is based on the work one normal dray horse can do, working 10 hours a day, under normal conditions. This, after a series of horses were tried out and after a series of tests were made, worked out to 33,000 foot-pounds a minute, in other words, one horse could lift continually for 10 hours working 33,000 pounds 1 foot for each minute of the ten hours.

This is the normal work of the horse. The spasmodic effort that he can make to pull a wagon out of the mud is not his true power any more than the spasmodic effort an automobile engine can make is its true power.

Power of Long-Stroke vs. Short-Stroke Motor

Now with regard to the long-stroke motor, there are many engineers who are not at all convinced that the long-stroke motor will develop as much power as the short-stroke motor. The whole thing resolves itself down to piston speed, and the mean effective pressure in relation to the piston speed. It is not good practice on a long-stroke motor to run any higher compression than on a short-stroke motor. You are limited with regard to your compression to get proper results. On the long-stroke motor your mean effective pressure will be lower than on the short-stroke motor, as you have a longer time for the gas to expand and it will exhaust at lower pressure than on the long-stroke motor. This will mean greater efficiency, but not more power. The short-stroke motor will start off with the same initial pressure and will exhaust at a much higher pressure and will have a very much higher mean effective pressure. A large part of the power will be wasted in the exhaust.

Of course, the short-stroke motor will develop a much higher revolution per minute than the long-stroke motor. In this way the piston speed is made equal or greater than the long-stroke motor, and a greater mean efficiency pressure is had. Under these conditions the short-stroke motor will show more horsepower than the long-stroke motor.

The advantage of the long-stroke motor has, however, is greater efficiency per pound of fuel consumed, for the long-stroke motor does not exhaust its gas at such a high pressure, uses its gas for a longer time and gets more horsepower out of the same amount. The long-stroke motor is undoubtedly more efficient from an economy standpoint, but there is no reason to believe that we know of that it will develop any more, if as much, horsepower as the short-stroke motor. If this be true, as I believe it is, the long-stroke motors should not be catalogued at any greater horsepower than the short-stroke motors, possibly at lower horsepower.—C. N. Kelsey, Kelsey Motor Co.

Combustion Chamber Contents as Basis—Wadsworth

Cleveland, O.—Editor The Automobile:—I believe that in event of dissatisfaction with the present taxation system that the only logical basis for a new method of taxation must be that of cubical contents of the combustion chamber. One taxation is determined by such a method, the problem of designing an economical, powerful and efficient motor of small bore and stroke is put squarely up to the designer.—G. R. Wadsworth, Peerless Motor Car Co.

(To be continued.)

Runabout Body for Pathfinder Chassis

Double-Dropped Frame Permits Low Body Position—Large Gasoline Tank and Ample Luggage Space Provided

RUNABOUT body designs vary to a greater degree and present a wider range of ideas in car superstructure than any other form of body classification. This is no doubt partly due to the low first cost of a runabout body, and the opportunity that this opens up of having a body built to suit individual taste, rather than to purchase a stock article. Also it is more particularly a man's car and a man is not bound by conventional lines when ordering a body that is to be used exclusively for his own pleasure and requirements.

The design here illustrated is not freakish in any way and will be found suitable for the purpose of a general knockabout for a great many people.

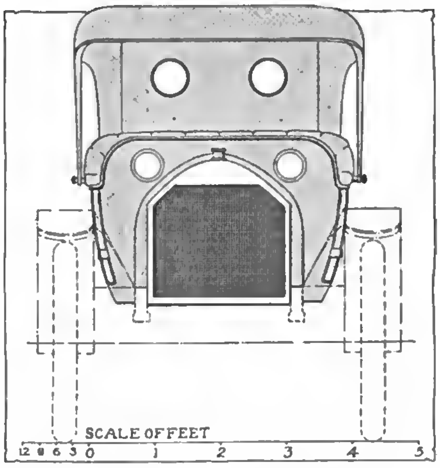


Fig. 1—Front view of body design, showing hood in raised position

The runabout body can be divided into two general classifications: those with and those without doors. The design presented is one with doors and is shown mounted on a Pathfinder 40 chassis, having 120-inch wheelbase, 36 by 4-inch tires and right side drive. The chassis frame is of the double-drop pattern, permitting a low body position and low center of gravity.

The stock chassis requires no alteration to accommodate the new body. The horn, which is under the hood, the electric lighting system, the dual tire carriers at the rear and the fenders, both front and rear, also remain normal as in the stock car. This use of the regular equipment as much as possible cuts down materially the cost of installing the new body.

Fig. 2 shows the side elevation of the complete assembly. It will be observed that the doors on this body are large and set well back, and though the steering wheel is on the right side, neither this nor the change and brake levers prevent a reasonably easy right-side entrance. The distance or space allowed under the wheel to the top of the seat cushion is 7.5 inches and from the rear edge of the wheel to the seat back 16 inches is allowed. The seat cushion is 7 inches thick, well sloped toward the rear and the seating size as shown on Fig. 3 is 39 inches long by 18 inches wide, providing ample accommodation for two people. The legroom from the seat to the dash is also generous and coincides with the other ample body dimensions.

Again referring to Fig. 2, it will be noted that the cowl is not fitted with a windshield. There is, however, a good, strong, four-bow, close-fitting top, that is shown both in its raised and folded down positions on this drawing. In stormy weather, curtains are fitted to the top on the front and sides, being fastened at the lower edge to the body. These curtains have celluloid lights and give the protection required. Under the driving seat, the space is utilized for carrying these curtains when not in use, as well as locker space for wraps.

At the rear of the passenger compartment the space is occupied by a combination gasoline and oil tank and the luggage hamper. The tank has a total capacity of 30 gallons, the divided compartments allowing space for 27 gallons of gasoline and 3 gallons of oil. This tank can be removed for repairs very easily, and the hamper to which it is attached furnishes space for carrying one suit case as well as the tool kit. The cover of this hamper is made watertight and in addition there is a small door on each side that allows the space forward of the tank to be

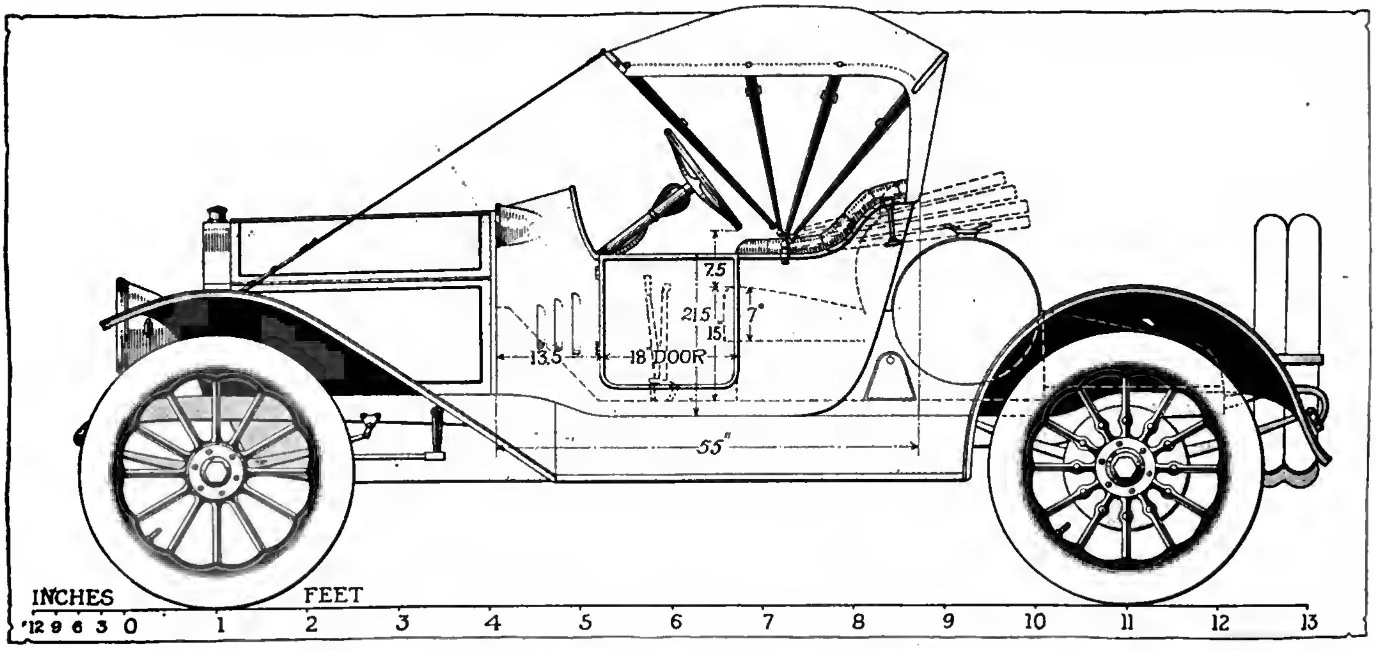

Fig. 2—Side elevation to scale of suggested runabout body with doors, adapted to chassis of Pathfinder 40

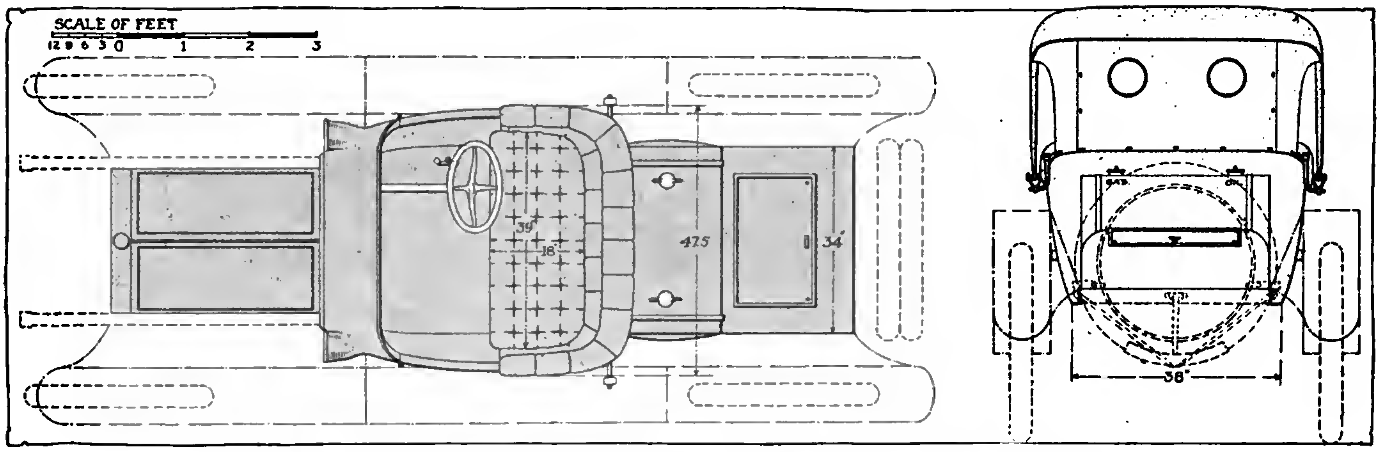

Fig. 3—Plan and rear view, showing location of tank and locker space at rear of seat

utilized for locker room also. Front, plan and rear views of the design, all to scale, are given in Figs. 1 and 3.

The construction of the body calls for aluminum panels for the major part of the body. Steel panels can be used where they are sufficiently flat not to require much beating.

The round tank at the rear is made of 22-gauge steel. The heads are soldered in and the joints wiped to give a smooth paint finish. The two steel bands that hold it in place on the hamper are threaded on each end and fastened with nuts below the hamper framing. The filler caps cover 3-inch openings.

A color suggestion for this design would be battleship gray for both the body and the running gear, black striping with here and there a white hairline stripe to relieve the flat color effect. The fenders could be black and the lamps a combination of black and nickel. Wood finish wherever exposed to be mahogany and the bows of the top, which are of wood, fitted to slat irons, are stained mahogany. The irons are blacked. A heavy khaki material would look well for the top, and the storm curtains of the same with celluloid lights.

The trimming material to be black leather, dull lustre and soft, and the trimming or upholstering of the sides, back and cushions to be a durable, moderately luxurious combination. All the materials for trimming, such as hair and springs must be of the best quality if satisfactory wearing results are desired.

The hamper and body are assembled together when going through the shop, and it is not intended to separate them at any time. This is considered necessary in order to make the joints watertight and thus insure the locker space being kept dry. For the same reason, the cutout under the tank is sealed and drainage is put around the piping.

Ventilation in the front is secured by means of flutings in front of the doors.

The Technical Training of Body Designers

ALTHOUGH every automobilist is acquainted with and takes a pride in the remarkable development of the self-propelled vehicle since its introduction, yet it is rather to be wondered at that so important a branch of this progress as the design of automobile bodies should receive comparatively so little attention. It is only necessary to recall the odd-looking vehicles that first ran under their own power, and mentally compare them with the beautiful lines of the modern automobile to realize what strides have been made in this respect. Not that appearance is the only factor to be considered; comfort and utility are even of greater importance, but these qualities have been attained at the same time as artistic tendencies have been introduced.

With the increasing demand for a good looking car as well as one mechanically efficient comes the need of body designers in large numbers to supply the automobile bodies of the near future. The training of men to fill these posts would seem to suggest the desirability of a new line of education in our technical colleges.

In this connection, the recent visit to Europe of Charles A. Heergeist, technical editor of *The Carriage Monthly*, for the purpose of investigating European methods of technical training, is of interest. This investigation was undertaken on the authorization of the Carriage Builders' Association, and Mr. Heergeist's report has just been published. Schools in England, France, Germany and Austria were visited. Among these the report of one at Vienna seems of especial interest:

"The Austrian Bureau of Public Works in Vienna supports an industrial establishment in which sample carriages and automobiles are designed and built by pupils desiring to perfect themselves in the art of constructing high-class, up-to-date work. Five different trades—designing, body building, smithing, painting, trimming and finishing, all most difficult to learn—are taught in this school. This establishment is open to employers, workmen and helpers, and all those between twenty-four and forty-five years of age are eligible.

"A full course in building carriages in the white occupies eight weeks; body and smith work, or painting and trimming, six weeks, all ten hours a day. This time may be extended, however, in special cases, and the course may even be repeated when desired.

The circular issued by the Vienna school announces courses as follows:

"Theoretical exercise, drawing, accounting, bookkeeping, machinery, technology, industrial law.—Working in the various branches of carriage and motor car manufacture.—Starting and finishing gear work in wood and iron, building carriage and automobile bodies, movable tops and putting on hinges and lock fixtures.—Gear work and suspending bodies. Top work for limousines, landaus, landaulets and cabriolets, including all the necessary fixtures.—Painting and varnishing carriages and automobiles.—Trimming and finishing interior and exterior of carriages and automobiles.

"Each course in all its branches is free, and, besides, paper, drawing instruments, pens and other necessaries are furnished free of cost. These schools have been established about three years, and the results have been exceedingly satisfactory.

"All the drawings and writings made by the workmen are their own property, while the bodies, finished carriages and automobiles are sold to those who have made them, and are auctioned off to the highest bidder. This is done not only to prevent competition with other concerns, but even to destroy all thought of it.

Service for Electrics

Complete Service Agreements Are Common and Simple Record Systems Becoming Popular in Large Cities

Besides special forms for recording repair operations made on batteries, electric-car service departments use much the same style of records as other stations, especially for compiling information which relates to repair work, a most important part of service. Where cars are stored in the service department, using it like a garage, a checking sheet supplements the cards here illustrated.

WHILE gasoline-car service stations are undoubtedly ahead of electric ones with regard to elaborate systematic organization, the latter are fast following. The efforts of the responsible men are best indicated by describing the principal features of service for electric cars given in New York and the surrounding territory.

A number of companies, among them the Baker and the Rauch & Lang, are giving complete service in their own garages. This service includes electricity, lubrication, washing and polishing and delivery of the car to the owner's house as well as calling there for it, both once a day. A charge varying from $35 to $55 a month—which, however, does not include the cost of repair work done without the guarantee—is made for this service; also, if the car is sent to and from the garage more than once a day, the time of the man driving it is charged to the car owner.

As for repair work, in the case of the Baker branch, owners, when desiring a repair job done on their cars, telephone to the manager of the company who is in the salesroom. The latter instructs, also by telephone, the service department's shop foreman and requests the car owners to drive their cars to the department, where the foreman is ready to have the necessary repairs made at once, if they are small, or in the shortest possible time, if they cannot be carried out immediately.

In the case of the Rauch & Lang service, the owner, when confronted with suddenly-arising trouble, communicates with the service department much in the same manner. Incidentally, this company's service includes the inspection, by service department men, of the car every-now-and-then so that necessary repairs may be made before their need has grown too urgent.

The Hupp-Yeats service station in New York City consists merely of a repair shop where inspections of the cars are made upon request of the owner and where broken or misadjusted parts are replaced or put in proper shape. It is a repair department and spare parts store. No arrangement is provided for a full-care scheme as in the case of the other companies.

The systems, too, which are used in these electric service departments, are rather elementary. A repair card for noting repairs made by the owner and checking them off, as they are being executed, together with a battery card for recording details when working on a car battery, are, as a rule, all that is used. Four of these forms are described and illustrated here.

Fig. 1 shows the general repair card used by the service department of the Baker Vehicle Co. This card is in form of a tag so as to be suitable to be attached to the steering lever or any other suitable part of the car, when the latter is brought into the repair shop. The card is 4.25 by 9.25 inches, printed black on tan cardboard and numbered, all cards being issued in series and bearing consecutive numbers. The use of the card is as simple as its design. When a car is brought in to be repaired—it does not matter whether the owner waits for the work or not—the foreman who takes the car over from him makes notes on the card of the owner's name and address, the number of the car and the required repair operations. Of course, the card is dated.

The work having been outlined on the card or tag, and the latter affixed to the automobile, the same is turned over to a shop worker or more to carry out the work. The man who does the work then fills out the lower part of the card—filling practically one-half of it—which is ruled for this purpose, with spaces for three columns. In the first column, the nature of the repair operation and the name of the man doing it are given; in the second appears the time in hours and minutes consumed by the man's work, and in the third the wage paid to the man for this work. If two men are on the job, each fills out a line referring to the operation, giving the name of the same as well as his own, and stating the time spent on the job. Following is a sample of how the card is filled out:

Taking up steering-gear play (Jones)......45 min., 37 cents

In a similar manner, the reverse side of the tag is ruled to form three spaces, for parts or materials used, unit prices thereof and the total price to be charged to the customer for a quantity of material or parts, as per example:

Fourteen feet of wire to motor... ....25 cents, $3.50

It is seen that by thus ruling the card with spaces for recording both time and materials used as well as their costs, a complete record of the cost of a repair job is obtained. Naturally, this card is supplemented by the weekly clock card used by all workers of the shop and requisitions whenever material is drawn from stock. This requisition gives the nature and quantity of the material needed and the number of the job for which it is made out, but it is designed much in the same style as other requisitions, and such having frequently been shown and described in The Automobile, it is thought superfluous to illustrate it here.

The Baker company also uses a special card in connection with battery repairs. This nature of work, constituting one of the most frequent requirements of electric cars, is so apt to run into details of which there are many, that it is worth while to have a special card and not make notes on a general repair card. The Baker company's card is 6 by 9.25 inches, printed black on tan cardboard and numbered. Fig. 2 shows that there are fully thirty-three spaces on the card, to say nothing of those for the date and special remarks. If a battery is brought in for repair, the card is filled out with the date and under remarks facts given by the owner or driver are noted. Then the shop worker taking care of the work fills out the spaces describing the battery and giving details which relate to its distinguishing marks, such as make, number, etc. The names of owner and workman having been filled out, the work is taken up and as it proceeds, the workman makes notes on the card of all parts drawn from stock to replace worn-out battery parts. The unit price to be charged, the number of parts used and the total net price to the owner are filled out in every case of replacement. Definite charges made for forming, washing or burning the cells are recorded and so is the time spent by the worker or workers on the job.

The Hupp-Yeats service forms are also used for R. C. H. cars and consequently do not seem to be specially suited for electrics, although they fill every requirement. The main card of the system is Fig. 3, 9.75 by 8 inches, which is printed black on tan cardboard and is made out with a duplicate on thin white paper. Or, rather, the white copy is made out a carbon duplicate on cardboard. Anyway, the latter copy goes to the shop with the car, while the white copy goes to the office. When making out the form, the repairman fills out the owner's name and address and the work to be done, as well as data referring to the car itself. This having been done, the owner or his representative who brings the car and orders the work, signs the card to authorize the job. Then, as the work is done, the various items are checked off as they are taken care of. On the shop card, no time spent or material used is entered, but time-distribution cards and requisitions serve to record this information, and the latter is put in suitable form when the job is complete and all the relevant forms are turned over to the office.

To put the records in the proper form, the blank, Fig. 4, is used. This is printed on the reverse side of the office copy of Fig. 3, and is so designed that every line permits of recording a repair operation, the number of the employees who did it, the time used and wage paid for the same, the materials used and their price, both the cost to the company and the amount to be charged to the customer. Of course, this side of the blank is also stamped with the number of the repair order and by keeping the various office copies of these orders filed—either alphabetically under the owners' names or by numbers with a cross index for the names—the information relating to all repairs is kept in accessible and tangible form. Naturally, the total labor accounted for must be equal to the total of clockcard times.

Novel Magneto Couplings for 1913

SILENCE, accessibility and flexibility are the three big requirements of a magneto or water pump shaft coupling. Automobile manufacturers have tried in various ways to secure this combination and many ingenious forms of shaft connection are to be seen on the cars that have been produced during the past few years. Leather has proved a popular material for transmitting the turning effort on account of its toughness and flexibility. The feature of silence is also one of the points for recommending this material. Among the important car manufacturers who employ leather in the magneto couplings may be mentioned Pierce, Packard, Stevens, Stearns, Premier, Haynes and Columbia.

Other concerns have pinned their faith to rubber. The Velie is prominent in this respect, employing a magneto coupling in which the drive is transmitted through a solid rubber disk.

Others have various arrangements in which metallic devices of a more or less flexible nature are used. Laminated springs have been found excellent and the Bosch Magneto Co. has brought out a device of this type.

A few years ago the use of the Oldham coupling for magneto work was very extensive. It was found that after a few hundred miles of running this type of connection became noisy through wear. The Oldham coupling, in order to be efficient, needs a close engagement between the splines and grooves, otherwise a small knock will develop.

Packard

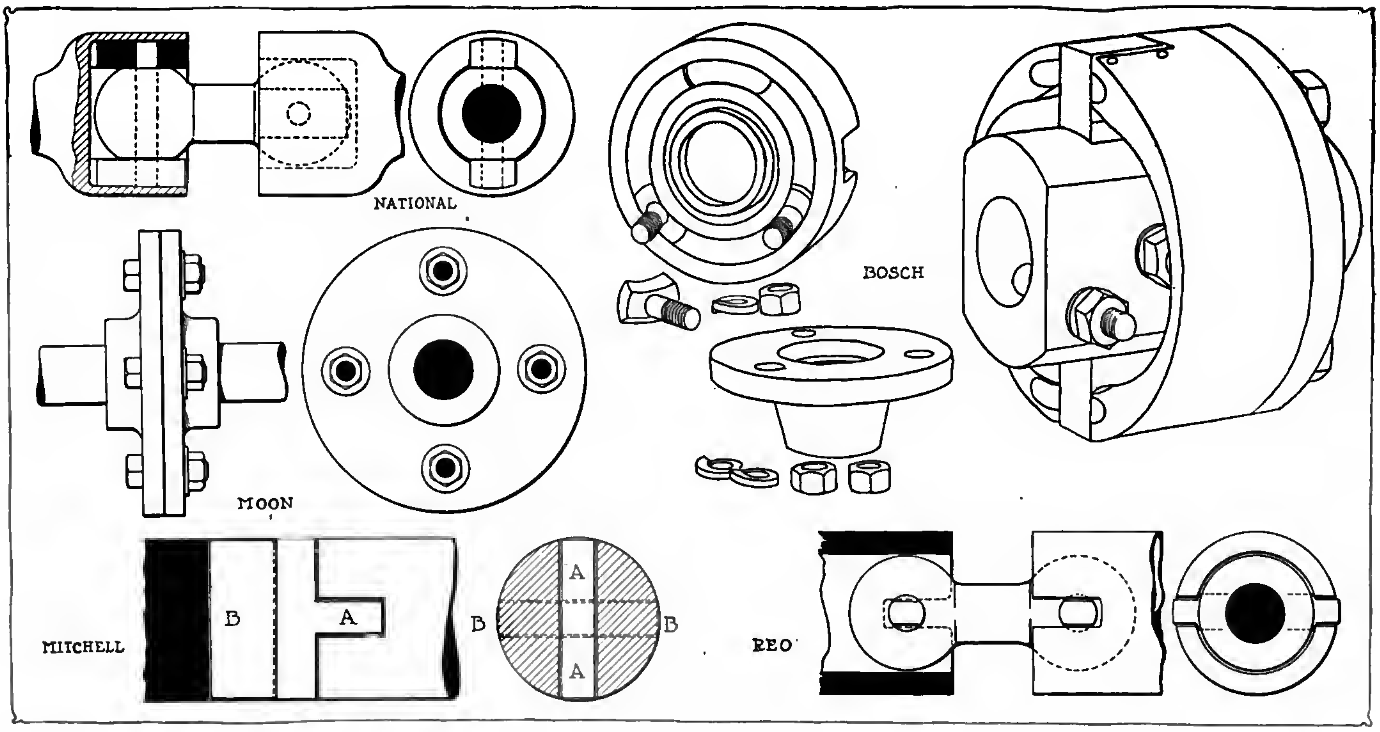
The Packard magneto drive is through two flanges which are pinned together by three pins and a leather washer which is inserted between them. This forms a rigid drive, none of the power being transmitted through the leather as the two shaft flanges are pinned firmly together. The use of the leather disk in this instance is merely for the sake of silence. There is no metallic contact between the two flanges and hence, even if a certain amount of wear should take place, there would be no clashing of metal. The Packard magneto drive is illustrated in two views herewith. The cross-sectional view shows the two shaft flanges with the leather disk placed between and the end view shows the arrangement of the drive-transmitting pins.

Lozier

Lozier uses a different scheme in transmitting the drive to the magneto. A study of the above sketch shows the Lozier scheme, which is along the lines of an internal gear. The gear is not used as such, it must be understood, as the teeth merely mesh with a toothed annulus. The gear is of bronze and the teeth of steel. It is evident that with such a large bearing surface, the drive is not likely to ever work loose. The drive is transmitted directly through these teeth from the magneto drive-shaft to the driven shaft. The annulus is supported by a collar which bolts to the magneto shaft. When it is desired to change the timing it is only necessary to slip the gear wheel out and slip it back so that it is rotated one or two teeth. This renders an indefinite number of adjustments possible with this type of connection.

Bosch

One of the most notable couplings to be found among those now in use is that brought out by the Bosch company. The drive in this coupling is transmitted through a laminated spring and the timing adjustments can be made directly at the coupling. The coupling is shown in some detail at the right on page 897. It consists primarily of three parts, a driving member, coupling sleeve and driven member. The driving member is a slotted block through which passes the laminated spring. The spring projects through the block and is held within it by bolts. The coupling sleeve is slotted and the laminated spring which projects from the block engages with the slot in the coupling and forms the transmitting feature of the drive. The driven member is bolted to the slotted coupling in such a way that it can be adjusted. The adjustment feature is secured by passing the bolts through slots and in adjusting it is merely necessary to loosen the bolts and to slip the sleeve around on the bolts the required distance. This form of magneto drive is more elabo-



rate than that usually seen because it includes both the flexibility and the adjustment features, one being secured by the spring and the other by the bolts passing through the slots.

Moon

For motor-generator drives the flexibility feature need not be considered because all the connections are rigid and since a large amount of power is transmitted by the cranking motor rigid connections are used. For instance, the Moon motor generator connection is that shown above, over the name Moon. The magneto drive has the additional feature of a leather washer slipped between the two flanges of the coupling. All the 1912 Moon cars had double-jaw universal joint connections for the magneto coupling, but in mounting the motor generator on the 1913 cars the designers have used the same type of drive for the magneto. The leather washer gives the touch of flexibility and silence to the magneto coupling which has been sought in the campaign against noise which has been instituted by automobile engineers in the past few years.

Edwards

Similar in many respects to the Lozier gear is the one employed on the Edwards-Knight car. On the latter, however, the gear wheel is of rawhide and further obviates any possibility of noise. The leather gear is carried by two stud bolts on the driveshaft from the timing gears and the collar containing the annulus into which the gear meshes is a fixed flange on the magneto shaft. The drive is thus in a measure flexible as it passes through the leather. It must be remembered, however, that the leather is of such thickness and toughness that there is no perceptible yielding to its action and no stretch whatever. The part sectional view given on page 896 shows the rawhide gear to be of considerable width giving sufficient beating surface to prevent the possibility of a loose connection. To make a change in the timing it is only necessary to pull the rawhide gear out of the annulus and advance or retard it a couple of teeth. No metallic contact exists between the driving and the driven members of this connection.

Pierce

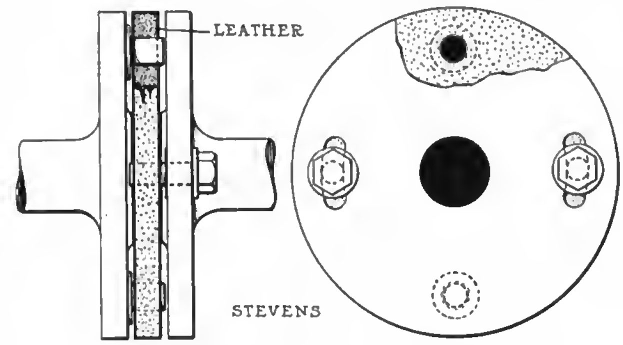
Another method of employing leather and one which has met with success in the Pierce-Arrow and other makes is that shown under the name of this concern in Fig. 1. The members in this drive are so arranged that there is no metallic contact between the driving and the driven members. The adjustments are not made at the coupling proper, but by means of an internal gear at the end of the shaft at the point at which the shaft passes through the timing gear casing. The connection used is in reality a cross-connection because the driving support and the driven are at right angles to each other. The drive is all transmitted through the leather and the strain equally distributed between the four quadrants of the leather disk. The leather is thus held at four points, equally spaced, on its circumference. The points at the extremities of one diameter are the driving members and the points at the extremities of the other diameter are the driven members.

National

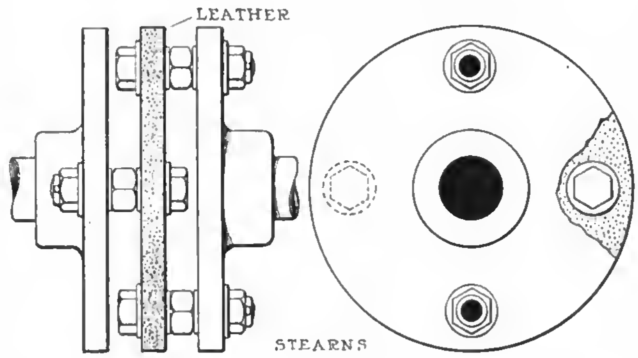
Radically different from any of the preceding types is the magneto connection on the National car. This is shown at the left top of the page. It is purely and simply a universal joint of the double-ball type. The driveshaft and driven shaft each terminates in a jaw into which is fitted a liner. Between these shaft terminals is a short universal shaft with each end terminating in a ball. As may be seen in the illustration, the jaws slip over these balls and a pin passed through each. It will be noted that the pin in one ball passes through at right angles to the pin through the other ball. This gives flexibility in two directions and takes care of any changes of alignment in the shafting. The National coupling is not adjustable as far as changes in timing are concerned; these are made independently. The big feature of this type of connection is its flexibility and its tendency to avoid wear because it automatically takes care of any misalignment which may take place.

Stevens-Duryea

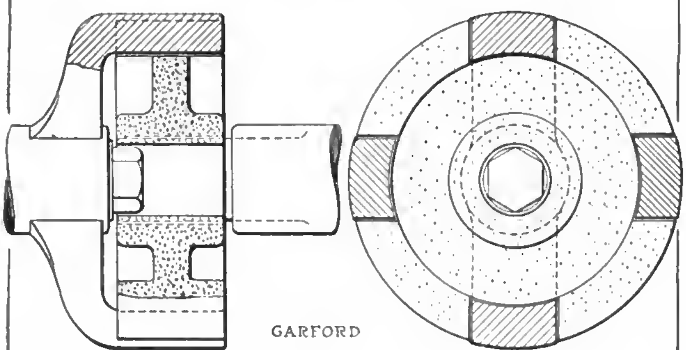
On the Stevens-Duryea cars an adjustable drive through leather is employed. At the top of the illustration on page 902 two views of this drive are given. It will be seen that the leather is in disk form and is placed between the driving and driven shaft flanges. Each shaft flange is connected to the leather at two points, one on the vertical and the other on the horizontal diameter of the leather disk. This arrangement makes a positive drive through the leather itself as there is a quadrant of the leather disk which separates the connecting point of the driving shaft from the connecting point of the driven shaft.



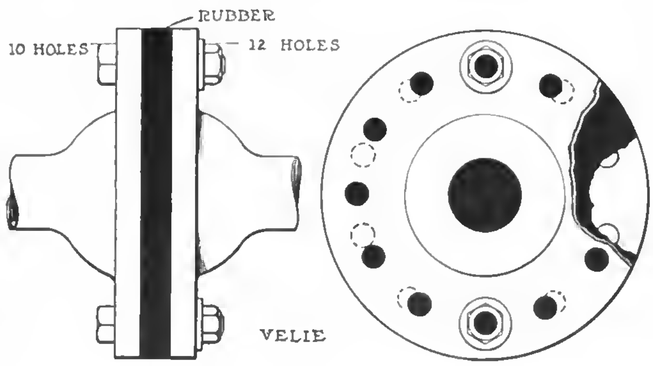
STEVENS



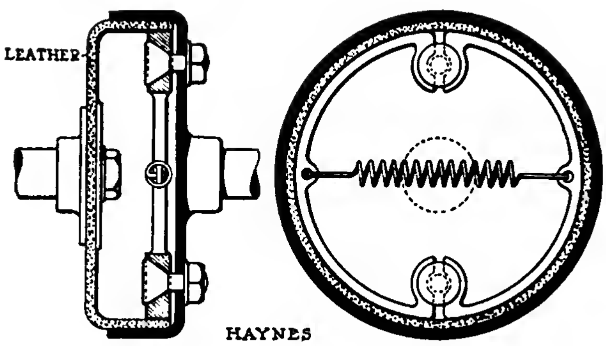
STEARNS



GARFORD



VELIE



HAYNES

This gives a slight flexibility in the drive itself and at the same time takes care of any changes in alignment which may occur in the shafts. The adjustment feature is included by having slots instead of holes through one of the shaft flanges. To make the adjustment the nuts on these bolts are loosened and the flange slipped around a short distance. A drive of this kind can be quickly taken down for removing the magneto, it is only necessary to remove the bolts and pull the connection apart.

Mitchell

A coupling similar to the Oldham type is used on the Mitchell car. It is a much more rigid proposition than the common form of Oldham, the flanges being much stronger. The main feature of the connection is a central disk with two rigid diametric flanges at right angles to each other. One flange is mounted on the driving side of the disk and the other is mounted on the driven side. These flanges act as splines and engage with grooves in the driving and driven shafts. This is an exceedingly light type of coupling, the finished job not having a greater diameter than the shaft itself.

Reo

The Reo magneto coupling is somewhat similar in appearance to the National coupling just described. Instead of the pins in the universal joint passing through at right angles to each other they are parallel. This is a flexible joint and readily takes care of the 1-32-inch misalignment that sometimes occurs between the drive and magneto shafts. Although the Reo magneto coupling is not adjustable, slight changes in timing can be effected in a shop by slightly twisting the universal ball shaft. One of the balls is clamped in a vise and a 12-inch wrench put on the other and a slight degree of change in timing can thus be secured. Other changes can be made at the timing gears in the usual manner by slipping the gears around one or more teeth in the order of meshing.

Stearns

A unique method of employing the leather disk between the shaft flanges is that seen on the Stearns cars. With this drive the leather takes all the power transmission and no metallic contact exists between the driving and the driven shafts. There is no chance for any noise to develop or a knock to occur because the bolt holes have become worn. The flange connections are at the extremities of opposite diameters, as in the case of many other leather-disk drives, but the novel feature is the use of a nut as a separator between the leather disk and the flanges. A longer bolt than usual is used. Each bolt passes through three parts, the shaft flange, the leather disk and a hexagonal nut placed between the flange and the disk. This gives an extremely flexible connection because the leather has enough clearance to get all the play that could ever develop in practice. Owing to the method of assembling this connection it is comparatively easy to take it down. It is only necessary to remove the bolts which hold the leather disk in place because the flanges are so far apart that the shaft can readily be slipped out when this is removed.

Garford

The Garford coupling is a variation of the cross coupling with the drive transmitted through a fiber block. As may be noted in the sketch, a collar carrying two arms is slipped over the magneto shaft and keyed thereto. The arms of the collar engage with the slots in the fiber and transmit the drive to them. The fiber block is keyed to the driving shaft. This is not an adjustable coupling and any changes made in the timing are made at the gears. There is no metal-to-metal contact between the driving and the driven parts of the connection and no noise can occur as the result of wear.

Velie

Instead of rawhide or leather, the Velie magneto coupling includes a disk of rubber. This elastic material fulfills the same purpose as does the leather in similar couplings. The Velie coupling consists of two metal flanges, one on the driving and the other on the driven shafts. Between these two flanges is the rubber disk used for silencing the drive and at the same time for giving it the necessary play. The adjustment feature of the timing is an actual part of the coupling and is arranged as follows: One of the metal flanges is pierced by ten holes all equally spaced around the circumference and the other flange is pierced by twelve holes. Since both the circumferences are the same size the holes form a sort of Vernier adjustment. One circumference is divided into tenths and the other is divided into twelfths, the minimum amount of variation that can be made will be the difference between 1-10 and 1-12 of the circumference of the circle, or 1-60 of the circumference. Since there are 360 degrees to a circle the adjustments can be made in spaces of 6 degrees.

Haynes

The Haynes coupling, although driving through leather, employs a different method of rendering the coupling flexible. The leather, as shown in the sketch at the bottom of page 898, is of cup shape instead of a disk. The cup is clamped at the bottom to the driven shaft and is fastened to the driving shaft by squeezing the flanges of the cup between a metal flange and a retaining ring. The retaining ring is split and through the openings made by the split there passes a small cone, as shown in the sketch. This cone acts in the nature of a wedge. The wedge action is secured by taking up on the nut passing through the axis of the wedge cone. This spreads the ring apart and holds the leather tightly. If the adjustment is to be changed it is only necessary to loosen the locking ring and slip the coupling around as much as desired and then retighten the wedges. The spring passing across the locking ring holds the segments tightly against the little cone-spreading wedges.

Studebaker

The Studebaker is a positive adjustable drive. The sketch at the top of the page shows it to consist of two metal flanges bolted together by two through bolts. One of the flanges is pierced by several holes spread around the circumference to make it possible to change the timing if desired. The power from the driving to the driven shaft is transmitted through the two bolts, which thus perform the double function of driving members and adjustment points.

Marmon

A cross-coupling type with fiber filling blocks is used on the Marmon for 1913. As may be seen in the illustration at the right, the principle employed is somewhat similar to that used in the Garford design, except that the fiber filling blocks are separate pieces instead of being a single piece cut to take the jaws of the coupling. The Marmon device consists of a housing, shown in black in the illustration, and two collars secured to the drive shaft and the driven shaft respectively by means of key pins. The jaws of the coupling are integral with the collars, two jaws forming a part of each collar. One of the distinguishing features of the Marmon design consists of the tapered face on the fiber filling blocks through which the drive is transmitted. The tension between the faces of the blocks and the housing of the coupling is regulated by loosening the lock screw shown in the illustration and turning the right side of the housing face as indicated by the thread lines in the sketch. This coupling is designed for durability and silence in operation.

Premier

The Premier magneto coupling consists of two flanges keyed respectively to the driving and driven shafts. Between these two flanges is inserted a leather disk to fulfill the purpose of deadening the sound. This is a rigid connection, the drive is transmitted through the bolts which pass through the two flanges and through the leather disk between them. No need of play is felt to be necessary on the Premier car as the part carrying the

Effect of Wheel Size on Speed—Decarbonizing with Kerosene Vapor—Packard School of Salesmanship — Latent Heat

More Speed with Bigger Wheels

EDITOR THE AUTOMOBILE:—What would be the difference in speed of two cars, one gear ratio 3.5 to 1 with 32-inch wheels and one with 3.5 to 1 with 34-inch wheels. How much faster would the one with 34-inch wheels go? Both cars have the same bore and stroke, 4.00 by 4.50.

Lee, Ill. E. W.

—Assuming that both motors are turning over at the same speed, the speed of the cars would vary as the square of the diameters of the wheels. Calling the speed of the car with the 32-inch wheels A and that of the 34-inch wheels B, the proportion $A : B :: 32^2 : 34^2$ or $A : B :: 1{,}024 : 1{,}156$.

At any speed the car having the 34-inch wheels would be traveling 1.13 times as fast as the car having the 32-inch wheels. At a speed of 30 miles an hour for the 32-inch wheel car the 34-inch wheel car would be going 33.9 miles an hour. This is 13 per cent. faster than the car with the smaller wheels.

Pinching Inner Tubes with Iron

Editor THE AUTOMOBILE:—I have noticed that several of the inner tubes on my car have an appearance as if they had been chewed by the tool when putting on the tire. The tubes blow out through these weak spots and I would like to know if the rubbing of the iron against the tubes would be sufficient cause for these blow-outs? It is quite an expense and if I could check it with a little extra caution I would like to do so.

Yonkers, N. Y. SUBSCRIBER.

—Ten per cent. of the inner tubes on clincher tires are bruised by careless handling of the irons. The tube can be actually punctured in this way or weakened to such an extent that it will blow out shortly. In putting on a tire the tube can be pinched by the iron and also by the bead of the casing, as shown in Fig. 4. Lifting up on the iron will give the tube a bad squeeze and when the bead slips into place it is apt to catch the tube in the manner shown. In working the tire off it is easy to keep away from the inner tube with the tool if it is used in the manner shown in Fig. 5. The iron is first worked in vertically and then rotated about the rim to a horizontal position.

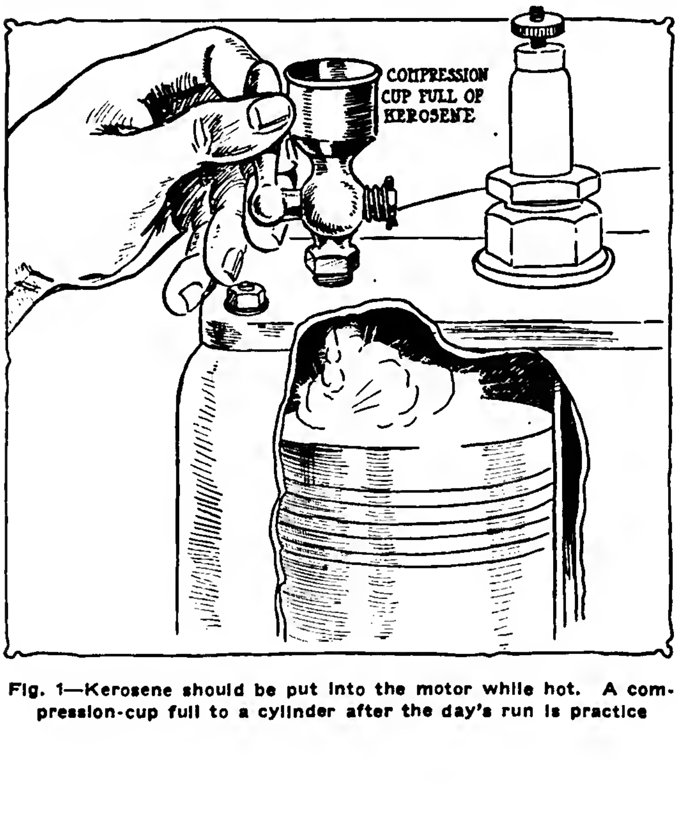

Fig. 1—Kerosene should be put into the motor while hot. A compression-cup full to a cylinder after the day's run is practice

Kerosene for Decarbonizing

Editor THE AUTOMOBILE:—Kindly let me know the following in regard to the use of kerosene to prevent carbon in motors: I read in THE AUTOMOBILE that you recommend putting a tablespoonful of kerosene in each cylinder after a run. I do not use my car for 3 or 4 days at a time and would like to know if it is necessary to start the motor the following morning or could I leave the kerosene in motor from one run to another.

Stockbridge, Mich. JAS. McC.

—There are two ways of applying kerosene as a decarbonizer. First, directly into the cylinder, and, second, through the intake. The wide difference between these methods is that the motor must not be running when the kerosene is applied directly into the cylinder, because if the petcock were opened when the motor was running the kerosene would be blown back. On the other hand, when applied through the intake the motor must be running in order that the kerosene be sucked directly up into the cylinder.

Fig. 1 shows the application of the kerosene to the cylinder direct. A compression cup full of kerosene is allowed to run into each cylinder after the end of the day's run and while the motor is still hot. As has often been explained in these columns, kerosene vapor is one of the strongest of carbon solvents. It is far stronger than the liquid kerosene which, however, is also a good solvent. When the kerosene runs down on the hot piston and comes in contact with the hot walls it is vaporized and then commences to attack the carbon. The carbon which is dissolved is deposited when the motor becomes cool in a thin, dust-like form. If the compression cup is opened and the motor cranked briskly this dust is blown out. As an experiment, treat the motor in the manner described and then hold a handkerchief over the petcock opening when the motor is spun rapidly.

The other method of applying kerosene is illustrated in Fig. 2. Many old and experienced automobilists swear by this method, stating that it is one of the best methods of freeing the cylinders of carbon. The motor is started and allowed to run briskly. Through the air intake of the carbureter, kerosene oil is slowly poured, a little at a time. This will cause the motor to sputter and misfire and allow huge volumes of gray smoke to come rolling out of the exhaust, but the misfiring is only temporary and the motor soon frees itself of the smoke. About a gallon of kerosene can be profitably poured through the carbureter this way, putting just enough in at a time that the motor will not die.

Many car owners are now using the patented compounds for removing carbon. Some of these are excellent and there are experienced men who prefer them to scraping the cylinders because it is a cheaper process and because the cylinders are left practically as clean as if they were scraped. These liquid and solid carbon removers are either very strong solvents or they burn the carbon out of the cylinders in the same way that the application of salt will burn the black off a gas mantle.

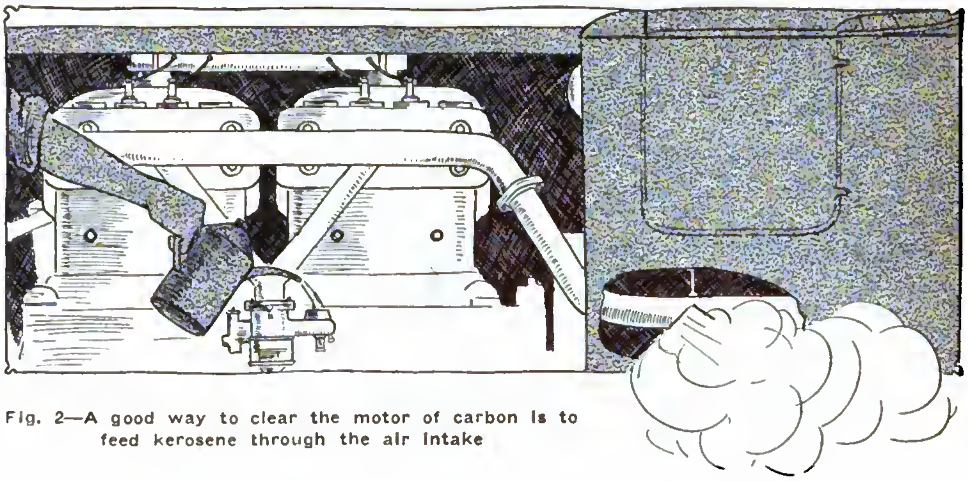

Fig. 2—A good way to clear the motor of carbon is to feed kerosene through the air intake

It is an excellent combination to follow the use of the carbon remover with an application of kerosene, allowing the latter to flow through the air intake of the carbureter in the method just described. The kerosene will positively destroy all the carbon that has been loosened by the stronger solvent or by any other process. If you live in a municipality where it is against the law to allow the car to smoke you should get out into the country before carrying out the work as the objectionable feature to the use of the kerosene in the manner described is the smoke which it causes. It would be well to go some place where noise of the motor is no objection so you will be able to open the muffler cut-out and allow all the smoke to escape to the open air in that way rather than through the motor. The muffler becomes clogged rapidly enough without adding any cause to make it absorb more soot. If the cut-out is opened the soot is deflected and the muffler escapes the heavy discharge.

Weight Affects Fuel Consumption

Editor THE AUTOMOBILE:—Does a car give more speed and milcage to gallon of gasoline with a light detachable rim than a heavier or a demountable? Also what would be the difference in running if the tire was one-third lighter than the average pneumatic? What kind of rims are used on racing machines? Do they have a special tire?

Brockton, Mass. J. W. CLAPP.

—The weight of a car affects the fuel consumption of that car because it requires a greater effort on the part of the motor to take it along the road, and effort on the part of the motor means the consumption of fuel. Every pound added to car's weight means so much taken off the highest attainable speed and also means so much added to the gasoline consumption at any given speed. The difference between the weight of a demountable rim and a quick detachable is so slight that the owner of the car would not notice any great difference in the cost of operating his car when he changed from one type of rim to the other. A difference of one-third in the weight of the tires would make an appreciable difference in the weight of the car and hence a somewhat greater economy as regards fuel consumption, although the difference would be scarcely perceptible. A 34 by 4.5-inch shoe weighs 24 pounds. According to this, the saving in weight would be only 32 pounds on all four tires. The addition of a passenger makes very little noticeable difference in the running of a car and therefore a saving of tire weight would make still less. On racing cars demountable rims are generally fitted, although cars fitted with wire wheels have used the Rudge detachable wheel to good advantage. The reduction of tire wear in races is accomplished by buffing the tires. An ordinary plain tread tire is taken and the surface of the tread removed on an emery wheel to allow the car to be carried practically on the fabric. Instead of decreasing the service of the tire in the race its service is increased instead. The heat can be radiated much more rapidly and blow-outs are prevented. The tires do not give way until worn through the fabric.

Criticizes Morley Spring Suspension

Editor THE AUTOMOBILE:—In your issue of February 20, 1913, you published an article on "A New Spring Suspension," by E. M. Morley. There are a few points concerning his suggestion which I believe make it impractical. He states that the object of using the system is to permit the end springs to oscillate about their supports, thus saving the car from sudden lurches, etc. I cannot see in just what manner this arrangement is to accomplish the desired result. Suppose we consider the accompanying sketch, which represents a frame with two end springs mounted so as to oscillate about their centers, and a center spring shackled to the other two, but rigidly secured to the frame in its middle.

Suppose points A and H to rest solidly upon some support, such as the axle and wheels, and suppose the frame to be depressed vertically. The tendency of the end springs is to revolve on their pivots and pull down C and D on the center spring. At this instant, however, the entire center spring, being fastened to the frame, is also descending and will drop a distance equal to the drop of the pivots of the end springs. Now reversing the process and supposing the wheel to strike a bump: A is forced up and in turn pulls down B and therefore C. But the frame, being rigidly secured to C, is likewise pulled down. In other words, the support N is forced up with exactly the same force with which M is pulled down. The same thing happens, of course, when either of the other wheels goes through the same disturbing process.

Now taking the first case above, in which the frame is descending: it is readily seen that M drops just as far as B and C; A rises through the same distance as the spring is hung at its center. In other words, the effect on the center spring is practically nil as it performs no part of the actual springing of the car. The same effect would be obtained by securing B to the frame immediately above. Even in case the spring were of actual value it should be hung in the opposite direction so that the curve would straighten out with load, and not increase in curvature.

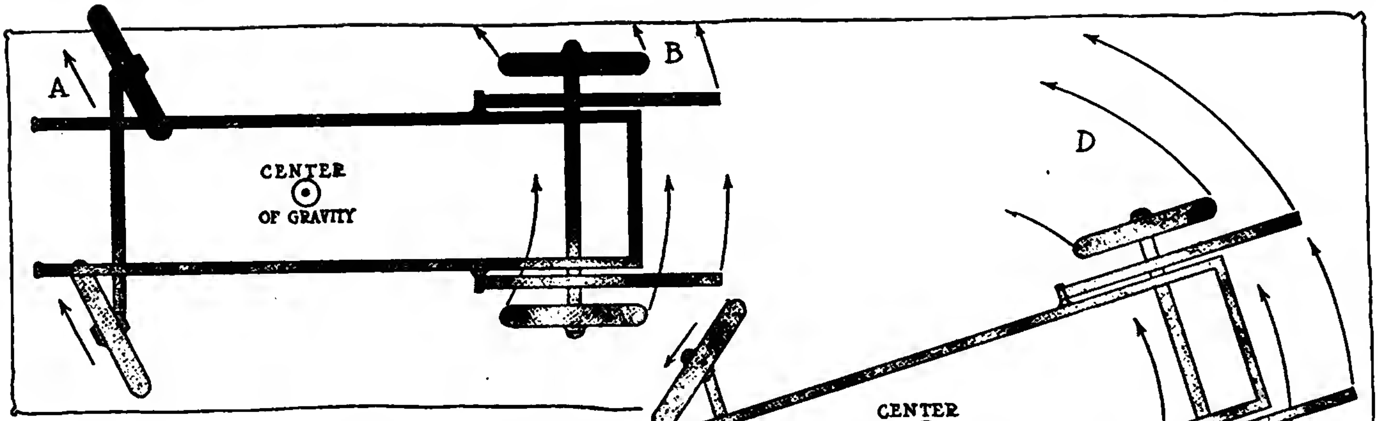
This problem could have been taken up from the graphical standpoint and the different forces and their directions determined, but I think that such treatment is unnecessary, on account of the simplicity of the arrangement.

Ann Arbor, Mich. O. W. HALL.

Packard Company Maintains School

Editor THE AUTOMOBILE:—Does the Packard company maintain a school for the education of Packard salesmen, and what system should an applicant use to get a course in Packard salesmanship?

Lexington, Ky. WM. B. B.



—The Packard company maintains a school for salesmen at its plant in Detroit. The men who graduate from this school are taken into the Packard organization as salesmen. To enter the school, the applicant is appointed through his local dealer and on the dealer's or branch manager's recommendation he is taken into the school, provided there is a vacancy. For your benefit it may be stated that there is always a demand for entrance and a waiting list generally confronts applicants.

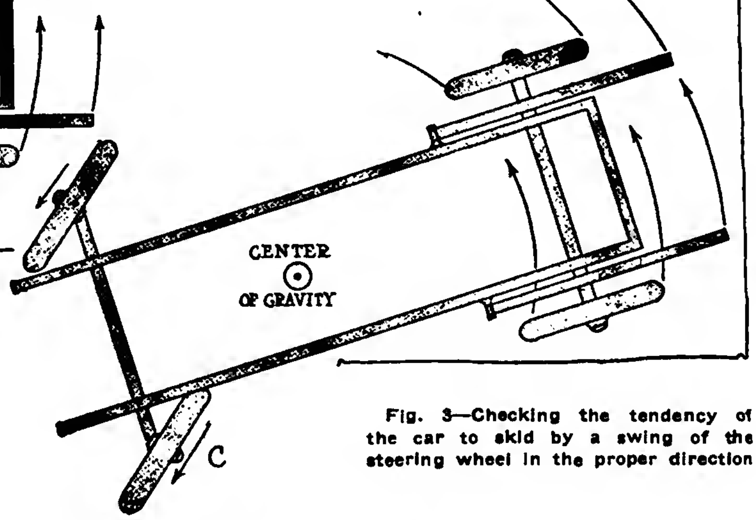


Fig. 3—Checking the tendency of the car to skid by a swing of the steering wheel in the proper direction

Preventing a Dangerous Skid by a Twist of the Wheel

EDITOR THE AUTOMOBILE:—There is nothing so fraught with danger to the automobilist as the skid. At this time of year when both the city streets and the country roads are often covered with a coating of slime which allows the wheels to get but a light grip on the surface of the road, the dangers under certain circumstances cannot be over-estimated. In view of this fact every one that drives should know the simple method of checking a skid by a simple manipulation of the steering wheel. As shown in Fig. 3, the car skids when there is a momentum tending to turn it about the center of gravity. When the forces about the center of gravity are balanced the car cannot skid. If the steering wheel is immediately turned in the direction of the skid, the skidding will cease because this will cause a tendency to rotate in the opposite direction. Following the diagrams, with the steering wheels turned as at A, the wheels B and A tend to swing in opposite directions and neutralize each other. When turned the other way C only tends to increase the skidding effect at D. After a little practice this swing of the steering wheel becomes instinctive.

New York City. L. BOURGETTE.

Can Make Money Running Car

Editor THE AUTOMOBILE:—According to a few advertisements in your paper one can run a car free of expense, as follows:

1—Ajax Tires, "5,000 miles."
2—Fit with Interlocks, "double mileage."
3—Repair with Tire-Dob, "double mileage."
4—Paint with Tirenew "Add 30%" Total; 26,000 miles.
5—Carry Gilmer pliers, "Pays for a set of tires every 4,000 miles."
Result, four surplus sets every 26,000 miles.

6—Feps carbureter saves	50%
7—Mondex Helix saves	40%
8—Stewart Gas Saver saves	40%
Total	130%

Thereby making on an average 3 gallons per 100 miles run. Why?

Philadelphia, Pa. G. W. B.

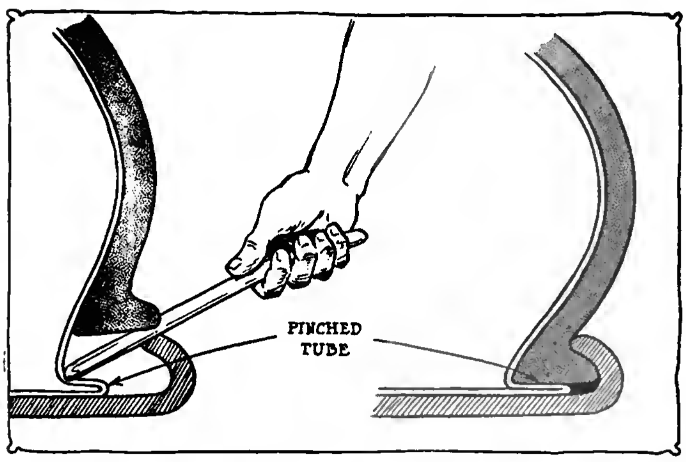

Fig. 4—How tubes are pinched by the iron and by the tire bead

Latent Heat of Vaporization

Editor THE AUTOMOBILE: What are the variations in the specific heat of gasoline and its effects in its vaporization? What is the latent heat of vaporization of gasoline? SUBSCRIBER.

New York City.

—The specific heat or amount of heat measured in British thermal units necessary to raise 1 pound of gasoline 1 degree Fahr. is .500. Hence a drop of 1 degree Fahr. in the temperature of 1 pound of gasoline corresponds to the dissipation of .5 British thermal units. The specific heat of air at constant pressure is .2375; and a drop of 1 degree Fahr. is attended by the dissipation of .2375 British thermal units per pound of air. Taking the mixture proportions as 1:15.39, as above, the heat available per degree Fahr. of drop in the temperature of the mixture is $1 \times .500 + 15.39 \times .2375 = 4.155$ British thermal units.

Since the latent heat of vaporization is very approximately 210.5 British thermal units, it follows that this 210.5 British thermal units must be supplied by the ingredients or by heat from some outside source applied directly to the fuel.

Consider the heat supply in the mixture ingredients themselves. Since the mixture 1 : 15.39 is capable of supplying 4.155 British thermal units per degree Fahr. of drop, it will require a drop of $\frac{210.5}{4.155} = 50.66$ degrees Fahr. in the mixture to completely vaporize the 1 pound of fuel contained therein. The mixture 1: 15.39 cannot exist below 1.5 degrees Fahr., so it will be necessary that both the air and the gasoline have a temperature of at least 1.5 degrees + 50.66 degrees = 52.16 degrees Fahr. before the commencement of vaporization. If the mixture is 1 : 18, it can exist at — 5.8 degrees Fahr., and the initial temperature of the ingredients must be at least 38.3 degrees Fahr.

If the requisite amounts of fuel and air are placed in a vessel insulated from outside heat, the above initial temperature values will hold only when the time allowance for vaporization is unlimited. Compared with the short time in which vaporization must be completed in an automobile engine, the passage of time before vaporization would be completed would be almost infinity. However, there are three methods whereby the rate of vaporization may be accelerated; either the fuel may be introduced in a finely divided form; or the initial temperatures of the mixture may be made higher than the above values; or a combination of both methods may be employed.

In any case, the temperature drop can be no more than 45 degrees Fahr. in any mixture of gasoline and air. Therefore, if an increase in initial temperature is resorted to, the final temperature will be higher than that necessary to support the mixture proportions by just the amount that the initial temperature is raised. Suppose an initial temperature of 100 degrees Fahr. and a drop of 45 degrees Fahr. The resulting final temperature in the mixture will be 55 degrees Fahr.

In consideration of the form in which the fuel is presented to the air in the average carbureter, this final temperature will be higher than 55 degrees Fahr. because the total amount of fuel will not have been vaporized, and the amount of heat necessary to complete the vaporization will remain in the mixture as a temperature value. But suppose the vaporization to have been completed in two cases with the final temperature of 55 degrees Fahr. in one and 1.5 degrees Fahr. in the other. Since the same amount of fuel is present, the volumes per pound of the two mixtures, at the same pressures, may be taken as bearing the same relationship to each other as the volumes per pound of dry air at equal pressures and the two temperatures given. Thus, the ratio of volumes per pound of mixture may be expressed 1 : 88, for the two mixture temperatures of 1.5 degrees and 55 degrees Fahr. respectively. Therefore an engine can aspirate only .88 the amount by weight of 55 degrees Fahr. mixture that can be aspirated of the 1.5 degrees Fahr. mixture. Loss in weight of charge will be greater than here indicated, since the efficiency of the pumping strokes will vary with density of the fluid.

The power of an engine varies as the weight of charge, being greater with a lower mixture temperature.

Making a Cadillac Raceabout

Editor THE AUTOMOBILE:—I have a 1910 Cadillac which I am remodeling into a raceabout. The seats are on the frame, and the steering column lowered, but the car is still too high. Would it be possible to lower the frame a couple of inches by taking two or three leaves from each spring, or would that weaken them to such an extent as to cause them to break?

New York, N. Y. J. B. ALLISON.

—You cannot take out any spring leaves even in consideration of the lighter weight of the body and still have a suspension which will be satisfactory. The best way of going about this job would be to swing the front springs under the front axle making an underslung construction here and then having the rear spring members flattened.

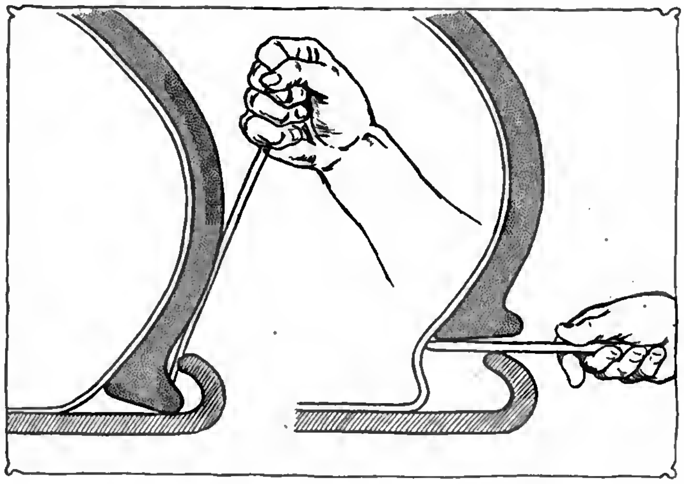

Fig. 5—Removing the tire with a downward movement of the iron

Novel Magneto Couplings for 1913

(*Continued from page 899*)

magneto is machined especially to take the base of the magneto and the entire fitting is so arranged that the drive is aligned permanently, that is, there is but one place to put the magneto and any shifting of this would cause the drive to be out of line. The flanges for the magneto coupling are slipped over a taper in the shaft and are held by a key and a nut over the end of the shaft.

Columbia

The magneto coupling on the Columbia cars is flexible and adjustable. The flexible feature is secured by having the drive transmitted through leather and the adjustable feature by having the connecting bolts pass through slots instead of holes. A study of the sketch will show that the leather disk, which is somewhat smaller in diameter than the shaft flange, is held to the latter by two bolts. These stud bolts are only threaded at the point at which they pass through the metal flange and are not threaded into the leather. The connection of the leather disk to the driving flange is by means of two bolts also, but in this case the bolts pass through slots. By loosening the nuts on these bolts they can be slipped around for a short distance to make minor timing adjustments.

Glide

A novel drive for the magneto is employed on the Glide cars. This drive has both features of being adjustable and flexible. The drive is transmitted through a spring. Unlike the Bosch drive, this is a modified lever spring and not a laminated spring. The adjustable feature is secured by a series of holes through which pass two bolts. By loosening these bolts and slipping the flange around in either direction the adjustments for timing can be made.

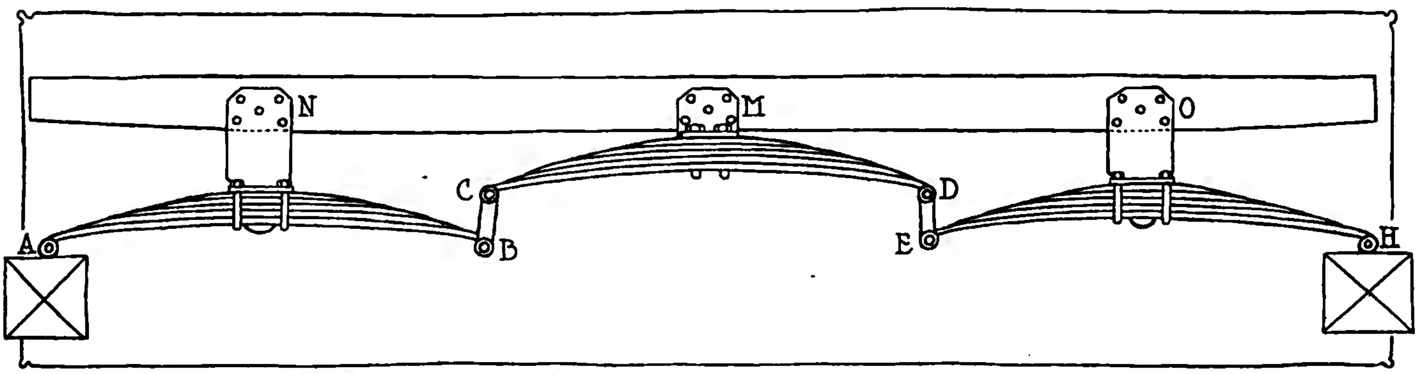

Fig. 6—Spring suspension of E. M. Morley criticized by a reader as wanting in flexibility

Filling special fuel tank in Harroun carbureter test

Test Harroun Carbureter on Kerosene

Road and Track Tests Made by "The Automobile"—New Instrument a Marked Success

By Darwin S. Hatch

INDIANAPOLIS, IND., April 21—Ray Harroun, one-time champion of the Motor Speedway, today completed another 500 miles on the famous oval in a much less spectacular manner than when 2 years ago he was hailed as the winner of the International Sweepstakes; but today's finish of the 200 laps has a meaning manifold greater to the motoring world at large than did the one that crowned him Speed King. It means the completion of a series of accurate tests that show beyond doubt that the cost of motoring can be more than cut in two and that without sacrificing anything in the way of easy starting or clean plugs or anything else that makes the operation of a motor pleasant and efficient. It means that there is at least one carbureter that will handle kerosene.

Harroun has turned from the profession of speed merchant, and for the past 2 years has devoted his energies to the manufacture of carbureters. He makes the carbureter that is stock equipment on the Marmon car.

The new carbureter is almost the same as this except that it is arranged so that practically all the exhaust gas passes around the venturi tubes, that is, the pipe that surrounds the spray nozzle is in the path of the exhaust gas.

The same automobile and carbureter were used throughout the tests. The carbureter was Harroun's new design, 1.25-inch size. It is exhaust-jacketed and the primary air is heated, though the secondary air, which is by far the greater proportion when the motor is running at normal speeds, is not heated. A means is provided for raising and lowering the needle valve by a little lever on the dash. This is not a special feature as it is a part of the older type of Harroun carbureter.

The car was an Overland, model 69, five-passenger touring car, with four-cylinder motor, 4 inches bore and 4.5 inches stroke, cooled by thermo-syphon water circulation, and fitted with U. S. L. electric cranking and lighting system. On the running-board is a small tank which holds 2 gallons of gasoline. This is connected through a foot valve at the dash to the intake manifold and is used to run the motor until the exhaust warms up the low-grade fuel. The operation of starting simply resolves itself to holding in the foot valve for a moment while the electric cranking button is pushed. The average time required to run on gasoline when kerosene is used was about 2.5 seconds; the longest time was 6 seconds. This was in the early morning after the car had stood outdoors all night. The auxiliary gasoline tank simply is a primer, and may be replaced by an acetylene primer. It also may be replaced by an electric heating coil, which would make the outfit start on the low-grade fuels.

A road test under average touring conditions was the first event staged. The course was from Chicago to Indianapolis by way of Logansport and Kokomo. At the beginning of the test the fuel tank was drained of its contents and filled with kerosene at a garage at $0.15 a gallon. This was 44 degrees Baumé Perfection oil, being the kind that is sold the country over at 10 cents retail. Lubricating oil and radiator tanks were filled and about 4 o'clock last Thursday afternoon we started. The party consisted of Ray Harroun, driver; the writer beside him, and Dillwyn M. Bell, president of the Ward-Bell Co., Chicago, as supercargo.

Fitted out with supplies, our driver put his heel on one button, his toe on another for an instant and the motor was running as sweetly on coal oil as though that were its natural food. Starting up in a garage can be depended upon to bring out the smoking capabilities of a motor, but even this did not develop excessive smoking. The smoke could be noticed, but it was not as evident as with the major portion of gasoline-burners.

Two miles north of Highlands, Ind., we struck some heavy sand where the road was being repaired after the late deluge. Most of the distance into the town was made on first or second speed, but the motor did not seem overly warm at the end of the stretch.

We made Valparaiso for late dinner and then over sand roads through the swamps to Knox, where we spent the night. The car was left standing out under the trees and when we started in the morning the primer button had to be held for 8 seconds. This was the only time that the engine did not take hold almost instantly.

At Logansport we took on 1 quart of oil after a run of 136 miles; stopped at Kokomo for lunch, and at Westfield for 2 gallons of kerosene. This also was Standard Perfection grade, but cost only 10 cents a gallon. It had a gravity of 43 degrees Baumé at a temperature of 60 degrees Fahrenheit. Indianapolis, the end of this cross-country kerosene cruise, was reached in the afternoon. After considerable running about town, the fuel, lubricating oil and water tanks were again filled to determine the amount used on the run. The total distance recorded was 224.2 miles and the consumption of kerosene for the run was 17.25 miles per gallon. Complete results of this part of the test are appended.

The second half of the tests were conducted on the Speedway to determine the relative values of four different grades of petroleum fuel products as handled by the new Harroun carbureter. These fuels were Crown gasoline of 60 degrees gravity, the Standard Oil Co.'s new product, Stanolind Motor Spirit, of 62 degrees gravity; Palacine oil, which is the highest grade of kerosene and tested at 49 degrees gravity: and Perfection oil, which is the ordinary kerosene you buy in every country grocery, testing at 40 degrees Baumé.

These fuels were drawn direct from the storage of the Standard Oil Co. at Indianapolis, tested for gravity at 60 degrees Fahrenheit, and the cans sealed. Then the main fuel tank was disconnected and a special tank attached to the outside of the car, where it could be filled and drained readily. After each test, the special tank was drained and the motor run until the carbureter ran dry before another fuel was put in the tank.

Before tests were commenced the odometer was checked over measured distances on the Speedway and found correct.

In the economy tests, 1 gallon of the fuel was put in the special tank and the car run at a practically constant speed of 25 miles per hour till the fuel was exhausted. The miles thus covered on the Speedway with 1 gallon of each of the four fuels was recorded as the miles per gallon economy of that fuel. The necessity of a stop during Test No. 1 for a tire change necessitated a similar stop in each of the succeeding economy tests. Had it not been for these stops it is probable that the economy on all of them would have been a shade better. These tests were made with driver and observer, top down and windshield up.

Next the four fuels were tested for their relative values as speed producers. No attempt was made to show the speed possibilities of either the car or the carbureter. No adjustments had been made on either. Speed economy and acceleration tests were all made with the same adjustment of the carbureter, except as it may be controlled from the driver's seat. By tuning up car and carbureter after the tour, it is certain that speed and acceleration showings would have been still better than they were.

Speed tests of the fuels were made by timing the car with a stop-watch over a measured mile and a measured half-mile on the Speedway. Occupants of car on these tests were driver and observer; top and windshield down. Kerosene showed 5 per cent. more speed than Motor Spirit and 12 per cent. more speed than Crown gasoline.

Acceleration tests on the fuels were made by timing with a split-second stop-watch the number of seconds necessary to increase the speed from 10 to 20 miles per hour and from 10 to 30 miles per hour. In this one test alone kerosene conceded first place, Motor Spirit making the best showing and gasoline next best. Results of these tests are given in the accompanying tables.

In general the deductions to be drawn from this series of tests are that:

1. As handled by Harroun's new carbureter, the low-grade kerosene known as Perfection oil and selling practically everywbere at one-half tbe cost of gasoline gives better mileage gallon for gallon than any of the other fuels tested; gives more than twice as much mileage dollar for dollar than gasoline; gives more speed than any of the other fuels; acceleration almost as good; carhonization, nil; smoking negligible; general action the same as gasoline except for the necessity of preheating the fuel.

2. The lower the gravity of the common petroleum distillates, the better economy in miles per gallon and cents per mile—excepting Motor Spirit, which seems to fall between gasoline and Palecine oil in these considerations.

Speed Tests Over Measured Mile and One-half Mile

Fuel	Gravity	Miles per hour ½	Miles per hour 1 Mi.	Ave. M.P.H
Kerosene	43	47.3	51.1	49.2
Motor Spirit	62	46.5	....	46.5
Gasoline	60	43.0	43.4	43.2

Acceleration Tests

Seconds to Accelerate from Miles Per Hour

Gr.	Fuel	10 to 20	10 to 30	20 to 30
43	Kerosene	8.2	16.4	8.2
60	Gasoline	7.3	16.1	8.8
62	Motor Spirit	7.3	16.0	8.7

Economy Tests of Four Fuels

Test No.	Fuel Used	Gravity Degrees Beaumé	Miles per Gal.	Price per Gal.	Ton-Miles per Gal.	Cost per Ton-Mile
1	Kerosene	43	22.2	$0.08	26.64	$0.0039
2	Kerosene	49	21.6	.10	25.92	.0038
3	Motor Sp.	62	20.4	.13	24.48	.0054
4	Gasoline	60	20.0	.16	24.0	.0067

Note—Prices based on quotations on tank wagon lots at Indianapolis April 19. Speed constant at 25 miles per hour. One stop in each test.

Kerosene Vaporizer Cuts Down Fuel Expense

THE G. C. vaporizer is a device just introduced into America for the use of the heavier products of petroleum. The heat of the exhaust is used to vaporize the heavy fuel and the latter is fed to the motor in the form of a gas. The motor is started on gasoline and runs with it until the vaporizer has become warm enough to do its work.

The vaporizer is a unit with the muffler or silencer and works in conjunction with it. The fuel passes through a regulation float feed arrangement on the way from the tank to the vaporizer. It is fed through a perforated pipe and passes over a bed of gray iron slugs, which act as a heat retainer and which absorb the heat from the exhaust. The resulting gas is sucked through a pipe by the motor and is mixed with air through a dash-pot arrangement, thus forming an explosive mixture.

The action of the entire system is exactly parallel to the action of a suction gas producer. The exhaust enters the muffler V and passes through the center into a cylindrical opening E. Surrounding this central pipe is a layer of the gray iron slugs D. Above the central passage and through the slugs passes a pipe F which carries the fuel supply. This pipe is perforated and permits the kerosene to seep through the hot iron. The heat contained in the slugs is sufficient to vaporize the kerosene and the result is that a gas is formed which fills the passage above the iron. Through the bottom of the muffler-vaporizer there is an air passage B, as shown in the diagram. Connecting the passage containing gas with the motor is the suction pipe.

The suction of the motor on this pipe draws the air through the hot kerosene vapor which mixes with it and the mixture passes on to the motor, drawn there by suction. The gas passes through a mixing valve A of dashpot pattern on its way to the motor and is there further mixed with air. The amount of gas and air drawn in is regulated by the demands of the motor. When the motor speeds up it naturally exerts more suction and also opens the dashpot further, thus getting a heavier charge into the cylinders.

To fully comprehend the action of the vaporizer the sectional view may be noted. The center is the exhaust passage into which the exhaust gases of the motor flow on leaving the cylinders of the motor. Surrounding this passage is a layer of cast-iron slugs through the top of which passes the fuel intake pipe and through the bottom passes the air intake. Outside of this is the baffled exhaust which is silenced by gradually reducing its pressure through expansion.

The car does not have to be changed in any of its salient features to accommodate the G. C. outfit. A small gasoline tank is added and the former gasoline tank used for kerosene or heavier fuel. The hand throttle is used to govern the gasoline flow for starting purposes and the accelerator pedal controls the flow of kerosene vapor to the motor. When using the kerosene system, the gasoline system is so arranged that a closed throttle absolutely closes the throttle valve instead of leaving a partial opening.

Owing to the construction of the vaporizer it is claimed that it will maintain its temperature for a period approximating 2 hours on the average. This means that within 2 hours after the stop was made the motor would start on the kerosene instead of going through the process of restarting with gasoline. The

The Field of the Cyclecar

THE British Isles, parts of Germany and other European countries are motor-mad over the new cyclecar which made its advent a year ago. This car, which has been responsible for the phrase, "new motoring" which is now becoming general abroad, is infusing not only a new life into the motorists themselves but into many in the manufacturing end. It is infusing new life because it appeals to a class of buyers who, up to the present, have been overlooked by the European makers, namely, the man of moderate means who has $800 for a car, but not enough money to maintain the present-day machine with its high consumption of gasoline, which sells at 43 cents a gallon, and its heavy tire wear.

The new cyclecar comes as a bonanza to this class of buyers, who are more concerned in the cost of annual maintenance than first cost. The European owner has always been a stickler on maintenance in that he has had his prescribed income to live on, outside of which he must not go under danger of financial embarrassment. Naturally, such a buyer wants the lightest car that will meet his requirements; wants the speediest car that he can receive, and wants the cheapest to maintain. Now that the English manufacturer has at least realized that there is such a purchasing clientele in Europe he has set out with extra endeavor to meet the requirement but to-day the demand is so great that many of the factories sold out their entire 1913 output during the Olympia show. Premiums are actually being offered for not a few of the best cyclecars.

While the movement had its inception in England, it soon spread to Europe. Germany took it up with avidity, and one manufacturer after recently announcing his new cyclecar through the European trade press, had his entire output contracted for on the first mail after the date of publication.

The exact status of the cyclecar has been largely dictated by the buying public. It wants a two-passenger car, with a space in the rear of the seat on which packages can be carried if necessary. A small motor is desired, the popular design being a four-cylinder block type, with a gearbox a unit with it. Cylinder dimensions rarely exceed 2.5-inch bore, and 3.5-inch stroke, so that 25 to 30 miles per gallon can be obtained in regular use and speed possibilities of 40 to 50 miles also within reach. The wheelbase averages 86 to 90 inches, tires are generally 28 inches and carried on light bicycle-type wire wheels.

All of these cyclecars are four-wheel designs. There is no demand for a three-wheeler. The farmer and market gardener, who are to-day buying these cyclecars in large quantities, want a real miniature car. It must have four wheels; it must have a steering wheel, and the body must be along standard lines. The three-wheeler is not meeting with success, although at one time it was looked upon with favor.

The side car attachment for motor-cycles is not considered because the buyer objects to its general arrangement.

The present construction of cyclecars favors a three-speed selective-type gearbox with shaft drive to a bevel-driven rear axle. Once again must be noted the desire for a real miniature car. Belt transmission was advanced by a few makers as a satisfactory system for a cheap car of this nature, but it has not met with ready response so that few manufacturers are even considering it to-day. Friction drive, which has been taken up by several French concerns, was looked upon as a coming type of cyclecar, but it, too, has failed to meet with acceptance by the buying public. Again, what is needed is the smallest, lightest, most economical, speediest, miniature car that can be marketed at approximately $900.

This cyclecar movement offers a fruitful field for the American maker who considers the export field. At present there are several European representatives traveling through America in search of agencies for cyclecars and the first inquiry with all of them is, Why has not the American builder taken up the cyclecar movement?

While America occupies a unique place in the cheap-car field, there is still much room for the cyclecar movement, which is bound to come, and which when it does come will serve as a feeder to the present low-priced car industry. Cyclecars will have to be produced in large quantities in order to be sold at a sufficiently low price to compete against regular cars of American build, and should the price of fuel increase in America, buyers will begin to give more consideration to the cost of maintenance, and consequently will not object to a fairly high original investment, providing they are assured of good fuel economy and low mechanical maintenance.

Big Plans for Joint S.A.E.-I.A.E. Sessions

NEW YORK CITY, April 21—The Society of Automobile Engineers has announced the program which will be carried out by way of entertaining for the visiting automobile engineers from England who will be returning the visit of the American Society made to Europe nearly 2 years ago, by spending 3 weeks with the American industry in and connected with the annual midsummer session of the S. A. E.

The Englishmen, of whom twenty-five are expected, will arrive in this city Monday, May 26, and the round of visiting factories, entertainment, etc., will continue until Saturday, June 14. During these 3 weeks a circuit will be made of the more important centers of the automobile industry, a day will be spent watching the 500-mile race on the Indianapolis Speedway and a week will be consumed in Detroit and on Steamer Detroit III, which will be the scene of the midsummer sessions of the Society. This will be followed by a circuit through Cleveland, Buffalo, Providence, New Haven and Hartford.

The itinerary among the industrial centers will begin at Pittsburgh, Wednesday, May 28, and on the following day, Thursday, May 29, the Carnegie Homestead Steel Works will be visited and also an inspection made of the works of the National Tube Co. at McKeesport, Pa.

The engineers will arrive at Indianapolis, Friday morning May 30 to view the 500-mile race.

On the following Saturday the Wheeler & Schebler plant will be visited before noon and also the Prest-O-Lite factory. The afternoon will be spent in entertaining.

The party will leave Indianapolis for Detroit at 9 p. m., and will arrive in Detroit Sunday morning, June 1.

On Monday morning, June 2, activities will begin, the forenoon being spent in a visit to the Ford plant and the afternoon at the Cadillac. There will be a party at the Temple theater in the evening.

Tuesday, June 3, will begin with a forenoon visit at the Packard plant followed by a luncheon at the factory and in the afternoon a visit to the Timken-Detroit Axle Co. In the evening there will be a banquet at Hotel Pontchartrain.

Wednesday, June 4, the Hudson Motor Car Co., and the Continental Motor Mfg. Co. will be visited in the forenoon. Luncheon will be had at the Chalmers plant and at 3 p. m. the party will embark on City of Detroit III for the trip to Sault Ste. Marie and return. Professional sessions will be held on board.

Professional Sessions on Boat

The boat will arrive at the Soo Thursday afternoon June 5, and will leave on the return trip at 6 p. m. the same day. There will be professional sessions on board.

Friday, June 6, will be spent in professional sessions, the boat arriving at Mackinac Island at 2:30 p. m. It will remain at the island until 7 in the evening when the return trip to Detroit will begin.

Saturday, June 7, will be occupied by professional sessions until the arrival in Detroit at 3 p. m. A stop will be made until 10 p. m., when the engineers will start by D. & C. steamer for Cleveland, O.

Sunday, June 8, will be spent at Cleveland, the arrival being at 7 a. m. Headquarters will be at Hotel Stattler and the day occupied in motor car drives around the city and to nearby country clubs.

Monday, June 9, will be taken up with visits to the Peerless, White and Winton plants in the forenoon. For those who desire arrangements will be made to visit one of the large Akron tire factories which is 1 hour distant from Cleveland by electric car. At 8 p. m. the party will leave for Buffalo by C. & D. steamer.

Tuesday, June 10, on arrival at Buffalo at 7 a. m., breakfast will be served on the boat. The Pierce-Arrow Motor Car Co. will provide the entertainment for the entire day including a trip to Niagara Falls to see the newest and largest hydraulic electric power plants.

This brings to an end the regular program and those of the foreign contingent desiring to sail on the Mauretania, leaving New York at 1 a. m. Wednesday, June 11, will have an opportunity of doing so but will be required to leave Buffalo at 1 p. m. Tuesday, eliminating the trip to Niagara Falls. An alternative trip through New England is provided.

Kerosene Vaporizer Cuts Fuel Expense

(*Continued from page 909*)

length of time that this could be done would depend on the temperature of the atmosphere. With average conditions the above time would be about correct.

Since the kerosene is vaporized completely before entering the cylinder of the motor it is stated that there is no tendency to form carbon. It is also stated that with this device worked on a 3.16 by 5.12-inch motor, the fuel consumption with a touring body figured 25 miles to the gallon. As there are no comparative figures for this same motor with gasoline these figures are only used to show that a good economy can be expected.

The passage of the kerosene vapor, mixed with ordinary air is at a very low speed—about 10 inches per second—and at a very high temperature of from 550 to 750 degrees Fahrenheit. A complete distillation of the kerosene in contact with the air is thus effected, producing a very light gas, which mixed with atmospheric air, gives a very homogeneous explosive mixture. The mixture thus obtained at the comparatively low temperature of about 122 degrees Fahrenheit, owing to the introduction of outside air, is drawn into the cylinders, compressed and burnt in the ordinary way. The horizontal perforated pipe has a large number of holes .145 inch in diameter, and the liquid is thus distributed by gravity to the hot metal parts, in the chamber in the form of about twenty-five small drops at a time.

The G. C. Vaporizer Co. of America has recently been incorporated and has established itself at 1790 Broadway, New York City. Stephen C. Wolcott is president of the concern, F. T. Blakeman secretary and treasurer and Arthur Waterman, formerly of the Hartford suspension company, general manager. This company has secured the American rights to the G. C. patents and will shortly run official tests through the Automobile Club of America laboratory and road tests under the sanction of the A. A. A.

REPORT

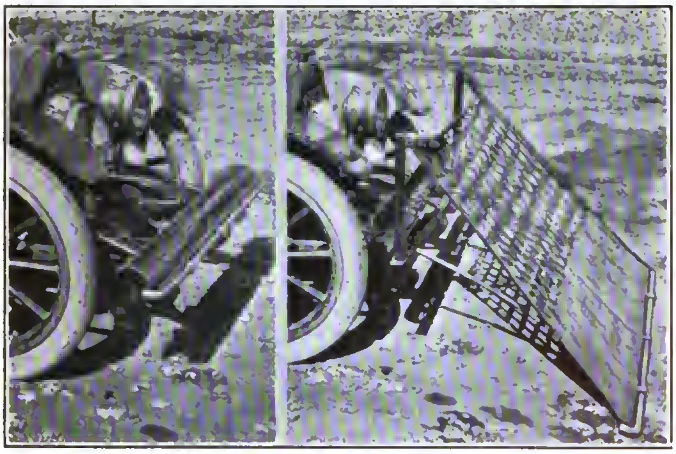
LONDON, ENG., June 3, 1912.

The G. C. Vaporizer, Limited—I have concluded a comparative test between gasoline and kerosene oil, on a 30 h.p. Aster engine, the engine while running on gasoline being under ordinary conditions, and fitted with a G.C. Vaporizer while running on kerosene oil, with the following results:

1. The full load consumption in gallons was the same with kerosene as with gasoline, and rather less at partial loads. The improved running at light loads was due to the more perfect carburetion with the G. C. apparatus as compared with an ordinary high-class gasoline carbureter.
2. Owing to improved carburetion the heat loss to the cylinder walls is less than in the case of a gasoline carbureter and consequently the engine runs cooler.
3. For the same reason the flexibility and acceleration of the engine are increased.
4. There is no apparent carbon or greasy deposit in the engine as a result of using kerosene in the G. C. apparatus.

I have also run a 28 h.p. Straker-Squire lorry, weighing 3 tons 12 cwt., to Brighton and back, fitted with a G. C. Vaporizer using kerosene, with the same mileage per gallon of kerosene as can be obtained for a gallon of gasoline in the ordinary gasoline carbureter. The lorry managed 95 per cent. of the road in top speed and only 5 per cent. in the second gear, proving that full power can be obtained from the engine.

The results of the above tests are clearly of such a satisfactory character that in my opinion there are very great advantages to be derived from the use of the vaporizer. the cost for fuel being halved; it is easily fitted, has no moving parts to wear out, and requires practically no attention.—ROBERT W. A. BREWER.



Figs. 1 and 2—Views of the National automatic bumper-fender in open and closed positions. It is brought into scooping action by means of a lever on the dash or through interconnection with the emergency brakes

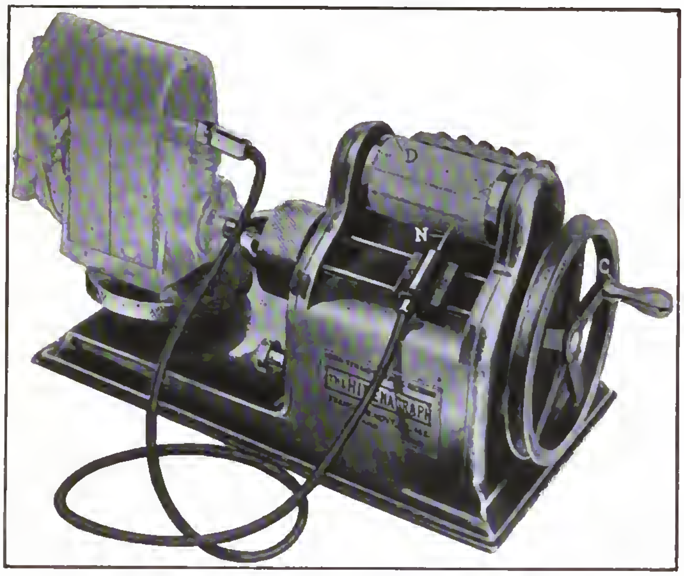


Fig. 3—The Hitenagraph is an instrument by which the timing of the sparks produced by a magneto can be accurately recorded by electrical action on chemically prepared paper

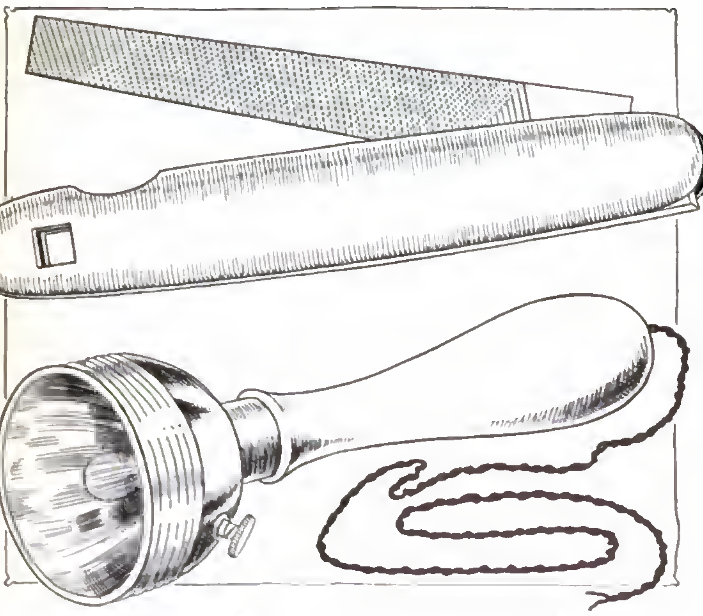

Figs. 4 and 5—Liveright pocket file for touring automobilists and Niagara trouble hunting lamp, in which the button switch is conveniently placed on the handle

Accessories for the Automobilist

NATIONAL **Bumper-Fender.**—What might be termed a scooping bumper is being manufactured by the National Automobile Fender Co., Omaha, Neb., the device being shown in Figs. 1 and 2. Ordinarily the bumper resembles the common steel-tube type, but Fig. 2 indicates the fallacy of this appearance, for when a lever on the dashboard is moved or the emergency brake is thrown on—either construction may be used—the seemingly normal bumper assumes the exterior depicted in the second illustration and is ready to scoop up whatever is in the way of the car, much on the principle of the old street-car fender.

The Hitenagraph.—An instrument that should prove of considerable value in the testing of magnetos is announced by Francis R. Hoyt, of Cleveland, Ohio. This recording device has for its principal purpose the determination of the synchronism, or lack of it, in the timing of the sparks produced by any magneto placed under test. Fig. 3 shows the general appearance of the instrument. The magneto is placed on the left in direct connection with a horizontal shaft carrying a handwheel, C. Above the drum, D, is geared to the shaft with a two-to-one ratio and carries a strip of sensitized record paper. A needle, N, mounted on guides and automatically carried along in close proximity to the sensitized surface by means of a traveling screw, is placed in electrical connection with the high tension terminal of the magneto as shown. The passage of a spark produces a clearly defined mark on the chemically prepared paper. The relative size of this mark incidentally affords some indication of the intensity of the spark. It is by noting the positions of these impressions that the spark timing is ascertained. A little consideration will show that since the recording drum is rotating at double the speed of the magneto, and further, that the magneto produces two sparks per revolution, the drum turns exactly a complete revolution between each spark. And therefore if the needle were fixed and the magneto accurate the recorded impressions would always be made at the same point on the paper. By causing the needle to move over the surface, however, a line of dots is produced, and according as to whether the line is strictly straight so is the magneto sparking accurately. If the dots alternate zig-zag fashion, the sparks are not occurring at 180 degrees apart, and the exact amount of error is correctly shown by the distance between the marks measured along the diameter. The paper is marked with horizontal lines representing degrees so that this measurement can be easily read. The makers state that with this instrument it is possible to test more than twenty magnetos an hour.

Liveright Pocket File.—Liveright Bros., Philadelphia, Pa. have designed a small pocket file, Fig. 4, which is made of a file steel blade and a nickel-plated casing. The blade is a fine-cross cut and of hard steel, therefore applicable to all sorts of work where care is a requirement and intricacy one of the conditions. The nickel-plated casing is cut with a square hole through it, so that it may be attached to a chain or key ring, making the instrument very handy, especially for touring motorists.

Niagara Trouble Lamp.—In Fig. 5 is shown a new trouble-hunting light made by the Niagara Searchlight Co., Niagara Falls, N. Y. This outfit consists of a dry cell, 6 by 3.5 by 2 inches, the poles of which are connected by insulated wiring to a trouble lamp. The circuit is closed by pressing a button, as a result of which the filament of the bulb is set aglow, the insulator handle permitting of applying the lamp at any point about the car, as the length of the wire is sufficient for this purpose. The device is neatly finished.

Vaile-Kimes Tire Pump.—An air pump designed to pump up the tires of accessory-stores' customers has been constructed by the Vaile-Kimes Co., Dayton, O. Fig. 6 shows the device, which is 28 inches long, 10 inches wide and 16 inches high, and is capable of pumping up a 40-inch tire from flatness to 75 pounds in 4 or 5 minutes, according to the maker. The combination of a motor with a small pump permits of rapid operation of the latter, so that the necessary tire pressure is easily attained; and in this point lies the advantage of this little machine over a heavy compressor serving a storage tank and working at all times to keep it full.

LBA Storage Batteries.—New methods of construction are incorporated in the latest LBA batteries produced by the Willard Storage Battery Co., Cleveland, Ohio. Instead of cell connectors of the ordinary lead pattern with sealed covers to the cells, a new design of bolted connector and cover sealed with pure, soft rubber gaskets is used. A big advance in accessibility is thus secured, and the resealing and reburning of connectors, etc., is obviated. In Fig. 7 a partial section of one of these new cells is shown, together with larger views of the special gasket, A, and cover, B, C, is the latest type of cell connector. The jars are built with heavy walls to insure against breakage. They are supplied with two depths of mud spaces, M, that shown in the illustration being the standard. In the other this space is twice as deep. Special vent plugs, designed to condense the gas produced in charging by breaking the bubbles before they escape, are used. Throughout all the LBA batteries the individual cell unit principle is employed, so that any one cell can be inspected or repaired without disturbing the others. As all connections between cells are above the top cover, the possibility of local action between cells is reduced to a minimum. There are no exposed parts subject to corrosion.

Essex Blow-out Sleeve.—The Essex Rubber Co., Inc., 258 Broadway, New York City, is the manufacturer of the Essex Double Strength Blow-out Patch or Inner Sleeve. It consists of several layers of high-grade cotton duck, securely vulcanized together by means of pure rubber and formed with two flaps which go between the bead of the casing and the rim to insure the patch's staying in place after being installed. This patch is shown in Fig. 8.

Hercules Car Lock.—A new lock for preventing the theft of the car has been placed on the market by the Hercules Lock Co., 1559 East 85th street, Cleveland, O. The lock operates on a principle similar to the cock of a gun, controlled by a Yale lock-and-key instead of a trigger. The lock, Fig. 9, is a casing containing the lock mechanism and sliding on the gearshift to which it is screwed. The casing is formed with two arms, A, reaching down into the quadrant cut. When the lever is in neutral, the lock casing may be pressed down by hand or foot until the arms enter the quadrant, when the lock snaps and the lever automatically locked in its place. It is only by applying the Yale key to the lock that the engagement may be released, whereupon the casing returns by spring pressure to its original position, leaving the gearshift lever free to move. The lock is guaranteed to be not removable without breaking it or the gearshift mechanism.

Ten Eyck Automatic Air Pump.—This device, shown in Fig. 10, and designed for use in connection with air starters and tire inflation, attaches to the side member of the chassis alongside the pump shaft, to which it is geared. The special feature of the pump is an automatically controlled gear meshing and clutching device which is operated by the pressure of air in the storage tank or tire being charged. This clutch and meshing gear is actuated by a small cylinder, C, incorporated in the crankcase. When in use the back pressure from the air receiver slides the pump gear into mesh with the driving gear, after which the clutch is engaged. Disconnecting the pump from the air tank or tire allows the pressure to escape from the automatic cylinder, withdrawing the gears by means of a return spring contained in the cylinder. It will be noted that all these operations are automatic. The danger of clashing gears when meshing is avoided by the combination of clutch with sliding gear wheels, the teeth being partly in mesh before the clutch is allowed to come into action. When used in connection with a storage tank for engine cranking purposes, a special air valve is inserted in the pipe between the pump and the tank, and is usually mounted on the dash. In recharging the tank this valve is opened, allowing the air pressure to enter the automatic cylinder of the pump and slide the gear into mesh. When the gauge registers sufficient pressure the valve is closed, thereby retaining the pressure in the tank, but permitting the air in the automatic cylinder to escape through a vent in the valve provided for that purpose. The return spring in the cylinder then forces the gears out of mesh into the idle position. This pump is being placed on the market by the Auburn Auto Pump Co., Boston, Mass., in two models, one as described, and the other not furnished with the gear meshing device, but otherwise identical.

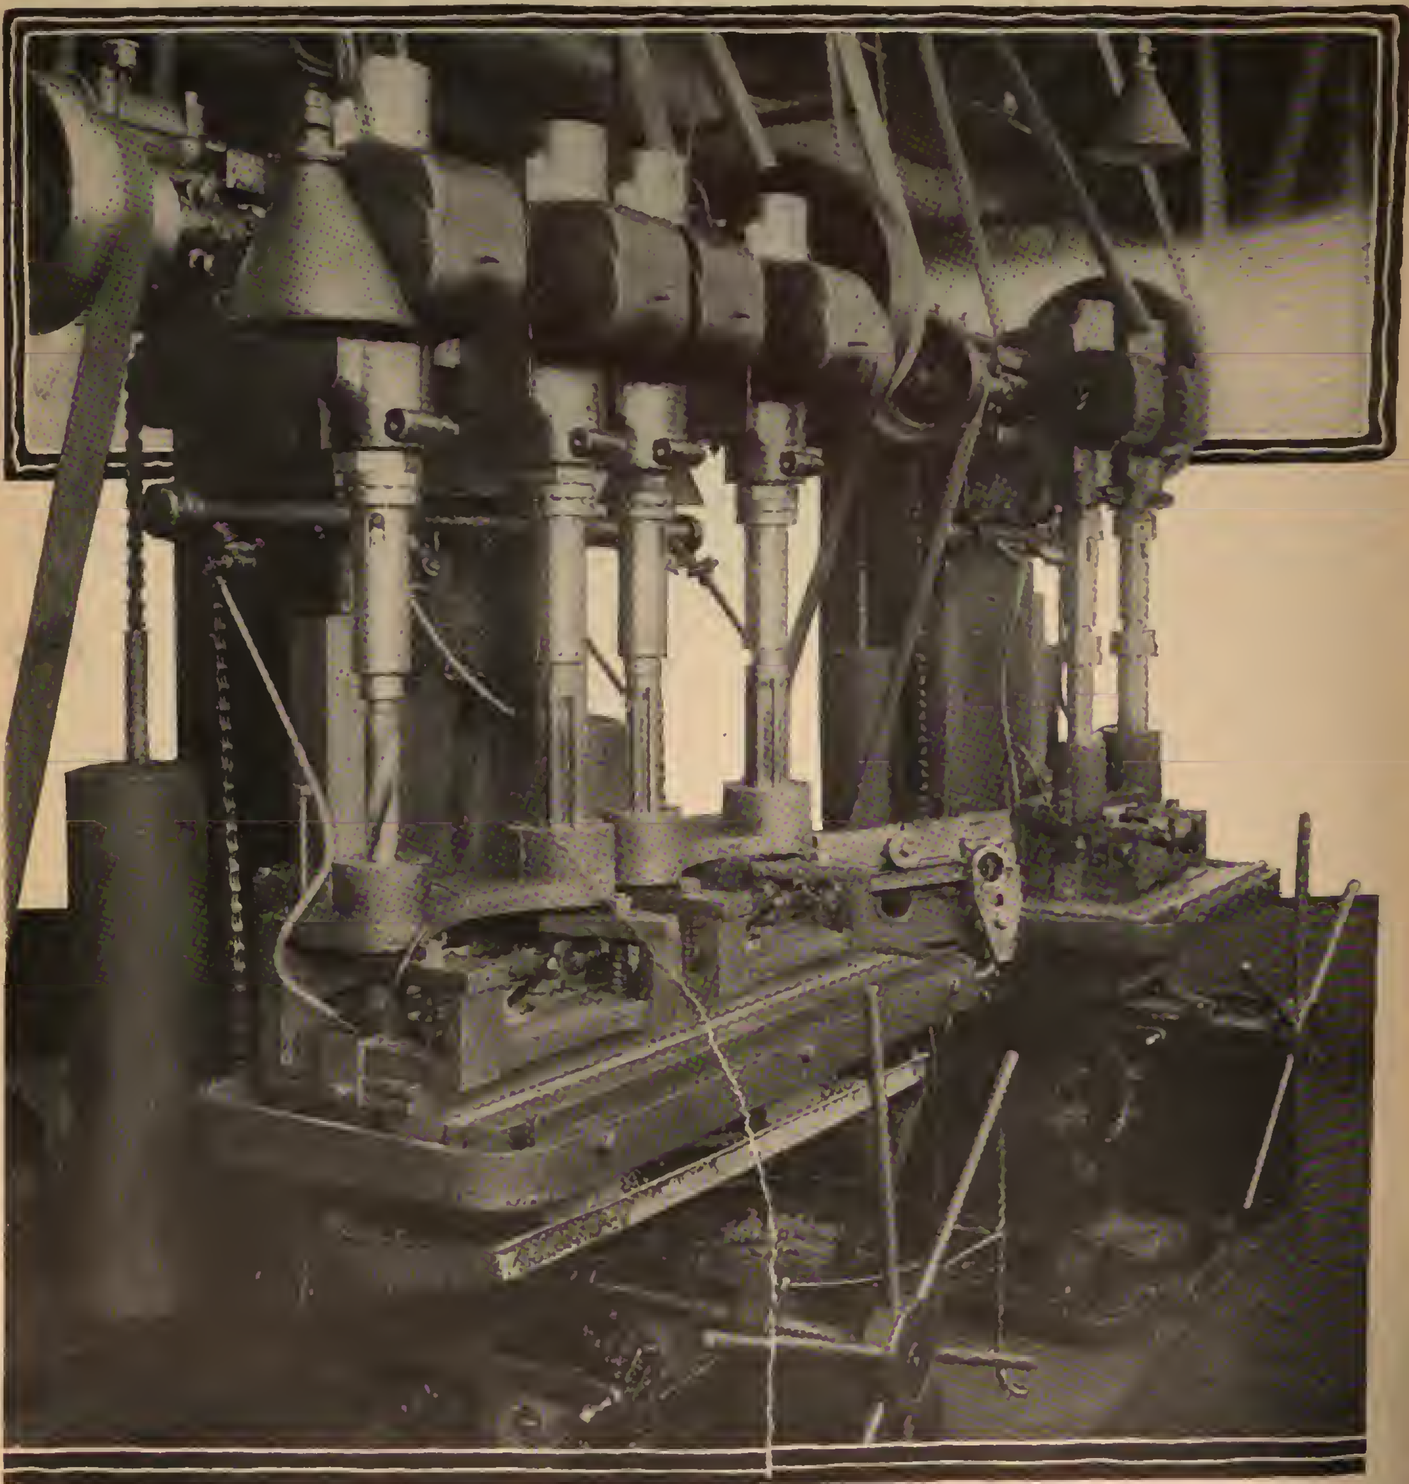
Factory Miscellany



THE above illustration shows a general view of the tools used in machining connecting-rods for the Case 40. The machine in the foreground is a four-spindle Moline drill press. The heavy fixtures having hardened bushings are clamped to the table of machine and the jigs for holding the rods, of which there are four, are located by means of hardened pins and an eccentric pin in a bushing on the base of the jig. The first two spindles drill the wristpin and crankpin holes respectively, and at the same time a second jig with a rod is completing the second operation, which is boring to reaming size.

The machine in the background is a two-spindle machine, having a fixture similar to the first, and whose locating points bring the rod into perfect alignment for the reaming operation. The fixture for holding the rod has a hardened nut with a taper working between two hardened plates. These plates are gibbed to the base, and by means of the nut a universal motion is imparted, thereby centering the rods. All previous operations are located by means of this same device. One man operates both machines loading the extra holder during the operations, thus saving time and increasing efficiency.

Werra Aluminum Foundry's Addition—The Werra Aluminum Foundry Co., Waukesha, Wis., has leased the Wisconsin Railroad shops and will change same for foundry purposes. The building has a floor space of nearly 35,000 square feet with additional buildings covering in all 55,000 square feet. This company manufactures automobile castings. It employes about 500 men.

Rambler's 13-Hour Shift—A 13-hour factory shift was put on recently by the Thomas B. Jeffery Co., Kenosha, Wis.

South Bend Wheel to Erect—The South Bend Spring Wheel Co., South Bend, Ind., recently organized, is planning to erect a factory building.

Automobile Clothing Factory Moved—The Summer and Auto Clothing Mfg. Co. has moved its factory to the old Alchular factory building, College Point, L. I.

Ryder Planning Addition—The Ryder Motor Co., Poughkeepsie, N. Y., is having plans prepared for the erection of a 90-foot two-story and basement addition to its present plant on Market street to be used for storage purposes.

For Automobile Frame Factory—The Parrish & Bingham Co., manufacturer of automobile frames, Cleveland, O., is having plans drawn for a new factory 900 by 100 feet. It will cost about $100,000.

Panama Rubber Seeks Plant—The Panama Rubber Co., Los Angeles, Cal., is seeking a location for a new plant to engage in the manufacture of automobile tires, and a building will be erected as soon as a site is decided upon.

Independent Tire Starts Operations—The Independent Tire Co., Ltd., Guelph, Ont., started operations recently. This concern manufactures the Independent security tread tire, and the general manager of the factory is H. H. Hastings.

Renault Frères L. I. Factory—At the junction of Jackson, Third and Beebe avenues a plot of 17,500 square feet, Renault Frères, automobile builders, will erect a two-story factory and repair shops. These structures will occupy about 10,000 square feet. On the Jackson avenue end the firm will put up an office building. It is intended to improve the whole site eventually.

Keeton Uses Tent—The Keeton Motor Co., Detroit, Mich., has erected a tent 100 by 100 feet to take care of its present business while its factories are being constructed. Plans to remove the body building, top building and upholstering plants to another factory temporarily are being concluded to still further add to the size of the assembling floors at the factory.

Tire Without Rubber—The Divine Rubber Co., which was incorporated recently in Utica, N. Y., with $250,000 capital stock, is preparing to erect a plant in that city in which to manufacture a new patented automobile tire. Instead of being made of rubber the new tire is built up of layers of fabric woven and compressed. A binder is used to give the tire a permanent shape. It is said to be adaptable to all sorts of wheels and to have been tested for several thousand miles on a 5-ton motor truck without showing appreciable wear.

Chicago Pneumatic Tool's Plant—The directors of the Chicago, Ill., Pneumatic Co. are said to have under consideration plans for building a large plant in Canada, possibly in Windsor, Ont., for the purpose of handling its orders in the Dominion. If the plan is definitely decided upon it will necessitate an expenditure of around $350,000. The company now has a plant in Montreal, but this is only equipped for repair work and its geographical location is not so well adapted to the requirements of a manufacturing plant as the one the board has now under consideration.

Shows, Conventions, Etc.

April 21-26........San Antonio, Tex., Annual Show, San Antonio Motor Car Show Co.
May 20-21.........Boston, Mass., Convention of Electric Vehicle Makers.
June 2-7...........Racine, Wis., "Made in Racine Exposition," J. I. Case Co.'s foundry.
June 5, 6, 7.......Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October ....Paris, France, Automobile Show, Grand Palais; 10 days.
November ....London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

April 23-27.........San Antonio, Tex., Track Meet, San Antonio Automobile Club.
May 2.............New York City, Secret Time Run to New Rochelle, Motor Dealers' Contest Association.
May 5-8...........Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14............New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 30............Indianapolis, Ind., 500-Mile Race, Speedway.
June 7............Philadelphia, Pa., Inter-Club Reliability, Quaker City Motor Club, Automobile Clubs of Delaware County, Philadelphia and Germantown.
June 16, 17, 18.....Columbus, O., Reliability Contest, *Ohio State Journal.*
June 25-28........Chicago, Ill., Non-Motor-Stop Reliability, Chicago to Boston, Chicago Automobile Club.
July 1.............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16..........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 4-5...........Sioux City, S. Dak., Track Meetings, Sioux City Automobile Club and Speedway Association.
July 5-6...........Tacoma, Wash., Road Race, Montemara Festa Automobile Committee.
July 8-16..........Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 27-28........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 27...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign.

April ....Barcelona, Spain, International Exhibition.
May ....St. Petersburg, Russia, International Automobile Exposition, Building of Michael Maneze, Imperial Automobile Club of Russia.
May 7-10-11.......Paris, France, Sarthe Automobile Meeting and Speed Hill Climbing.

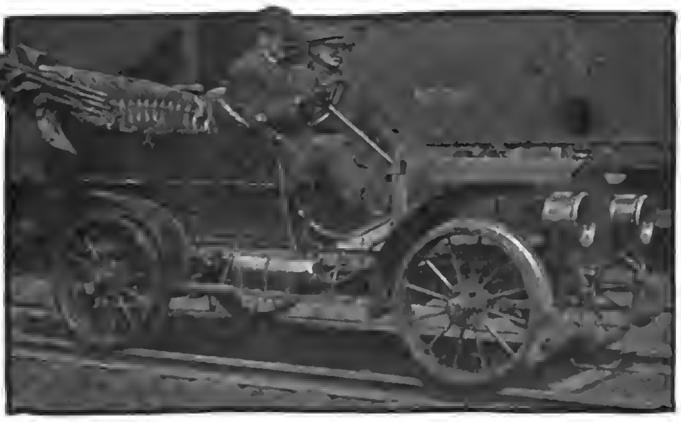
June 23-28.........London, England, International Road Congress.
July 12............Amiens, France, Grand Prix Race.
July 13............Paris, France, French Grand Prix Cyclecar Race.
July 18-26..........London, Eng., Imperial Motor Transport Conference.
Sept. 21...........Boulogne, France, 3-Litre Race.
Sept. 25...........Isle of Man, International Stock Car Race.
October ....Paris, France, Paris Automobile Show.

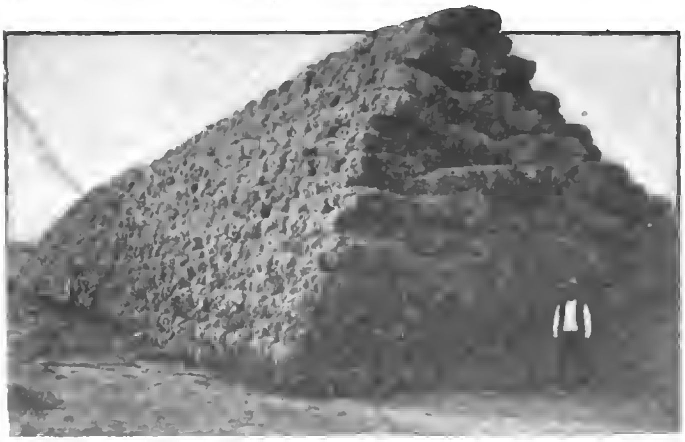
View of the factory of the Hupp Motor Car Co., Detroit, Mich.

The Week in the Industry

Engineer — Dealer — Repairman — Garage



Gasoline railroad inspection car used at Hartford, Conn., by the superintendent of the old Central New England Railroad. An old two-cylinder Pope Hartford car provided the chassis. A four-cylinder E. M. F. motor was installed. The regular wood wheels were displaced by iron flanged wheels. The car can travel about 60 miles an hour on the level



Big stack of guayule rubber shrub. Manufacturers of crude rubber out of the guayule shrub in Torreon and tributary section are preparing to greatly enlarge their operations as soon as the present chaotic condition of political affairs in this part of Mexico is improved. The price of guayule rubber is now double what it was a year ago, and urgent orders have recently been received by several of the independent manufacturers for shipments of all available stock as rapidly as possible. These orders came both from Europe and the United States. It is stated that the cause of the remarkable advance in the price of crude guayule rubber is that it has finally been definitely established that this product can be used instead of Para rubber in the manufacture of automobile tires and electrical equipment

Drawback Extended—The treasury department at Washington, D. C., has made a ruling to the effect that its regulations of November 27, 1907, providing for the allowance of drawback on motor cars manufactured by Brewster & Co., of New York City, with the use of various imported materials and parts, shall be extended to cover the exportation of motor cars manufactured by A. T. Demarest & Co., of New York City, with the use of imported engines, leather, cloth, carpet, plate glass and other materials and parts, in accordance with their sworn statement, filed with the collector of customs at New York.

Open New Garage—J. W. Nelson and Walter Sanford have opened a new automobile garage at Franklin, Neb.

Magee Sales Manager—M. A. Magee succeeds P. M. Pontius as sales manager of the Motz Tire & Rubber Co., Akron, O.

Doolittle Continental Advertising Manager—The Continental Motor Mfg. Co., Detroit, Mich., has engaged A. H. Doolittle as advertising manager.

Coles for Fire Department—The Philadelphia, Pa., Fire Dept., has ordered five Cole roadsters for the use of battalion chiefs.

Shadrick Manager—R. H. Shadrick has been made manager for the Viehman Auto Co., Minneapolis, Minn. He has been on the road.

Seattle Reo Moves—F. A. Mitchell and Co. has recently moved into new and larger quarters at 1010-12 East Pike street, Seattle, Wash.

Open Columbus Supply House—C. E. Justus and E. E. Parket have opened automobile supply house at 45 North Third street, Columbus, O.

Motor Import Co. Moves—The Motor Import Co., Montreal, Que., will shortly remove to new premises at 971-973 St. Catherine street, West.

Motz Tire Agency Moves—The Philadelphia, Pa., branch of the Motz Tire & Rubber Co., in charge of W. M. Stubbs, has removed to 207 North Broad street.

Appointed Republic Tire Distributors—Grenier Warrington & Co., Ltd., Montreal, Que., have been appointed Provincial sales agents for the Republic tires.

Philadelphia Oakland Moves—The Philadelphia Pa., branch of the Oakland car, of which E. K. Leech is manager, has removed to 227 North Broad street.

Kelly Tires in Montreal—The Kelly Tire Co., Montreal, Que., has been formed to act locally as distributors for the Province of Quebec for the Kelly-Springfield tires.

Washington Auto Service Moves—The Washington, D. C., Auto Service Co. has moved from 1610 Fourteenth street to larger quarters at Fourteenth and W streets

Philadelphia Firm Moves—The General Motor Car Co., Philadelphia, Pa., has removed to new quarters on Twenty-first street, below Market. It is 60,000 square feet in size.

Tremme Joins Millen—Arthur Tremme, formerly with Chandler and Lyon, Seattle, Wash., has become manager for John Millen and son, at Vancouver and Victoria, B. C.

New Motz Tire Branch—The Motz Tire and Rubber Co. has opened a branch at 1012 Fourteenth street, N. W., Washington, D. C., with Frank G. Fickling as manager.

Truck Club's New Headquarters—The Motor Truck Club, New York City, has leased a new office of the United States Rubber Bldg., Broadway and Fifty-eighth street. Its number is room 1,004.

Open Columbus Supply House—C. E. Justus and E. E. Parker, under the partnership name of Justus and Parker, have opened an automobile supply house at 45 North Third street, Columbus, O.

Coleman Resigns from Atterbury—J. R. Coleman has resigned as chief engineer and designer of the Atterbury Motor Car Co., Buffalo, N. Y. It is his present plan to locate in Detroit, Mich.

Appointed Automobile Supply Manager—N. S. Stinchcomb has been appointed manager of the automobile supply department of the Rudolph & West Co., Washington, D. C., in place of E. L. Wilson.

Coburn in New Location—R. F. Coburn, New England district manager of the United Motor, Boston, Mass., Co., announces the removal of that company to its new warehouse, 410 Newbury street.

New Garage at Ulysses—D. C. Chase has purchased the lower floor of the G. A. R. building, Ulysses, Pa., and will soon open as a garage. Automobiles and motor trucks are to be sold and a repair shop will be maintained.

Pilgrim Motor Truck Branch—E. N. McNabb, president of the Pilgrim Motor Truck Co., is in San Francisco, Cal., establishing a branch assembling plant, where the various models of the Piggins truck will be assembled.

Merchants' Association's New Quarters—The Merchants' Assn., of New York, has moved into its new headquarters in the Woolworth Bldg., 233 Broadway. The new quarters occupy the greater part of the ninth floor of that building.

Fire in Peerless Branch—A fire broke out in the paint room of the Boston, Mass., branch of the Peerless Motor Car Co., recently, but it was confined to the upper floor where it started, because the building is one of the modern fireproof structures. The loss is estimated at $25,000.

New Locomobile Manager—E. R. Travis, until recently assistant manager of the New York City branch of the Locomobile Company, has been transferred to Boston, Mass., as manager to fill the position made vacant by the resignation of K. M. Blake, who has gone with the International Motor Co.

Frontier Transportation Co.—The Frontier Transportation Co. has been incorporated in Buffalo, N. Y., to operate motor buses over the principal streets of that city. The stock is being marketed along the business interests of Buffalo and the operation of vehicles will be started in the near future.

Mail Collection by Automobile—The first automobile to be used in the mail collection service of Omaha, Neb., made its initial trip recently. The trip included fifty-four stops, and the 3.8 miles recorded by the speedometer was made in 43 minutes, just over half the time required for the same trip by wagon collection.

Parkway for Storing Automobiles—Safety Director Mooney, of Toledo, O., has announced the opening on Monday, April 21, of a parkway for the storing of automobiles, now crowded into public streets and left standing for hours while owners transact business at their offices. The new parkway covers an area of 40,000 square feet and is capable of parking 300 machines.

FISCHER WITH BOSTON MICHIGAN—J. Fischer has become manager of the retail sales department of the Boston, Mass., branch of the Michigan Motor Co.

GARAGE IN RICHLAND CENTER—The Pier Automobile Co., of Richland Center, Wis., has broken ground for its new garage and sales building, to cost about $7,500.

CLARK NEEDS ADDITIONAL EQUIPMENT—The Clark Motor Car Co., Louisville, Ky., will need additional equipment for the repair shop of its new garage at 206 East Broadway.

U. S. TIRE IN WORCESTER—The United States Tire Co., New York City, has opened its new branch in the city of Worcester, Mass., under the management of L. C. Havener.

TRACY PROMOTED—R. B. Tracy has been appointed manager of the Central district by the Michelin Tire Co., of Milltown, N. J. His territory comprises the Chicago, St. Louis and Minneapolis branches.

PURCHASE ECONOMY GARAGE—J. W. Tyler, of North Fond du Lac., Wis., and Walter Kisk, of Wausau, Wis., have formed a partnership and purchased the business of the Economy Garage Co., at Harvard, Ill.

N. Y. DE DION MOVES—Emanuel Lescaris, manager of the De Dion Bouton selling branch, New York city, will move the same on May 1 to larger quarters at 1672 Broadway. The present address is 1649 Broadway.

RED WING ORDERS TRUCK—The city council of Red Wing, Minn., has ordered a $5,600 Seagrave combination chemical and hose motor cart. An expert will instruct the firemen how to drive, and by May 1 the machine is expected to be in operation.

TWIN CITY COMPANY MOVES—The Twin City Motor Car Co., St. Paul, Minn., has moved to a new location, 163 West Sixth street, where it has a service department in charge of Gustav Michaud. A. F. Williams is in charge of the truck department.

LAWRENCE LEAVES NYBERG—Clarence Lawrence, advertising manager of the Nyberg Automobile Wks., Anderson, Ind., has resigned his position to enter the advertising department of the National Cash Register Co., Dayton, O. Victor Washborn succeeds him.

KELLY BOSTON GOODRICH MANAGER—A. J. Kelly, formerly in charge of the B. F. Goodrich Co's. Syracuse, N. Y., depot, has been transferred to the Boston, Mass., branch. Mr. Kelly has been succeeded by Mr. F. G. Mossop, formerly located in the Buffalo, N. Y., branch.

PITCHER COLUMBUS ELECTRIC MANAGER—L. W. Pitcher, 5 years with the electrical department of the Columbus Buggy Co. branch, Minneapolis, Minn., has been made manager. A. E. Archer, for many years the manager, has gone to St. Louis, Mo., where he will sell Ohio electrics.

ST. PAUL ORDERS APPARATUS—For protection of the outlying Midway district the fire commission of St. Paul, Minn., has ordered a Waterous motor-driven and motor-pumping fire engine, manufactured in that city, and a La France combination chemical and hose motor wagon. The two will cost about $12,500.

MINNEAPOLIS BUYS VELIES—The city of Minneapolis, Minn., has bought two Velie 3-ton trucks for use by the city sewer department. The price was $3,165 each. The health department is considering purchase of a Martin tractor to collect garbage from stations and haul to the incineratory. The bid is $3,750.

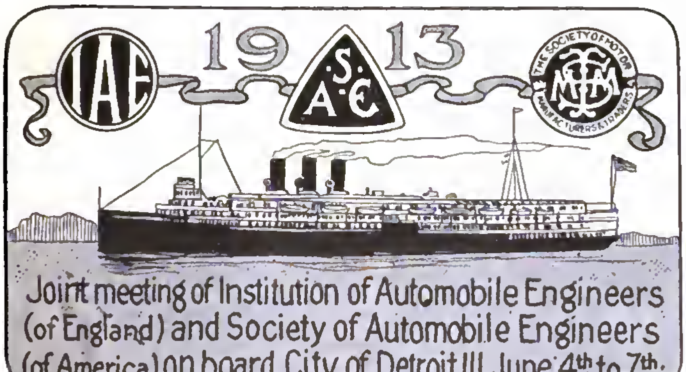
WAGNER AND NICHOLS HANDLE SPARTONS—F. J. Wagner and J. C. Nichols, of New York City, have taken the distributing rights for Sparton horns in the East. They will handle the business from a Broadway headquarters adjoining the General Automobile Supply Co. and the Schebler distributing agency, at 1671 Broadway.

AUTOMOBILE OWNERS IN JOHANNESBURG—A list of the 810 owners of automobiles in the city of Johannesburg, South Africa, and also of the dealers in automobiles and the garages there, has been received from Consul E. N. Gunsaulus, and will be sent to inquirers by the Bureau of Foreign and Domestic Commerce, Washington, D. C.

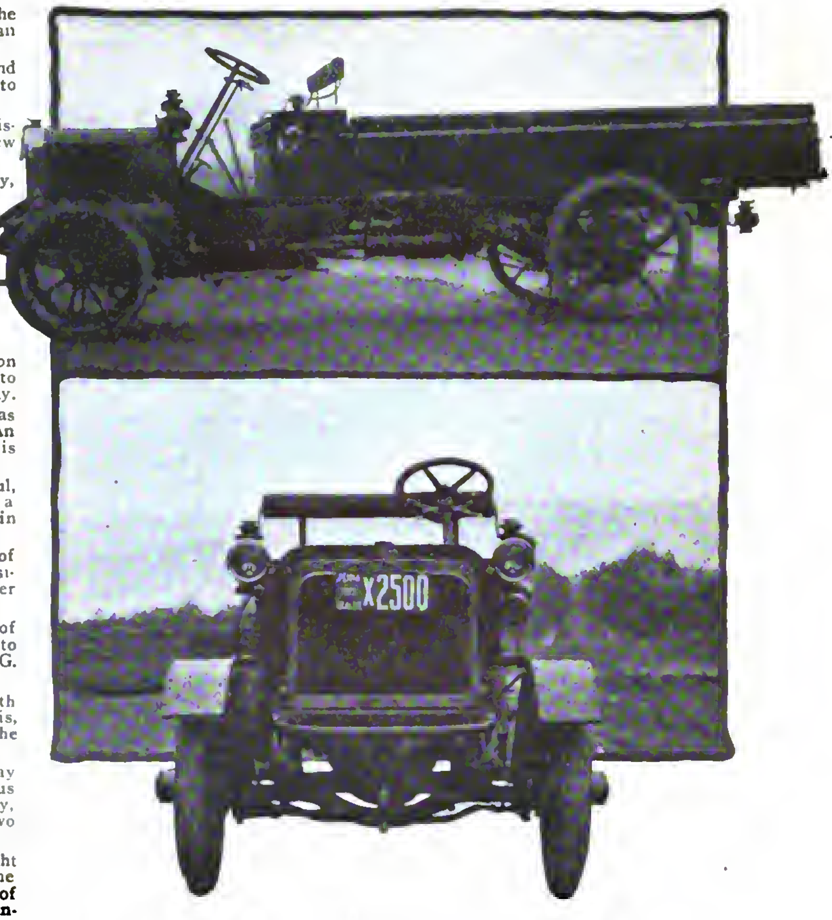
ARGENTINA'S AUTOMOBILE REPAIR SHOP—It is proposed to start a cooperative mechanical workshop in Mendoza, Argentina, to attend specially to the constant repairs required by the numerous automobiles which traverse the city and outlying districts. The idea is likely to be taken up and will serve as a corrective to the very high charges at present in the repair business.

TRADE BETTER THAN EVER—Automobile dealers in Kansas say there never has been a year when the prospect of business was better than it is this year. Much of the patronage in Kansas is from the prosperous farmers, and when the farmers are making good crops they not only buy machines, but they are disposed to buy second and third cars, and better and better cars.

MONTREAL WANTS MORE TRUCKS—The controllers are asking the City Council, Montreal, Que., to vote money to buy a dozen motor wagons of various makes for the road department. Each will have a capacity of about 6 tons and will move about four times as fast as a team, doing the work of 8 dozen horses. The price is $6,200 to $6,500 each. Three types of machines, four of each make, will be purchased.



Poster of the joint meeting of the I. A. E. of England and S. A. E. of America. This is being used at present on all S. A. E. correspondence. On June 4 to 7 these two societies will be on board the steamer City of Detroit III.



Side and front views of the first truck to be manufactured by the Delahunty Dyeing Machine Co., Pittston, Pa. It is of 1.5 tons capacity

NEW OMAHA STUDEBAKER BUILDING—B. J. Scannell, agent for the Studebaker car in Omaha, Neb., recently leased a new building at Twenty-fifth avenue and Farnam avenue. It is said that it will be the largest automobile building in the city. The building will cost $75,000. It is 75x140 feet, four stories high, the first story built of reinforced concrete and the stories above of brick and terra cotta.

NEW BUILDING IN INDIANAPOLIS—Another building has been added to Motor Row in the Capitol avenue boulevard, Indianapolis, Ind. The building has been occupied by Brandt Bros., who have the Lozier agency; the Detroiter Sales Co., which has the Briggs-Detroiter agency and by the McCullough Motor Supply Co. The building is at Vermont street and the boulevard.

MOTOR OMNIBUSES IN PITTSBURGH—Eight large motor trucks, said to be the largest in the world, will be placed in service in Pittsburgh, Pa., on May 1. The Pittsburgh Auto Transit Co. is the purchaser. Each of the vehicles will have a seating capacity of thirty-four passengers. The exterior and the interior strongly resemble street cars. They are of the pay-as-you-enter type and passengers may step from the curb directly into the bus vestibule. A six-cylinder motor is used.

ADDITION TO AUTOMOBILE SALESROOMS—Kahn & Greenberg, Philadelphia, Pa., have purchased properties 107-109 South Twenty-fourth street, 32x50 feet, and will use the sites as an outlet for the garage buildings and motor salesrooms they are building at 2302-12 Chestnut street and 103 South Twenty-third street. When completed the buildings will have a frontage of 174 feet on Chestnut street, and 240 feet on Ionie street. The entire operation will represent an investment of about $300,000.

BUILDING INCREASE IN MILWAUKEE—Broadway, from Mason street to Martin street, which has during the last 5 years assumed pretentious proportions as a motor row in Milwaukee, Wis., will strengthen its position as such with the addition of the Overland-Wisconsin Co., and George W. Browne, Inc., in June. A large garage and sales building will be erected at once at the northeast corner of Broadway and Biddle street by a large investment interest which recently acquired big frontages on Broadway, with an idea of inducing an influx of dealers and garage men in that direction. George W. Browne has taken a 10-year lease on the new building, which will be three stories high, 100x100 feet in size, of reinforced concrete construction.

SEATTLE'S AUTO ROW EXPANDING—Four new buildings involving the expenditure of upwards of $63,000, are to be constructed in the Broadway district, Seattle, Wash. All will be ready for occupancy within the next 90 days. A one-story brick 112x100 feet, will house automobile and supply stores at Broadway and Pike, costing $15,000. Across the street is another building which will rise three stories and cost $15,000. Also L. W. Roe is building a two-story garage and salesroom at Twelfth avenue and East Union, which will represent an outlay of $25,000. Alexander Pierce now has in course of construction at Boylston avenue and Pike, a one-story brick building which will serve as an auto house and will cost upwards of $8,000 and will be completed within 60 days. With the occupation of the four sites mentioned in the foregoing there remains but a few vacant lots in the Broadway district that are suitable for automobile trade. The automobile and supply industry in Seattle, Wash., has grown so rapidly that building operations have not kept pace.

COLE SERVICE STATION ALTERATIONS—Extensive alterations on the Cole service station and electric garage of C. W. Robinson, in Peoria, Ill., have been completed.

CRAWFORD RESIGNS—J. W. Crawford has resigned his position as assistant engineer for the American Motors Co., to start in the experimental department of the Chalmers Motor Co., Detroit, Mich.

WHITE IN DETROIT—C. M. White, Jr., of the Firestone Tire & Rubber Co., Akron, O., has recently located in Detroit, Mich., as pneumatic tire representative to the automobile manufacturers of Michigan.

LEAVITT WILL BUILD GARAGE—J. W. Leavitt & Co., Seattle, Wash., have announced the purchase of a lot at East Pike street and Eleventh avenue, on which they will build a garage, which will cost in the neighborhood of $35,000.

UNITED MOTOR SERVICE PLANT—The Long Island City, N. Y., colony of service buildings and departments has been added to by the United Motor, New York, Co., which has taken space amounting to 20,000 square feet in the Galvin Bldg., Thirteenth street and East avenue.

CONVENTION IN BOSTON—Makers of commercial and pleasure electric vehicles are to meet in Boston, Mass., at a convention to be held there May 20, in conjunction with other big electric interests. Papers will be read on various subjects, among them the New England Motor Field, Advertising, Trucks vs. Pleasure Cars, and Gasoline vs. Electrics.

Recent Incorporations in the Automobile Field

AUTOMOBILES AND PARTS.

BROOKLYN, N. Y.—Noden's Auto Trucking Co.; capital, $10,000; to do automobile trucking. Incorporators: Abraham Noden, Ada Noden, Benjamin H. Noden.

BURGAW, N. C.—Pender Auto Co.; capital, $15,000; to deal in automobiles. Incorporators: C. B. Sodergrist, F. M. Lewis.

CINCINNATI, O.—Imperial Auto Livery Co.; capital, $2,000; to conduct an automobile and livery business and deal in automobiles. Incorporators: S. F. Glassemeyer, William Shullman, N. A. Michelson, Joseph Lemkuhle, O. T. Ryan.

CLEVELAND, O.—Krit Motor Sales Co.; capital, $10,000; to deal in automobiles an daccessories. Incorporators: R. S. Smith, C. A. Smith, O. A. Sell, C. P. Tampier, D. Hakes.

NEWARK, N. J.—Carlough & Mallon, Inc.; capital, $50,000; to deal in automobiles. Incorporators: E. D. Carlough, F. V. Carlough, W. L. Mallon.

NEW YORK CITY—Indiana Motor Truck Sales Co.; capital, $10,000; to manufacture and repair automobiles. Incorporators: W. A. Schwarzkoff, Rosalind Lovy, L. O. Knoegel.

PLATTE CENTER, NEB.—Platte Center Automobile Co.; capital, $15,000; to deal in automobiles. Incorporators: E. J. Macken and others.

RALEIGH, N. C.—Dixie Motor Co.; capital, $10,000; to manufacture and sell automobiles. Incorporators: J. C. Arbagast, J. E. Craddock, J. B. Anderson.

SAN FRANCISCO, CAL.—Pacific Kissel Kar Co.; capital, $500,000; to deal in automobiles. Incorporators: W. H. Hughson, G. N. Emmons, H. K. Butterfield.

SCHENECTADY, N. Y.—Schenectady Auto-Car Co.; capital, $10,000; to deal in automobiles. Incorporators: Emmett Fisher, A. Lengenauer, L. Ruonfigilio, W. S. Carman, F. Howenstein, Lee Foy, C. A. Mulleo, O. S. Wagner, J. Wagner, B. Kling.

TARRYTOWN, N. Y.—Motokart Co.; capital, $250,000; to manufacture light commercial automobiles. Incorporators: A. R. Gormully, B. J. Knerr.

WILMINGTON, DEL.—Commer Truck Co. of America; capital, $3,000,000; to manufacture motor trucks. Incorporators: J. F. Curtin, H. O. Coughlin, J. M. Satterfield.

GARAGES AND ACCESSORIES

ASHEVILLE, N. C.—Phillips Tire Co.; capital, $10,000; to manufacture automobile tires. Incorporators: W. L. Phillips, E. Craddock.

BIRMINGHAM, ALA.—Birmingham Motor and Country Club; capital, $150,000; to carry on an automobile club. Incorporators: Oscar Turner, Solon Jacobs, G. A. Binn, Jr.

BROOKLYN, N. Y.—Self-Generating Motor Co.; capital, $250,000; to manufacture machines for generating steam. Incorporators: O. G. Holahansen, R. T. Mani, H. B. Wood.

CINCINNATI, O.—National Automobile School of Cincinnati; capital, $50,000; to conduct an automobile school and garage and repair shop and to manufacture and deal in motor vehicle supplies and accessories. Incorporators: G. A. Hewley, H. G. Williamson, W. A. Evan, C. R. McComas, J. D. McCrecken.

CLEVELAND, O.—Elastic Tread Tire & Wheel Co.; capital, $25,000; to manufacture patented elastic treaded tire wheels. Incorporators: J. A. Murrey, R. E. Mollenkopf, F. J. Axel, Peter Schneider, F. O. Joss, W. J. Young.

DETROIT, MICH.—American Lamp & Stamping Co.; capital, $100,000; to engage in the manufacture of automobile lamps and plumbing supplies. Incorporators: G. E. Edmonds, William Jones.

EAST PALESTINE, O.—McGraw Tire & Rubber Co.; capital, $1,000,000; to manufacture automobile tires. Incorporators: J. C. Chaplin, C. H. Bolton, J. S. Wilson, George Fiaccus, E. O. McGraw, L. N. McGraw, Robert McGraw, John Morgan, R. F. Taggart, R. B. Taggart, J. C. Chemberling, H. O. Fraser, C. I. Merwin.

HOLYOKE, MASS.—Auto Accessory Mfg. Co.; capital, $25,000; to manufacture automobile accessories. Incorporators: W. J. Shannon, E. N. Frary, E. A. Frary.

JOPLIN, MO.—Arnold Motor and Supply Co.; capital, $2,000; to deal in automobile accessories. Incorporators: J. L. Arnold, Ida Tweed Arnold, Flora Arnold Snider.

MORAVIA, N. Y.—Auburn & Moravia Auto Bus Co.; capital, $7,000; to run an automobile bus line. Incorporators: E. C. Weaver, E. D. Parkhurst, F. W. Ackerman.

NASHVILLE, TENN.—Card Taxicab Co.; capital, $1,000; to engage in an automobile taxi business. Incorporators: C. O. Card, Glenn Taylor, W. O. Taylor, C. W. Carle, O. S. Mayfield.

NEW YORK CITY.—Allied Motor Accessories Co.; capital, $10,000; to deal in automobile accessories. Incorporator: Annie Harroun.

NEW YORK CITY—Mottlau Transmission Inc.; capital, $250,000; to manufacture transmission, etc. Incorporators: A. J. Mottlau, W. L. Post, T. F. Conrad.

NEW YORK CITY.—National Spark Plug Co.; capital, $10,000; to manufacture spark plugs. Incorporators: R. L. Oherburg, C. B. Bennett, Agnes Boselman.

NEW YORK CITY.—Schermerhorn Garage Co.; capital, $20,000; to carry on a garage business. Incorporators: Jacob Ginsburgh, Leo Rosett, P. A. Lee.

NEW YORK CITY.—Still's Automobile & Accessories Co.; capital, $10,000; to deal in accessories. Incorporators: G. M. Still, George Edwin Still, Josiah H. Still.

NEW YORK CITY.—Wegner Specialty Co.; capital, $5,000; to deal in automobile accessories. Incorporators: A. F. Wagner, Frederick Walsh, Moses Morris.

PITTSBURGH, PA.—Federal Auto Supply Co.; capital, $10,000; to deal in accessories. Incorporators: O. O. Herr, G. M. Newmyer, C. D. Greene.

PITTSBURGH, PA.—Pittsburgh Auto Transit Co.; capital, $5,000; to carry on an automobile transportation business. Incorporators: A. V. Crookston, H. B. Ouraler, W. A. Feltyberger, O. R. Beatty.

PITTSBURGH, PA.—Transmission Engineering Co.; capital, $13,000; to [illegible] an electric transmission. Incorporators: G. N. Lemmon, A. W. Burke, H. L. Patterson, V. H. Ely, B. W. Kerr, M. Epstein, L. C. Hart.

PRINCE ALBERT, SASK.—Owners' Garage Co.; capital, $20,000; to carry on a general garage business.

RICHMOND HILL, N. Y.—Richmond Hill Garage & Machine Co., Inc.; capital, $6,000; to carry on a garage business. Incorporators: M. E. Tunca, [illegible] H. Ryan, A. F. Ryan.

ROMNEY, W. VA.—Hampshire Garage Co.; capital, $5,000; to carry on a general garage business. Incorporators: J. J. Cornwell, T. F. Martin, W. [illegible] McClane.

SASKATOON, SASK.—Standard Auto & Supply Co.; capital, $50,000; [illegible] manufacture automobile supplies.

TOTTENVILLE, N. Y.—Tottenville Garage Co.; capital, $500; to carry on a general garage business. Incorporators: I. A. Silver, Jr., G. W. [illegible] E. L. Silver.

WHEELING, W. VA.—Belleaire Automobile Garage Co.; capital, $10,000; [illegible] carry on a garage business. Incorporator: Hart Morris.

WORCESTER, MASS.—Worcester County Automobile Owners' Assn.; [illegible] $5,000; to conduct an automobile club. Incorporators: J. W. Healy, [illegible] Divoll, H. A. Wood.

CHANGES OF NAME AND CAPITAL

AKRON, O.—Stern Double Cushion Co.; capital decrease from $200,[illegible] $10,000.

DEKALB, ILL.—DeKalb Wagon Wks.; capital increase to $50,000.

NEW YORK CITY.—Joscelyn Stable Co.; change of name to the J[illegible] Garage, Inc.

The AUTOMOBILE

BAILEY
ELECTRIC SYSTEM

The Coming Light

With the arrival of the perfect electric generator, electric lighting for motor cars is unquestionably displacing all other forms.

Electric generatars have heretofore been subject to criticism on account af their inefficiency and unreliability.

The Bailey Electric Generator, a wonderful dynamo only 5½" high, 5½" wide and 7½" long, weighing 17 pounds, designed by Benjamin F. Bailey, the famous Electrical Engineer, furnishes the first logical solution of the electric lighting problem.

In its construction, all unsatisfactory and trappy devices, such as reverse current relays, magnetic switches, vibrating contacts, delicate rheostats, slipping clutches, corroding platinum points and other trouble making appliances have been entirely eliminated.

Furthermore, there are no moving parts involved in the Bailey System of Regulation.

A patented mercury switch, the very simplicity of which has foiled other inventors, makes the construction of this generator so simple and compact, that in spite of the fact that its output running from 10 to 15 amperes is almost double that of other generators, the entire mechanism is little larger than a man's hand.

Another thing—due to its peculiar construction, when the big headlights are thrown on, it automatically supplies the additional current required for their lighting.

You are always assured of brilliant lights on all your lamps, and a sufficient reserve in the battery to take care of emergencies.

Prices of Complete Outfit

Model L 1, suitable for car lighting systems requiring 60 candlepower or less, $75.00.

This price includes generator, wiring, harness, 60-ampere hour storage battery and all controlling switches ready for installation. Price f.o.b. Grand Rapids.

Model L 2, suitable for car lighting systems requiring 60 to 100 candlepower, $125.00.

This price includes generator, wiring, harness, 80-ampere hour storage battery and all controlling switches ready for installation. Price f.o.b. Grand Rapids.

The above outfits can be attached to any existing type of car having an exposed rotating shaft on the power plant.

Send for our booklet, "Electric Lighting Explained," which shows in detail how the generator is made and what it will do. Also describes the Bailey Combination Ignition Starting and Lighting Unit.

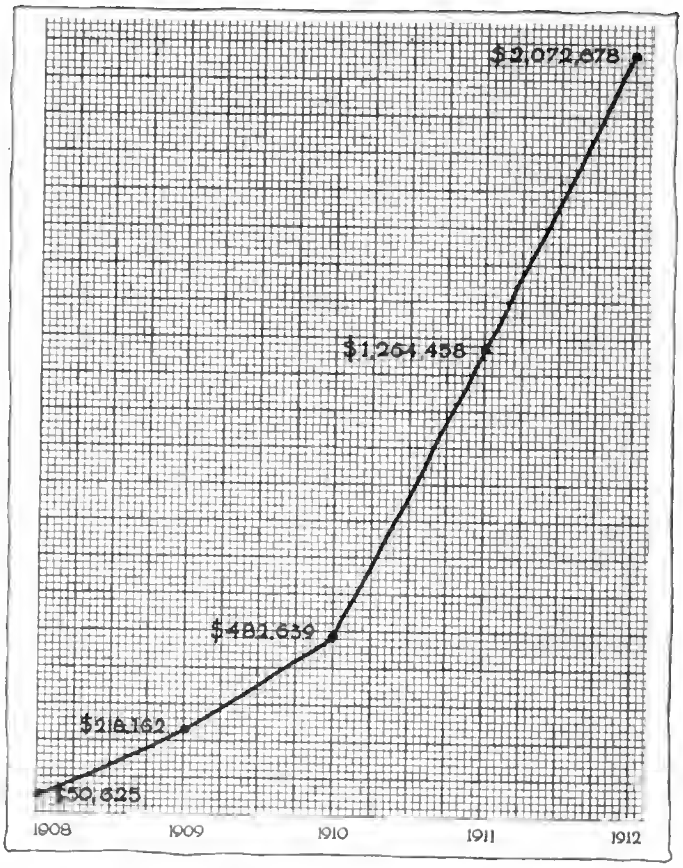
The AUTOMOBILE

Australia—A Fine Export Field

Total Imports Rose from $6,007,943 in 1911 to $9,334,627 in 1912, an Increase of 55.5 Per Cent.—America Leads in Bodies and Is Second to England as Chassis Seller

TWO territories there are in the New World which are just being thrown open to the commerce and industry of the world: South America and Australia. The former, largely in the hands of the original Spanish settlers, is not as quick as its natural resources and possibilities would warrant it; while the latter, under the hands of the British, most successful of colonizing nations, is making most astonishing headway. Agriculture, mining and a variety of industries make Australia a territory of very considerable buying power, and that the automobile industry of the world is getting its share will be shown in the following article.

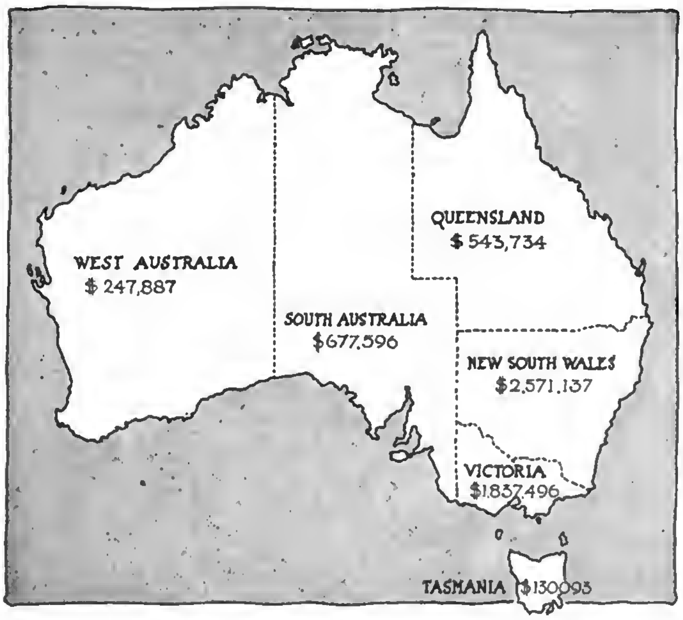
The present status of automobilism in Australia has been dealt with statistically in an article published in THE AUTOMOBILE of October 31, 1912. It will now be shown how the number of automobiles in Australia is on a rapid increase, as a fitting illustration of the good chances and the success of American automobile exporters. Australian automobile imports during 1911 and 1912, according to government figures, are our material used in this article.



Curve showing the steady rise of American exports to Australia, which increased fortyfold in 4 years

The most interesting phase of the whole situation—the import of American automobiles—is illustrated by the curve appearing on this page. From the modest figure of $50,625 of the cars imported from the United States in 1908, this value has risen during the subsequent 4 years to forty times its magnitude, or $2,072,678. The rate of increase of American exports to Australia has been rising continually, as is shown by the steepening slope of the curve.

Details of automobile imports from America to Australia are shown in the diagram on page 920. The total amounts for the last 2 years have been dissected in the case of this diagram, showing the value of chassis, bodies and of motorcycles, including cyclecars, for both years, the 1911 values being represented by spaces filled with dot-shading and those of 1912 by line-



Distribution of 1911 imports through Australian states

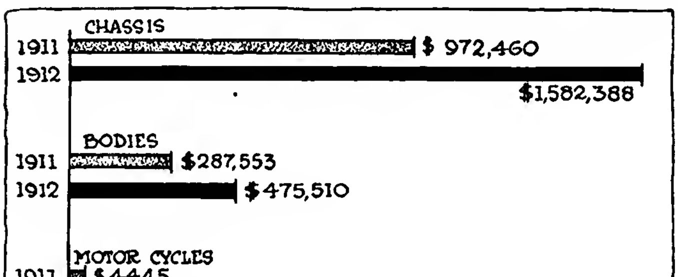
shaded spaces. The value of chassis imports in 1911 was $972,460 and in 1912 $1,582,388, equivalent to an increase of 62.5 per cent. Bodies imported from the United States rose in value from $287,553 in 1911 to $475,510 in 1912, the increase amounting to $187,957, or 65 per cent. Motorcycle and cyclecar imports rose from $4,445 to $14,780, an increase of $10,355, or 233 per cent.

America Supplied 10 Per Cent. in 1912

The total value of automobile chassis and bodies, including both passenger and commercial types, exported from the States to Australia during 1912 is $2,057,898. Assuming that the average value of each car exported was $1,000—a reasonable estimate—this means that somewhat more than 2,000 automobiles were sold in Australia in that year. If the total number of cars in Australia at the close of 1912 was 20,000, which is very close to the actual number, **one-tenth of this respectable number had been purchased from American manufacturers during that very year.** It should be borne in mind, too, that the values given in the diagram on this page do not include the prices paid for tires on the cars, but merely those of the products of the automobile industry proper.

So far as bodies are concerned, the United States was the leading exporter to Australia in 1912, but in respect of total chassis value it ranked second to the United Kingdom, while in regard to motorcycles and cyclecars it was only fourth, Great Britain, France and Belgium being leaders. But that America is making good progress even in these two regards is shown by comparing the tabulations showing Australian imports for 1911 and 1912. In 1911 America ranked only as second body exporter and was fifth in the motorcycle field, Germany being then ahead of it, which has been left behind during 1912.

The tables on this page and on 921 show imports of automobiles into the various states of the Commonwealth of Australia,



Comparative diagrams of 1911 and 1912 American imports

with the exporting countries arranged in the order of their export values. Even a superficial inspection of these tabulations brings out the fact that America's principal rival is Great Britain, who controls Australian imports in many fields and therefore holds supremacy in automobiles as well. But the steady advance of American exports, as shown by its first position on the 1912 body table, cannot be denied. Another fact shown by these tables is that France ranks among the principal exporters, although she seems to be falling behind. Indeed, her chassis exports increased by the amount of $176,058 during 1912; her body exports increased $11,744, but the small-car trade shows a falling-off amounting to $690. This may seem to be a small amount, but as every country has been trying its best in its Australian trade during the past 2 years, even this decrease is significant. A different and pleasant situation obtaining with regard to the United States' exports is revealed by comparing the French figures with those illustrated by the diagram at the bottom of the page.

An extraordinary gain in chassis exports is seen in the case of Canada; her 1912 trade exceeds that of 1911 by $437,521, the gain being 205 per cent. This puts her fourth among chassis-supplying countries. Italy is making reasonable progress and Belgium's trade develops at about the same rate. Germany showed a gain of just $100,000 during 1912. Swiss trade fell off, the loss being $8,671. Austria-Hungary's exports fell $3,108 and those of the Netherlands $8,558, or 91 per cent. Sweden, however, showed an increase of $11,354, or 96.5 per cent.

The tabulation of Australian body imports shows a similar situation. Except for the fact that the United States took first place in 1912 and the United Kingdom second, reversing the positions of the preceding year, the order of countries that exported to the Commonwealth remained much the same as before. Canada remained third, more than doubling her trade: France retained fourth place, although she lost $11,744, or 26 per cent. of her exports; Germany followed in both years, gaining slightly during 1912; in that year Italy overtook Belgium, the former gaining $4,238, or 159 per cent., while the latter's export business fell from $7,757 to $4,704, the loss being 39 per cent. New Zealand almost doubled her trade and that of Switzerland rose

	119,058	75,535	23,762	44,013	15,503	6,973	284,844

to five times of what it had been in 1911. Austria lost somewhat and Sweden disappeared entirely; the same applies to the Netherlands. On the other hand, Japan and the Commonwealth are new additions to the list.

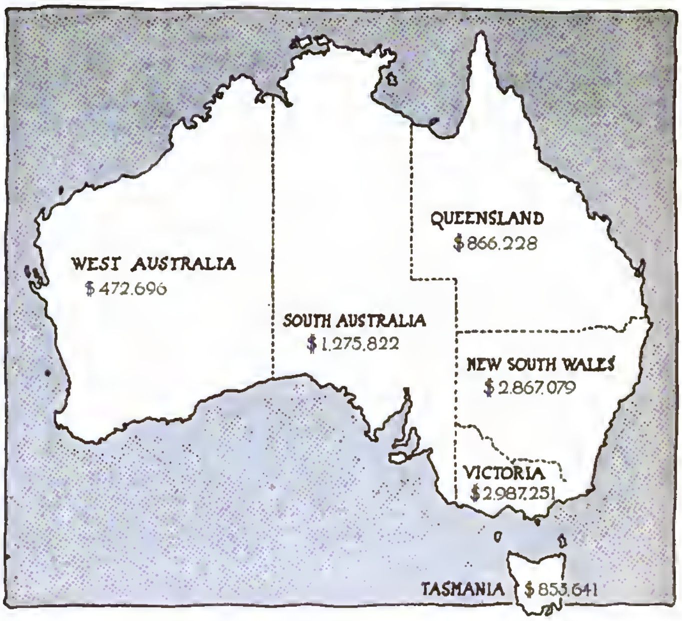
In the motorcycle and cyclecar class, the United States advanced from the fifth to the fourth position, displacing Germany. France was the only loser in this class of imports, all other countries showing gains. In 1912 New Zealand appeared on the list for the first time.

It would be utterly wrong, however, if anyone would be inclined to consider Australia as one uniform territory throughout which the same conditions hold good. The Australian continent is divided into five states which, together with the island of Tasmania, constitute the Commonwealth. The following tabulation shows the total imports of all sates for 1911 and 1912, with the percentage of increase during the latter year, the states being arranged in order of the automobile registrations:

State	1911	1912	Increase Per Cent.
New South Wales	$2,571,137	$2,867,079	11.5
Victoria	1,837,496	2,987,251	57.2
South Australia	677,596	1,275,822	89.6
Queensland	543,734	866,228	59.4
West Australia	247,887	472,696	90.6
Tasmania	130,093	853,641	556.5

This shows that the demand for automobiles is very strong all through the Commonwealth, but that the import rates rise most in the territories which have the least numbers of cars, Tasmania having about 600 at the end of last year. New South Wales, on the other hand, had some 6,500 cars, or ten times as many as Tasmania; but the rate of import increase is only one-fiftieth of that of the latter. This indicates that the island is a specially hopeful territory which has hardly been touched yet. Queensland's registration is just in the middle between the numbers of West and South Australia, so that her percentage of rise should be about 90; instead it is only about 60, showing either that the state has not received proper care from automobile dealers or that conditions there are not as favorable for automobiling as elsewhere.

In the previous article mentioned above, which treated of the status of the automobile in Australia, it was stated that Ford registrations were about 50 per cent. ahead of any other make, showing the prevalence of low-priced American cars. It was also stated then, that Australians have a preference for American bodies due their greater comfort. That there is truth in this argument, is now being shown by the lead of the United States in the line of body imports. The other arguments in favor of American cars, low price, easy-riding suspensions and full equipment are also of great consequence in introducing United States made products in the Commonwealth.



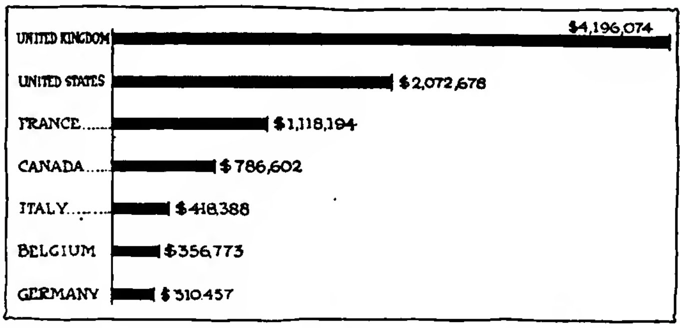
Distribution of 1912 imports through Australian states

How To Go About Australian Trade

It may not be out of place to state here that British exporters to Australia as well as patriotic importers of English origin have grave apprehensions with regard to the American trade. The danger, so-called, of an invasion of the land by American products is felt more in Australia than in many other countries, because the Commonwealth is still very much in its growing period.

Information about Australia is continuously coming in, especially through the United States Consulates established in the various cities. It will be advisable for any maker who desires to export to the Australian continent, to communicate with the Department of Commerce and Labor for information regarding the local conditions obtaining in the various states and their parts, as such a knowledge is a requisite in making a success in automobile exporting.

Judging from general conditions in Australia, which are favorable to business, it is more than highly probable that American automobile exports to that country will increase during this year at no lesser rate than they have grown during 1912 and perhaps at an even greater rate. America will probably still be second among chassis-supplying countries, but closer to England.



Car imports of 1912 arranged by manufacturing nations

Bay State Hopes To Defeat Truck Bills

Automobile and Motor Truck Interests Present Solid Phalanx of Opposition to Attempt to Tax Commercial Motor Vehicles Without Levying on Horse-Drawn Wagons—Decision Regarding Duties of Automobilists in Case of Accident—New York Cuts Chauffeur's Fee from $5 *to* $2.

BOSTON, April 28—The fight of the motorists of Massachusetts assisted by the National Association of Automobile Manufacturers to prevent the increase of motor truck registrations to $5 per ton, has progressed so that today it looks as if the proposed legislation will be defeated and, if so, a good work will be done for the entire truck industry, in that it is certain that if Massachusetts were to pass such a law it would be followed by other states in the near future.

The meeting of the motor committee last Thursday brought together a large gathering of men identified with different lines, and the sentiment was unanimous to conduct a general fight to entirely bury the scheme of taxing the commercial truck industry when horse-drawn trucks are not taxed. The purpose now is to make a political campaign as there are enough men identified with the motor industry to swing an election if opinion were molded so that the electorate would get the real facts, and already a few of the progressives are at work on it to take advantage of the situation.

Commissioners Go Out of Their Field

The opinion is general in this state that the highway commission was responsible for giving the committee on roads and bridges, which has the proposed legislation in hand, a wrong idea which led this committee to report favorably on the $5 per ton tax. From the opinions of many of the legislators and senators there is a strong feeling that the highway commission would make better progress by sticking to its executive duties and leaving legislative matters alone.

The state house was fairly seething with opposition last week when the work of the motorists began. Constituents began to let members of the legislature hear from them. It was learned that the motor truck increase is one of the measures that the Republican party intended to push across when its legislative members had a meeting recently. So notice was served on the Republican leaders that it will be held responsible for what happens. The Democratic party does not favor it, and from the political viewpoint it begins to look like another of the little jokes of Governor Foss that will prove a jolt to the G. O. P. this fall.

The motor interests are now united so that next fall literature will be sent out to all the districts throughout the state, to every voter, giving a résumé of what has happened during the past few years. There is a general feeling that this literature will have its effect, and with the progressive party moving forward shrewd followers of political affairs look for a change in governorship, with the motorists' vote united.

There has been further opposition in Massachusetts to the appointment of a commission for uniform motor legislation throughout New England. The committee on roads and bridges reported "No legislation necessary," on Governor Foss' recommendation to have a committee appointed to confer with commissioners from other states on uniform motor laws. When Governor Sulzer of New York made the suggestion that he was ready to appoint such a commission, Colonel Schier, of the Massachusetts Highway Commission, in an interview in a Boston paper, stated there was no need for such a commission being appointed, as the Massachusetts law was adequate for present needs. Today Maine has appointed such a commission; New Hampshire will probably follow suit, and possibly Rhode Island. In view of this, the action of the Massachusetts commission came as a surprise, and the motor interests wondered if it were to checkmate any plan to have the present truck bill dropped to such a commission for consideration during the coming summer. Under these conditions it means now a fight on the part of the motorist to kill the bill entirely, and having been fooled once through compromise another one will not be accepted.

That such an interstate commission on uniform laws is necessary is shown by the progressive amendments passed in Maine and New Hampshire this year whereby a neutral zone of 15 miles has been established, to offset the "10 days in one year" clause that was jammed through the Massachusetts legislature by the highway commission and caused other states to adopt it, only to find out it was a boomerang needing a change. The stand-pat feeling that has permeated the atmosphere of Massachusetts for a number of years has woven itself into the motor legislation with ill effect.

The Massachusetts Highway Commission, in a recent decision, has made it plain that it does not consider that when a motorist figures in an accident whereby he causes damage to a person or property that to merely stop so that the number of the car may be taken does not constitute a compliance with the law, but that he must not only stop, but give his name and address in order to make himself known.

The Automobile Legal Association of Boston to make it clear to motorists about this law states that a number of motorists in the past year have been so unfortunate as to kill dogs, and because they failed to stop and make themselves known they have been liable to criminal prosecution, but rather than take the chance of a conviction they have paid various sums as damages for killing the animals, which they would not have been obliged to pay had they stopped and made themselves known as provided by law. A person cannot be held liable for killing a dog unless he is operating his machine recklessly or in a grossly negligent manner.

N. Y. Reduces Chauffeurs Fee

ALBANY, N. Y., April 29—*Special Telegram*—At the hearng this afternoon before the committee of Internal Affairs of the Senate on new motor legislation, it was agreed that the license fee for chauffeurs will be reduced from $5 to $2, and that there will not be any fee for renewal. Heretofore there had been a fee of $2 for renewal.

Beyond this little of importance by way of change came up. Secretary of State Mitchell May, desired additional power in his hands for revoking licenses, but it was shown that under the present Callan law there is ample power for such revocation if the causes are specified. There was general opposition to the amendment requiring all operators, whether owners or chauffeurs, to be licensed. The movement to create a Bureau of Inspection and Investigation in the state was entirely killed. The general feeling was that the existing Callan law is entirely satisfactory with the exception of chauffeurs' registrations as mentioned.

ALBANY, N. Y., April 29—Proposed automobile legislation is moving slowly these days. Senator Loren H. White, chairman of the Internal Affairs Committee of the Senate, which is handling all of the legislation, says that there will be little if any effected this session. Chairman White expects that his bill authorizing three committeemen of the state to confer with other committeemen from Maine, Vermont, New Hampshire, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware and Maryland to obtain uniform motor laws will be passed.

Chairman White expects that legislation will be enacted giving Secretary of State May power to revoke a license for cause; and, further, that an amendment will be passed which would license all operators without fee or examination.

A public hearing was held on April 23 and at this the Secretary of State was willing to give in on all questions of legislation excepting two. These were: (1) License owners without an examination and without a fee; (2) he wants power to revoke a license of either chauffeur or owner for any cause, a clause which would give him more power than the Czar of Russia, a clause which would give him power to revoke a license if the tail light happened to be blown out by the wind.

At the hearing, Frank D. Lyon, secretary of the New York State Automobile Association, favored levying a wheel tax or issuing licenses to all vehicles using the public thoroughfares with the exception of vehicles of the farmer used by the farmer for his own direct and personal benefit in delivering his product to the market, this exemption being urged because the farmer already pays a direct tax upon his land property for the purpose of maintaining the highways and bridges of the state.

Lippincott Favors Joint Commission

New York City, April 29—J. H. Lippincott, of New Jersey, favors a commission of states to draft uniform motor laws and is emphatic in his views that the present motor laws are mere patchwork. In an interview with The Automobile he said:

"In reference to the possible work of the joint commissions appointed by the Eastern States for the purpose of drafting recommendations for the adoption of a uniform automobile law, I can, of course, only speak for the policy which New Jersey would probably adopt in such a conference.

"The question of proper registration fees to be charged, the proper regulation of drivers of motor vehicles generally, the disposition of the revenue, and the reorganization of the rules of the road would seem to be the first question which would be taken up by such a commission.

"A matter of equal importance would seem to be the relation which each state should adopt toward the licenses issued by sister states and the adoption of some system which would be an improvement to the present reciprocity acts which have proved only partially satisfactory. No real results can be obtained in this class of legislation without concerted action on the part of all states similarly located.

"I think it is very generally conceded that our motor vehicle laws have been little better than a series of patchwork legislation and unsatisfactory compromises. The motor vehicle has now arrived at a point where the need for scientific laws governing its use and controlling the relation with which the state or states regard it is absolutely necessary.

"For instance, the place which the business automobile should occupy in our laws has been very generally disregarded. The great increase in the use of automobiles for business purposes makes it absolutely necessary that there be a standard law on this subject.

"The various forms of licenses which are necessary should also properly come before such a conference, as well as the question of the exemption of owners of automobiles from personal taxation on them.

"Some method should be developed of automatic regulation and control by some central authority in each state over all licenses, whether they be granted by the state in which they are at the time touring or whether they be granted by a sister state. In fact, there is hardly a provision of our present motor vehicle acts which could not stand considerable revision and simplification.

"It would seem that the first duty of the commission would be to determine on a model law, dealing with the questions generally and capable of being adopted by each and every state represented at the conference.

"The preliminary work of this commission must, of course, be one of investigation, and I would suggest as a member of the commission from New Jersey, that the automobile laws of all the states in the Union, together with similar laws in the foreign countries, be compiled and classified as to subjects, with the idea that the model act which would be drawn would contain the best features of all the laws on this subject."

Mitchell May, secretary of state for New York, is opposed to such a commission as he has expressed himself as follows:

"It is my opinion that there is no necessity for uniform automobile laws in the various states, so far as they concern the home automobile, because it would be an unnecessary interference with the internal affairs of the various states. There should, however, be some plan adopted by all, and by which automobiles could be operated in foreign states. This would avoid unfair discrimination and bring about that comity among the states which is so desirable. The question, however, pertaining to license fees, speed of automobiles, powers of secretary of state, and such, must of necessity be determined by each state for itself."

Colorado Has State License Law

Denver, Col., April 25—Colorado's first law for a state license tax upon motor vehicles has been signed by Governor Ammons, and it is estimated that it will add in the neighborhood of $40,000 annually to the state road fund. If the measure is not subjected to a referendum vote of the people it will go into effect the middle of July.

The law provides for a yearly license tax of $2.50 for automobiles of less than 20 horsepower, $5 for 20 to 40, $10 for more than 40, and $2 for motorcycles. It also requires all paid operators to secure a license costing $2. To encourage tourists visitors will be allowed to register their cars without charge for 90 days

New York Mayor Signs Objectionable Ordinance

New York City, April 30—Mayor Gaynor yesterday signed the Folks ordinance, lowering the speed limit to 10 miles in congested sections of Manhattan and Brooklyn, 15 miles in other sections and 20 miles an hour in outlying parts of the Bronx, Richmond and Queens. The ordinance will go into effect June 1. The mayor vetoed the original Folks ordinance because it placed the burden of proof on the city.

The point in the ordinance which will be most disliked by automobilists is that in the case of any accident, driving faster than 15 miles an hour in any locality will be considered *prima facie* evidence of negligence, and the burden of proof will be upon the automobilist who must show that he is not guilty or become liable to penalty.

Columbus, O., April 28—The attorney-general for Ohio has held that the amendment to the present automobile law for an equal distribution of the surplus money derived from the registration of automobiles in the state among the various counties of the state for road improvement is constitutional. The attorney-general holds that as roads may be considered both of a local and state-wide nature, the principle that taxes are to be spent where raised may be disregarded.

New Orleans, La., April 26—Automobile owners, dealers and agents of New Orleans have made a decided protest against the speed limitations provided for in the traffic ordinance shortly to be introduced in the City Council. The ordinance places the speed limit at 8 miles in the business district, 15 miles in the residence section and 20 miles in isolated parts of the city.

Gilbert Is Lozier President

Succeeds H. M. Jewett, Who Leaves Lozier Company To Devote Himself to Paige-Detroit Organization

Harry Lozier Elected Vice-President of Lozier Firm with Fred Gies Secretary and Assistant Treasurer and N. R. Sultes Treasurer

DETROIT, MICH., April 29—Joseph M. Gilbert, who last week resigned as general manager of the United States Tire Company, was today elected president of the Lozier Motor Company, succeeding Harry M. Jewett, whose active connection with the Lozier company will cease, and who in the future will largely devote his efforts to the Paige-Detroit Motor Car Company, of which he is president.

Harry Lozier was elected vice-president of the company; Fred Gies, secretary and assistant treasurer, and N. R. Sultes, treasturer. Mr. Sultes was connected with the Morgan & Wright Company for 20 years, being president of that concern for 10 years, and when the United States Tire Company was formed March 1, 1911, he became assistant treasurer.

No other changes have been made in the Lozier organization. J. G. Perrin remains as engineer, and Works Manager Pollard will continue in that capacity. The output of the factory is to be largely increased. Paul Smith, who was appointed sales manager a few months ago, will continue in that capacity.

The resignation of Mr. Gilbert as general manager of the United States Tire Co. came as a great surprise last week. He was one of the moving spirits in bringing together Hartford, Morgan & Wright, G. & J. and Continental into this new organization a little over 2 years ago, and since that time he has been general manager. Mr. Gilbert has been connected with the trade for 12 years.

No announcements have been made of Mr. Gilbert's successor as general manager of the United States Tire Company.

Postal Truck Contracts Declared Void

WASHINGTON, D. C., April 30—*Special Telegram*—Contracts for the purchase of more than $100,000 worth of automobiles for the parcel post were declared void today by the Comptroller of the Treasury. Award of these contracts was the last official act, March 3, of Postmaster-General Hitchcock. New bids will have to be advertised for and accepted. Postmaster-General Hitchcock made the award on the theory that he was entitled to advertise for bids and award the contract by provisions of the parcel post act of August 24, 1912, which permitted the expenditure of money for special equipment, but automobiles are not special equipment for the post office department in the opinion of the comptroller of the treasury. "Having no authority to advertise for bids," says the comptroller, "he had no authority to award contracts and the bidders cannot be held to their bids. That they would like to be held and would furnish promptly the 100 automobiles concerned makes no difference." Postmaster-General Burleson is advised by the comptroller that the whole business will have to be undertaken anew.

Boston May Hold Truck Show in March

BOSTON, MASS., April 28—The question of whether or not Boston will join the ranks of New York and Chicago and discontinue the annual motor truck show will be definitely settled next Wednesday when the matter will be taken up at the annual meeting of the Boston Commercial Motor Vehicle Association. Following the show in March, Manager Chester I. Campbell stated that there would be another show next year at the same time, the only difference being that it would open on Tuesday evening and close Saturday night instead of starting Wednesday and running through to Wednesday of the week following. At that time he had twenty-four applications for space.

To Make Washington Cars and Trucks

HYATTSVILLE, MD., April 28—The Washington Motor Car Co. has been incorporated under the laws of Delaware with a capitalization of $300,000 to continue the manufacture of Washington passenger cars and motor trucks on a large scale. A. Gary Carter, president of the company, and Frank L. Carter, secretary, have purchased the plant and assets of the Carter Motor Car Corp., of this city, and will make extensive improvements. The new models will be out by September 1.

Railroads Clamor for Freight Raise

NEW YORK CITY, April 30—The railroads operating between New York and Chicago have decided to ask the Interstate Commerce Commission for an increase of freight rates. It is stated that the recent flood disaster, together with almost general wage increases, make such a step necessary.

To Make Slide Valve Motor

CHICAGO, ILL., April 28—The Beller Slide Valve Motor Co., Chicago, has been incorporated for the purpose of manufacturing a non-poppet motor. With a capital of $20,000 the company will market a motor with sliding valves. The inventor is Esten B. Beeler. Facilities for the building of the engine are not yet at hand but it is expected that a factory site will be selected shortly.

Automobile Securities Quotations

As a result of very weak trading there was a general decline in market values during the past week. But six quotations showed any gain at the end of the week and the greatest gain made by any of these was two points. Maxwell first preferred and Goodyear Rubber each fell off 20 points.

Clark Co. Factory Is Sold

Interests Represented by Maurice Wolf of Chicago Purchase Personal Property for Appraised Value of $11,219

Real Estate Is Taken at Appraised Value by the Citizens' Industrial Club, which Held a Lien Against It for $26,000

SHELBYVILLE, IND., April 28—Interests headed by Maurice Wolf, of Chicago, have bought the plant of the Clark Motor Car Co., at Shelbyville, Ind., subject to the approval of the court. The sale was made by Herbert C. Jones, receiver for the company. The personal property was sold for the appraised value of $11,219, while the real estate will be taken at appraised value by the Citizens' Industrial Club, which held a lien against it for $26,000. Mr. Wolf will organize a new company which will continue the manufacture of the Clark car in Shelbyville.

Appraise Schacht Company Plant

CINCINNATI, O., April 28—The Schacht Motor Car Co., which went into receivership a week ago is being appraised under the order of the court which as soon as completed will be filed in the court files for the inspection of all who are interested. All creditors have been requested to furnish statements of their accounts.

It now develops that practically all of the stockholders and 85 per cent. of the creditors joined in the receivership proceedings. The corporation has assets of the book value of approximately $600,000 and it is stated that the total liabilities will not exceed $175,000. It is expected that all creditors will be paid off in full and leave a good margin for stockholders, even in the event it becomes necessary to wind up the affairs of the company which course is not definitely decided upon as yet. For the meantime the business will be continued under direction of Receiver J. F. Deitz, who will make all efforts to pay off the indebtedness and get the affairs back into sound shape.

To Sell Bergdoll Company's Factory

PHILADELPHIA, PA., April 28—The plant of the Louis J. Bergdoll Motor Car Co., at the corner of Sixteenth and Callowhill streets, this city, will be sold, together with its contents, at receiver in bankruptcy's sale on May 14 and 15.

On March 17 three creditors of the concern instituted proceedings in the United States District Court to have the concern adjudged an involuntary bankrupt. The creditors who petitioned the court and their claims were as follows: W. C. Rhodes, Inc., $1,696.85; Chilton Co., $505; and the Castle Lamp Co., $1,772.85. It is alleged that just previous to that date the Bergdoll company had made preferential payments amounting in the aggregate to over $33,000 to Erwin R. Bergdoll, C. A. Bergdoll Coal Co. and the North Broad Street Realty Co. This action by the three creditors has resulted in the bankruptcy sale.

Creditors May Buy Columbus Buggy Co.

COLUMBUS, O., April 28—Considerable interest has developed in the coming sale of the property of the Columbus Buggy Co., Columbus, O., which has been set for May 14. The committee of creditors which has been working on a plan to buy in the property has not yet secured the required number of agreements to carry out the plan, although approvals are coming in daily. It is believed by members of the committee that sufficient agreements will be in by the time of the sale to permit the committee to carry out the plan proposed. Inquiries concerning the earnings of the company show that most of the prospective purchasers want to use the plant for the manufacture of electric automobiles almost exclusively.

NEW YORK CITY, April 30—The movement to organize a national association of motor car dealers is gaining headway. Fifteen or twenty trade associations in the East are expected to send representatives to this city for a meeting the end of the week when the possibility of such an organization will be gone into and the matter definitely decided whether a call will be issued for a national convention to be held at Indianapolis May 29 for the purpose of perfecting such an organization.

Public Service Corp.'s Welfare Scheme

NEW YORK CITY, April 30—The Public Service Corp. of New Jersey is putting into practice an employees' insurance and sick benefit plan, designed along the following lines: The sum of $300 becomes payable to relatives, dependents or beneficiaries of deceased employees of the Public Service Corp. or any of its allied companies, if a man has been in the company's employment since January 1, 1911. If no such beneficiaries are known, the employee will be buried at the expense of the company not exceeding $75. In the case of sickness of employees who receive from $365 to $1,800 a year, the sum of $1 for each day including Sunday, during the first week of absence will be paid. If the wage is less than $7 a week, the benefit is limited to that weekly wage. The sick benefits during 1 year are limited in every case to $90. This arrangement only refers to regular employees of the corporation and its allied companies.

Studebaker Profit-Sharing Plan

SOUTH BEND, IND., April 26—The Studebaker Corp. has decided to introduce a profit-sharing plan among its salaried department managers, assistant managers, superintendents and foremen. After all dividends have been paid, a part of the remaining net profits will be set aside for the profit-sharing fund and Studebaker stock will be bought for it at market prices. After 3 years, the stock will be distributed among the employees who have been employed by the company during that time.

Market Changes of the Week

The most important changes of this week's markets occurred in copper and tin. Electrolytic copper declined $.00 1-10 per pound while tin rose $.25. The tin market was dull, though on Tuesday, little if any interest apparently being taken. Though the prices were quoted slightly higher, the buying was very inactive. The copper market was quiet, the buying being reduced to a minimum. Lead remained constant at $4.50. There was a good volume of trading reported. The petroleum products remained at last week's prices and continued firm, Pennsylvania at $2.50 per barrel and Kansas at $.88. Cottonseed oil experienced a decline of $.04, due to further weakness in the provision markets. No new developments arose in the scrap rubber market, automobile scrap remaining firm at $.10 per pound.

A.C.A. To Test Packard Motor 200 Hours

NEW YORK CITY, April 28—A 200-hour motor test on a 1913 six-cylinder Packard motor is to be made at the testing laboratory of the Automobile Club of America in this city some time between May 1 and 5. The test has already been arranged for by the Packard Motor Co., of Detroit, but it will be conducted by the testing corps of the club laboratory under the direction of Herbert Chase, laboratory engineer. The motor will be run on a block for this time and probably 300 hours with the throttle wide open and operating at a constant speed of 1200 revolutions per minute. The power output will be measured by the club's electrical dynamometer and records will be taken of fuel and oil consumed together with other data.

The real object of the test will be to demonstrate the durability of Packard motors under prolonged and exacting service and it is proposed to show the material and workmanship of these motors. Visitors will be admitted to the laboratory at any time during the test by securing a pass from the laboratory office. At the conclusion of the test full reports will be published.

Will Be a Record-Making Test

This test if successful will be the longest official performance of its kind ever recorded in this country, if not in the world, and will exceed in duration the test of the Knight sleeve motor made by the Royal Automobile Club of Great Britain in 1909. The test will continue day and night without interruption, the motor being under the constant supervision of the laboratory staff working the three 8-hour shifts.

Rules covering the test have been drafted, and some excerpts from these follow:

RULE No. 4—If the entrant or technical committee shall order an interruption of the run because of actual or impending failure or breakage of a vital part of the motor, the test shall be considered incomplete and the facts, together with the reason for the stop, shall be fully stated in the report and certificate. The entrant may elect to begin the test anew after effecting repairs or adjustments. The total number of hours running in an interrupted test shall not be considered as equivalent to an equal period of uninterrupted running.

RULE No. 6—No control device which is not a standard equipment of the motor shall be used in the test, except with the approval of the committee. During the test those controls which are operated by the driver from the seat may be used.

RULE No. 8—In no case shall the piston speed be less than 1,000 feet per minute nor the power less than 70 per cent. of the maximum which the motor is capable of developing.

RULE No. 9—The following tests shall be required in the order named: Test A—Wide throttle runs. A series of short runs with wide-open throttle and of sufficient duration to determine the maximum power the motor is capable of developing. The speed at which this maximum power is developed shall be known as speed M in revolutions per minute. Test B—Non-stop run. A continuous run of not less than 100 hours duration at a speed selected by the entrant, but which shall not be above the speed of maximum power M or below a 1,000 feet per minute piston speed.

RULE 10—During the run the following observations shall be recorded: Air consumption of motor; rate of flow of water through jackets; section in inlet manifold; temperature of air entering carbureter, mixture leaving carbureter, exhaust leaving manifold, water entering and leaving carbureter jacket and gasoline entering the carbureter. Observations of the atmospheric conditions with respect to the barometric measure and humidity shall be made at intervals of not less than 2 hours during test speed. The specific gravity of the fuel used shall be taken each time the supply in the weighing tank is renewed.

RULE 11—The fuel will be supplied by the committee but lubricating oil by the entrant. The report will show the nature and quality of both.

RULE 12—The temperature of the water entering the cooling system of the motor shall not be less than 120 degrees Fahrenheit. A draft of air may be used to cool the motor or any portion thereof when necessary.

RULE 13—Following the dynamometer tests the committee will upon application of the entrant, conduct such road test as will demonstrate the performance of the motor in the chassis under a wide range of conditions.

RULE 3—The entrant shall, prior to the test, specify the length of the endurance run when the motor is to run longer than the minimum required under rule 9. He may elect while the test is in progress to continue it without stop for any longer period, but shall in this case give written notice more than 8 hours previous to the end of the run being made.

RULE 5—Ample time prior to the official test will be allowed for preliminary runs to make necessary adjustments. No adjustments of the motor or its accessories which directly affect the quantities being measured will be permitted after the first official test run has been started except as provided in rule 9. This rule shall not be construed as covering adjustments classified under rule 6.

Peerless Announces Three 1914 Sixes

CLEVELAND, O., April 28—The Peerless Motor Car Co. has announced its new models for the coming season, which are three, all sixes, and listed 38-six, 48-six and 60-six. All are alike in design. Several improvements are included: Gasoline tanks are carried under the chassis rear and give a lower center of gravity. Springs are made with thinner leaves and more of them than formerly. Shock-absorbers are fitted front and rear.

The motor improvements include lighter pistons, using three rings instead of two. The practice of using T-head cylinders in pairs, with exposed valve parts, is continued. Semi-steel spiral gears are used for driving the camshaft, magneto and water pump. There is a universal joint between the clutch and gearbox which takes the place of the former flexible coupling.

All three models are listed with complete equipment, including power-driven tire pump, electric starting and lighting. The body designs are similar to those of this year, with all metal parts finished in nickel instead of brass.

The other general features of design are continued, namely, four-speed gearbox, arched rear axle, etc. Right-hand steering is used. Firestone demountable rims are stock equipment, and there is a tire bracket on the rear for supporting the two additional rims with tires.

SYRACUSE, N. Y., April 29—A full line of closed bodies will appear on the Franklin little six chassis next fall. There will be a limousine seating four inside, a berline seating four inside, a sedan seating five people and a coupé seating three.

Is Now Tarrytown Motor Car Co., Inc.

TARRYTOWN, N. Y., April 29—Owing to the recent strict interpretation by the New York state authorities regarding inclusion in corporate names of words not in the English language, the application by organizers for a charter for The Motokart Co., Tarrytown, N. Y., has been refused, the new concern therefore being incorporated as the Tarrytown Motor Car Co., Inc. It will retain, however, the word Motokart as its trade mark.

NEW YORK CITY, April 29—E. H. Broadwell, who recently resigned the vice-presidency of the Hudson Motor Car Co., Detroit, Mich., has assumed the vice-presidency of the Fisk Rubber Co., New York City, with whom he was for years associated before going to the Hudson. His headquarters will be at Chicopee Falls, Mass.

Prest-O-Lite Refillers Fined

NEW YORK CITY, April 28—It is illegal to fill a Prest-O-Lite gas tank with any but Prest-O-Lite gas, according to a decision rendered here in the Municipal Court today against two dealers who had filled such tanks with Searchlight gas and had been sued by the Prest-O-Lite Co. for alleged violation of the trademark section of the New York business law. Justice Spiegelberg, who rendered the decision against the defendants, Smith-Haines and Norman Brickner, based his opinion on the statute of the law forbidding the refilling of receptacles which bear trade marks, making each violation punishable to the extent of $100. This penalty was imposed upon each of the defendants. Louis Lande, their attorney, has entered an appeal against the decision and the case will be heard in the Appellate Term of the Supreme Court on June 2. Winter & Winter represent the Prest-O-Lite Co.

Three Isottas for Indianapolis Race

INDIANAPOLIS, IND., April 30—Although the entry lists will not close till Thursday, May 1, there are twenty-two cars entered in the third annual 500-mile International Sweepstakes race which will be held at the Indianapolis Motor Speedway May 30. This is eight more cars than were entered at this time last year when the contest was such a great success.

The latest entries to be received are three 36-horsepower (S. A. E.) Isotta-Fraschini cars. The Isotta-Fraschini Motors Co., New York City, states that two of these machines will positively appear in the race and will be driven by Teddy Tetzlaff and Harry Grant. The third machine entered will also probably appear on the course with either Gilhooley or Trucco, from the Isotta factory, at the wheel. The entrant of the first car is William Ziegler, Jr., while the second racer is entered by E. E. Hewlett, of Los Angeles and G. M. Heckscher, of New York City, its joint owners.

PARIS, FRANCE, April 23—Booked to sail from Havre Saturday, May 10, on the French liner La Provence, Albert Guyot and his mechanician Grossmann, will doubtless reach Indianapolis with the six-cylinder Sunbeam racer, about May 19. The Sunbeam racer, which has been tuned up by Guyot on Brooklands track, is being crated to be shipped to New York via Liverpool. It will reach America a few days ahead of the driver, thus being ready to be put at once on the fast train for Indianapolis. Guyot counts on having 10 clear days during which to carefully tune up the car on the Indianapolis Speedway. Immediately after the race it is the intention of Guyot to return to Paris, for he is under a contract to drive for Delage, in the French Grand Prix. It is quite possible, however, that the Sunbeam racer will remain in America and that Guyot will come back toward the end of July in order to take part in other American races.

LONDON, ENGLAND, April 18—Fast time was made when two wheels were changed at the time of the recent Peugeot record exhibition. At the end of the first hour the car stopped for 35 minutes, during which two Rudge-Whitworth wire wheels were replaced with the car jacked up. This space also included the substitution of Boillot for Goux as driver.

English to Hold Benzol Contest

LONDON, ENG., April 24—In view of the fuel problem the announcement that the Brooklands Automobile Racing Club are to run off a race for cars running exclusively on benzol is extremely interesting, while the first prize of $500 and $250 and $100 for second and third prizes are to be presented by the Royal Automobile Club, the Society of Motor Manufacturers and Traders and the Automobile Association and Motor Union respectively, is also arousing interest as these bodies are at present investigating the possibilities of alternative fuels to petrol. No effort is to be spared to make the event thoroughly representative, and to draw the attention of the public to an alternative fuel that at the present time is available only in limited quantities. Not only is benzol to be supplied to competitors free of charge for the race, but also free of charge for the purpose of practice. Not more than twelve cars will be able to compete, and a special cup is to be presented to the entrant of the car which, having also competed in the 100 miles an hour race for cars running gasoline, accomplishes in the benzol speed test for a flying lap of the track a speed that will compare with its highest speed lap in the race for gasoline cars. The race is to be included in the program of the Brooklands Whitsun meeting, so that there will be a very attractive program with this event figuring as the principal and the usual handicaps, and from the main event one will be able to form some idea as to whether better speeds are to be obtained by running on benzol than on gasoline.

Grand Prize Conditions Announced

NEW YORK CITY, April 28—The Automobile Club of America has given out information relating to the conditions under which this year's—the fifth annual—Grand Prize run will be carried out. The race will be over the Savannah course, 11.44 miles long, so that thirty-five laps will give a total run of 400.4 miles. Outside of the Grand Prize trophy there will be four money prizes, amounting to $3,500, $2,000, $1,000 and $500 respectively.

Each car entered in the race must have a reverse gear driven by the motor, an exhaust outlet not directed toward the ground and an overall length not exceeding 146 inches. The cars will be started according to their order of entries.

The entry fees are as follows: A single care of one make, $1,000; a two-car team, the cars being of one make, $1,500; three cars of the same make, $1,750.

Oldfield Makes Record Mile

NEW YORK CITY, April 28—News was received here today that Barney Oldfield yesterday broke the world's record for the mile made on a 1-mile dirt track by making the distance in 46 2-5. The feat was accomplished at Bakersfield, Cal., on the new $100,000 race track during a sanctioned meeting. The previous record time was 47.85, made by Bob Burman in the 300-horsepower Benz on the Brighton Beach track on September 7, 1912.

The mile was timed by an electrical device, but the latter will have to be submitted to the A. A. A. and tested to their contentment, before the time made by Oldfield's bill will be recognized as an official world's record.

Tetzlaff in the Fiat went 5 miles in 4:22 2-5. The 25-mile free-for-all for $2,000 cash prize was won by Tetzlaff in a 120-horsepower Fiat in 23:38. Cooper, in Stutz, second, and Hill, in Fiat, third. Ten-mile race won by Nikrent in Buick.

Hope for Another Fairmount Race

PHILADELPHIA, PA., April 26—There is a possibility of the resumption of the Fairmount Park road race. A committee from the Quaker City Motor Club waited on Mayor Blankenburg yesterday and urged him to reconsider his opposition to the event and to recommend to the Fairmount Park Commissioners that permission to use the park course be granted for the purpose of conducting a 200-mile road race under the same rules and regulations as governed the chassis in the past. Mr. Blankenburg said that while he would not stand sponsor for the race nor accept any responsibility in connection therewith, if the Councils were to pass a resolution requesting the Park Commission to grant the Quaker City Motor Club the necessary permission he would not oppose it. Accordingly, Common Councilman Hardart will introduce such a resolution at the next meeting of the City Councils.

NEW YORK CITY, April 30—The first automobile contest to be held this year by the Motor Dealers' Contest Association will take place Friday, May 2, and will be a secret time run. Both gasoline and electric cars will compete for the prizes offered to those running nearest to the secret time.

PHILADELPHIA, PA., *April* 26—Thirty-three entries have been received so far for the sixth annual sociability run of the Quaker City Motor Club next Saturday to Atlantic City, N. J. The run, which is a fixture of the organization, will be a secret time schedule event, four prizes being awarded the four contestants finishing nearest a time secured by adding all contestants' guesses together and dividing the total by the number of estimates. Independently of the prizes a silver tie clasp, on which is the club's insignia, will be given each entrant.

Sample Salesmanship

HERE is an example of how a business man sometimes views the salesman who tries to contort matters and give the impression that his product is the panacea of the industry. Ostrich-like salesmanship is the poorest kind. It occupied a place a few years ago when salesmanship did not exist, but when the so-called salesman was merely a billing clerk for orders. Here is the example, and for every one of these, where the would-be victim takes the trouble to write his experience, there are thousands that pass unheard.

"Yesterday an agent for the —— shock-absorber, one of your advertisers, called on me for the purpose of selling me a set of his devices. Among other things he made the statement: 'They will save their price in tire wear in 2,000 miles of running.'

"A set of tires for my machine costs approximately $70 and is guaranteed to give 5,000 miles per tire. This makes tire cost .00125 cent per mile. If, therefore, the —— absorber devices saved 100 per cent. of tire wear, so that at the end of 2,000 miles running, the tires were as good as new, it would have saved $28. On the contrary, it would not do this and obviously would not save more than 25 to 50 per cent. of the wear at most.

"On the 25 per cent. basis this saving would amount to $7, and the device, which he agreed to sell me for $35, would save enough money to pay for itself in 28,000 miles of running.

"If my calculation is correct, either the salesman in question does not know his business or he deliberately tried to mislead me. In either event, I am offended at this kind of salesmanship."

THE AUTOMOBILE receives letters similar to this nearly every week, drawing attention to how the business man objects to the selling tactics of many salesmen. In view of this, it is to be regretted that the organization of salesmen formed last fall should not be carrying on an active campaign throughout the present season, which is one of the most acute in the selling field.

There is as much need for an organization of salesmen as there is for a society of automobile engineers, but their efforts must not all be centered in a scientific-salesmanship festival once a year, but must be distributed in workable rations, particularly over the acute selling period.

Such an organization could have an active executive committee which would issue monthly bulletins of the practical, get-down-to-business type, which bulletins would reach every dealer in the country, and who could place these arguments in the hands of his salesmen at times when they are working at the greatest capacity. By so doing you will gradually improve the caliber of the salesman. You will not do it on the "annual gorge" plan.

Dealers To Organize

A REPRESENTATIVE of a business house not associated with the automobile industry, excepting through financial relations, recently made the statement that he considered the automobile dealers to be the poorest class of business men in the country. The percentage of failures in their ranks, he went on to say, was abnormally large, and further that a great majority of those at present doing business are not making money.

It is impossible for any line of business, not making a rational profit, to be in a healthy condition, and in the case of the dealers it would seem that the chief responsibility for their failure to make money rests on their poor business ability and poor organization.

Certain dealers have been selling gasoline at a profit of 4 cents a gallon and making money on it, whereas others handling the same fuel at 15 cents a gallon profit have not been making money. This one example proves the necessity for business acumen in the ranks of the dealers.

It is to be hoped that the new national organization of dealers which is being discussed at present will go through. There is need for it. Such an organization will put the dealers on a new plane if it does nothing more than teach them the rudiments of conducting a business. These dealers have to be taught how to handle forces of salesmen; how to conduct repair shops; how to conduct the accessory departments of their business; how to conduct the tire repair department; in a word, how to conduct each and all of their various departments.

Such a national organization has a legitimate field for existence, and those piloting its early life must see that it is launched on a sound financial basis and that the highest-caliber men are obtained to man it. Such an organization is purely a business institution. It is needed as much as the state and national organizations of the banking world. Such an organization must work every day in the year. It is not an organization of seasons but one with a task before it and its efforts will have to be diverted along a hundred channels.

French Road Maintenance Costs $1 a Head

JEAN DE PULLIGNY, chief engineer of roads and bridges in France, made the statement before the recent Roads Convention of the A. A. A. in Washington that France is spending annually $1 a head for road maintenance.

France is about four times as large as the state of New York, its population is a little more than four times the state of New York, consequently with a population of New York state slightly over 9,000,000 in 1910, it means that this state would have an annual expenditure of $9,000,000 for road maintenance. This does not include road construction.

During 1912, twenty-nine of the states of the American Union expended $62,691,425 on the construction of roads. The total population of these states is 61,261,000 so that the expenditure in these states approximates practically $1 per head. Practically all of these states, however, were experiencing abnormal road expenditures, which expenditures will have to be continued for some years. But France spends her $1 per head on road maintenance, and these states have been spending $1 per head practically on road construction. Many of our states have not yet learned the lessons of road maintenance, but if it is on a par with that in France it will practically mean a sum equal to that used on construction.

The original cost of construction of French roads was $12,040 per mile for a hard macadam surface. Hard road construction, and the agitation for good roads in France began 150 years ago, and the beginning of the present network of French roads radiating from Paris dates from 100 years ago. Most of the roads in France, even the earliest, were of macadam construction.

France has to date 340,000 miles of roads, and in the last century has spent $1,300,000,000 on these. Of this amount $400,000 has been supplied by the central French government to the heads of the roads departments throughout the country extending over a period of 70 years, namely 1820 to 1890. Since 1890 the work has been going on at a slower pace with smaller appropriations, most of the useful work having been done prior to that date. This means that the central government of France during those 7 years appropriated $6,000,000 a year in the building of roads. During that time the appropriation for building smaller roads was approximately the same as that for maintaining the national highways. The French government is now expending $45,000,000 per annum for maintenance alone.

But there are other public roads which the central or federal government has nothing to do with, but which work is carried on in different departments. France has department roads and county roads. For some of these roads the money is taken in taxes which belong to the department; for some others it comes from taxes that belong to the county; and for some others from taxes that belong to the townships.

The deparment is divided into units called counties and over each county is a chief engineer. Each county is divided into judicial districts which has a district engineer. Free interchange of ideas takes place among the engineers, the county engineers are taken among the district engineers and the chief engineer is taken among the county engineers. Head over all is the prefect, a political man, who is not necessarily a practical man in road-building but who operates through his chief engineers in the various departments.

The district engineer has charge of the patrolmen who care for road maintenance. That engineer is going nearly all day riding or on foot or using a bicycle, or perhaps a motor car. Every day he goes to the villages, speaks to the people, consults with the mayors, and knows perfectly what the people desire. He knows where the money ought to be spent and is independent and has no reason to favor one any more than the other. In this way he estimates every year for the building of new roads and also for maintenance. He forwards the estimate to the engineer above him who knows the total of his district from such reports and in turn prepares such a scheme for his entire district and forwards it to the chief engineer of the department; and the chief engineer of the department in turn confers with the Prefect. From such reports is prepared a scheme for the complete building of new roads and for maintenance and this scheme is brought into the local legislature.

These departments are really the little states of France that have their own governments elected by the people, and it is these local parliaments that decide where the money shall be spent.

Predicts a Great Demand for the Cyclecar in America

HARTFORD, CONN.—Editor THE AUTOMOBILE:—I have read with considerable interest your editorial in THE AUTOMOBILE for April 24, with reference to the cyclecar, and while I thoroughly agree with you with regard to the tremendous demand and the future of the cyclecar, our concern probably being the first to promote the cyclecar in this country, I want to take exception to that part of your editorial which states, "there is no demand for the three-wheel car," in proof of which I want to say that over a year ago we were unable to fill approximately 3,000 orders which we had on our books for these cars. Since this time the demand for our cars has greatly increased, and while we are great believers in advertising, and the first demand for our car was undoubtedly created by the advertising which we had done, for the last year we have not spent 1 cent in advertising, and yet we have orders on our books today for fully 4 months ahead and every one of these orders has come in to us without solicitation further than answering correspondence, sending out catalogues and literature.

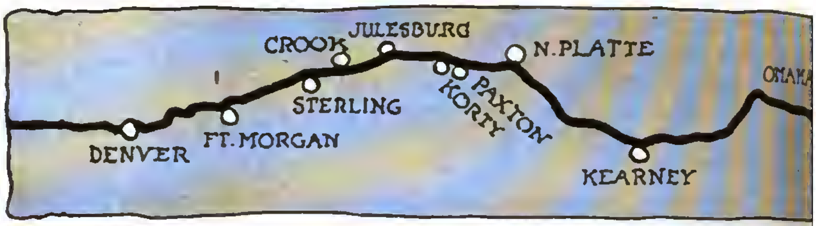
There is a demand all over the United States for cyclecars, either of the construction of the Motorette or other cars as described in your article and this demand is enormous.

We know what we are talking about in this particular. We have been building Motorettes for 3 years and have had ample time to judge the public pulse. It has been my experience that automobile dealers throughout the country do not want to handle three-wheel machines, and that their feelings against them are not due to any real market conditions, but to the fact that there is a lot of pride connected with an automobile dealer, and that he is inclined to believe that the other dealers will make fun of him; but in spite of this the demand exists. The general public wants something along cyclecar lines and it does not care whether it has three wheels or four so long as it is reliable, durable and neat in appearance.

There is a tremendous demand for any reliable cyclecar, which will stand up under American road conditions and which will be easy-riding at the same time.

While we are not given to predicting, we believe that within the next 2 to 3 years there will be built in the United States more cyclecars and cars of the Motorette type than all the other cars put together.

We believed this condition was coming 3 years ago when we first put ours on the market.—C. W. KELSEY, Kelsey Motor Co.



A Transcontinen

By Ernest L. Ferguson

Covering 650 Miles from Omaha to Denver, Constituting the Second Stage

FROM Omaha to Denver is 650 miles. This is the second stage of the 2,600 miles of the transcontinental route between Chicago and the California line. Last week the Chicago-Omaha leg was taken up; next week the Denver-Salt Lake City division will be handled, and the following week Salt Lake City to the California state line.

Omaha to Denver is a river-level route, in that the Platt river and its southern branch are followed or paralelled for practically 90 per cent. of the 650 miles. You are not close to the river side, often several miles distant, but always traveling on approximately the water-level elevation.

This leg of the trip is made up of two types of roads: The first half is a sandy one with the exception of a few miles between Omaha and Fremont. It extends nearly to Julesburg, Col. The second half, Julesburg to Denver, is on an alkaline soil, which makes heavy going when wet.

The first half of this trip is really a virgin sand road. To improve it will need mixing a clay or gumbo with the sand. In local sections this is being started.

The Irrigation Territory

From Julesburg to Denver embraces the irrigation territory, and the people have found it necessary to have good roads in order to get their goods to the beet sugar factories. Consequently, these alkali roads are better looked after than the sandy first half.

The entire route between Omaha and Denver is signposted, thanks to the enterprise of the Platte Valley Transcontinental Good Roads Association, which is also doing much to improve the road.

Of the 650 miles 200 miles may be designated bad roads in case of abnormal rains, which would wash the sand. An ordinary day's rain will not have any effect upon it. In the irrigated section a heavy rain means that you stop your trip for several hours, or perhaps a day, until the soil has dried.

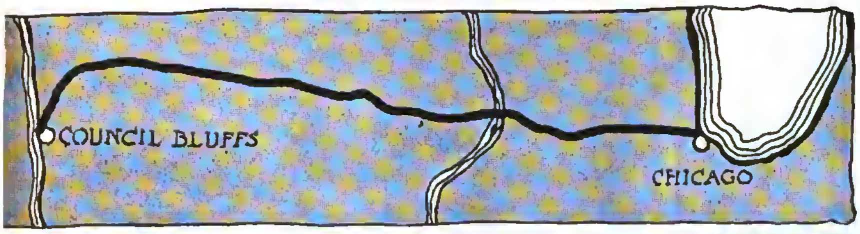
Between the Missouri river and the Rocky mountains the transcontinentalist, in selecting the last leg of this section, is confronted with objective points of interest. Whether to include Denver in the trip or to push straight through via Cheyenne, Wyo., are the selective conditions. Assuming that a day or two extra time is not of moment in a 3,000 or 4,000-mile journey, one should by all means include Denver with its many sur-

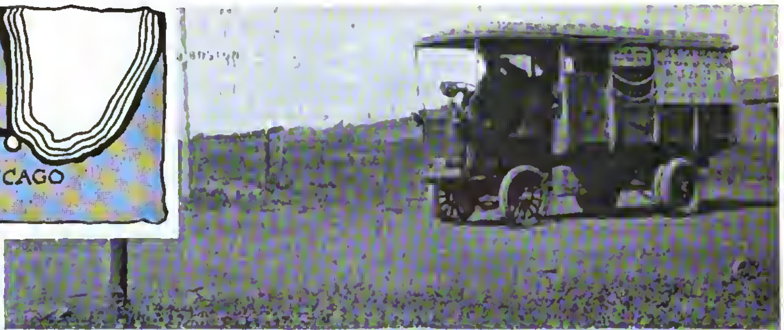
Top—Well-graded and slightly crowned, this road, near Marshalltown, Ia., has its surface maintained by dragging after each rain. Its one fault is that the side growth of weeds and grass should have occasional right-angle gutters that the surface water may flow to the shallow ditches on each side indicated by the arrows.

Upper Middle—A road between Omaha and Central City, Neb., that was well graded, crowned and side-ditched when laid out for improvement. Lack of attention in the meantime has allowed vegetation to encroach on the sides and the crown to become flattened from traffic. Horizontal line shows flattened crown with side slopes.

Lower Middle—Traffic alone defines the traveled way from the fields by cutting two deep ruts in the deep sand. The landowners along the way hope the county authorities will haul in clay (gumbo) and spread it as a blanket 4 inches deep on top the sand. This will give a treacherous road when wet, merely going from one evil to another. By thoroughly mixing the two with a disk harrow then crowning and rolling and side-draining there would be an excellent road as the result. There are 6 miles of this road between Silver Creek and Central City, Neb. The arrow indicates a deep ditch which leads nowhere.

Bottom—Almost bottomless is this sand. The traveled way changes its surface conditions with each rain. The county authorities have promised to some day fix this stretch at Valley, Neb., by claying it 3 or 4 inches deep. In the meantime all traffic struggles through as best it can. The arrow indicates a soft spot.





tal Hodge-Podge

Part II

Of the Entire Stretch, 200 Miles of Road Are Bad in Case of Abnormal Rain

rounding scenic attractions. These will more than repay for the added time.

From Denver west the most traveled route swings to the north and then west. In this touring north a chance is had of keeping to the west of Cheyenne, direct to Loramie, or going via Cheyenne. This latter adds but 2 hours to the trip, and if one has dated the trip to be in that location during the annual fête of Pioneer Days at Cheyenne, then that town should certainly be included in the itinerary.

In touring west from Omaha the transcontinentalist has the choice of two routes. The one that has been most frequented is that following the old Overland Trail along the Platte river, historic with associations of the early fur traders, the Mormons, the Oregon pioneers, the Forty-niners, the pony express, the six-team coaches, and then by the first railroad across the continent. All of these were preceded by buffalos and Indians from time immemorial, making the line of travel for those who came after.

First Route Logged

This route was the first west of the river to be logged in detail during the pathfinding for the annual tour of the American Automobile Association in 1910. The tour first brought it into prominence for automobiling. Since then there has been formed the Platte Valley Transcontinental Good Roads Association which is doing much to improve its conditions.

While the roads for most of the way will require a lot of work upon them, it is now very efficiently marked by a signal made up of a combination of white, black and yellow bands. White is used as the central color and above and below this is a band of black one-eighth the width of the white, then come the top and bottom bands of yellow that are one-third the width of the central white.

In following this route it is at Julesburg in the extreme northeast Colorado that occurs the dividing of the ways. Here the decision must be made whether to hurry on to the Pacific coast by branching off to the northwest across country and direct through Cheyenne, or whether to take in the more worth-while scenery around Denver by branching across country to the southwest. The layout is like a huge Y with the stem reaching from Omaha to Julesburg, the right-hand branch leading northwest and the left-hand leading southwest

Top—The half-way, coast-to-coast air line sign, measured in terms of miles and not in the matter of time, owing to the differences in the roads to the right—east, and to the left—west. It is 4 miles from Kearney, Neb.

Upper Middle—The Platte river has no banks, its boundaries are therefore undefined. For most of the year it is shallow, where it is not a series of sandy flats, and looks like a huge marsh. Four times the river is crossed on wood structures one-half mile in length and well kept as to condition. This bridge is crossed soon after leaving Gothenberg, Neb.

Lower Middle—This roadway between Ft. McPherson and North Platte, Neb., is so heavy with sand that even light buggies require two horses, and they never get out of a walk. It was once the bed of what is now the Platte river. Its only possible reasonable-cost betterment is to discover a clay bed fairly near that the two may be correctly mixed. There is probably one stretch of 8 miles. This is the type of road that surrounds the national soldiers' cemetery at Ft. McPherson. The truck is off the real roadway.

Bottom—Not a plowed field but the regular roadway. A nearby farmer had started to throw the side sod into one of the sand ruts in the effort to reduce strain on the horses and harness, but soon tired of his efforts. This is the approach to a dry creek bed that once was tributary to the Platte, one mile west of Paxton, Neb.

The Engineering Digest

A Digest of Technical Information from the Engineering Journals

Attention of automobile engineers and manufacturers is called to the Bonecourt system of flameless surface-combustion by which gas and liquid hydrocarbon fuels may be converted into power with scarcely any waste of heat units, making steam far more economical as a power source—sometime in the future—than the internal-combustion motor, even on the Diesel plan. Flash and semi-flash generators apparently not out of the question.

Some remarks on double ignition for low-speed motors —and something on deceptive car and motor noises.

—

FLAMELESS Combustion and Automobiles of the Future.—While the mechanical perfection attained in well-made automobiles is turning popular attention toward the delicate fuel question and is centering the interest of the industry in improved methods for lowering the cost of producing these high mechanical qualities heretofore secured in too-high degree by painstaking fitting depending upon manual skill, rather than by foresighted and comprehensive engineering of the highest order, new discoveries in thermo-engineering —if such a term is permissible—are already gaining a practical foothold in which there is discernible a steady advance against the supremacy of the internal-combustion engine in all of its applications, including eventually the automobile motor. Although it may require a series of years before anything can be produced on the basis of the new discoveries which will equal the automobile motor in reliability and compactness, the same may be said of the many efforts now actually under way for perfecting aviation motors and for adapting the gasoline motor to the use of kerosene or heavy oils as fuel. Flameless combustion under the "Bonecourt" process, though at present steered toward other more immediately apparent industrial objects, fixes upon the horoscope of the automobile movement an obvious possibility of a widespread return to steam power in the form of a small flameless oil-fed boiler-generator working with a diminutive turbine engine, somewhat of the Wittig type (quite widely used in Germany), with a simple oil-separator, a ventilated condenser and preheating of the air needed for combustion.

Fig. 3—Experimental 500-hp. flameless surface-combustion steam boiler tried in England and Germany. First type tried

Flameless combustion is at present in the hands of powerful corporations in England and Germany and is under the substantial wings of the Standard Oil Company in this country. It is scheduled for extensive trial in special locomotives to be built —or perhaps already under construction—for the New York Central railway company.

Scientific information on the nature of the discovery is given in *Engineering* of May 10, 1912, page 632, and in *Feuerungstechnik* of January 1, 1913, page 118.

It suggests closely the processes of slow flameless combustion taking place in the respiratory organs, the lungs of animals and humans, and has long been foreshadowed in the phenomenon known as catalytic incandescence caused in spongy platinum when a hydrocarbon gas is brought in contact with the air contained in the pores of this substance—a phenomenon which was turned to account for ignition purposes in some early automobiles in France and the principle of which has been applied to cigar-lighters, repeatedly though not very practically, during the past fifty years and perhaps earlier. Flame-retaining wire screens and Welsbach gas mantles also afford parallels for comparison, so that the invention may be considered a natural upshot of contemporary knowledge.

That any danger which flameless combustion involves for a conservative development of the automobile motor means a new chance for greater efficiency and economy in the manufacture and utilization of automobiles, and therefore for further expansion of the automobile movement and of the industry which caters to it, is perhaps self-evident. And to what extent the discovery and the inventions already clustering around it may be entitled to the attention of automobile engineers and inventors, with a view to applying the new methods to road vehicles, and establishing a competing variety of the latter, will appear from a presentation of the subject in the *Zeitschrift des Vereines Deutscher Ingenieure* (Journal of the Society of German Engineers), of February 22, from the pen of Richard Blum, a director of the German corporation which has the industrial development of the matter in hand for German-speaking countries. While nothing is said in this article, which was first delivered as a lecture before engineers in Berlin, of any application to automobile purposes, those familiar with automobile requirements can readily draw interesting inferences from the facts presented and may even form a provisional idea on the important question relating to the amount and weight of the materials which it would be necessary to incorporate in a flameless combustion power plant for an automobile or motor truck of a given power. The most telling passages and illustrations of this articles are reproduced in the following.

—

To burn gas completely in an ordinary gas burner, about twice as much air is required in practice as theory demands. As the extra air must be heated in the flame, and as the air drawn into the flame from the sides also has a cooling effect, the temperatures developed fall far short of the theoretical heating value of the fuel used. If the gas pressure is increased till the speed of the flow exceeds the relatively low speed of backward flame propagation, the flame becomes detached from the burner nozzle and is soon extinguished by the afflux of air behind it. The flame is also cooled by its relatively cold surroundings.

In order to get better results from high pressure and speed of the gas mixture, a different burner must be used. If the end of the feed pipe of the burner is surrounded with granulated highly fireproof materials, and the gas mixture is now sent in under a pressure which would at once extinguish an ordinary burner, the effect is surprising. The fire-proof mass becomes first red-hot, then incandescent. A lively combustion consequently takes place in the interior of the mass. The explanation lies in the larger combustion-zone afforded for a given amount of gas mixture, in the exclusion of cold air from the sides, and in the preheating from the interior of the fireproof material of those surface portions of this material where the true combustion, during continued operation, is found to take place.

The most surprising fact in connection with this surface-combustion is, however, that the amount of air required for effecting it does not exceed that demanded by the chemical theory of combustion by more than about ½ per cent. An experiment is illustrated in Fig. 1. When a mixture of gas and air in the proportion mentioned is pressed, in the direction of the arrow, against the fireproof porous plate A and through it, and is ignited, the most rapid combustion takes place without flame in the pores nearest to the circumference of the plate, and the latter is maintained incandescent, radiating an astounding amount of heat.

The discovery of this effect was made at the same time by Engineer Schnabel of Berlin and by Professor Bone of London. The "Thermotechnische Gesellschaft" was formed in Berlin to exploit it, and in London the "Bonecourt Surface Combustion, Ltd." took charge. In July, 1912, these corporations were merged in all matters excepting territory.

To obtain the full effect, a coarse granulated mass of fireproof material as well as a material with very fine pores is required for some of the applications of the process. A certain grade of chamot has been found suitable for the porous mass, but it was only after many experiments that Schnabel developed a coarse granular material sufficiently cheap for the purpose, and this material, which sustains temperatures of above 2,000 deg. C. without disintegration or fusion, has been adopted by both the concerns referred to.

One of the simplest applications of the method is illustrated in Fig. 2 representing a blacksmith's forge in which no coke or coal is used, the granular mass on top taking its place, so far as covering up the work during heating is concerned, while the gas mixture is led into the porous substance in the center pit under pressures and in quantities varied according to the heat wanted. This clean fire, in which there is no surplus of hot uncombined atmospheric air to oxidize the metal, is especially valuable for the forging of high-speed steel tools.

The Skinningrove company in England has for more than one year had a flameless-combustion steam plant in operation. The gas used is piped from a cokery. Trials made by prominent

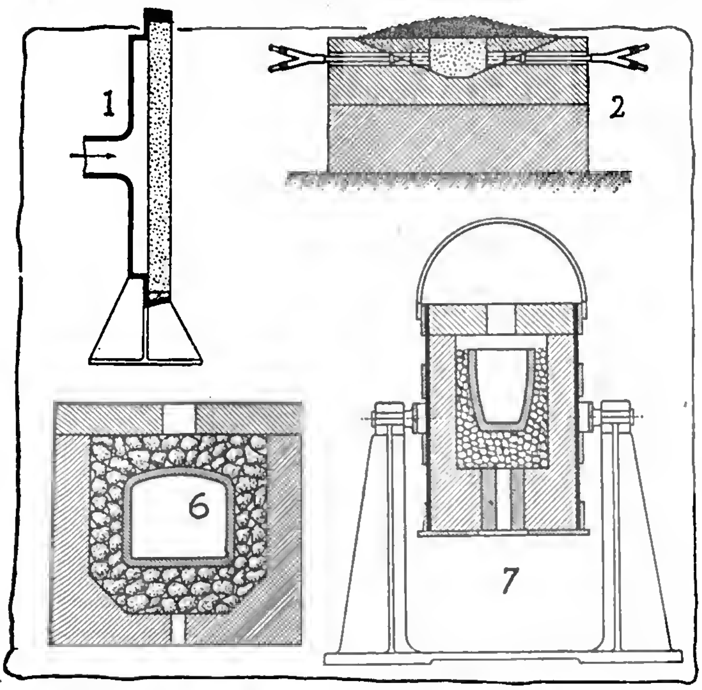


Fig. 1—Experimental chamot flame screen. Fig. 2—Flameless blacksmith's forge. Fig. 6—Bonecourt muffle oven. Fig. 7—Melting pot for crucible steel production by surface-combustion method

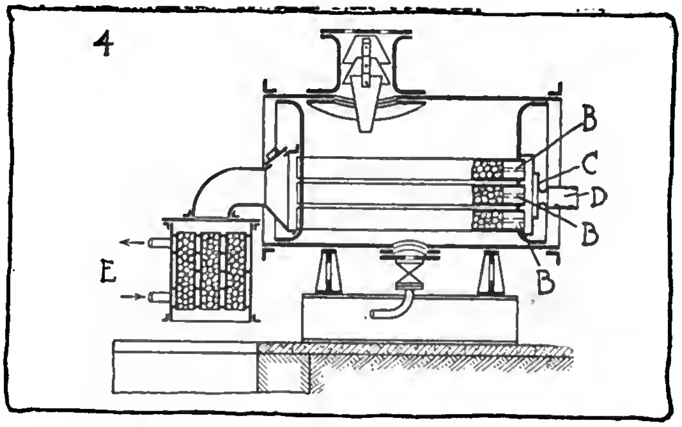

Fig. 4—General plan of flameless surface-combustion steam generator with feed-water heater. Later models much compacter

English and American boiler specialists have demonstrated for this plant the previously incredible steaming capacity of 105 kilograms per square meter. The contrast with the maximum of 45 kilograms for ordinary fire-flue or water-tube boilers is striking. The fuel efficiency varies from 93 to 95 per cent.; or, in other words, there is scarcely any loss of heat units in converting water into steam by surface-combustion of gas. In this case the gas mixture is drawn into the boiler by a suction fan producing 1/20 of an atmospheric pressure. It could of course be forced in, as well, with a centrifugal blower.

A boiler erected in Germany generates steam for 500 horsepowers. It is shaped as a drum, as shown in Fig. 3, and is about 3 meters in diameter and 1.2 meter thick. Each of the flameless-fire tubes generates 20 to 25 pounds of steam per hour with an interior diameter of 75 millimeters and walls 6 millimeters thick. All the fire tubes are in the lower half of the drum, while the upper part is braced with tie-rods. Fig. 4 shows the firing method. At the front end of each tube there is a fireproof [non-porous] stopper with a central bore, 13 millimeters in diameter, through which the gas mixture flows in. This protects the joint with the boiler wall against excessive heat. Adjacently to the stopper the filling with granular material begins. The grains measure about 10 millimeters each. [Blum doesn't mention how far the material extends and does not say whether any of the fine porous chamot is used, as, in fact, throughout his account he refrains from publishing definite details. It seems that the chamot is used only for constructions in which outside air cannot readily be barred and in which the heat is utilized for radiation and light rather than for convection.] In front of the tubes there is a mixing chamber receiving the gas and air sepa-

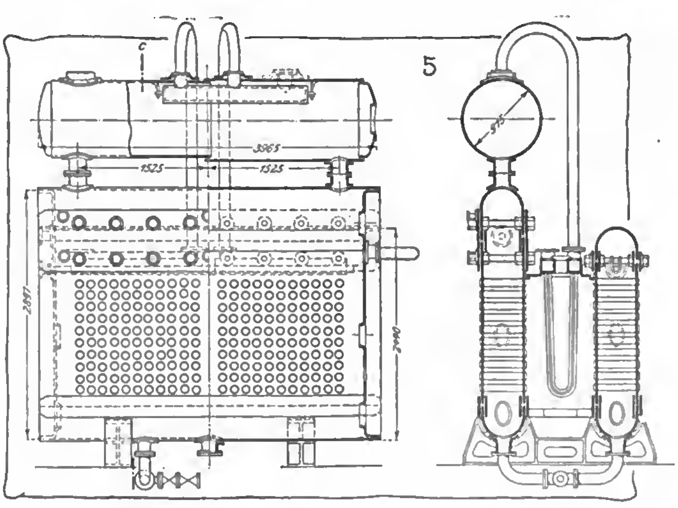

Fig. 5—Vary compact marine flameless surface-combustion generator, tripling ordinary steaming capacity and wasting only 3 per cent. of heat units of fuel

rately from feed pipes D. By shutting off the latter, groups of 5 fire tubes can be taken out of action to vary the steam generation. If pressure-feed is used, there is a chamot plate in front of each stopper, acting as a screen to prevent heat from striking back if the pressure subsides. The feed-water heater E is arranged on similar principles.

The operation is as follows: Air and gas are admitted to the fire tubes and the mixture is ignited by means of a specially arranged torch at the ends of the tubes. This gas burns at first with a flame, but when the proportion between gas and air is adjusted [the air supply reduced] and the pressure is regulated, the flame gradually draws back to the interior of the tube. The real combustion zone begins at the inner end of the fireproof stopper, and here—which is the most important feature—only in the middle of the granular mass. A core of about 100 millimeters long and 20 to 25 millimeters in diameter is here raised to brightest incandescence, reaching a temperature estimated at 1400 to 1600 deg. C. The heat drops rapidly toward the tube walls, and the material adjacent to these is only red-hot. The metal of the tubes thus does not come in contact with the fiercest heat, which explains why they endure the service indefinitely. The cooling of the gases is also very pronounced toward the rear end of the tubes. Measurements have shown that 70 per cent. of the steam is generated by the front 1/3 of the tubes, 22 per cent. by the middle 1/3 and only 8 per cent. at the rear end of the boiler. The temperature of the exhaust gases is only about 200 deg. C., and this is reduced to 95 degrees in the feed-water heater, the water being raised from 20 to 50 degrees. The proper pressure and gas proportion depend upon the type of gas and the nature of the granular material. The radiation losses of the boiler amount to 1½ per cent., while the pressure or suction fan absorbs 2.5 per cent. of the power and the exhaust gases carry away 3 per cent. of the heat value of the fuel. In this radical thermic economy, in comparison with which that of the internal-combustion engine appears as wanton waste, lies the promise of widespread industrial applications.

Fig. 5 shows the construction of a surface-combustion marine boiler of a design much compacter than that shown in Fig. 3. Experiments in England with a plant of this type showed a steaming capacity of 145 kilograms per square meter, and a German commission of incredulous specialists verified this figure by tests extending over a full week.

Liquid Fuels Tried With Success

Encouraged by the results obtained with gas, the engineers of the movement instituted trials with liquid fuels and in fact with tar oil. The success was so epochal that a locomotive in England is now being equipped with a surface-combustion boiler. If the author is correctly informed the New York Central railway company in New York also has the intention of building such locomotives, which by their absence of all smoke promise to make electrification superfluous.

Among other recent progress in the development of the method, it is to be mentioned, that it has been found possible to work with reduced fuel pressures by using suitable diameters of the tubes and by employing other means of which nothing can be said at the present moment owing to the unfinished condition of the patent rights relating thereto. This is of especial importance for applying the flameless method to lighting, heating and cooking purposes. [It also indicates a certain likelihood of adaptability to automobile motor requirements.]

In Figs. 6 and 7 there is outlined a suggestion of how flameless surface-combustion—now generally termed Bonecourt combustion, a copyrighted name and trademark—may be used with enormous saving of fuel for muffle ovens, which are used so largely in the automobile industry for casehardening work and other forms of the heat treatment of steel, and for the melting pots in crucible-steel works, where each crucible usually holds only about 30 kilograms of metal and with the present arrangements never can be uniformly heated.

[The author refers with some detail to a large number of other industrial applications, some of them of wide sweep, but the facts and ideas which bear in any manner upon the possible adaptation of the Bonecourt heating method to automobile purposes are contained in the foregoing extracts.—Ed.]

Double Ignition.—In reply to an inquiry as to the advisability of changing a single spark magneto ignition to a dual spark ignition by arranging two plugs in series H. Féron writes in part: It is not always an improvement when single ignition is changed to double in an existing motor. To be sure, the double spark always hastens the combustion of the gas, but the rate of combustion ought to be proportionate to the maximum piston speed of the motor. If the motor is not adapted for high piston speeds, the rapid flame propagation will result only in inconveniencies. The motor may, for example, be so small in proportion to the weight and gear ratio of the vehicle that a high piston speed on direct gear becomes impossible. The diameters of valves and pipes may be so small, purposely, as to check motor speed, or the shapes of the cams may be such that the valve action cannot "follow." In such cases a double spark will only give very high pressures which cannot be utilized; the motor will run hard, with a tendency to vibrate from the checking of the explosions. Without any compensating advantages, a more rapid wear and tear of pistons and connecting-rod bearings will be experienced.

In certain motors in which the piston speed is too high for the form of the combustion chambers double ignition may take the place of variable spark-timing by quickening combustion, but the case is rare. On the other hand, the writer has seen motors which ran acceptably with fixed timing and only one spark plug and which began to knock desperately at the slightest slowing of the motor when fitted with double ignition.

With two spark plugs in series, a stronger magneto is needed than for ordinary ignition, because the spark must jump the gap between terminals in two places, which involves overcoming about twice as great a resistance as the jumping of one gap, especially if the compression is high.—From *Omnia*, April 12.

Sounds of the Motor.—Unless the silencing of the motor is carried very far—and perhaps farther than desirable—the experienced driver can tell a good deal about the condition of the motor by the sounds it emits. This fact is widely known, but it does not seem to be so well understood that the sounds, or rather the driver's perception of them, is influenced considerably by factors which have nothing to do with the condition of the motor, and that such factors therefore should be taken into account.

A leather cap well pulled down over the head acts as an ear trumpet and magnifies most sounds, while it seems to muffle others. Also, when the ear muffs of a cap are let down, one can frequently tell loose bearings much more plainly than with the ears unobstructed. The raising of the top of a car brings all small noises from the motor out very strongly, unless a windshield is used, and therefore "troubles" are sometimes discovered during a rain which have existed for a long time, but the symptoms of which could not be heard till the top caught the sound The mudpan has a similar influence.

Surroundings and road conditions modify all sounds. A traction chain which seemed almost noiseless on an open stretch of road makes an astonishing "racket" on a narrow paved street. In a very narrow street the noise of the exhaust makes itself heard distinctly in spite of the muffler.

When a car is passing close by a short piece of wall with the cut-out open, the reflected roar will sometimes give a sudden scare to a driver not thoroughly familiar with the cause. On mountain roads the echoes may easily give even an experienced driver an impression of a slipping clutch or of irregular ignition. On a sunken road the motor breathes deep and full, on a dike in a higher key and more faintly. On a hard road the sounds grow sharp, on a soft one indistinct. Sand and snow reduce all noises surprisingly.—From *Auto* (Berlin), March 1.

Detecting Resistance—Saving Fuel

PART III.

Tests Made on Actual Cars with Accelerometer Show Varying Resistance on Similar Cars—Internal Friction May Be Tested

By Professor W. C. Marshall

THIS is the third of a series of four articles on the accelerometer and its use. The accelerometer is an instrument for determining amount of the accelerating and retarding forces of a car under all conditions. By its use the power required to drive a car, the condition of the brakes, the condition of the running gear, the friction of the motor and a number of other important details can be either read directly or be deduced by very simple processes.

In appearance the accelerometer resembles an alarm clock. It is cylindrical in form, 4 inches in diameter and 2.25 inches in height. It is carried in the car and is not attached thereto in any manner whatsoever, except that it must rest on a fixed horizontal platform which maintains a constant relationship to the car.

At a paper read at the Metropolitan section of the Society of Automobile Engineers during the April meeting, considerable discussion took place on the value of electric testing outfits for manufacturing plants. It was pointed out that one of these outfits cost in the neighborhood of $1,400 and that the average factory would require anywhere from ten to twenty instruments. This enormous outlay would not readily be made by a factory unless they were fully assured that the return would be adequate.

With the accelerometer, many details in addition to those learned on the road test would be learned, and while the road test would not be diminished in any way, the additional details could be learned without any additional time being required in making them and they would go to make a more detailed accounting of the performance of the car and would furnish a check on the condition of running gear and the power required to drive the chasis than the simple road test would do.

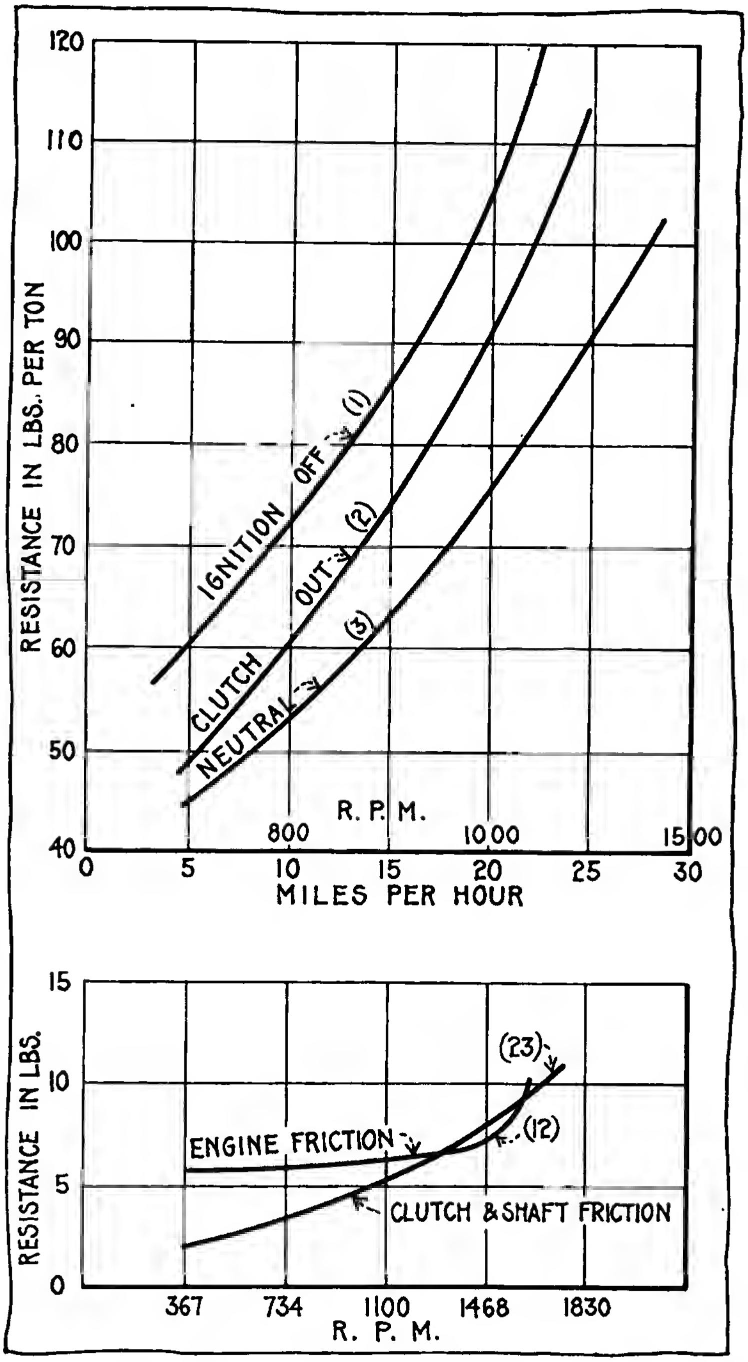

Fig. 1—Two sets of curves, the lower being deduced from the upper, showing the resistance of a given car with the ignition off, the clutch out and the gears in neutral

Actual tests show a wide difference in the resistance of two cars of the same weight and horsepower. This means that these two cars would be using a varying amount of fuel to drive them if the efficiencies of the motors were the same and the carburetion was all that could be desired on both cars.

Knowing the performance of the car the difference made by different road surfaces may be obtained. A car run over asphalt will have less road resistance than a car run over a road which is less smooth. If a test is made with the engine ignition switched off and then with the clutch out the resistance of the motor due to its internal friction may be obtained. Various other data can also be obtained. In the tests which are mentioned below the methods of working out these details are explained.

In the last issue of THE AUTOMOBILE, Part II of this series, the results of several tests made by this

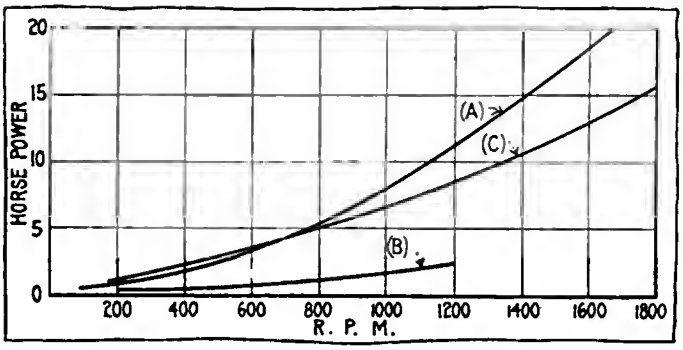

Fig. 2—Curves of engine friction secured by different investigators. The high curve, A, was secured by Reidler

instrument on actual cars were detailed. This week these tests are continued and a clear conception of the value of the instrument may be obtained.

Results of certain tests made by the author on a four-cylinder, four-passenger car are given below. The car weighed 2.077 tons, carried four passengers and had a windshield, which was up.

The road was good, hard macadam and level. There was no wind.

Speed. Miles per Hour	Coasting Resistance in Pounds per Ton				
	Ignition Off		Clutch Out		Neutral
15	90		...		60
20	100		60		70
25	110		70		80
30	120		80		80
35	135		90		100
40	...		100		...
	ON SMOOTH		ASPHALT		
	Readings	Average	Readings	Average	
10	70–70	70	45–40	42.5	..
15	80–70–80	77	55–60	57.5	..
20	80–90–90	87	55–60	57.5	..
25	90–90–80	87	70–70	70	..
30	110–110	110	80–75–80	78	..

There were two or three readings taken in the asphalt tests, as indicated by dashes between the numbers in the above table.

The curves for the resistances are plotted in Fig. 3.

The horsepower curves are broken lines and were only calculated for the resistances on macadam.

The neutral gives more resistance than when the clutch is disengaged, due either to the inertia of the multiple disk, clutch or to the dragging action of the disks of the clutch, which are on the crankshaft.

The friction of engine is shown in Fig. 4, the curve being plotted from the curves A and B in Fig. 3.

The resistance of grades may be read from the accelerometer by noting the percentage grade mark and then the retardation number opposite. For example, opposite 2 on the scale marked downward gradient is read 40 on the retardation scale. This means a 2 per cent. grade is equal to a retarding force of 40 pounds per ton.

Mr. Wimperis has published some results of experiments made on cars fitted with iron and with rubber tires which show the coasting resistance on various kinds of roads at speeds of 10, 15 and 25 miles per hour. These are good so far as they go, but more evidence is needed to accurately determine the laws of resistance at high speeds with pneumatic tires.

Table I following gives the results of these experiments and shows the high resistance of muddy roads, also the low resistance of iron tires on granite blocks.

The results on hard roads appear to be large as compared with those determined by other experimenters.

In the following tests, Table II, also made by Mr. Wimperis, smaller resistances were obtained than those above, even at higher speeds.

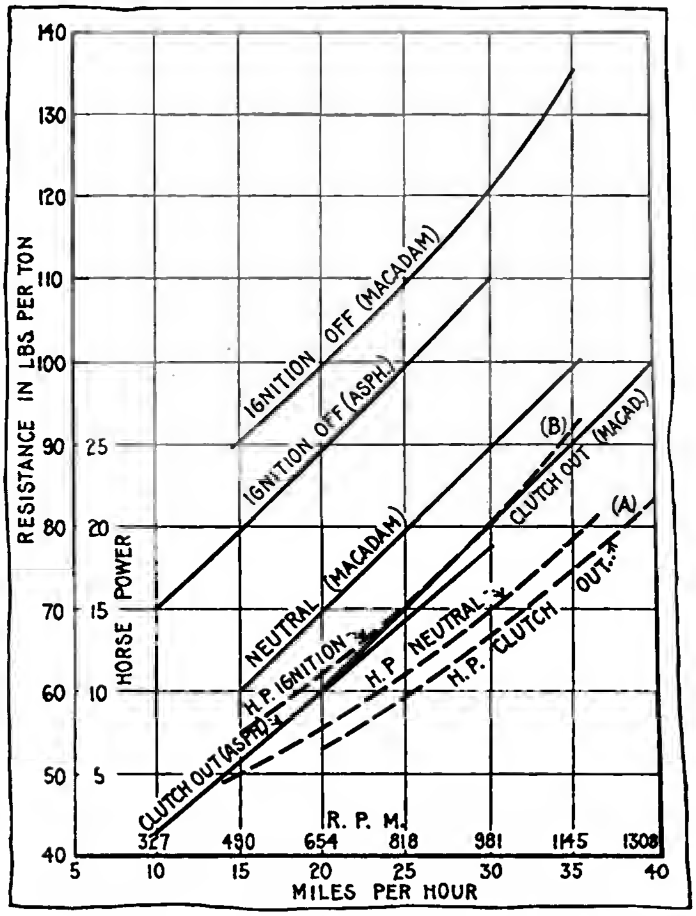

Fig. 3—Effect of road resistance on the total. The above curves show a comparison between macadam and asphalt

The roads had good, hard surfaces, the tires were of solid rubber and there was no wind.

The difference between the resistances at the clutch and with neutral gear is quite marked, due probably to pumping action of gears running in the grease of the gear box.

TABLE I.

Nature and Condition of Road	Declutched Coasting Resistance Pounds per Ton	Speed in Miles per Hour	Kind of Vehicle and Weight in Gross Tons	Tires
Tar macadam road.....	65	10	Motor wagon	Steel rear Front sol.
Tar macadam, soft and cut up..............	140	10	Wgt. 4.3 tons	Rubber
Granite blocks..........	50	10	Wgt. 4.3 tons	Rubber
Hard, dry main road....	73	15	Heavy touring car, wgt. loaded, 225 tons	Solid rubber
Half rolled road metal...	150	15	Heavy touring car, wgt. loaded, 225 tons	Solid rubber
Clean wood pavement...	70	10	Motor wagon	Solid rubber
Tar macadam, dry, hard	70	10	Wgt. loaded 4.35 tons	Solid rubber
Tar macadam, very muddy and sticky....	95	10	Wgt. loaded 4.35 tons	Solid rubber
Road metal partly rolled	[120	10	Wgt. loaded 4.35 tons	Solid rubber
Road metal unrolled....	200	10	Wgt. loaded 4.35 tons	Solid rubber

A car moving up a 2 per cent. grade at constant speed would overcome a resistance of 40 pounds per ton due to grade plus a resistance due to rolling friction, wind, etc. If this latter resistance was, say, 85 pounds per ton, then the total resistance overcome would be 125 pounds per ton.

If the speed was 20 miles per hour on the grade, the probable

TABLE II.—Coasting Resistance on Motor Wagon

Weight loaded 3.28 tons—no wind—hard main road

Speed. Miles per Hour	Coasting Resistance in Pounds per Ton (Gross)		
	Ignition Off	Clutch Out	Neutral Gear
0	55	40	35
2½	55	40	35
5	57	42	40
7½	60	45	40
10	65	50	45
12½	75	55	50
15	85	63	55
17½	105	80	60
20	...	95	65
22½	...	110	70
25	...	...	80

speed on the level would be 37 miles per hour when the engine was exerting the same amount of power.

Conversely suppose a car to run on a level road at 40 miles per hour, its resistance being 90 pounds per ton. What grade can it ascend at 25 miles per hour if the engine can exert the same power?

The accelerometer can be used in conjunction with measurements of gasoline used, to determine the thermal efficiency of the motor, when a car is run over a route the grades of which have been determined. The car resistance is first measured at the speed or speeds to be maintained during the run. The average resistance is then calculated for the whole run, taking into account grades and levels.

The average resistance of the car in pounds, the distance covered and the amount of gasoline used having been determined, we then find the thermal energy in the gasoline and the amount of work performed in driving the car. Expressing the work done in foot pounds gives the expression:

$F = R \times 5280 \times M.$

F = foot pounds of work.

R = average resistance of car in pounds.

M = miles per gallon of gasoline.

The thermal energy in the gasoline would be approximately 15,941,220 foot-pounds per pound, the total energy being 6 × 5,941,220 foot-pounds per gallon.

The brake thermal efficiency of the engine would be, therefore,

$$E = \frac{R \times M \times 5280}{6 \times 15{,}941{,}220} = \frac{R \times M}{18000}.$$

In this formula the specific gravity of the gasoline was assumed to be .72 per cent. and the weight 6 pounds per gallon.

Acceleration measurements are useful in making a comparison of the power of the motor as exerted to produce rapid acceleration at certain speeds. For example, consider two cars running at speeds of 20 miles per hour. The throttle is then opened to give the maximum power of the motor, which at once produces an acceleration of the car.

In one case the needle reads 2 feet per second, while in the other it only moves to 1.8 feet per second.

As force = mass × acceleration, if the cars weighed the same and had the same resistance to motion, the power of the motors would carry it directly as the acceleration, viz.: 2 to 1.8.

There is often found to be a great difference in the power of various cars due, not to the resistance, but to the action of the carbureter when furnishing the gasoline vapor to the motor.

Some carbureters furnish such a rich mixture when the throttle is opened wide that it will not ignite and the motor slows down.

Such a carbureter does not permit the motor to produce rapid car acceleration, whereas a well-designed one giving a uniform mixture, enables it to respond instantly to wide open throttle.

If the torque curve of a motor, previously determined from laboratory tests, is reduced to a curve denoting the power available at the clutch, we have a means of determining the probable power which can be used for acceleration.

In Fig. 5, at A is shown the resistance curve of the Pierce-Arrow touring car.

The revolutions per minute of the motor were calculated from 37-inch wheels and a gear ratio of 3.3 on fourth speed.

From the laboratory test of a Pierce-Arrow six-cylinder motor made by Herbert Chase at the Automobile Club of America, the brake horsepower was obtained at various speeds.

The horsepower curve used was the one marked A in the test, and was obtained with muffler and throttle wide open.

The horsepower at each speed was then reduced to resistance at the clutch in pounds per ton and the torque curves were plotted from gear rations of 5.44 for third, 7.095 for second and 12.639 for first speed.

(Continued on page 949)

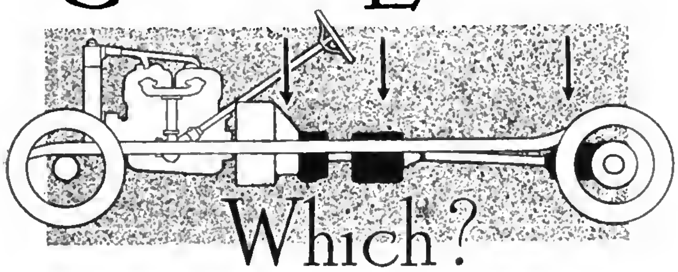
The Engineers' Forum

Gearbox Location



Leading Automobile Engineers Show as Much Diversity of Opinion on This Question as on Horsepower

Marmon Favors Location on the Rear Axle
Holmes Calls It a Commercial Problem
Wall Also Likes the Central Location
Planche Is in Favor of Rear Axle Type
Smith Is Another Rear Axle Advocate
Edwards Finds Amidships Type the Best

THE article on "The Rear Axle Gearbox," by S. D. Waldon, which appeared in THE AUTOMOBILE for April 17, excited considerable interest among the leading automobile engineers of the country in this important question of design, and the following responses to inquiries regarding their individual views on the subject are very interesting, especially because of the wide diversity of opinions evident. So many communications have been received that they will appear from week to week in the Engineers' Forum as space is available. The arguments advanced for and against the various types of construction in this particular are those of experts who have studied the situation thoroughly and therefore deserve the attention of everyone interested in the problems of automobile design and construction:

Small Increase in Rear Axle Weight—Marmon

INDIANAPOLIS, IND.—Editor THE AUTOMOBILE:—**The incorporation of a motor car gearset with the rear axle can be accomplished, if a little ingenuity is used, with a surprisingly small increase in the total weight of the rear axle. A 5 to 7 per cent. increase in the weight of the axle is all that is necessary.** This is less than the variation in weight caused by the use of different styles of demountable rims.

The rear axle gearbox eliminates one grease retaining reservoir by utilizing the oil bath already provided for the bevel gear. It results in a quieter operating car than if the same gearset were placed under the footboards which act in the nature of a resonator.

If properly designed, the rear axle gearbox is far more accessible than one located under the body, and if occasion arises that necessitates the opening up of the gearbox, the finely-finished and upholstered portions of the body do not suffer from being covered with the contents of the gearbox. The most important advantage of the rear axle location, however, comes from the fact that the magnification of the torque, due to the use of the various gears in the gearbox, is transmitted directly to the bevel pinion, and not through the universal joints and the propeller shaft. This prolongs life in the universal joints themselves, and permits the selection of a propeller shaft of small diameter that will carry the torque of the motor with some torsional deflection. Such a propeller shaft will perform the functions of a spring drive, and compensate for the variations in angular velocity that take place between the flywheel of the motor and the road wheels during each revolution of the motor, and a decidedly smoother operating car results.

Such construction is, of course, impossible with the gearbox near the motor, as the propeller shaft must be designed to take anywhere from four to eight times the torque necessary in the previously discussed constructions. The effect of the spring drive is then lost.—HOWARD MARMON, Nordyke & Marmon Co., President Society of Automobile Engineers.

A Question of Economy in Tires—Holmes

SYRACUSE, N. Y.—Editor THE AUTOMOBILE:—The location of the gearbox on the rear axle is but one of the points now prominently before the automobile public in connection with the demand for more economical cars.

The total cost of a car, meaning everything paid for same from first to last is in some cases an enormous sum. Tire cost is a very large factor in this account. For this reason the location of a gearbox correctly on a rear axle adding its weight to the unsprung weight of axle is no longer a question of engineering purely—it is a business proposition, or perhaps should be called commercial engineering.

Tire cost, fuel cost, everything that goes to make up the total cost of a car must be reduced in time. This simply means less weight, and especially less weight in the unsprung parts.—A. HOLMES, Engineer H. H. Franklin Mfg. Co.

Racing Shows Amidship Advantages—Wall

INDIANAPOLIS, IND.—Editor THE AUTOMOBILE:—In regard to the proper position of the gearbox on a motor car, while there has been a diversity of opinion in the past in regard to the relative advantages of the three arrangements generally used, attaching it to the engine, placing it amidship, or attaching to the rear axle, it now appears that the majority of engineers are realizing that to place the gearbox amidship has a number of advantages over using it either as a part of the engine or as a part of the rear system.

The disadvantages of placing the gearbox on the rear axle are very evident, as it subjects it to very hard shocks when traveling over rough roads, due to the fact that it is not protected by the springs of the chassis, which also accounts for the severity of this construction on the rear tires. It is in a position where it is very difficult to get to in making any necessary adjustments or repairs, besides the disadvantage of having long control rods running to the hand levers. It is also much more liable to meet with accident when hung low in this position.

Attaching the gearbox to the crankcase of the engine has the advantage of compactness and reduction in expense of manufacture, so that it is generally found on the cheaper cars. It **has the serious disadvantage, however, of inaccessibility to the clutch parts and the difficulty of proper suspension so as to get the maximum resistance to strains, as it is generally designed as a cantilever supported by the rear arms of the engine, or else supported at the rear end and acting as part of a truss to sustain the weight of engine. With either arrangement a great and unnecessary strain is placed on both the gearbox and crankcase.**

Placing the gearbox amidship has a great many advantages, though the slight disadvantage of requiring a little more expensive construction than attaching to the engine; the great advantage of this position, however, is its flexibility and the fact that there is considerable less strain on the bearings of the gearbox in this position, due to the use of universal joints both at the front and rear ends. Hanging it amidship also makes it extremely accessible and allows ready access to the clutch and its parts; it assists in the proper balancing of car, dividing the weight between the two axles, is up out of harm's way on rough roads, and is in a position where even serious accidents can hardly damage it.

Also it makes an extremely convenient design with center control, and does not require the control shafts to slide out of case, necessitating packing boxes; it is in a position where it can be easily lubricated and looked after, and probably receives much better treatment than in any other location.

For a number of years the National car has had the gearbox placed amidship with excellent results, and considerable of its success in the racing field can be attributed to this design. It is a fact, though not generally known, that, with probably one exception, all cars that have become prominent in racing have had the gearbox placed amidship, which is good proof of the flexibility and dependability of this construction.—WM. G. WALL, Chief Engineer, National Motor Vehicle Company.

Rear Axle Type Is More Accurate—Planche

DETROIT, MICH.—Editor THE AUTOMOBILE—The problem that confronts the engineer, who is ready to establish the design of a car, can be reduced to the following simple expressions:

Place the motive power in a chassis and transmit that power to the rear wheels with the least possible loss.

Lower the center of gravity of the car to the minimum height compatible with necessary road clearance.

If these two conditions are fulfilled, the car built by this engineer will be economical, of great stability, easy to drive and comfortable. The first condition is filled when the center line of the crankshaft passes through the center of the rear axle—it is a straight-line drive.

In practice this straight-line drive can be obtained through the building of motor, gearbox and rear axle in a solid unit, with the front of the motor pivoting at the starting crank—the only car built along this line is a French car—the Simplicia. In this case no universal joint is used and the efficiency at the rear wheels is maximum.

The next best solution is the Chevrolet design. It is also a straight-line drive when the car is loaded and rolling on a smooth road. The gearbox is mounted as a unit with the rear axle and the driveshaft is also a unit with the gearbox. This makes a rigid assembly which is bolted to the frame by means of a large pivoting fork and is connected to the motor by a single universal joint. The universal joint operates only when there is a deflexion of the springs, and as the springs deflect very little under load, the loss of power is reduced to a minimum through the universal joints. That first condition is also filled when the motor and gearbox are built as a unit and placed in a straight drive with the rear axle transmitting power to the rear axle through one universal joint.

The most inefficient way of transmitting power to rear axle is when the motor, gearbox and rear axle are all separate units connected together by universal joints because the chances of misalignment increase, more universal joints are needed, consequently more power is lost. Then, if we consider only the question of transmitting power the most efficiently to the rear wheels, we would consider the gearbox, rear-axle unit as equal to the motor-gearbox unit, but both superior to the motor, gearbox and rear axle as separate units. But if we consider the second condition we have formulated above, we find that the gearbox, rear-axle unit answers that question better than any of the other two solutions. Effectively in that type the weight of the driveshaft, torsion tube, transmission is brought closer to the ground consequently the center of gravity of the car is lowered, the load on the rear wheels is increased giving better adherence to the ground and the stability of the car is also increased, affording more security to the passengers for high-speed travel.

One could also say that the building of rear axle and gearbox as a unit, or of motor and gearbox as a unit removes the uncertainties of manual labor in assembling the car and leaves it to the more accurate work of the machine tool.

These are the reasons why we prefer in our own opinion the mounting of driveshaft and gearbox as a unit with the rear axle.—E. PLANCHE, Chief Engineer Chevrolet Motor Co.

Rear Axle Unit Is More Quiet—Smith

INDIANAPOLIS, IND.—Editor THE AUTOMOBILE:—Referring to the discussion recently appearing in THE AUTOMOBILE relative to the merits of the three present methods of installing the gearbox in passenger automobiles, would state that we naturally favor the suspension of the gearbox in unit with the rear axle, for four particular reasons:

First, on your lower speeds it reduces the torque on your universal joint and drive shaft in direct proportion to the ratio of difference between your second or low speed, and engine speed, which is a decided advantage in a stiff pull.

Second, it reduces to the extent of the weight of your gearbox unit the dead weight on your frame, hence the weight supported by the springs, and gives you the advantage of that much more flexibility in your spring suspension.

Third, you can shift gears much more smoothly, due, we believe, to the longer linkage and greater flexibility of your gearshift mechanism to say nothing of the wide range of choice for the enginer in the location of his control levers which may be set practically anywhere to conform to his particular idea of accessibility.

Fourth, the gears are located so far back that the slight growl or hum from the constant mesh gears and idle pinion is nearly, if not entirely, lost. This is one of the reason that the rear axle transmission is quieter than other types.

There are several lesser arguments in favor of the rear axle gearbox, but the four above, we believe, are the chief reasons that are leading the trend of motor car builders today to adopt an ever-increasing proportion of the rear axle gearbox over the other types.—J. M. SMITH, Factory Manager and Engineer, Henderson Motor Car Co.

Is More Accessible Amidship—Edwards

NEW YORK CITY—Editor THE AUTOMOBILE:—Referring to the question as to whether it is better to mount the gearbox of an automobile as a unit with the rear axle, as a unit with the motor, or as a separate unit approximately amidship in the chassis.

As a unit with the rear axle: A disadvantage is that it adds that much unsprung weight to be carried by the axle and the tires. It also adds the weight of the gearbox to a part of the axle where it is least desirable. On the other hand, the mounting of the gearbox on the rear axle has the advantage of deadening the noise of the gears.

As a unit with the motor: This construction has the advantage of clean design and if used with the three-point suspension no trouble should be experienced on account of the length of the complete unit of engine and gearbox.

As a separate unit: The advantage is that the gearbox is a separate assembly as a manufacturing proposition and by the use of universal joints there is no undue strain placed on the bearings of the gearset, due to weaving or warping of the chassis. In case of trouble with the gearset it is easily accessible, removed or replaced.—H. J. EDWARDS, Engineer, Edwards Motor Car Co.

Cost-Keeping System for Warehouse Trucks

Exact Daily and Monthly Records Enable Operating Companies To Get Most Economic Service from Vehicles

Long Time Spent in Loading and Unloading Trucks Causes High Cost Per Mile Traveled

THE closer the profits of a given business the more urgent is the requirement for unerring records, as gain or loss plays a much more pronounced rôle in such an undertaking, owing to its high percentage with relation to the total or net profit. Consequently, if motor trucks are applied in a line of work where profit is small, systematic cost-keeping is a desideratum if not a necessity; whereas, if they are used without profit and merely to the purpose of advertising, by coupling in the common mind the name of a company with the idea of up-to-dateness—which is not unfrequently the case now—the strictest economy, controlled and recorded by exact compilation of data, is needed.

One of the businesses of this nature is the storage-warehouse trade. In this line of enterprise, which often includes the moving of furniture, all work is strictly non-productive, and consequently the profit is small, since profit accompanies principally the making of one product into another. The two sources of income in this business, then, are moving furniture and storing it. The latter department is dependent for its rentability upon the extent to which the buildings of the company may be utilized and is roughly proportionate to the magnitude of the company's business; but the former, being founded upon work, human and animal or mechanical, offers possibilities for a variable profit, which is proportionate to the low cost of transportation on one hand, and to its efficiency—speed, safety and dependability—on the other. Safety refers to the possibility of entrusting a van or truck with goods, feeling certain that nothing ill will happen to them; dependability, that they will be delivered on time.

As the profit on furniture transportation is very variable, the advantage of exact records which are a means to the end of strict economy is obvious. By keeping all information relating to the work done by trucks and their cost of maintenance, the economy of operation can be more and more increased, as waste may be diminished by eliminating its several causes. To put a truck fleet, large or small, on a basis of increasing economy, a cost-keeping system such as that described below may be used to advantage, it being constructed after abstracting the principal features of several schemes in use by various storage business houses.

This system comprises four forms, namely: a daily time-checking sheet, a daily cost-and-work sheet, a monthly trouble-and-repair card and a monthly record sheet. The first is a garage form, the second made out by each driver after the day's work, the third is a ledger form filled out by the garage-and-shop foreman and the fourth by the bookkeeping department.

The checking sheet is 15 inches square, printed on white ledger paper which is ruled red from side to side and blue from top to bottom and printed black, as shown in Fig. 3. The sheet is secured to a board near the garage door on the first of the month, and every time a truck enters or leaves the place, its time is put down on the sheet. Trucks engaged in work of moving furniture do not make more than two trips a day, while machines that do may be recorded on a separate sheet, using two columns instead of one. This sheet serves much the same purpose as the weekly time card in shops.

To account for the distribution of time, in addition to giving the details of the work done by a truck, a daily cost-and-work sheet is used. When a truck returns in the evening or night, the driver fills out a blank, Fig. 2. The latter is 12 by 8 inches, printed on letter stock of medium thickness, ruled according to the same color scheme as Fig. 3 and is made out with a carbon copy. The driver puts down the number of his truck, the date, his name and that of the helper and then proceeds to give all the required data referring to the several trips. The latter are numbered. The

Fig. 2—Daily work-and-cost sheet

addresses from and to which furniture was taken, the time of checking in and out of the garage, the time spent in loading and unloading the truck, the miles traveled on the trip as shown by the tripmeter mechanism on the speedometer, and the length of time during which the truck was standing are noted. The quantities of gasoline, oil and grease used are also recorded. If any repairs or the purchase of parts, fuel, etc., on the road were necessary, the driver states this, together with the price. Finally, there is a space for miscellaneous remarks. The original of this report is kept by the foreman, while the carbon duplicate is sent to the office, where it is kept by the bookkeeper.

In order to keep track also of the full history of the trucks, as pictured by repairs, their costs and miscellaneous happenings which have a bearing on the value and ultimate life of the machine, a monthly repair and trouble card is used. The latter is designed like Fig. 4, being 10 by 12 inches, ruled and printed similarly to Fig. 2 and coming in form of pads with duplicate blanks. Every repair is recorded on this form, there being one page—or two or more pages, if necessary—for each car kept in a binder. With the nature of the repair, the cost of the material and parts used are recorded, as is the exact cost of labor spent on the job. Likewise, any trouble which arises, whether requiring a repair or not, is recorded. At the end of the month the foreman signs the report and files it, the duplicate going to the bookkeeper.

The information given on the three forms is compiled on a fourth, the monthly record, Fig. 1. This is a white sheet, 15 by 12 inches, ruled red and blue and printed black. The hours spent outside the company's garage are taken from the checking sheet, and the hours during which the truck traveled are obtained by deducting from this time the standing time given in Fig. 2. The miles traveled are also taken from the latter record. From the amounts of gasoline and oil, Fig. 2, the prices are calculated, while those of new equipment and road repairs are taken direct from that record. Fig. 4 gives the cost of repair jobs whenever they are carried out. A certain amount is charged against each truck daily for garaging. Overhead is calculated in the following manner: After deducting the garage and shop labor accounted for by repairs from the payroll of that department, the remainder of the wages and the salary of the foreman, together with light, heat, power, insurance, etc., are added and divided by the number of cars, the quotient being in turn divided by the number of days in the month. In this way a daily overhead charge is found, which is entered in that column. The day's wages of driver and helper are also recorded. By adding all the money amounts, the total cost of the truck per day is found, and dividing this by the miles traveled, the cost per mile is obtained. Leaving the lost interest and depreciation out of consideration for the reasons of one being not a reasonable charge and the other impossible to calculate exactly in advance, the total cost of the day and that per mile are exact. At the end of the month, all columns are totaled, the form being so designed that the total miles traveled, hours out of the building, hours traveled, total cost for the month and monthly average cost per mile are especially prominent. The bookkeeper who transfers the figures from the other sheets and one who checks his work sign the record.

In New York City, the cost per mile of several concerns in the furniture-moving and storage-warehouse fluctuates between 50 and 80 cents, depending on the good care of the truck and the possibility of keeping it moving, while a horse team costs about half that per mile. If it were possible to keep automobiles moving all day, the cost per mile could be brought down to the horse figure or below it, with the result that all horse teams would at once or very quickly be supplanted by motor-driven freight vehicles.

In the furniture-moving and storage warehouse business, motor trucks have a chance of developing only one-third of their usefulness, due to the long time lost in loading and unloading them. It is in consequence of this disadvantage that the total cost of operating motor trucks averages from 50c. to 80c. per mile, while that of horse vans of about the same size and carrying capacity is in the neighborhood of 25c. or 30c. Therefore, many companies who now use automobiles only to show that they are keeping pace with the times, do not supplant the bulk of their horses, but would do so as soon as the automobile cost per mile could be brought down to the level of the horse figure.

To obtain strictest operating economy, exact records of truck achievements and maintenance expenditures are one of the best means. If the costs are dissected, it is much easier to distinguish between necessary and unnecessary expenses of maintenance than without these details on hand.

No Clutch Adjustment on Maxwell Special—Remodelling for a Speedster—Construction of Acetylene Tank—Money for Roads—Adjusting Oil Level—Speed of Electric Vehicle Motors—Criticism of Present Day Body Design

Cannot Adjust Maxwell Clutch

EDITOR THE AUTOMOBILE:—Would you be so kind as to give me some information on adjusting the clutch on a 1912 Maxwell Special?

We have drained the oil out of the clutch box and washed it out with kerosene, thinking that possibly some of the grease from the gearbox had worked into it, but washing it out did not help matters. We find that the machine will pull all right on low and intermediate gear, but when on high, and a good stiff pull before it, the motor will begin to race and the machine will slow down.

We do not see any way to adjust the spring that holds the clutch in. Is there no way to tighten the spring up so it will throw the clutch in tighter?

New Albany, Ind. FRED KAHLER, JR.

—The 1912 Maxwell Special car used a multiple-disk clutch with a single spring upon which there was no means of adjustment. The spring was made extra heavy and it was thought that adjustment would never be required upon it. There is only one method which suggests itself outside of purchasing a new spring and that is the fitting of a collar between the spring end and the shoulder against which it rests. This would compress the spring slightly and give a stronger contact between the plates. The insertion of cork inserts in the disks would also alleviate your difficulty.

Increasing Speed of Ford Car

Editor THE AUTOMOBILE:—Please inform me if it is possible to change the gear ratio of a Ford model T in order to obtain a greater speed on level roads?

I am thinking of taking the body off, and my experience has led me to believe that a model T Ford, if the gear ratio is altered and, if possible smaller wheels put on, will attain a speed of 48 miles an hour on the level.

I should also like to know if it is feasible to alter the angle of the steering post and if a longer column could be put in. Also the approximate cost of these two alterations.

New York, N. Y. JULIAN R. SPEYERS.

—In order to change the gear reduction of the Ford model T it would be necessary to have a gear made specially. The Ford T is geared 3 3-11 to 1 on high and if this same ratio is used with 32-inch wheels and the body stripped down, a speed of 60 miles an hour is possible. In fact a couple of years ago, a Ford car similarly equipped with a high-tension magneto added made 65 miles an hour on the Brighton Beach track. It is not necessary to change the magneto.

In changing the rake of the steering column it will be necessary if you have a 1912 model or a touring model of any year, to put in a 1911 torpedo steering column. The price of the new steering column is $20.

Asbestos in Acetylene Tanks

Editor THE AUTOMOBILE:—1—What per cent. of acetone and asbestos does the Prest-O-Lite Co. use in its gas tanks to keep them from exploding?

2—Do the overhead valves (as in the Buick) give more power than the inclosed valves?

3—Do iron and steel crystallize?

Norma, Neb. ELMER S. SMITH.

—1—In the style B Prest-O-Lite tanks, which have a capacity of 40 cubic feet of acetylene gas, there are 4.5 pounds of acetone. The acetone absorbs the acetylene gas. The tanks are completely filled with asbestos and the gas is contained in the pores of the asbestos. Very little, if any, of the acetone escapes with the gas so that it is not necessary to replace much of it. The Prest-O-Lite company stencils each tank with its weight when containing the acetone and the asbestos. When the tank is exhausted and returned to the factory it is weighed and any difference in weight represents a loss of acetone because there is no chance whatever of the asbestos getting away. The empty Prest-O-Lite tanks of the style B, of 40 cubic feet capacity, weigh between 25 and 30 pounds, 28 pounds being a good average. Acetylene weighs 14.4 cubic feet to the pound, so that in the 40-cubic-foot tank the difference in weight between a filled and an empty tank is a little less than 3 pounds.

2—The advantages and disadvantages of overhead valves have often been discussed in these columns. It is generally conceded that, owing to the more advantageous shape of the combustion space with overhead valves, the latter furnishes a more powerful engine. On the other hand, motors having valves of this kind are hampered by a more complicated valve mechanism and hence one which is more difficult to keep silent. It is a matter of pick and choose and the intending purchaser will be able to listen to perfectly reasonable arguments from salesmen of both types of engines.

3—The term crystallization is rather vague, but in the general acceptance of the term in implying intermolecular disintegration under repeated shock and alternating strains and stresses, iron and steel do crystallize. There is a crystal-like appearance to a section under fracture after the elastic limit has been materially reduced.

Spark Plugs and Roads Discussed

Editor THE AUTOMOBILE:—From the number of patents for different types of spark-plugs, and the strenuous claims of the makers, it would seem the efficient spark-plug had not yet arrived. Making engine and carbureter experiments, I produced an awful fouling mixture, and using various plugs, fouled them from 3 hours' running and up until I struck the type like the sketch, Fig. 1. This type stands more oil than any I have come across. The bolt on the upper side of the shoulder or collar is wrapped with asbestos, is put into the porcelain and held by a nut on top, the asbestos fitting snugly into the taper in the porcelain makes a gas-tight fit. The porcelain is then put into the nut, the inside of the nut above the thread, has a taper, the outside face of the porcelain collar has also a taper and when they are put together make a wrapped opening. This is filled with asbestos and is then screwed into the bushing and the spark-gap adjusted.

When there is an excess of oil or fuel, from poor carburetion. there is a film of oil deposited on the walls of the cylinder, spark-plugs, etc., the flame not getting between the film and the metal surface only a portion of the outside surface is burned off, a residue remains and absorbs some of the dense smoke, etc., forming carbon deposit, making a path for more or less current and making a short-circuit.

The asbestos being a fuzzy composition has no hard surface, consequently the flame can get back of the oil film, the asbestos acting as a sort of wick, the oil is more readily burned up and keeps the asbestos clear. Since it is a non-conductor, and presents greater resistance than the spark gap, you get the hot spark by the current all going by the gap. Through time, standing, etc., the asbestos may get soaked; it can then be taken apart and new asbestos put in and is as good as a new plug.

This plug was put in oil and sparked, taken out, wiped off, put in a Ford car, and ran several weeks. It was then taken out and put in a ton truck and gave the best of service. I have repeatedly fed an excess of oil until it dripped from the exhaust pipe, but it never feazed this plug. Those who have spark troubles can verify this by giving this plug a trial. It gives a white hot spark. A blue spark indicates a short circuit needs renewal asbestos with battery. One point gives hotter spark than two or three.

The Road Question

The road question now being in the lime-light, a recent editorial in THE AUTOMOBILE made a few rather pointed remarks about the farmer. It would only be fair to get the view of the farmer. Farming is no get-rich-quick scheme. Nature has certain laws the farmer has to go by; hence he is naturally conservative. At a farmer's institute I once attended there was a speaker advocating road improvement by bond issue. He had an apathetical disinterested audience who all felt he was only the mouthpiece of monied man seeking a safe investment for surplus money (the motive and only reason for all bond issues), as bonds meant interest and interest meant increased taxes. Then a farmer got up and said, "roads were the avenues of commerce and that it was unjust to ask the farmers to bear the brunt of that commerce, and the bond issue was only another phase of the present system. There was not enough money now for a cash business and road building would be a new business. There should be new money made and suitably appropriated by the government." Instantly every farmer was a spirited and interested listener, the bond issue man alone looking cross-grained. Briefly the idea was to repeal free coinage, demonetize gold and silver subsidiary coin. The 50-cent piece was to be made of hardened aluminum, the dollars to be made greenbacks without exception; and were to be appropriated to the different states as required, as the mint was a co-operative institution. It being built by the people's money and taxes, it was operated and maintained by the people's money and taxes. Consequently the products belonged to the people, and an owner has the right to the directing of the use and disposition of his property: an unanswerable argument. In less than seventeen years the interest consumes the principal of $100 put out at 6 per cent. It takes it out of circulation, unless new money is put into circulation by the government (no loans); property has to be taken for the principal. This leads to concentration of wealth and no money in the hands of the common people—the trouble with the road question today.

The enormous invested capital of the United States demands such government appropriation to check the ever-increasing concentration of wealth or else abolish interest entirely by establishing government banks or chaos, the lop-sided agitation of government reform, of socialists, prohibitionists, single taxers, etc., adding to the confusion. The assumed privileges of immense wealth is creating such disrespect of law that there is danger of realizing Abe Lincoln's prophecy, the life of the Republic meeting the fate of the ancient Roman empire.

Transcontinental Pike

Take, for instance, the transcontinental pike movement; consider it a moment. Isn't it a thing of great national interest and benefit? Why build it by subscription? Isn't that a retrograde movement? From civilization, organized ability to individual effort like primitive man, the very suggestion seems to savor of hasty impulses, a sort of a lack of comprehension of governmental prerogatives and a magnitude of intellectual decline.

Why not make use of the years of learning and experience and go at it with the organized ability of unlimited government resources and build such a road of efficiency and durability that future ages would point to it as a great feat of accomplishment? Why not assume your sovereignty, instruct your hired men—Congress—to authorize the making and appropriate the amount of greenbacks for the construction of a road of minimum grades and curves, a solid foundation, surfaced with the best vitrolized brick or the best material that science could produce—an ocean-to-ocean road, 100 feet wide, no difference what the cost, whether $50,000,000 or $100,000,000? The mint is there, the operators are being paid, and it is not going to increase cost to turn this money out. We would then have grand roads, and no individual, however humble, would feel an oppression of the burden to the weight of a hair, while it would put money into the hands of the common people who want automobiles and so stimulate the trade that it woud dispense with the present style of strenuous advertisement of the makers and enable them to view Judgment Day with greater equanimity.

If any Pennsylvanian thinks the statement disrespect for law or a pipe-dream he has only to get a copy of his State's constitution and Webster's Unabridged Dictionary to brighten up his so-called education. Read the first article of that constitution, take his dictionary and get the literal meaning of the words used and he will see that the law practically says that a man who discredits time-honored custom and buys an automobile—the deadly menace to life and society—is an anarchist, imposes an annual fine on him, gives him a number as a ticket-of-leave man, scorning the custom of his forefathers—human locomotion by two legs. He must be tabulated like a prize dog at a poodle show or forfeit his liberty. Yet autoists generally considered as representing the better class submit with the same docility as any other boob. The ignorance of the money question is the barrier to civilized motoring. It will require a fine, more subtle knowledge than of the motor, ere realizing Bobby Burns' "Man to man will brother be for a' that."

Bradenville, Pa. JOS. MUNDEN.

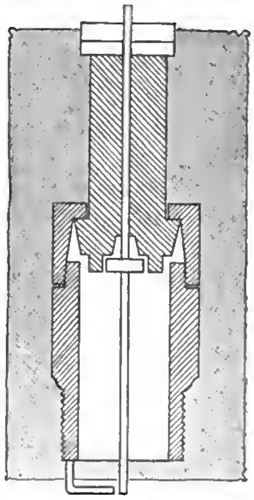

Fig. 1—Type of plug said to possess non-fouling qualities, owing to its method of construction and the material used in making different parts

Fan in Intake Manifold

Editor THE AUTOMOBILE:—Please state the advantages and disadvantages of a revolving fan in the intake manifold. Will it prevent the motor from getting a full charge of gas on high speeds with the throttle wide open?

Ithaca, N. Y. R. A. FREAR.

—It is generally the opinion that the revolving fans or other devices in the intake manifold do decrease the volumetric efficiency of the motor to some extent by increasing the friction in the manifold and hence cutting down the amount of charge entering the cylinder. When the carbuetion is poor and the atomization of the fuel is bad, the fan or other device will act to break up the globules. In other words a device of this kind will help out a poor carbureter by breaking up the fuel. The decrease in volumetric efficiency is a slight consideration because the motor is seldom run at the full power and the difference would not be noticeable. It must be remembered that only a comparatively low horsepower is used on the road.

The difficulties of good carburetion are increased because of the low grade fuel now on the market. With .58 gasoline we cannot get the same rapidity of vaporization as we could with .65. When the motor is running very slowly, it is hard to break this heavy gasoline up into a fine spray and it is also very hard to vaporize it perfectly. Under these circumstances the fan or other device in the intake manifold will do its best work and give the most beneficial results.

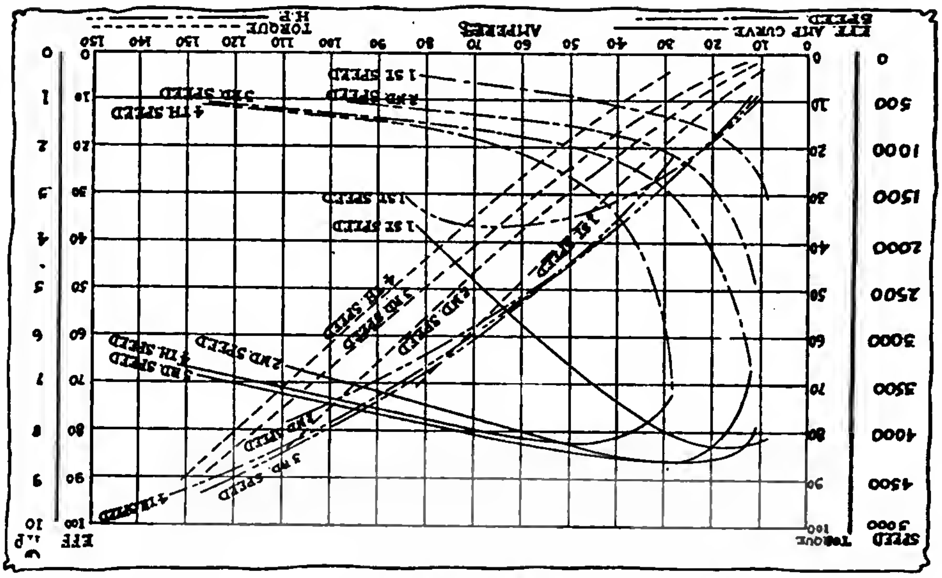

Fig. 2—Diagram showing the performance of the Rausch and Lang electric motor and car at different speeds

Dip of Splash Lubricating Scoops

Editor THE AUTOMOBILE:—1—About how much dip would the scoops have in the oil of a motor, four-cylinder, four-cycle, 2.5-inch bore, 3-inch stroke, same classed as high-speed motor, using a vacuum splash system of oiling?

2—What is the gear ratio of the Ford model T, 1912, 1913?

3—What motor did the Hudson company use in the "33" model?

4—What motor does the Dorris use at the present time? Is it their own?

Fairfax, Mo. A. L. CARTER, JR.

—1—The dip of the connecting-rod scoop should be 1-8 inch.

2—The gear ratio is 3 3-11 to 1 for both years.

3—The Hudson company used their own design of motor. No other concern uses the same design.

4—The Dorris company uses their own motor. It is of the valve-in-head type with the cylinders cast in pairs.

Information on Electric Vehicles

Editor THE AUTOMOBILE—Will you kindly let me have the following information in reference to the motors used on electric cars?

1—Name the revolutions per minute at the different speeds from 4 to 25 miles per hour. State the amount of current consumed in amperes at these speeds.

2—What is the type of motor used; also the voltage at which the motor is run?

3—The capacity of the batteries, volts and amperes.

Newark, N. J. EDWARD FALK.

—The answers to the questions you ask would vary for different makes of vehicles. A few representative makes are considered and the answers as applying to them are given herewith under the name of each vehicle.

Anderson

1—Speed and revolutions of the car and the motor are given in the following table:

Controller Position	Miles per Hour	Revolutions per Minute of Wheel	Revolutions per Minute of Motor	Current at Volts	
2	8	79.1	389	10	40 volts
3	13	128.6	633	18	40 volts
4	17	168.1	828	30	80 volts
5	20	197.8	972	39	80 volts

2—Part of this question is answered under answer 1, as regards the type of motor; this is of the straight series wound type.

3—With lead battery 140 ampere hours, Edison battery 100 ampere hours. The gear reduction is 1:4.92.

Argo

1—The Argo car is geared so that the motor turns 77 revolutions per minute for each mile an hour of the car. This gives the following results:

4 miles per hour— 308 revolutions per minute.
10 miles per hour— 770 revolutions per minute.
15 miles per hour—1150 revolutions per minute.
20 miles per hour—1540 revolutions per minute.
25 miles per hour—1920 revolutions per minute.

The current drawn from each cell of battery for the above speeds will be as follows: 20, 20, 25, 38 and 55 amperes, respectively.

2 and 3—The motor is of the four-pole series wound type, operating at 80 volts, and the rated capacity of the storage battery is 138 ampere hours; and we have found in our car, will average from 160 to 180 ampere hours in normal city running.

Borland-Grannis

1—The number of revolutions per minute at different car speeds from four to twenty-five miles an hour is best answered by stating that the motor which issued is rated at 1200 revolutions per minute, and at this rate at four miles per hour, the revolutions per minute would be about 55.5, and at twenty-five miles an hour, 1387 revolutions per minute.

2—The winding of motor is series-parallel. The voltage of the motor is 85.

3—The capacity of storage battery in ampere hours is 112 for the 40 cells of 9 M. V., and 137 1-2 hours for 40 cells of 11 M. V. Hycap. These two battery equipments are optional in most of our models.

Brock

1—Revolutions per minute at 25 miles an hour is 1711.5, and reduction of speeds is correspondingly, that is, at 5 miles an hour, which is one-fifth of 25 miles, will be one-fifth of the revolutions per minute, or 342.7. Other speeds, of course, are in proportion.

2—Type of winding used on motor is shunt. Voltage of motor, 80 volts.

3—Capacity of storage battery in ampere-hours; 137 1-2 ampere hours, and capable of giving even better under right conditions. The performance of the car is as follows:

Speed	Revolutions per Minute	Miles per hour	Current Consumed	Watts Consumed
5th	1708	25	45 amperes	3600 watts
4th	1400	21	30 amperes	2400 watts
3d	1116	16	20 amperes	1600 watts
2d	686	10	15 amperes	600 watts
1st	350	5	10 amperes	400 watts

Church-Field

1—The revolutions per minute at any speed may be deduced from the fact that the reduction from motor to wheel is 4-1 on direct and 8-1 on low gear, and the diameter of the wheels is 36 inches. This gives 34.3 revolutions per mile an hour.

2—The motor is series wound and the speed is controlled by a variable shunt resistance connected across the field terminals. There is no fixed current at any given speed of motor, i. e., at 800 revolutions per minute the motor might draw 22 amperes or 200 amperes, depending upon the amount of shunt resistance in circuit and torque required. A speed curve for each point of control would be necessary to answer this question. The motor operates at 48 volts.

3—204 ampere hours at 40.8 amperes is the battery rating.

Ohio

1—The motor revolves 160 revolutions at 4 miles per hour; 1000 revolutions at 25 miles per hour. The current consumption, 30 amperes at 810 revolutions 75 volts.

2—The motor is a series wound motor. Voltage of motor 75.

3—Battery capacity in ampere hours is 178.5.

Rausch & Lang

The number of revolutions per minute of the motor may be found by multiplying the miles per hour by 88. Thus at 10 M. P. H. the motor speed is 880.

The motor is over wound and has a set of small shunt coils used to get the electric braking effect and to get a steep torque curve on the high speed position.

The current consumed at various rotative speeds can best be got off the accompanying curve, Fig. 2.

The motor is wound for 80 volts and is used on 40, 41 and 42-cell equipments of 11 M. V. Hycap batteries or their equivalents.

Criticism of American Body Design

Editor The Automobile:—Within the last few years great improvements, both in comfort and appearance, have been made in American motor car bodies. When compared with the latest foreign products, however, the stock bodies fitted on 1913 models by some of our foremost car manufacturers leave much to be desired. It may be maintained that this is but natural, considering that abroad almost all high-class firms have the body work built for their cars by specialists.

Manufacturers of high-grade American cars would be even more successful in competing with the foreign product on home soil if they gave more attention to coach work. At present an owner who wishes a presentable open touring body has to scrap the stock body (or is allowed a ridiculously small allowance for it) and sends the chassis to a coachbuilder to whom he has to pay from $1,200 to $1,800. If the manufacturer would only collaborate with a good body builder and give the purchaser some latitude in regard to his personal desires, the resulting body would be just as comfortable and pleasing to the eye as one built to order.

One of the most obvious points in designing a touring body is the desirability of merging the hood into the body. Yet, how many products of our high-class firms embody this feature? In almost every case we find a sharp line of demarcation between the hood and the body, either as a dashboard exposing an ugly reveal above and on either side of the hood, or as a convex cowl, serving equally well to destroy the smooth sweep from fore to aft so essential to beauty. When will more American manufacturers learn that the smooth and easy transition between hood and body can be effected by tapering the hood and properly treating the dash?

In very few cases is the projection of the top in front of the windshield sufficient. As a rule there is a space between the windshield and top just large enough to allow the rain to drift in and thoroughly wet the occupants. When certain tops are up, it is dangerous to enter the front seat, as one's head is almost certain to come in violent contact with the strut running from a point about half way up the vertical post to the front of the top.

Much has been done recently towards clearing up the running boards and not making them the receptacle for tool and battery boxes, luggage, generators, gas tanks, etc., but there still is room for improvement in this respect. If spare tires must be carried on the running board why are they not sunk several inches in it, so that they will not project above the sides of the body, thus impairing the appearance of the car?

Among the popular double-compartment limousines there are many examples of poor design. In the first place the sudden transition between hood and body produces an even more unpleasing effect than in an open car. Also many of these limousines resemble two independent bodies joined together. This peculiar broken appearance is due largely to the fact that the window-sill line is not carried on the same level throughout, being lower around the front seats than the rear compartment. The whole effect is singularly ponderous, many of these bodies looking as if they weighed tons.

Perhaps the most important novelty in coachwork disclosed at the motor-car shows held this season was the single-compartment body or, as it is generally termed, the sedan. Since this is perhaps the most difficult type of body to design it is not astonishing that very few satisfactory examples have as yet been produced in America. In many cases a compromise between the true single-compartment body and the limousine has been attempted with rather unhappy results. The body illustrated herewith has no partition between the driver and passengers.

One of the objects in designing this body was to reduce the wind resistance as much as possible. To this end the cowl dash forms a continuation of the bonnet, there being no reveal whatever on either side of the hood. The upward flare of the dash, the downward sweep of the roof and the narrowness of the body in front leave very little surface normal to the direction of travel.

The shape of the rear which is almost semi-spherical, reduces the vacuum behind the car, thus minimizing the dust. A segment of the back swings open, giving access to a circular recess for the spare wheel. This arrangement is ideal as the extra wheel is completely protected from the elements and does not mar the appearance of the car.

Some of the dimensions given in inches are as follows:

Wheelbase	136
Ground to top of frame	24
Width of frame	36
Dash to back of frame	108
Dash to front of forward seats	29
Depth of forward seats	17
Back of forward seats to front of rear seats	27½
Depth of rear seats	19
Height of all seats from floor	13½
Height of body, inside	56
Width of doors	24
Height of doors	51

New York City. John Jay Ide.

A Mistake in Mathematics

Last week The Rostrum published a letter signed by E. W. in answer to which it was stated that the speed of two similar cars would vary as the square of the wheel diameters. This should have read, as the wheel diameters. The car with the 34-inch wheels would travel 1.0625 times as fast as the car with the 32-inch wheels.—Ed.

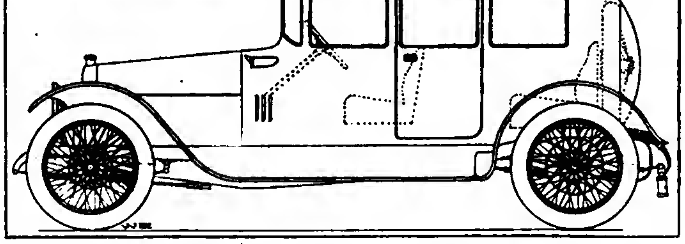

Fig. 3—Suggested lines of a single compartment car with body designed for minimum wind resistance

Dynamometers vs. Road-Testing

Metropolitan Section of the S.A.E. Hears Paper Read by P. P. Dean on Laboratory Chassis Testing Methods and Apparatus

NEW YORK CITY, April 24—At a meeting of the Metropolitan Section of the Society of Automobile Engineers held here, P. P. Dean, of the Diehl Dynamometer Mfg. Co., read a paper on Chassis Testing Apparatus. The idea of the paper was to bring out discussion which would shed light on the possibilities of supplanting a large part of the road testing by stationary work. Many of the small towns about Detroit are passing laws forbidding the cars of the testers to pass within their corporate limits at high speed and the work of the testers is hampered at all times by legal processes. Mr. Dean said in part:

The commercial testing of the finished chassis whereby accurate measurements may be taken seems to have received very little attention in this country, many engineers being of the opinion that it is unnecessary to keep any records or take any such measurements.

Road Test Is Not Sufficient

It is claimed by some that a good road test cannot be improved upon, such a trial providing all conditions that a car in actual use will meet, but I believe that the time has come to look more closely into this, both from a technical and commercial standpoint.

While the majority of engineers admit the stationary test to be ideal, supplemented, of course, by a short road run, they claim that the price of a good rear wheel equipment is against manufacturers adopting them in sufficient quantities to eliminate road testing altogether, and there is not to my knowledge a single concern offering a real good and complete commercial equipment for rear wheel testing at a reasonable price.

The advantages claimed for stationary over road testing are:

1—Actual measurement of horsepower at rear wheels. Loss in drive from wheels to brake is negligible and cannot be readily separated.
2—Speed in miles per hour at any load may be measured, also revolutions of engine.
3—The chassis may be loaded to its maximum capacity, both in horsepower and speed, a limit of say 70 miles per hour being established on account of the speed of the driving chains.
4—The maximum power available may be absorbed through either first, second, third or fourth gear and reverse, through any length of time.
5—Transmission gear may be noted under full load operation as to noise, lubrication, ease of shift, etc.
6—The slightest increase or decrease in power developed, by carbureter adjustment, may be easily noted on the horsepower motor, while running. This also applies to spark setting, and is important.
7—Actual effect of muffler cut-out.
8—Actual load, speed and time of test, limited only by ability of reciprocating parts to stand strain.
9—No abnormal road speed necessary, therefore possibility of speed fine eliminated.
10—One operator can test four or five chassis at once and keep accurate record of every measurement.
11—Actual consumption of gasoline under any condition may be ascertained.
12—No tire expense.
13—Every important part except springs may be watched under full load conditions. Complete record on file for reference or prospective purchaser.
14—The above mentioned observations may be made when using an electric cradle dynamometer, some modification being necessary in the event of a water brake being used to absorb the power.

Now that some of the many possible measurements and facts which can be actually ascertained have been enumerated, the question arises of just how much of this information is really required, and in view of the fact that the road test has been used continually since the beginning, it seems hardly probable that engineers will sink a fortune in testing stands without first being confident of a substantial saving or gain in another direction.

If stationary tests are to be adopted in place of the usual road trials, at least a dozen equipments would have to be installed, but this number would, of course, depend upon the factory output, so that first cost of the installation is a considerable item. The kind of apparatus would depend upon the accuracy of the measurements required, *i. e.*, if actual rear wheel horsepower is desired, either an electric or hydraulic dynamometer is required, and even then the driving chain loss cannot readily be separated.

A fair comparison of the cost of the three methods mentioned of a single equipment designed to take care of 50 horsepower at rear wheels would be as follows:

Hydraulic dynamometer dynamo	$ 900.00
Electric dynamometer	1,400.00

Including all speedometers, measuring instruments and chains but without stands and universal joints.

Against this first cost recognition has got to be taken of the saving of time effected, saving of tires, quality of the results, and facilities for observations not possible while he car is in motion.

The apparatus described by Mr. Dean was illustrated in THE AUTOMOBILE for March 13.

The discussion on the paper did not bring to light any new facts, the attitude of the members showing some skepticism as to the value of a laboratory test as compared to an actual test on the road. Morris Machol asked if the racking and twisting strains on the chassis and its consequent effect on the running gear of the car could be duplicated in such a test.

Mr. McMurtry stated that the value of being able to make the proper carbureter adjustments and ignition, timing, etc., would be great in an installation of this kind. He estimated that 60 per cent. of the road tests could be eliminated.

Professor Marshall stated that one of the great drawbacks in the laboratory methods of testing was the fact that the wind resistance was not taken into account and that this could amount to as much as 20 per cent. at the higher speed of the total resistance of the car. The losses through the tires also are an important factor and cannot be gauged by a chassis testing outfit.

English Trucks May Transport Gasoline

LONDON, ENG., April 22—It was 3 years ago that the Home Office Departmental Committee appointed to inquire into the sufficiency of the regulations relating to the storage of gasoline and the conveyance of it in bulk was issued. In this report the committee recommended that all road tank wagons for the conveyance of gasoline should be horse-drawn. Acting upon later evidence, however, the committee have just published their final report, in which it states that mechanically-propelled wagons should not be prohibited, providing that they are properly constructed for the purpose, and built to regulations.

Whether the recommendations should prove to be any benefit to the motorist if carried out seems doubtful, for there are no measures recommended that will tend to reduce the price of the spirit. With regard to the prohibition of tank steamers to proceed above Thameshaven, by the Port of London Authority, the committee find no reason for this attitude, which does undoubtedly affect the price of imported gasoline as much more handling than is necessary takes place, which only means expense, and should the boats be allowed to travel further up the Thames before unloading the spirit it would greatly facilitate distribution, and have a tendency to reduce the price.

Resuscitating a Dead Storage Battery

Sometimes the Generator Is at Fault—Investigate for Imperfect Switches, Sockets and Wiring—Use Plenty of Distilled Water

CLEVELAND, O.—Editor THE AUTOMOBILE:—The almost universal adoption, by car manufacturers, of electric lighting and starting systems, has necessitated the use of storage batteries to an extent never before reached.

The storage battery, properly handled, is a most efficient and uncomplaining servant, but like a good watch or any piece of machinery, it is neither trouble nor fool proof and will suffer from lack of care or unintelligent handling.

Storage battery ailments are very few, but as the most annoying one is a so-called dead battery; the following instructions for its resuscitation may prove of benefit to users:

Should your battery become dead, first ascertain if the generator is putting up its proper amount of current; a storage battery is not a creator of energy and depends for its supply upon the generator, which is driven by the engine.

If you find your battery dead at any time, introduce an ammeter in the battery circuit and see how much current is being delivered by the generator at different speeds—8, 12, 16 and 20 miles per hour. A generator properly built will furnish at least 10 amperes at 12 miles per hour. If you are only getting 7 amperes at this speed the generator should be adjusted to give its full output.

When a storage battery is allowed to fall behind, it will not store the energy supplied by the generator even though the latter is giving its output, for the reason that the battery has gotten into a stale condition and does not properly take a charge.

If investigation shows that the generator has not been giving its rated output, and the battery has fallen behind, it should be taken to a garage and charged according to directions given on the battery name plate. Adjust the generator so that it delivers the output claimed by the manufacturer of the car or generator; put the battery back into service, and, as long as the generator gives its output there will be no lack of light or power for starting.

Value of Ammeter on Dash

Some manufacturers furnish with their apparatus, an ammeter, which is placed on the dash of the car and shows the amount of current passing into the battery. This is very desirable as it indicates whether there is any interruption of current due to any cause whatever and also whether the generator is giving its full output.

Some manufacturers leave this instrument off the car as a matter of economy, but it will be readily understood how valuable this kind of an instrument is when consideration is given to the fact that a battery may become dead and possibly ruined by lack of knowledge of conditions existing in the generator.

Faulty lamp sockets may also cause a storage battery to lose its current. After proceeding as above, if the cause of your trouble has not been located, examine your lamp sockets and look for looseness and poor contacts, which should be corrected at once.

Investigate the switches in both the lighting and starting circuits and make sure that they return properly to the "Off" position when current is not being used.

Ascertain whether your wires are in good condition. Look for places where the insulation may be worn off from friction, where wires rub against the frame or other metal parts of the car.

Inspect your lamps to determine whether or not your battery is overloaded. The total candlepower of lamps used should be in proportion to the capacity of the battery and if you are using more than you should, get lamps of the proper candlepower.

All parts of your lighting and starting systems being right, remember that if you operate your car mostly at night, when lights are all on, and very little in daytime, you are not giving your generator opportunity to do its work and a dead battery resulting from this cause shows no fault either in generator or battery. To avoid this condition when car is used mostly at night, economize on your lighting when possible and run your engine a while each day to fill up the battery.

Last, but not least, don't neglect keeping your battery well filled with distilled water. Remove vent plugs once a week and see whether plates are covered with solution to the depth of at least 1-2 inch. If not, add pure water, never anything else. This is important, as nothing will more certainly insure loss of capacity and final ruin of a storage battery than allowing the plates to become dry.—C. BARRELL, Willard Storage Battery Co.

Detecting Resistance—Saving Fuel

(Continued from page 939)

The curves B, C and D show the increased resistance offered by 5, 10 and 14 per cent. grades.

The vertical distance between the curves (A) and (1) shows the capacity of the motor to accelerate the car on a level road. At 20 miles per hour the motor can exert at the clutch a force equivalent to 147 pounds per ton, which will produce an acceleration of 2.37 feet per second.

At 40 miles per hour the acceleration will be 1.36 feet per second.

If the car begins to ascend a 5 per cent. grade the force available for acceleration will be reduced by the force necessary to mount the grade. As this is 100 pounds per ton, the force available at 20 miles per hour will only be 47 pounds, which will produce an acceleration of 0.75 feet per second.

The acceleration decreases with increased speed until the resistance and torque curves cross, when the car will run at a uniform and maximum speed.

Thus on the fourth speed the maximum velocity will be between 50 and 55 miles per hour on a level macadam road.

The maximum speed obtainable on a 5 per cent. up grade is 37 miles on fourth gear. The maximum grade surmountable on the fourth gear would probably be about 7 per cent. and that at a speed of 15 miles per hour.

Shifting gears to third would raise the accelerating power at 15 miles per hour on a 7 per cent. grade. The power at the clutch would be increased 150 pounds per ton—a large enough amount to accelerate the car 2.4 feet per second.

The speed of the car could be increased to about 35 miles per hour on this gear and grade.

On a 10 per cent. grade the resistance curve (C) for this grade crosses the third speed torque curve at 31 miles per hour, which will be the maximum speed obtainable at that gear ratio and power.

By drawing the resistance curve for any grade whatever we can determine what gear can be used on this grade and what will be the probable limit of car speed.

(To Be Continued)

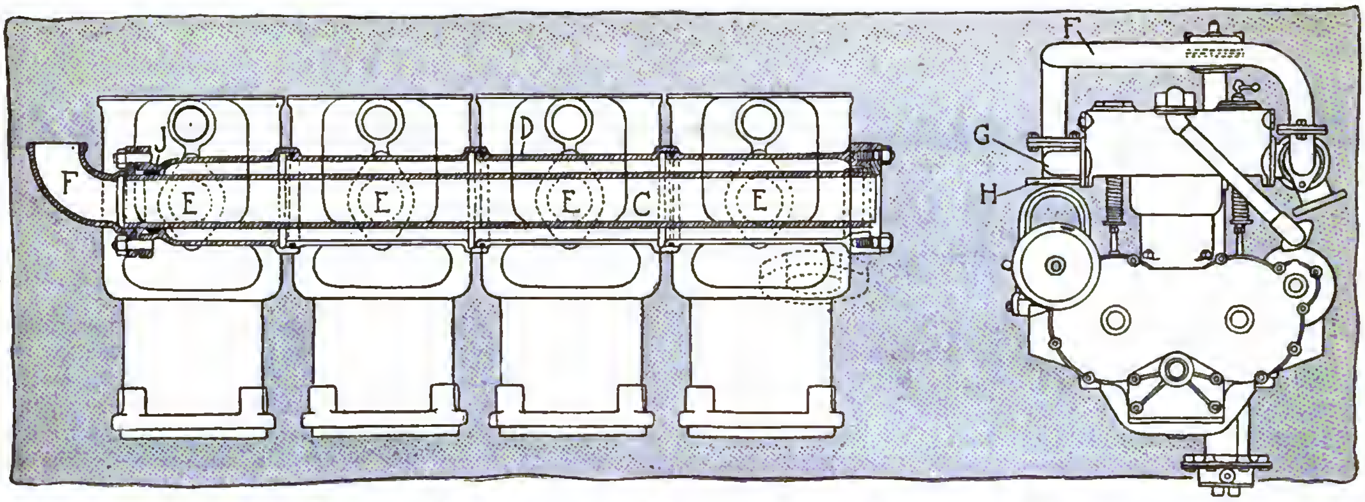

Fig. 1—Elevation and end view of engine fitted with the White and Poppe paraffin system

Paraffin as a Fuel

Heat Necessary To Make Vaporization Sufficiently Complete

THE chief reason why paraffin cannot be used in ordinary motor car engines with existing carbureters is that considerably more heat is required to convert the paraffin into vapor than is the case with gasoline. The same applies in a smaller degree to benzole and other fuels heavier than gasoline but lighter than paraffin, although many gasoline carbureters can deal with these fuels, but not with paraffin unless this is mixed with a lighter fuel.

In the White and Poppe system, which is illustrated in Fig. 1, an ordinary White and Poppe gasoline carbureter is arranged, delivering the mixture through an elbow to the vaporizer pipe C. This passes through the exhaust branch D, to which the exhaust gases are admitted from the cylinders through the four openings E. The fresh gas passes out from the vaporizer tube C by the pipe F to the ordinary induction pipe G, which is arranged in this case on the opposite side from the exhaust branch, and is often fitted with an additional carbureter which is bolted up to the flange H. The supplementary carbureter which is attached at H supplies the inlet pipe with gasoline vapor in the ordinary way, the carbureter A being used for paraffin.

To start up, the gasoline carbureter is used until the vaporizer is sufficiently heated. It is not essential that there should be two carbureters, as one single carbureter can be used, being first supplied with gasoline and then with paraffin. On one car fitted with this system, of which I have had a little experience, the gasoline carbureter was shut off after 2 or 3 miles running, and the paraffin carbureter was then used. By this time the vaporizer was sufficiently hot to gasify the liquid paraffin. As far as one could tell, precisely the same results were obtained with paraffin as with gasoline, and this system is being used on Dennis motor lorries as well as on certain private cars. It is applicable in different ways to suit different types of White and Poppe engines.

The manner in which the objections referred to are overcome is somewhat ingenious. It will be noted that the walls of the vaporizer pipe C are very thick, and the pipe is made of some metal of high heat conductivity, such as copper, and is rigidly attached at one end and held in an expansion joint J at the other. This thick copper tube is therefore free to expand, and, being thick, it retains the heat a considerable time, so that when once heated up the engine can be run slowly for long periods without failure of the vaporizer. Similarly, if the engine be

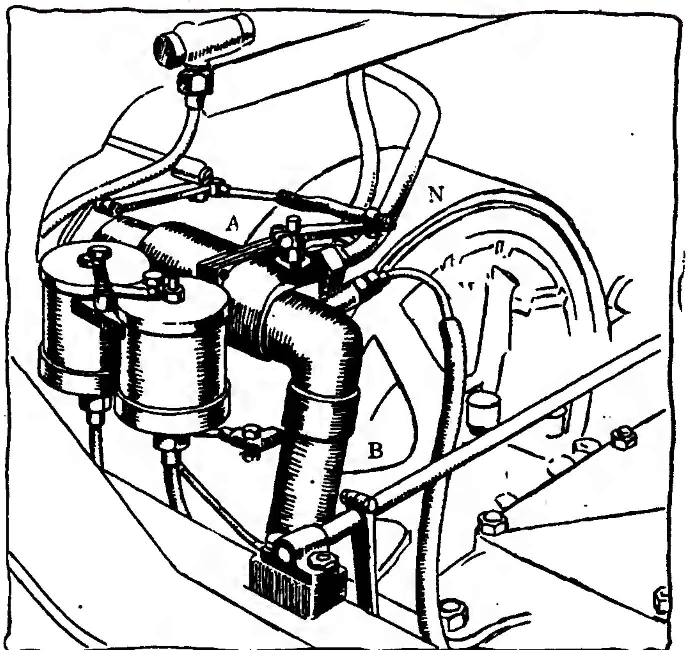

Fig. 2—Carbureter mounted behind flywheel; N is moist air pipe

raced for any length of time the thick copper pipe does not become excessively hot near the exhaust ports E, and firing of the paraffin vapor is prevented.

I have been afforded an opportunity of examining the condition of the pistons and valves of a 28-horsepower Dennis lorry to which the device is fitted. The valves after 1,500 miles running showed no signs of pitting, and the valve heads and piston heads were covered with a slight deposit of fine soft carbon quite different in texture from the usual thick, hard, caked carbon experienced after running on gasoline. The interior of the main supply pipe running through the heater was quite clean, and the oil which had been drained from the crankcase had no smell of paraffin.

It is possible to start without the use of gasoline, as openings are made in the exhaust branch so that a lamp or heater can be used to warm the vaporizer.

Another system is the Halliday paraffin carbureter, which is handled by the Winchester Carbureter Co., 11 Gresham street, London, E. C., and is arranged in a somewhat similar manner to the White and Poppe, but differs in many respects. Fig. 2 is a typical illustration taken from a demonstration car which has been running successfully for many months. It will be seen that the carbureter is arranged just behind the dashboard, and is supplied with hot air from the exhaust box by the pipe

B. It delivers its mixture into a vaporizing tube contained within the main exhaust branch, and the vapor passes off by a vapor pipe to an induction pipe on the other side of the engine. Just before the gas enters the induction pipe it has added to it a small quantity of moist hot air, which is supplied in a manner described hereafter. The carbureter is provided with two float chambers fed with gasoline and paraffin respectively, and from these either fuel is supplied to a jet nozzle which stands vertically in the spraying chamber. A two-way tap beneath the jet nozzle controls the feed of fuel to the jet. Surrounding the choke tube is an automatic air inlet valve and a slow-running by-pass is used, these parts being substantially such as are used in ordinary gasoline carbureters. The lever controlling the two-way tap is coupled to a corresponding lever on the spindle of the water tap. This tap controls the admission of water from the water inlet pipe M to an ordinary jet nozzle. Around this jet nozzle air is drawn from the hot-air pipe passing out through the moist air outlet N, shown in Fig. 2. The quantity of moist air is exactly controlled by the lever which is coupled to the main throttle lever, so that as the throttle is opened more moist air is supplied, and *vice versa.* The control of moist air is, therefore, automatic, and follows the movement of the throttle, and the turning on or off of the water is coupled with the manipulation of the two-way tap. When gasoline is used the water supply is cut off, heing supplied only with paraffin.

The vaporizer itself is of rather peculiar construction. At each side of the vapor pipe is provided a rib which forms a partition preventing the passage of the exhaust gas from one side of the pipe to the other except through the cross tubes. These cross tubes are arranged spirally, and they taper throughout their length. In the vapor pipe they constitute a spiral baffle which breaks up the gas as it passes through the vaporizer, so that ample heating is obtained at low engine speeds.

Those who have had much experience of paraffin in ordinary vertical engines have probably found trouble with their main engine bearings. In fact, with the two-stroke engine referred to three months' running was sufficient to wear out a big end bearing. The reason for this may be that during the last few revolutions, after the engine is switched off, paraffin is drawn into the cylinder, and, as the engine cools down, this condenses and travels down past the piston, and on its way washes away the cylinder oil and on its arrival in the crank chamber it dilutes the oil there and causes the bearings to be scored. Unless provision is made to cope with this, much trouble is liable to be experienced in vertical engines. To prevent trouble from this cause I generally finish the running on gasoline, so that 3 or 4 minutes before I stop the engine I change over from paraffin to gasoline.—From *The Autocar.*

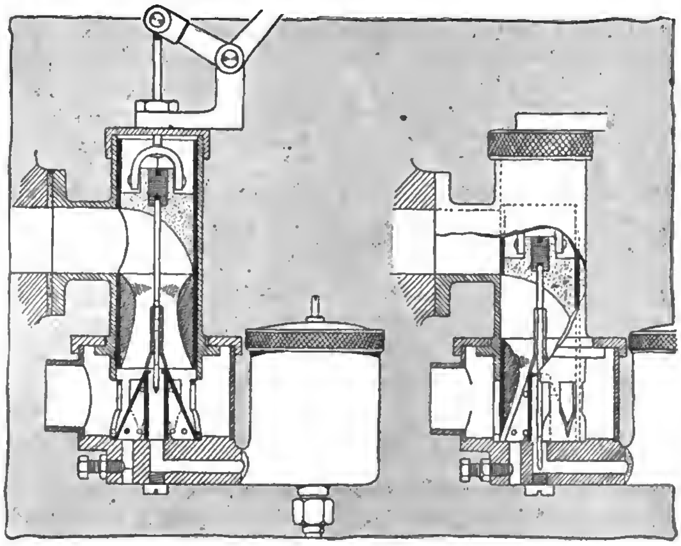

Fig. 3—Part sectional views of Cox carbureter, left with throttle open, right with throttle closed

Cox Carbureter Out

Has Single Jet and Positive Mixture Regulation

A SIMPLE single-jet carbureter has been brought out by Arthur Cox, of Birmingham, England, which has many novel features of construction to recommend it to the student of carbureters. It may be said to consist of an L pipe with a jet in it. The jet takes the form of a .25-inch tube with a cap having an orifice of about .125 inch. Into this orifice a taper needle is entered and withdrawn as the throttle is closed or opened. At its closed position there is still a small annular space between the needle and the side of the jet orifice and, of course, as the needle is raised the area of the orifice and, consequently, the supply of gasoline is increased, Fig. 3. Round this jet is a series of air ports having taper bottoms which are not sharp V-tapers, but slightly curved, and these ports are opened or closed as the needle is moved up and down in consonance with the opening or closing of the throttle. The throttle consists of a tube with a curved passage in it, this passage registering with the inlet pipe. The tubular throttle, further, carries the needle for the jet, and as it is raised or lowered, *i. e.,* opened or closed, it also opens or closes the air ports. When the throttle is fully open the needle is raised high in the jet and the air ports are also wide open, and it will be seen that on full throttle the carbureter is of the most open type, providing a perfectly free passage for the air, both before and after carburetion, into the engine.

Low Speed Provided For

This kind of carbureter is well known to be satisfactory for high speeds and full power, but it is difficult to get easy starting and good slow pulling with it, and the way Mr. Cox has overcome the difficulty is as ingenious as it is simple. In the slow running and starting position the throttle is practically closed, the air ports are closed all but a fraction, only just the fine point of the V being open, and the needle is well into the jet orifice, so that the annular space between it and the jet orifice is very small indeed. It will be noticed that around the jet tube is a petticoat, or cone, in which some small holes are bored, and there are holes beneath it through which air is drawn, in addition to that passing through the tiny apertures at the bottom of the V-slots. The larger of these under holes can be adjusted by means of a bolt and nut, so that the adjustment can be set for slow running.

The throttle is formed in one piece with the choke tube, and consequently the latter moves up and down with it. In the slow-running position, therefore, the most restricted diameter of the bore of the choke is at the same level as the top of the jet, so that the negative pressure is maintained despite the throttle closing and the resultant loss in engine speed. At the other extreme, *i. e.,* full throttle, the choke is raised high and the top of the jet is in the largest diameter of the choke tube, as shown in the left-hand view.

It will be realized that at all times the gasoline issuing from the jet is of annular form—that is to say, it takes the form of a very thin-walled cylinder, or pipe, of gasoline, and, the clearance between the needle and the jet being infinitesimal in the starting or nearly closed position, the atomization is remarkably good, besides which the suction on the jet is very strong, so that plenty of gasoline is obtained for starting, slow running and acceleration.

It will be noticed on studying the drawings that the carbureter has been designed to provide the minimum of resistance to the passage of the air and carbureted air through it; indeed, all its proportions are the result of patient experiment.—From *The Autocar.*

American Automobiles in World's Markets

Latest Consular Report Shows Low-Priced American Car a Fast-Growing Favorite in European Countries—Best Exporting Methods for Manufacturer Outlined

A SECOND special consular report in the form of a supplement to that issued last summer under the title of Foreign Markets for Motor Vehicles has just been issued by the Department of Commerce and Labor at Washington. The first of these publications was dealt with in THE AUTOMOBILE for August 22, 1912. All the separate reports from the various countries received since that time have been incorporated in the booklet just brought out under the title of Development of Motor Trade Abroad.

The reading matter contained is of great interest and should prove of exceptional value to the American manufacturer who wishes to obtain accurate information relative to the conditions of trade and other requirements of contemplated fields for the exploitation of his product.

Figures dealing with the number and value of the imports into each country are included in the separate reports and although those for the year 1912 are not yet available except in one or two cases, the statistical information given, covering generally the last 2 or 3 years, is sufficient to furnish a useful indication of the most profitable market for exported automobiles.

Cyclecar Possibilities

One of the chief foreign markets for low-priced American automobiles is the United Kingdom. This year a prominent feature of the British report is the amount of space devoted to the new light vehicle termed the cyclecar, the manufacture of which is already an industry of considerable importance in England and in one or two other European countries. It is suggested that it may be practical to meet the British demand for these cars by producing an American vehicle of the same type. Cyclecars are built with three or four wheels, with a track of 36 to 40 inches, and as a general rule are two-seaters, though there are a few carrying three or four passengers. The narrower gauge cars are built to carry passengers tandem, but those in which the passengers ride beside each other have been most favorably received. The fact that these vehicles can be run cheaply is a point in their favor that is having far-reaching results, and the indications are that the demand is growing at a faster pace than the production. The average price is around the $500 mark or slightly above.

The motorcycle, too, is a thriving industry in Great Britain and there seems to be no reason why an increased market should not be created for high-grade American motorcycles provided they meet the English demand as to type, construction and price.

Requirements

But while the use of these smaller vehicles may be worthy of some consideration by the American manufacturer, naturally the chief interest of the booklet centers on the progress and prospects of exported passenger cars. American exporters of automobiles have established firm trade connections with several foreign markets, and have overcome, by the excellence of their product, the conservatism which was a feature of the European attitude a few years ago. But if these excellent beginnings are to be maintained, a close study of the special requirements of the foreign markets must form part of the exporter's policy. Some valuable suggestions, gathered from the several consular reports as well as from his own individual observation, are given by the consul-general. These include the following:

The personal visit of some responsible member of the exporting firm is necessary to the establishment of a successful agency in Europe. It is not sufficient to send a subordinate except to collect preliminary information.

2. There must be a complete stock of parts available and facility for quick supply and repair, as our cars are in direct competition with foreign cars, for which spare parts can be had in a few days in any part of the continent.

3. It is essential that the exporter show a real economy in the operation of his car, because of the vastly higher price of gasoline in Europe. It appeals to the thrift of the average foreign buyer, and is the foremost claim that can be made for any car in the first stages of its introduction.

4. It seems desirable to concentrate efforts on a smaller number of cities than is becoming the custom of some manufacturers. Where countries are small and populations compact, better results will be attained by a general agent in each commercial capital. Some countries require more than one agent because they have more than one capital. This is true of Italy and Germany but not of France, where Paris is the natural center from which the entire country may be covered.

5. Exported cars must have a high degree of durability. It is not the habit of the Continental buyer to get a new car every season. In time some arrangement could be made for the exchange of old cars for new, as is done by European makes. But in general the European buyer runs his automobile much longer than is the rule in America.

Following are brief digests of the reports from each of the countries which are considered in this comprehensive booklet.

United Kingdom

The extensive sale of American cars is still a much-talked-of subject in English automobilism, but several British experts now acknowledge that the introduction of the American product has not only stimulated the home manufacture, but has also extended the entire market considerably. The manufacture of low-priced cars here is undoubtedly due in a large measure to the American initiative. Durability is to be insisted on. The slightest deterioration in the quality of a single American make which is sold to any extent abroad will not only affect the particular manufacturer disastrously, but will cause definite injury to the prestige of all American manufacturers selling automobiles in foreign countries.

An important point in connection with the wants of the British buyer is that while the excellent running powers of the engine and operating parts are giving complete satisfaction there are indications that he would be willing to pay a little more for increased comfort in the upholstery and a finer body finish to the car in general. It is for this reason that there appears to be a considerable market for the manufacturer who cares to supply a chassis without body so that the body can be fitted to meet the special wishes of the purchaser.

Chassis Wanted

It is claimed that a good chassis at $500 or slightly more would meet with a ready market. The chassis should include a 15 to 20 horsepower engine, four cylinders, three or four-speed gearset, and be capable of a speed of 25 to 35 miles per hour. Self-starters are said to be in demand but not in supply. An agent for American cars said that if Americans are to command the field in this line they must come quick or lose the market, as many experiments are being tried there and a perfect appliance is looked for at any time.

It is estimated that British manufacturers are supplying two-thirds of the home demand, about sixty firms offering nearly two hundred types of machines, supplying an annual output well over 20,000.

France

According to official statistics, the value of the automobiles imported into France from the rest of the world in the 3 years 1909, 1910 and 1911 was, respectively, $1,453,483, $1,677,556 and $2,223,746. The noteworthy increase in 1911 was due almost wholly to the increased popularity of the moderate-priced American car. This increase was maintained in 1912, the imports of American automobiles in the first 10 months of 1912 being $328,000 greater than in the same period of 1911.

The Paris salon of 1912 will be memorable as the first automobile exposition held there in which American cars and accessories were displayed on a scale which adequately represented the American automobile industry. Formerly, American makers were for the most part absorbed in their home trade. This state of affairs is now changed and there can be little doubt that the popularity of the American vehicle in France will continue to grow.

Belgium

The Belgian automobile industry is enjoying a boom due to an enormous increase in its sales abroad. The import figures for 1910 and 1911 show a decrease while the export trade for the same year shows the enormous increase of 75 per cent. This country therefore does not seem to offer a very profitable field for the American manufacturer. In 1911 only thirty-two automobiles were imported from the United States, while the imports from France, the adjacent country supplying the bulk of the machines imported into Belgium, are declining. The manufacture of automobile bodywork is an important industry in Belgium, many accepted features of present day body design having originated in that country. In 1911 the value of exported Belgian automobile bodies amounted to $1,158,000.

Spain

Although France dominates the Spanish market the United States is becoming a keen competitor and, according to information received from local agents, the American automobile has now gained a strong foothold in Spain in spite of the fact that its introduction was exceedingly difficult. The sale of low-priced American machines in Spain is not, however, as extensive as it might be and one of the reasons given for this restriction of trade is the big profit exacted by the local agent from purchasers, which brings the selling price to almost double that asked by the agent in the United States. As showing that there is a better market in Spain for the lower priced automobile the import figures for the years 1910 and 1911 provide an interesting contrast. In the first of these years the total number of cars exported was 393 at a value of $739,230. For the following year the number of cars reached 612 but the actual value represented a decrease, the figure being $565,422. This latter amount is roughly one-quarter of the total value of automobiles imported into France for the same year. Imports from France into Spain during 1911 totalled $392,973, while those from the United States represented $68,723. The figures for 1912 are not yet available, but the ratio between French and American imports will in all probability show a decided decrease. Machines of high power are not desired by the Spanish people, the average car running from 12 to 20 horsepower.

Russia

Russian roads are unsuitable for automobiles and the streets of all cities, except a few in the capital and Moscow, are even worse, as they are paved with cobblestones. In spite of these conditions, however, the sale of automobiles is increasing rapidly and as the home manufacture so far is only slight the market for the outsider is profitable. There is a real demand for cars of all classes, particularly of the cheap but strong kind, in both the larger cities and the provinces, and few cities in Europe afford better opportunities for the extension of American trade, though there is a certain prejudice to live down due to the introduction a few years ago of some American cars that did not show any conspicuous merits.

Italy

The serviceable low-priced American automobile is also making its mark in Italy. For the 11 months ending November 30, 1912, there were imported into this country 227 cars of American manufacture, as against 145 for the calendar year 1911, only 25 in 1910 and 7 in 1909. While Italian agents are at present manifesting special interest in American machines, complaints have been made that although the American car is an excellent one for the money, the deliveries have been slow. The manufacturing output of Italy is also increasing rapidly. In 1911 the number of machines turned out amounted to nearly 5,000, this figure including trucks. This output is likely to be raised to 8,000 for the year 1912. The actual figures are not yet available.

Argentina

Although France supplies the largest number of automobiles, the sale of American cars in Argentina is increasing satisfactorily. In 1911, automobiles to the value of $330,126 were imported from the United States, a figure which has been exceeded by the imports registered during the first 9 months of 1912, the total value for that period being $392,197. It is estimated that almost half the cars in this country are used in Buenos Aires.

India

The latest figures from India show a remarkable increase in the imports from the United States. For the past official year ending March, 1912, the value of American cars reached $195,925, four times the amount of 1910-11. This puts the United States into second place, the United Kingdom still retaining the bulk of the trade, and shows that our manufacturers are taking a serious interest in the Indian market. The sales from Belgium, France and Italy are falling off, while those of Germany indicate a slow progress.

Japan

In 1912 the automobile business made rapid progress in Japan. This year in Tokio licenses have been issued to 305 machines and in Yokohama 108 licenses have been granted. The combined figure for both cities last year was only 194, so it will be seen that the increase registered is well over 100 per cent. In Tokio a taxicab company has been formed and has in regular service fifty-six cars of American manufacture.

Australia

The latest figures available in regard to the importations of automobiles into the Commonwealth of Australia show the trade to be thriving in every state. During 1911, chassis, bodies and complete vehicles, including motorcycles, to the value of $6,019,947 were imported. The United Kingdom led in countries of origin with shipments valued at $2,265,801, and the United States was next with $1,268,096. The American has obtained a strong hold on this market.

—

Trade Opportunities

Automobile Agencies—An American consul in the United Kingdom, in a report on the sale of automobiles in his district, writes that the cars most in demand at present are from 15 to 20 horsepower. Three firms have expressed a desire to enter into correspondence with American manufacturers with the view of acquiring agencies. Correspondence in English. Inquire at the Bureau of Foreign and Domestic Commerce, Washington, D. C. File No. 10,713.

Electric Automobiles—An American consul in a European country reporting on the market for electric automobiles in his district states that two local business men are interested in receiving offers and catalogues from American manufacturers of very cheap and light American electric cars which could be sold to the public at about $1,500. File No. 10,762.

Factory Miscellany

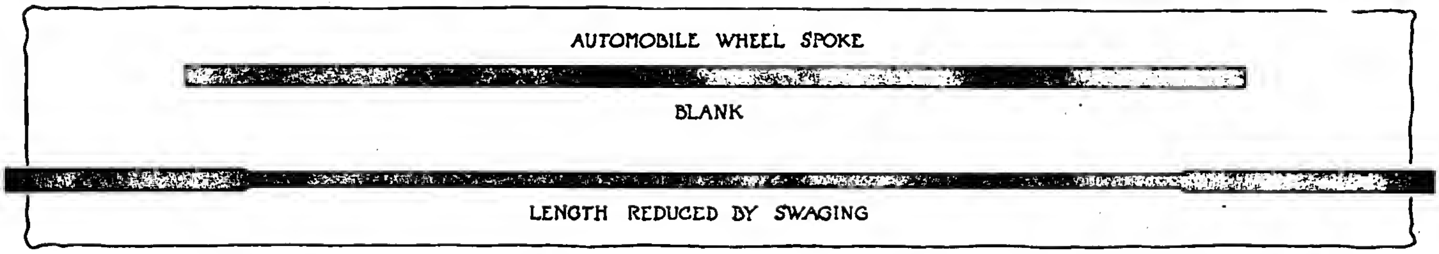

Diagram showing wire spoke for an automobile wheel in two stages of construction. A blank spoke is shown above, while below it is illustrated the effect produced by the swaging machine

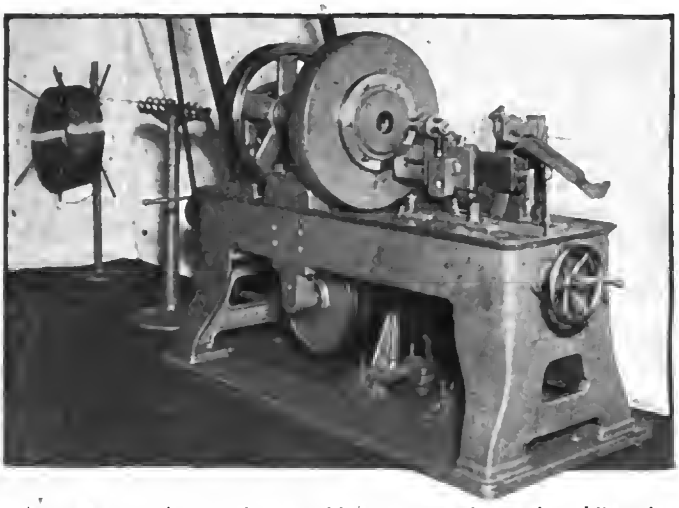


Special automatic swaging machine for swaging automobile wire wheel spokes used by the Langelier Mfg. Co., Providence, R. I.

THE accompanying illustration shows an improved type of automatic swaging machine designed and built by the Langelier Mfg. Co., Providence, R. I., for swaging automobile wire wheel spokes such as shown in the above diagram. It takes the wire from the coils, straightens it before entering the machine, swages the spokes between butts and mechanically cuts them off to length after swaging, all operations being entirely automatic and absolutely without waste or manual handling.

This machine has a very high output, on ordinary automobile wire wheel spokes this output reaching as high as three spokes a minute, all straightened, swaged and cut off. This efficiency is obtained by eliminating all time losses between operations. While one spoke is being swaged, a finished spoke is being cut off.

The coil of wire is supported on a wire reel resting on the floor at the extreme left, from which it unwinds as it is drawn through the straightener on its way to the swaging machine. This straightener is of the rotary type. It has offset steel eyelets mounted with ball bearings in suitable holders, so designed that the offset eyelets do not bear in an unyielding manner against the passing wire, but revolves so that no marring of the finish of the wire occurs, as in ordinary wire straighteners.

The wire enters the swaging machine through the rear end of the hollow spindle carrying the dies, and as it is drawn through these swaging dies, these close automatically over the wire, after allowing the portion forming the butt to pass out of them, and impart a high number of sharp, clean blows simultaneously in couples from diametrically opposite directions on the stock, reducing it rapidly and giving it a sort of hammer temper, for the distance between the butts, when the dies again open mechanically, allowing the portion of wire forming the opposite butt to pass out of the machine unswaged.

The outward travel of a saddle with chuck mounted on a horizontal slide, in front of the machine head draws the wire through. This saddle is provided on its rear with a rack seen projecting at end of slide in photograph, in which meshes oscillating segment gear, already set in motion by a face cam and roller underneath the bed of the machine.

The connection between the segment and the cam roll lever is obtained by means of a special form of link having a right and left hand nut, readily reached and locked from the rear, which, upon being adjusted vertically, varies the centers of the link pins, increasing or decreasing the arc of travel of the segment gear, correspondingly varying the travel of the saddle on the horizontal slide above the bed, producing spokes of different overall lengths and with different swaged portions between the butts.

Forced oil lubrication to all running parts and on the dies is maintained by an automatic oil feed pump. Other types of wire feeds besides that described are also put on to suit different makers' spokes and the machine is built for either belt or motor drive. The machine weighs 5,550 pounds and takes up a floorspace about 3 by 6 feet.

REMY Negotiating for Factory—Frank and Perry Remy, of Anderson, Ind., are negotiating for a factory building in that city and expect to re-enter the manufacturing business in a short time. Since their return from Europe some time ago they have maintained a laboratory and have perfected a number of electrical devices. They formerly owned the Remy Electric Co., which they sold 2 years ago.

Installing Steel-Tempering Furnace—The Spokane Auto Parts Co., Spokane, Wash., is preparing to install a large gas steel-tempering furnace.

Dyneto Plant Moved—The Dyneto Electric Co., Syracuse, N. Y., has removed its plant from Elbridge, N. Y., to Syracuse, occupying the plant of the Crouse-Hinds Co.

Buckeye Awards Contract—The Buckeye Rubber Co., Akron, O., has awarded a contract for the construction of a brick, steel and concrete factory addition, to cost $25,000.

Lenox Buys Property—The Lenox Motor Car Co., Boston, Mass., has secured the property owned by Norman Marshall on Factory street, in the Hyde Park section, and will convert it into an automobile plant.

Timken Employs 1,500—In the April 10 issue of THE AUTOMOBILE it was stated that the Timken Detroit Axle Co. employs 150 men. This was a typographical error, as this company has 1,500 men on its payroll.

Want Chandler Building Bids—The W. S. Ferguson Co., engineers, announces that it will be ready for bids in the near future for the general contract of building the new Chandler automobile plant at St. Clair avenue, Cleveland, O.

Velie Increases Capacity—The Velie Motor Vehicle Co., Moline, Ill., has increased its capacity by the construction of a new plant operating under the name of the Velie Engineering Co., which is devoted exclusively to the manufacture of trucks.

Chase Contemplating Additions—The Chase Motor Truck Co., Syracuse, N. Y., is contemplating extensive building improvements. Plans are being contemplated for doubling the capacity of the general offices and greatly extending the manufacturing facilities of the plant.

Hawthorne Planning to Build—The Hawthorne Mfg. Co., manufacturer of automobile horns and metal stampings, is having plans prepared for a new five-story building in which it is proposed to begin construction sometime this spring. This company recently installed some additional drop presses.

Cole's $150,000 Addition—The future production figures for the Cole Motor Car Co., Indianapolis, Ind., will double, a $150,000 addition to the present plant on East Washington street will be built, and the organization generally enlarged. A four-story building has been started and is expected to be completed by October 1.

Weller-Thomas Plans Plant—The Weller-Thomas Co., recently incorporated by Zanesville, O., capitalists, is planning to erect a plant for manufacture of motor-driven fire apparatus. The high waters of the latter part of March may make it necessary to postpone the arrangements. The concern was incorporated at $1,000,000.

Students Inspect Milwaukee Plants—A party of 150 engineering students of the Ohio State University at Columbus, O., spent 2 days inspecting Milwaukee, Wis., industries recently, visiting many of the automobile plants.

Aluminum Goods Awards Contracts—The Aluminum Goods Mfg. Co., Manitowoc, Wis., has awarded contracts for the construction of additions costing $45,000 and which will be completed by September 1. This will increase its output by 35 to 50 per cent.

Klumb to Erect—Paul Klumb, of Sheboygan, Wis., has organized a new company with his two sons, Ewald and Oscar, to engage in the manufacture of gasoline motors. A plant will be erected in the near future. The main building will be 150 by 80 feet.

Establishes Welding Plant—The American Gas Engineering Co., recently organized at Sheboygan, Wis., by E. M. Parmelee, B. Lucas and L. L. Rowlands, has established a welding and general machinery plant as the nucleus of the gas engine business which its founders intend to ultimately establish.

Chase to Increase Facilities—The Chase Motor Truck Co., Syracuse, N. Y., is contemplating extensive building improvements. Plans are now being completed for doubling the capacity of the general offices and greatly extending the manufacturing facilities of the plant. The company increased its working forces two months ago and also started running night as well as day shifts.

To Make Tires—As the result of a strike of thirty employees of the strapping and cementing department of the Chicago Rubber Clothing Co., at Racine, Wis., it is probable that the concern will discontinue the manufacture of rubber clothing and turn the big plant into a motor car tire manufactory. The plant is well equipped and it would require only a small outlay to equip for the production of tires.

New Clintonville Plant—The Four Wheel Drive Automobile Co., Clintonville, Wis., has awarded all contracts for factory No. 3, the newest and largest addition to its plant at that city, which is to be ready for operations July 1. Upon its completion work will be started on factory No. 4, which is to be 100 by 120 feet, similar to the No. 3 building now under way. A power house 40 by 40 feet in size will also be erected without delay. The improvements will cost in excess of $75,000.

Morgan & Marshall's Plant—The Morgan & Marshall Rubber Co., East Liverpool, O., announces new plans and specifications for, a new plant. The company will expend about $1,200,000 for the construction and expects to turn out 500 tires a day at its completion. Ground will be broken in May for three buildings, 60 by 120 feet and 50 by 120 feet. They will be two stories high. There will also be a boiler house, 30 by 100 feet in size. Steel truss construction will be used throughout.

Canadian Goodrich Plant Activities—The B. F. Goodrich Co., Toronto, Ont., is definitely committed to a new Canadian factory, which will be commenced just as soon as the weather permits the builders to get busy. Thirty-two acres of land have been secured at St. Catherines, Ont., conveniently located for the handling of traffic by railroad and the new factory will be modeled on the lines of the parent Akron, O., plant. When fully developed it is planned to employ 1,000 hands, with ample provision for future extensions.

New Wisconsin Aluminum Group—The Wisconsin Foundry Co., Manitowoc, Wis., which recently increased its capital to $110,000 to provide for the construction of an entirely new plant, has received plans for a new group from its architect. The plans call for a large casting shop, 50 by 100 feet in size and 40 feet high; an assembling and finishing room, 50 by 105 feet, and an administration building, 40 by 60 feet in size and two stories high. It will be ready about September 1. The company agreed to expend $360,000 in wages in 6 years' time in order to secure the donation of the new site from the Citizens' Assn. of Manitowoc.

Ambridge Has Automobile Plant—Ambridge, Pa., has joined the ranks of the automobile manufacturing cities. Recently several Ambridge men got together and purchased the parts for twenty automobiles from the Pitt Motor Co., of Pittsburgh, Pa., when that concern went out of business. These parts have been shipped to Ambridge and are now being shipped assembled in an old planing mill building. D. C. Anderson, manager of the Economy Electric Co., has charge of the work, and several men are being employed at the present time. Six more expert mechanics are wanted, as it is a desire of the projectors to have the machines ready for market within the next few weeks. The persons interested in the project are Mr. Anderson, C. G. Carr, Dr. P. J. Sohn, F. C. Schroeder and David Challis.

The Automobile Calendar

Shows, Conventions, Etc.

May 20-21.........Boston, Mass., Convention of Electric Vehicle Makers.
June 2-7..........Racine, Wis., "Made in Racine Exposition," J. I. Case Co.'s foundry.
June 5, 6, 7.......Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October ....Paris, France, Automobile Show, Grand Palais; 10 days.
November ....London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

May 2............New York City, Secret Time Run to New Rochelle, Motor Dealers' Contest Association.
May 5-8..........Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14...........New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 17...........Atlanta, Ga., Automobile and Accessory Association Annual Hill Climb.
May 30...........Indianapolis, Ind., 500-Mile Race, Speedway.
June 7............Philadelphia, Pa., Inter-Club Reliability, Quaker City Motor Club, Automobile Clubs of Delaware County, Philadelphia and Germantown.
June 16, 17, 18.....Columbus, O., Reliability Contest, *Ohio State Journal.*
June 25-28........Chicago, Ill., Non-Motor-Stop Reliability, Chicago to Boston, Chicago Automobile Club.
July 1............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Association to the Pacific Coast.
July 1-16.........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 4-5..........Sioux City, S. Dak., Track Meetings, Sioux City Automobile Club and Speedway Association.
July 5-6..........Tacoma, Wash., Road Race, Montemara Festa Automobile Committee.
July 8-16.........Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 27-28........Tacoma, Wash., Tacoma Road Races.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups Holding Company.
Nov. 27..........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Foreign.

May ....St. Petersburg, Russia, International Automobile Exposition, Building of Michael Maneze, Imperial Automobile Club of Russia.
May 7-10-11.......Paris, France, Sarthe Automobile Meeting and Speed Hill Climbing.
May 11-12.........Palermo, Sicily, Targo-Floria Race.
June 3-7..........London, Eng., Third International Road Congress, Rees Jeffreys, General Honorary Secretary.
June 23-28........London, England, International Road Congress.
July 12...........Amiens, France, Grand Prix Race.
July 13...........Paris, France, French Grand Prix Cyclecar Race.
July 18-26.........London, Eng., Imperial Motor Transport Conference.
Sept. 21...........Boulogne, France, 3-Litre Race.
Sept. 25...........Isle of Man, International Stock Car Race.
October ....Paris, France, Paris Automobile Show.

Plant of the Rochester Electric Motor Co., Rochester, N. Y., occupying 35,000 square feet. The machinery is driven by individual motors and group drive

The Week in the Industry

Engineer — Dealer — Repairman — Garage

This illustration shows how the State of Connecticut got rid of a dangerous turn in the highway by changing the course so that the road is straight. The old iron bridge at the left of the white fence was formerly used

Crossing at Berlin, Conn., where a number of serious and fatal accidents have occurred. Note the absence of gates

The death trap, one which the motorist should eliminate. This has been the cause of many fatalities in the state of Connecticut

LOCOMOBILE BUILDING NEW HOME—The breaking of the ground for the new salesroom and service station on West 61st street, just off Broadway, marks the most important steps taken by the Locomobile Co. of America, in New York City since their start back in the earliest days of the automobile industry. The new building, which will be eleven stories high, will be completed in October, and will have a frontage of 100 feet on 61st street. The front of the building will be devoted to show rooms with offices on the mezzanine and second floor, while the upper floors will be devoted to storage, repair shop, paint shop and room for rebuilt cars.

FIRE TRUCK FOR SELMA—Delivery has been made in Selma, Ala., of a new automobile fire truck.

GRIBBEN WITH CENTRAL MOTOR—W. C. Gribben has been appointed manager of the Central Motor Car Co., Lexington, Ky.

PULLAR COMPANY FIRESTONE AGENT—James Pullar & Co. have been appointed Hartford, Conn., agents for Firestone tires and rims.

KING FERDINAND BUYS MERCEDES—The Bulgarian ruler, King Ferdinand, has bought a Mercedes car equipped with a Knight engine.

NEW FIRESTONE ADVERTISING MANAGER—E. S. Babcox is now advertising manager of the Firestone Tire & Rubber Co., Akron, O.

LAWTON BI-MOTOR SALES MANAGER—C. T. Lawton has been appointed sales manager of the Bi-Motor Equipment Co., Boston, Mass.

OPEN TIRE REPAIR SHOP—The Hartford Steam Vulcanizing Wks., Hartford, Conn., have opened a tire repair shop on Mulberry street.

TIRE AGENCY BUILDS ADDITION—The Automobile Tire Co., 129 Allyn street, Hartford, Conn., has acquired double floor space by building an addition.

MANHATTAN CLUBROOMS OPENED—The new clubrooms of the Manhattan Automobile Club, 222 West 59th street, New York City, recently opened to members.

BUMP RETIRES—F. R. Bump recently retired from the R-C-H Corp., Detroit, Mich. He was the sales manager of the company, with headquarters at Detroit.

NOW HANDLES SHAWMUT TIRES—The Imperial Motor Tire Co., Washington, D. C., has succeeded the Imperial Motor Co., and will handle Shawmut tires.

SMITH SALES MANAGER—R. Scott Smith has been appointed sales manager of the E. C. Johnson Co., Philadelphia, Pa., distributor of the Reo and Premier cars.

QUIMBY WITH PACKARD—J. C. Quimby has joined the sales force of the Packard Motor Car Co., of Boston, Mass., as assistant manager of the used car department.

WILCOX RESIGNS AS REGAL MANAGER—George Wilcox has resigned from the staff of the Regal Motor Car Co., Detroit, Mich. He was the company's sales manager.

NEW UNIONTOWN GARAGE—The Craig Motor Car Co., Uniontown, Pa., is completing a garage on East Main street and will embark in the automobile business there.

ROWLAND ADVERTISING AGENCY MOVES—The Rowland Advertising Agency, Inc., has moved to the United States Rubber Bldg., Broadway, at 58th street, New York City.

Sibbald Resigns from Salesmanagership—F. C. Sibbald has resigned as sales manager of the Probey Co., Washington, D. C., and has been succeeded by W. D. Arrison.

Kuhns Resigns from Studebaker—E. L. Kuhns has resigned from the Studebaker Corp., Detroit, Mich., where he served in the capacity of sales and branch manager.

Boogher Resigns from Apperson—H. H. Boogher, of Seattle, Wash., recently resigned his position as secretary and manager of the Apperson Motor Car Co., of that city.

Quaker Tires in Binghamton—H. H. Young, Binghamton, N. Y., has secured an agency there for Quaker automobile tires, made by the Quaker City Rubber Co., Philadelphia, Pa.

Ten Fords for Uruguay—Ten Ford cars were exported through New Orleans, La., for Uruguay recently. The cars were assembled and put in extra heavy crates at New Orleans.

New Bosch Appointment—The Bosch Magneto Co., New York City, has appointed the Motor Parts Co., 185-187 Columbus avenue, Boston, Mass., as distributor of its products.

Akron Wants Fire Truck—Bids will be received by D. P. Stein, director of public safety of Akron, O., until May 20 for an automobile fire engine for use of the fire department.

Rose Pacific Lozier Manager—L. H. Rose has been appointed Pacific Coast manager for the Lozier Motor Co., Detroit, Mich. He will make his headquarters in San Francisco, Cal.

Atkin with Sheffield Simplex—Captain J. E. Atkin recently arrived from England to take charge of the sales department of the Canadian Sheffield Simplex Auto Co., Toronto, Ont.

Davis in Detroit—D. D. Davis, recently chief engineer of the Hayes Wheel Co., Jackson, Mich., has been placed in charge of the Detroit, Mich., office of that company at 617 Ford building.

Sleeper with New Concern—I. S. Sleeper, former advertising manager of the Firestone Tire & Rubber Co., Akron, O., is now general sales manager of the Colonial Printing Co., Cleveland, O.

Hoffman Firestone Syracuse Manager—E. A. Hoffman has been appointed manager of the Firestone Tire & Rubber Co., at Syracuse, N. Y. The branch is located at 504 East Genessee street.

Wahpeton Garage Organized—The Wahpeton Garage Co., Wahpeton, N. D., has been organized and will construct a two-story brick building, 50 by 130 feet. Mayor Frank Eberley is president.

Buses Replace Street Cars—The city of Huntington, Ind., has declined to grant a franchise for a street car line and has substituted in its place a motor omnibus service under a 20-year franchise.

Jackson Cole Territory Manager—The Henderson Motor Car Co., Indianapolis, Ind., has appointed W. E. Jackson as territory manager for Southern Illinois with headquarters in Indianapolis.

Apgar Resigns Ford Managership—H. C. Apgar, formerly manager of the Ford Co., in Dallas, Tex., has resigned as manager of the company and will enter the automobile business for himself.

Goes to Factory—Warren Atkinson has just been transferred to the factory of the Lenox car in Boston, Mass., from the Bassett Garage, Bridgewater, and he is to have charge of the stock room.

Woman Garage Manager—J. C. Redmond is claimed to be the only woman garage manager in California. She took over the business from her son, C. A. Redmond, 4317 Central avenue, Los Angeles.

Now with Michigan—John Fischer has become manager of the retail sales department of the New England branch of the Michigan Motor Car Co. of Boston, Mass. He was formerly with the Hupmobile.

Aplco Lighting in Columbus—The Rogers Supply & Tire Co., Columbus, O., has taken the central Ohio agency for the Aplco lighting and self-starting systems, manufactured by the Apple Mfg. Co., Dayton, O.

Indianapolis to Buy Automobile—On the recommendation of fire chief Coots, the board of safety of Indianapolis, Ind., will purchase an automobile for the use of the superintendent of the fire alarm telegraph system.

Vesta Service Station Opened—A branch office and service station has been opened in Providence, R. I., for the installation and care of Vesta electric lighting systems for automobiles, by the Vesta Providence Co.

Cutting Enters Richmond—The Cutting Motor Car Co., Jackson, Mich., is preparing to enter the Richmond, Va., field and has rented a salesroom next to the Chamber of Commerce building on Main street, near Fifth.

Smithson in Charge—B. M. Lindaley, Southwestern manager for the Kissel Kar Co., Dallas, Tex., announced recently that G. W. Smithson would have charge of the commercial vehicle department of that company.

Bolton Changes Detroit Address—L. D. Bolton, representative of the Brown-Lipe products, Spicer universal joints and Kinsey radiators and gaskets in Detroit, Mich., has moved to larger offices at 2215 Dime Savings Bank Bldg.

Dye Resigns—J. E. Dye, manager of the Begg Motor Car Co., Vancouver, B. C., has severed his connections with that firm. He will become managing director of a new company being incorporated and in the same line of business.

Three Years Contract—W. D. Myers, sales manager of the Stutz, has been in Boston, Mass., a few days, where he signed a contract with M. H. Chase, who handles the Stutz in that territory, to take these cars for the next three years.

Warren Resigns from Haynes—C. B. Warren, general manager of the Haynes Automobile Co., Kokomo, Ind., has resigned. His resignation will take effect on the first of June. He was formerly manager of the New York City branch.

Flynn Eastern Sales Manager—J. J. Flynn, formerly manager of the Locomobile branch in Washington, D. C., has been appointed eastern sales manager of the Standard Electric Car Co., that city, and will have headquarters also there.

Back on the Old Job—E. H. Broadwell has gone back to his old position as vice-president of the Fisk Rubber Co., which he resigned to go with the Hudson Company at Detroit, Mich. He will make his headquarters at Chicopee Falls, Mass.

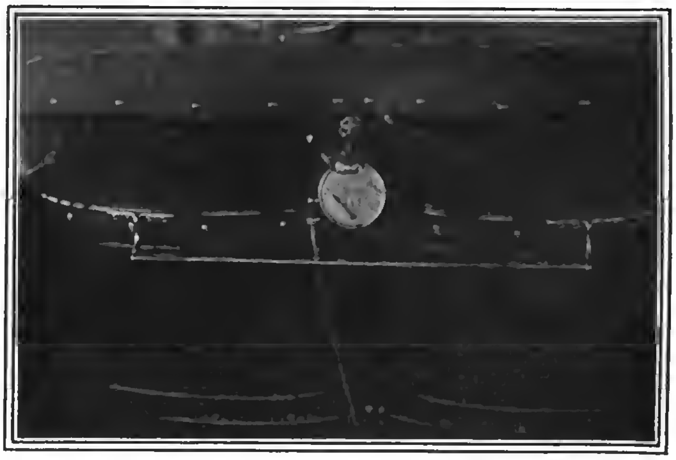
Taxicab Service in St. Paul—The Cook Carriage & Omnibus Co., St. Paul, Minn., will establish a taxicab service with rates based on the zone system. Taxicabs of 1913 model will be installed and the speed restriction will be 15 miles an hour.

Naddy Columbus Visco Representative—The Visco Motor Oil Co., Cleveland, O., has appointed Charles Naddy, of Columbus, O., to act as representative for its products in Columbus, and all counties in the central and southern parts of Ohio.

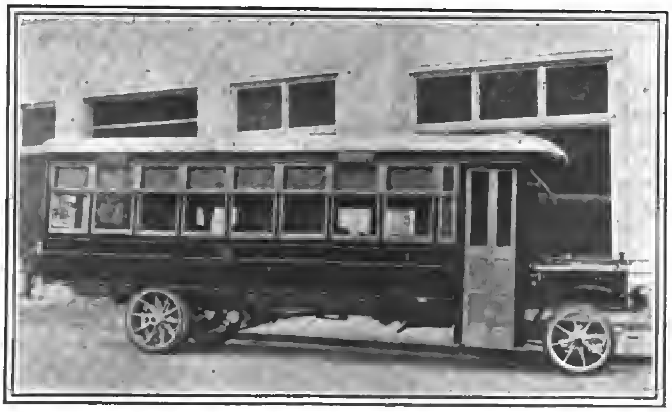
New Vancouver Garage—The Archibald Garage, on 1230 Georgia street, Vancouver, B. C., was recently completed. It was built at a cost of $30,000. It is built of reinforced concrete, has an entrance on two sides and a total floor space of 18,000 square feet.

Carburetor Company's New Department—The Wheeler-Schebler Carburetor Co., Indianapolis, Ind., maker of the Schebler carburetor, has established a publicity department in connection with its advertising department. Joseph Kelly has been placed in charge.

Munger Company Enlarging—The Munger Automobile Co., Dallas, Tex., is adding a two-story building to the big automobile district of that city. It is to cost upwards of $12,000 and will be located at Main and Preston streets. This company handles the Cadillac cars.



A new idea in automobile equipment was evolved by a recent purchaser of a Lozier six, who ordered the speedometer placed on the rear of the front seat, facing the occupants of the tonneau. In placing the speedometer in the tonneau a special tube over 6 feet in length was used, owing to the distance of the dial from the front wheel. Among other novel ideas on the car is the placing of the electric horn midway between the two headlights in front of the radiator. Two push-buttons near the tonneau door are connected with the electric horn and the speedometer light, so that the owner is able to apprise pedestrians of the car's approach in case the driver fails to give warning in time.



One of the pay-as-you-enter white buses used by the Pittsburgh Auto Transit Co., Pittsburgh, Pa. It will seat thirty-four passengers. The wheelbase measures 229 inches

Banquet tendered to President J. J. Cole and Cole owners in southern California by the southern California Cole distributors, at which possible improvements were discussed

ELECTRIC CHARGING IN GARAGE—A. J. Klein & Sons, Lomira, Wis., operating the Lomira garage, are making improvements costing $2,500. The company is equipping for tire repairs, electric vehicle charging and accessory selling.

REPLACES EIGHTY-TWO HORSES—A giant 60-horsepower farm tractor, capable of work which it is estimated would require the labor of eighty-two horses, was recently delivered at Rhinebeck, N. Y., for use on the farm of Vincent Astor.

FITZSIMMONS WITH BUFFALO ELECTRIC—George Fitzsimmons, formerly assistant sales manager of the Velie Motor Vehicle Co., Moline, Ill., has joined the Buffalo Electric Vehicle Co., Buffalo, N. Y. His work will be in connection with the sales and advertising management.

STURDY PLUGS IN CANADA—The International Accessories Co., 117 Belmont Ave., Detroit, Mich., and Windsor, Ont., has taken over the Canadian sales agency for the Sturdy Mfg. Co., Chicago, Ill., manufacturer of the Sturdy and Starite brands of ignition plugs for automobiles.

GRAHAM SANFORD DISTRICT MANAGER—J. A. Graham, formerly sales manager of the Westfield Motor Truck Co., has been appointed district manager for the New England district of the Sanford Motor Truck Co., Syracuse, N. Y. He will make his headquarters in Boston, Mass.

HARDING TAKES LEITCH BUSINESS—The business of the M. Leitch Co., Toronto, Ont., has been taken over by Frederick Harding and is being managed by him. In addition to the F. & S. annular and thrust ball bearings they have taken on a complete line of tires and accessories.

WILMINGTON NEEDS EMERGENCY CAR—It was demonstrated recently that the Wilmington, Del., police department needs an emergency car of some kind, and as soon as the city council can see its way clear to increase the department's appropriation it is likely that one will be purchased.

TAKE PUNCTUREFIX AGENCY—Ireland and Allison, Columbus, O., have taken the central Ohio agency for the Original Puncturefix Co., of Marion, O. The Puncturefix Co. manufactures a fluid which is placed inside the inner tubes for the purpose of closing all punctures automatically.

MONTREAL TO PURCHASE AUTOMOBILES—The corporation of Montreal, Que., will shortly own between twenty or thirty automobiles as the result of the decision of the Board of Control recently to recommend the purchase of five additional machines for greater efficiency in civic administration.

CHANCE FOR AGENCIES—Joseph B. Crandon, A. H. Fuller, C. W. Butterfield and Edwin A. Rowe have formed a company at Bellows Falls, Vt., and they have leased a building on Canal street where a general garage and repair business will be carried on and the territory taken for two or three cars looking for agents.

LOOKING FOR CARS—Chester P. Rowell and Carson P. Bennett have formed a company to handle taxicabs and do a general renting and garage business both at Lawrence, Mass., and Salem, N. H., just over the state line, and they have rented a building at both places. They will also take on some agencies for cars.

CONNELLY WITH DETROIT FIRM—J. F. Connelly, who has had charge of the advertising and publicity department of the Abbott Motor Co., Detroit, Mich., for the past 2 years, has resigned his position to become advertising manager of the W. H. Van Deusen Sales Co., with headquarters in the Ford Bldg., Detroit, Mich.

TWO CHANGES IN PORTLAND—Two changes were made in Portland, Ore., recently. E. A. McCarthy, of the firm of Neate & McCarthy, has withdrawn from the firm, while C. G. Arnold gave up the management of the Pacific Motors Co. Mr. McCarthy has secured the latter company, and for the present will handle the Paige and Oakland cars.

SHANAHAN NORWALK CANADIAN MANAGER—J. M. Shanahan has been appointed sales manager of the Norwalk Motor Car Co. branch in Toronto, Ont., with headquarters at 3-5 Roncesvalles avenue. The former Canadian branch was recently taken over by the parent company at Martinsburg, W. Va., and is now handled exclusively by that company through a selling branch.

HERNANDES KNIGHT TIRE MANAGER—R. M. Hernandes, who has been connected with the United States Tire Co., New York City, since its organization as special representative in the Chicago, Ill., territory, has resigned to become Eastern district manager for the Knight Tire & Rubber Co., Canton, O. Mr. Hernandes will make his headquarters at 1671 Broadway.

Recent Incorporations in the Automobile Field

AUTOMOBILES AND PARTS

ASHEVILLE, N. C.—Dixie Motor Co.; capital, $50,000; to deal in automobiles. Incorporators: J. C. Arbogast, R. C. Arbogast, J. E. Craddock.

BELLAIRE, O.—Bellaire Automobile Co.; capital, $6,500; to manufacture and deal in automobiles, trucks and gas engines of all kinds. Incorporators: G. D. Spragg, J. F. Johnson, George Heil, J. R. Greenlee, W. H. Morris.

BUFFALO, N. Y.—Selleck Co.; capital, $40,000; to deal in automobiles. Incorporators: W. V. Selleck, G. K. Selleck, M. L. Selleck.

CINCINNATI, O.—Cincinnati Alco Motor Car Truck Co.; capital, $25,000; to deal in motor trucks. Incorporators: W. H. Peters, J. E. Kelding, G. H. Macduff.

CLEVELAND, O.—Pressed Steel Motor Car Co.; capital, $200,000; to manufacture and vend automobile parts and accessories. Incorporators: W. H. Milliken, F. M. Ossman, A. M. Helmberger, C. L. McConnell, L. O. Helmberger.

HARTFORD, CONN.—New England Car Co.; capital, $5,000; to deal in automobiles. Incorporators: H. T. Sheldon, A. E. Osborne, T. M. Steele.

INDIANAPOLIS, IND.—Indianapolis Auto Sales Co.; capital, $10,000; to conduct a taxicab and motor car sales business. Incorporators: H. S. Wilcox, D. H. Herr, B. W. Rout.

JOPLIN, MO.—Arnold Motor & Supply Co.; capital, $2,000; to deal in automobiles. Incorporators: J. L. Arnold, Ida Tweed Arnold, F. A. Snider.

NEW YORK CITY.—Eagle Sales Corp.; capital, $5,000; to deal in automobiles and supplies. Incorporators: Leo Weinberg, David Goldman, Isidore Goldman.

NEW YORK CITY.—Signal Motor Truck Co.; capital, $350,000; to manufacture motor trucks. Incorporators: J. S. Coates, W. C. Floyd-Jones, F. C. Canfield.

PIERRE, S. D.—F. P. Motor Wagon Co.; capital, $250,000; to manufacture automobiles. Incorporators: L. L. Stephens, T. F. Graham, E. E. Slade, W. G. Price, R. J. Reynolds.

RICHMOND, VA.—H. G. Wagner Auto Co.; capital, $3,000 to $25,000; to deal in automobiles. Incorporators: H. G. Wagner, F. W. Morehead, Frank Phillips.

SOUTH BOSTON, MASS.—Auto Co.; capital, $15,000; to deal in automobiles. Incorporators: J. A. Mebane, F. Mebane.

GARAGES AND ACCESSORIES

ASHEVILLE, N. C.—Phillips Tire Co.; capital, $10,000; to manufacture automobile tires. Incorporators: W. L. Phillips, J. E. Craddock, O. D. Cooper.

BIRMINGHAM, ALA.—Birmingham Motor and Country Club; capital, $150,000; to build a clubhouse and a lake.

BROOKLYN, N. Y.—Noden's Truck Co.; capital, $10,000; general automobile trucking. Incorporators: Abraham Noden, B. H. Noden, L. F. Senke.

BROOKLYN, N. Y.—Whittemore Cab Co.; capital, $1,000; to engage in automobile cab business. Incorporators: W. I. Wiedeman, Albert Wald, C. F. Fuerst.

BUFFALO, N. Y.—Fedders Mfg. Co., Inc.; capital, $400,000; to manufacture automobile radiators and specialties. Incorporators: L. F. Fedders, J. M. Fedders, T. C. Fedders.

CLAYTON, N. Y.—Clayton Motor Repair and Supply Corp.; capital, $15,000; to repair automobiles and deal in accessories. Incorporators: W. M. McCawley, L. A. Phillips, A. O. Bakewell, Jr.

CLEVELAND, O.—Elastic Tread Tire & Wheel Co.; capital, $25,000; to manufacture an automobile tire. Incorporators: J. C. Murry, R. M. Morlenkopf, F. J. Axel, Peter Schneider.

CLEVELAND, O.—Hercules Lock Co.; capital, $1,000; to manufacture automobile specialties. Incorporators: H. A. Hanxhurst, George Bissell, R. T. Mitchell, R. Hall, M. T. Flannagan

DENISON, TEX.—Davis Livery & Motor Car Co.; capital, $10,000; to carry on an automobile livery business. Incorporators: E. E. Davis, Earl Wood, R. L. Apsley.

NEW YORK CITY.—Hampton Kerosene Carburetor Co.; capital, $150,000; to manufacture carburetors. Incorporators: W. Hampton, C. A. Eurr, O. H. Cacciola.

NEW YORK CITY.—Gaulois Tire Corp.; capital, $20,000; to deal in automobile tires. Incorporators: Jean Grenier, V. W. Cutting, Maurice Leon.

NEW YORK CITY.—Merralls' Air and Steam Engine Co.; capital, $150,000; to manufacture engine starters. Incorporators: William Brady, J. C. Heberer, W. A. Merralls.

NEW YORK CITY.—Motor Service Corp.; capital, $500; to engage in an automobile service. Incorporators: W. G. Smith, F. H. Merrill, Mabel Dittenhoefer.

NEW YORK CITY.—Schermerhorn Garage Co.; capital, $20,000; to carry on a general garage business. Incorporators: J. Ginsburgh, Leo Rosett, P. A. Lee.

OKLAHOMA CITY, OKLA.—Liquid Tire Tonic Co.; capital, $10,000; to manufacture a liquid that automatically heals punctures in automobile tires. Incorporators: F. B. Dean, H. N. Schofield, T. H. Williams.

STEVENS POINT, WIS.—Hydraulic Transmission Co.; capital, $45,000; to manufacture a hydraulic transmission. Incorporators: Arthur Beijer, Benjamin Beijer, J. P. Atwell.

TROY, N. Y.—Grand Street Garage Co.; capital, $3,000; to engage in garage business. Incorporators: S. W. Smith, W. G. Swartout, M. J. Cohen.

CHANGES OF NAME AND CAPITAL

AKRON, O.—American Tire & Rubber Co.; capital increased from $200,000 to $500,000.

INDIANAPOLIS, IND.—Wizard Motor Co.; increase of capital from $50,000 to $100,000.

MILWAUKEE, WIS.—Fellhacb Motor Co.; increase of capital from $20,000 to $50,000.

Accessories for the Automobilist

THE FAWKES traffic signal, made by the Fawkes Auto Co., Minneapolis, Minn., is a small searchlight mechanism attached to the front of the car by a cross bracket, Fig. 4. The signal itself consists of a vertical post mounted in a socket and turnable in the same, in response to an operating mechanism from the steering wheel, and a horizontal rod carried by the vertical one and having at its end an electric bulb capable of emanating a bright light. By means of a switch the bulb is turned on or off and a small lever on the steering wheel, connected to the vertical rod by steel rodding and universal connections, are used to turn the horizontal bulb-carrier toward the right or left, depending on whither the driver means to steer the car.

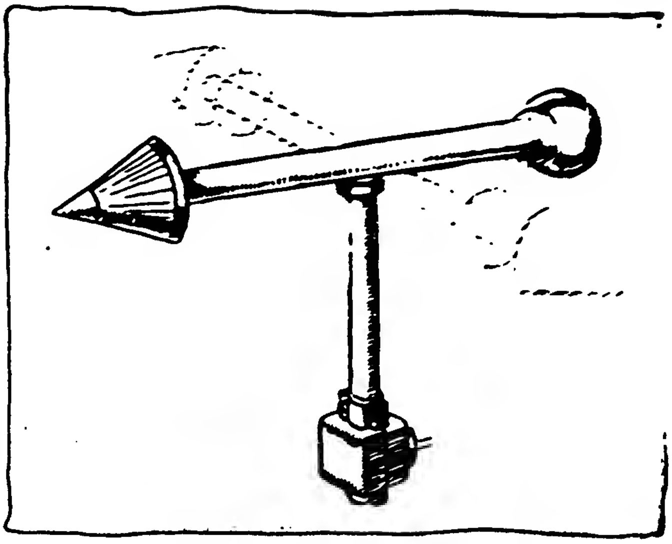

Fig. 4—Fawkes electric turning signal

Thick-Tread Inner Tube

The Kokomo Rubber Co., Kokomo, Ind., manufactures the Kokomo thick-tread inner tube, Fig. 1. This tube differs from others by having the half-ring contacting with the inside of the tread portion of the casing made considerably thicker than the inner half-ring, so that not only is the interior space of the tube lessened and consequently the amount of air needed for proper inflation reduced, but the probability of blowouts, punctures and short life are lessened by the increased strength of the tube. The cross section of the tube, as Fig. 1 shows, is oval shaped to fit well into the casing.

Vellumoid Packing Material

A novel material for gaskets, packings, leather imitations and other applications has been invented by Charles D. Brown & Co., Inc., 49 Federal street, Boston, Mass. Vellumoid is made of a fiber related to paper, and is impregnated with an oily material to make it waterproof. While not recommended for contact with hot steam under pressure, it is applicable to such uses as intake manifold gaskets, etc.

Hemmeter Visible Spark-Gap

A small device for continuous inspection of the motor ignition system has been designed by the Hemmeter Spark Gap Mfg. Co., Pontiac, Mich. This gap is seen in Fig. 2, and consists of a small glass cylinder held by two hard-rubber plates which are connected by brass screws, and two screws extending through the centers of both plates so as to form a narrow gap, which measures about .02 inch, or even somewhat less. The high-tension wire from the magneto or coil is connected to the upper inclosed screw, and the lower is screwed on to the plug terminal by means of a small connector. If the ignition system is functioning, a spark is formed between the two inclosed screws at each ignition stroke of the motor.

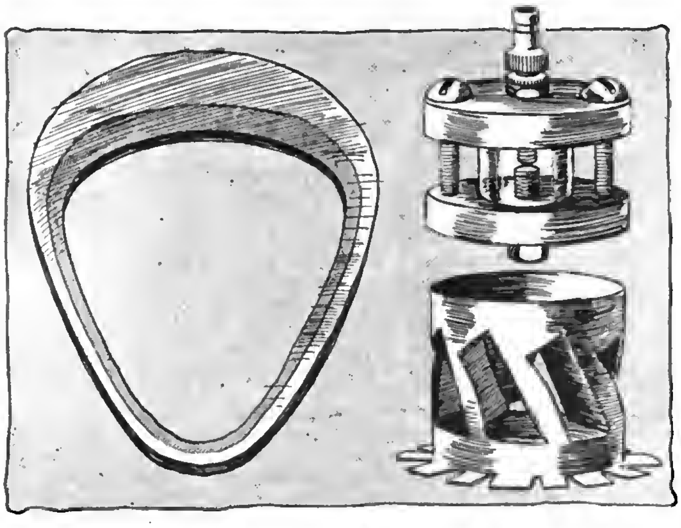

Fig. 1—Kokomo tube. Fig. 2—Hemmeter spark gap. Fig. 3—Egyptian mixer

Egyptian Mixer for Intake Pipe

The R. D. Loose Mixing Chamber Co., 110 North Fifth street, Springfield, Ill., manufactures the Egyptian mixer, a small device which is fitted into the mixture intake pipe of the motor, between carbureter and manifold, in order to break up the liquid globules carried along by the mixture formed in the carbureter. The mixer is made of a single, cylindrical piece of sheet brass of the carbureter outlet diameter. This cylinder, in the making of the mixer, is cut on a slant as in Fig. 3, and then along one circular edge of the cylinder in twelve places. Furthermore, six sections of the cylinder wall are cut and bent inside so as to form blades which break up the mixture and tend to impart a rotating motion to it.

Prest-O-Starter Demonstrator

The Prest-O-Lite Co., Indianapolis, Ind., is providing its agents with demonstrating models of the Prest-O-Starter, which consists of a wooden frame provided with fixtures necessary if a starter of this type is used on the car. The upper half of the wooden frame represents the dash of the car holding the starter pump, etc., and a lower part supports the tank as well as the reducing valve. In making the demonstration the stand is placed beside the front mudguard of the car and connected to the cylinders through flexible brass tubing having injectors which are inserted in the priming cup openings. If there are no priming cups in the cylinders, combination sparkplugs which are formed in themselves with priming cups are used in place of the ordinary plugs.

Miller Telescoping Grease Cup

A telescoping type of grease cup, designed by the inventor of the Miller grease gun, is being placed on the market by Asch & Co., 1777 Broadway, New York City. This accessory consists of four principal parts: First, the main body of the cup

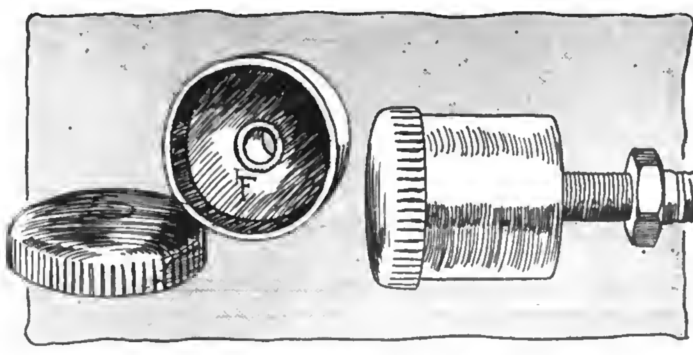

Fig. 5—Miller telescoping grease cup

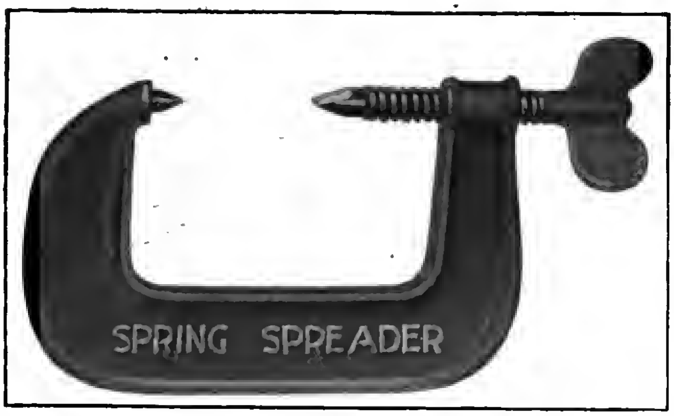

Fig. 6—Dayton automobile spring spreader for springs 2.875 inches in width, as well as the narrowest types

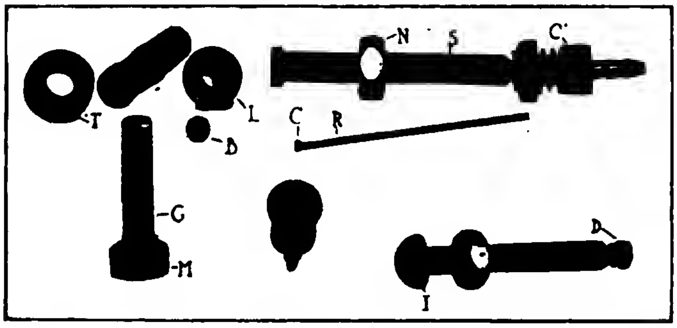

Fig. 7—Standard tire valve and slip-off casing, useful when a driver is accustomed to frequently test the pressure

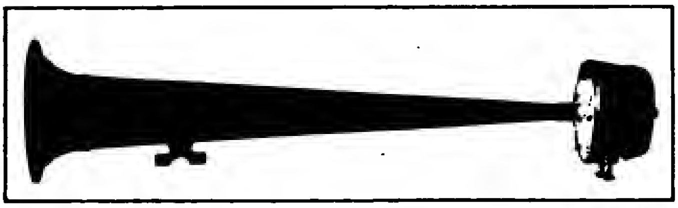

Fig. 8—Maxeff electric horn, specially designed for mounting under the hood

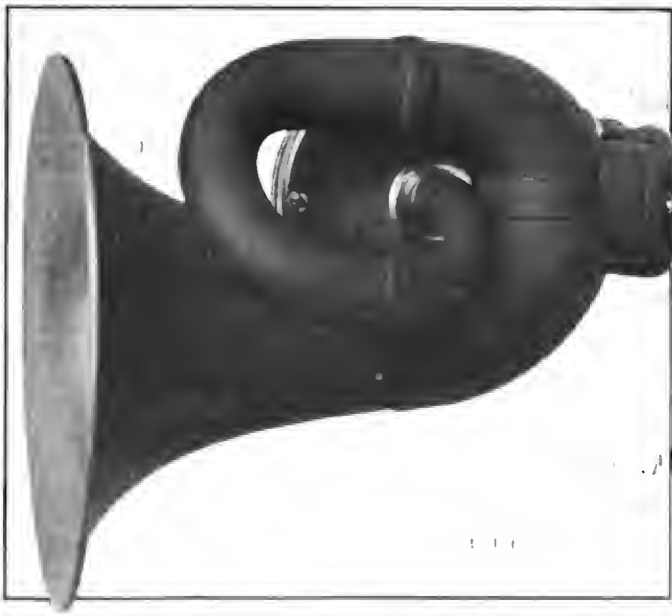

Fig. 9—Maxeff electric horn of conventional design for usual type of mounting

comprising a cylinder with a bottom F which is secured to the outlet pipe of the cup; second, an outer cylinder screw-threaded so as to work along the outside of the inner cylinder; third, a cap for the cup, and, fourth, a nut for pressing a cup-leather washer against the bottom of the cup to prevent leakage of the grease. The outer cylinder, if it is turbed, is made to travel up or down along the inner cylinder. To fill the grease cup, the cap is removed and the outer cylinder is screwed up as far as possible, its coming off the inner being prevented by a rivet. Then the space inside the outer cylinder is filled and the cap is replaced. When the outer cylinder is now screwed down, the bottom of the inner one is moved up, relatively, decreasing the volume of the space in which the grease is contained and forcing the latter out of the cup by way of the outlet pipe. Practically the entire volume of grease in the cup is thereby available.

Carr Gasoline Warning Signal

Automobilists who have found themselves 10 miles from the nearest garage, without enough fuel in the tank to go on, will appreciate the advantages of the Carr signal gauge. This device consists of a float tube containing a float, which is inserted in the gasoline tank, a contact in the top portion of the float tube and an annunciator mounted on the dash, under the hood or wherever desired. If the float falls to a certain point due to the decreasing level of the gasoline, the end of a lever to which it is secured by a string is drawn down, whereby its other end is made to touch a metal contact, thereby closing an electric circuit and ringing the annunciator. A switch on the dashboard may be used to turn off the signal after the driver has noticed it and knows that there is only a limited quantity of gasoline left in the tank.

Dayton Malleable Spring Spreader

The Dayton Malleable Iron Co., Dayton, O., is the maker of the spring spreader, Fig. 6, which is composed of a steel clamp, a steel point attached to one end, a screw threaded through the other and a wedge carried by the inner end of the screw. The point is centered between the leaves of the spring and by turning the wing nut, the wedge carried by the screw may be driven between the leaves to such an extent as to separate them and permit of lubricating the ordinarily contracting surfaces. The maximum clearance is 2.875 inches, so that the spreader is applicable to springs of this width, while it can also be used for the smallest car springs on the market.

Maxeff Electric Automobile Horn

Another electric horn has been brought out, thanks to the manufacturing activities of the Maxeff Electric Horn Co., 814 Woodward avenue, Detroit, Mich. This horn is made in two principal types, regular, Fig. 9, and under-hood, Fig. 8. The horns are of the motor type, and the generating device is attached at the end of the under-hood type or at the side, as in the case of the regular design. Control is by a push-button fixed to the steering wheel, from where the wiring is taken through a flexible casing to the horn. Slip-on terminals are used to connect the wires to the motor terminals.

Usoline Metal Cleaning Cloth

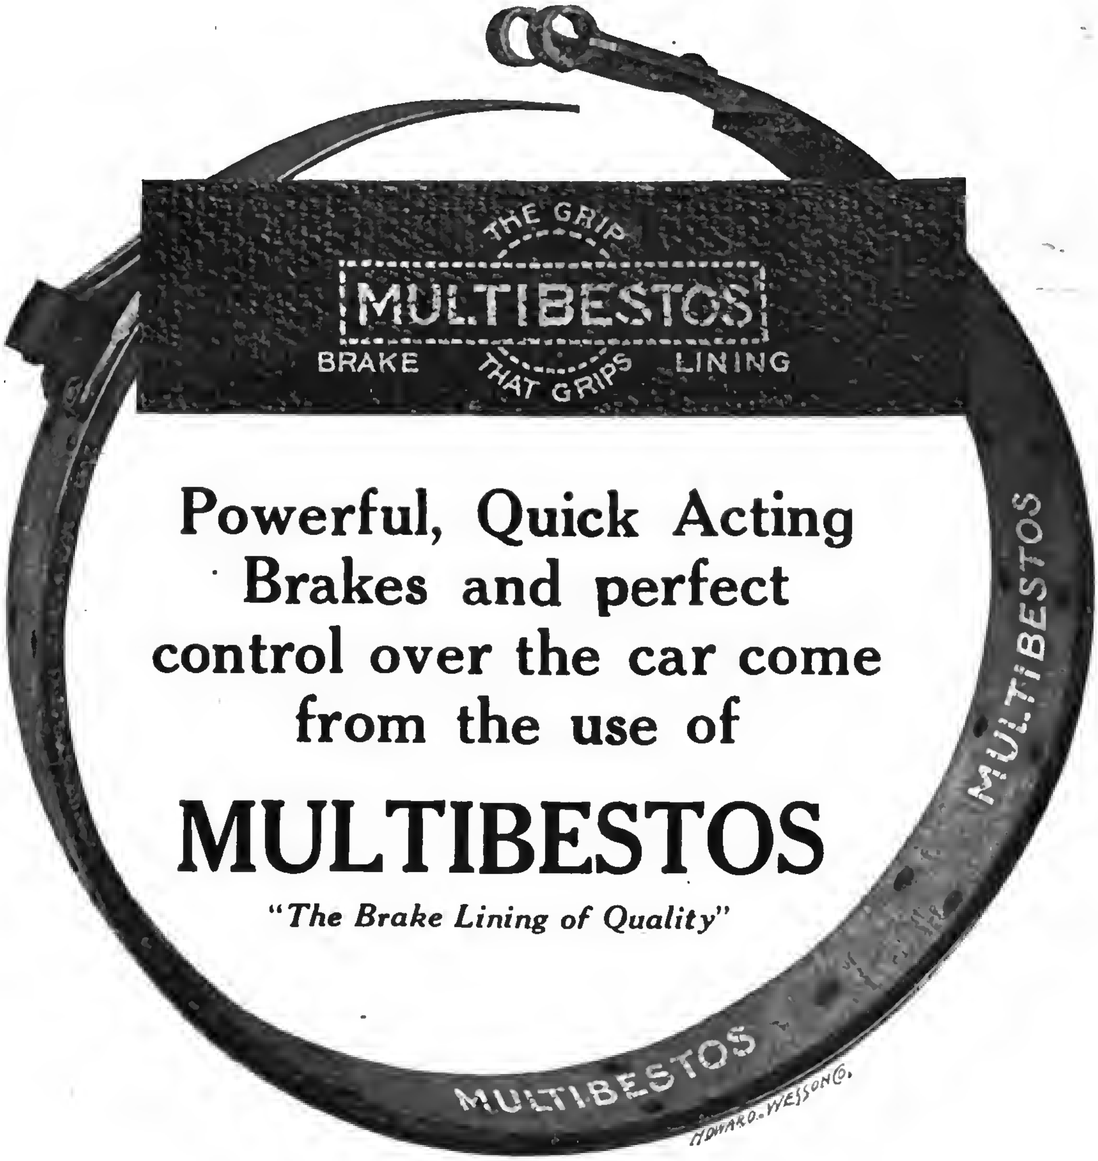
Usoline polishing cloth is the latest product in the Oil Products Co., Inc., New York City. This material consists of a fabric impregnated with a polishing compound, removing dirt from metal surfaces and imparting a fair degree of polish to them, without attacking them in any way.

Standard Tire Sundries

Various new tire fittings have been brought out by the Standard Engineering Co., Woonsocket, R. I., makers of the Potter valve. One of them is the new style of valve, Fig. 7, which is distinguished by the peculiar method of making it airproof. The inner end of the valve is shown at I, consisting of a steel cap with a transverse slot which screws on the end of the valve casing S. The rod or stem R, formed with a conical end C, is inside the casing, and C bears against a rubber ball B. The latter is contained inside I and the pressure in the tube presses B against C, maintaining tightness of C against the valve casing and preventing the leakage of air. Nut N is for drawing the valve casing tight against the inner tube.

Another specialty made by the same company is the connections C1. The construction is obvious from the illustration, Fig. 7. The threaded end of the hose connection screws over the inflating end of the valve casing ordinarily closed by the cap D. The fitting screwing over the end of the casing is pressed in place by a coiled spring.

The gauge cap G has been designed to fit over the casing S



Powerful, Quick Acting Brakes and perfect control over the car come from the use of

MULTIBESTOS

"The Brake Lining of Quality"

The enduring efficiency of Multibestos is due to a firm, close weave of the purest, long fibre asbestos with brass wire and the treatment of the finished fabric by an exclusive formula.

Its adoption, by the makers of so many of the leading cars, offers most convincing argument for Multibestos efficiency, durability and economy.

STANDARD WOVEN FABRIC CO. Worcester, Mass.

SALES BRANCHES

NEW YORK, 276 Canal Street	CHICAGO, 1430 Michigan Boulevard
PHILADELPHIA, 1427 Vine Street	DETROIT, 1598 Woodward Ave.
BOSTON, 903 Boylston Street	SAN FRANCISCO, Fred Ward & Son

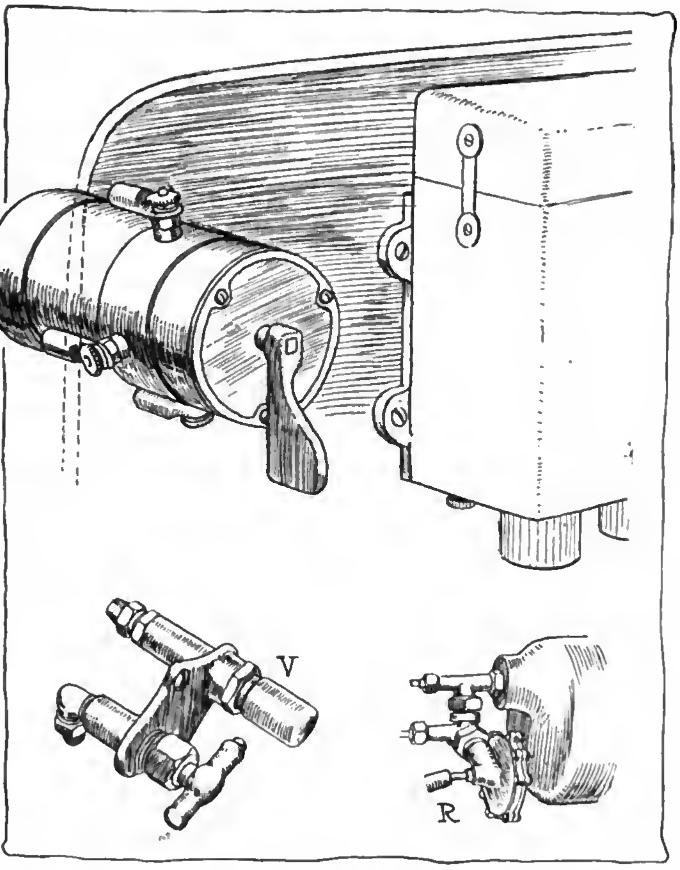

Fig. 10—Connecticut master vibrator and combined dash switch. Fig. 11—Prest-O-Primer reducing valve R for attachment to acetylene tank and foot operated valve V on dash

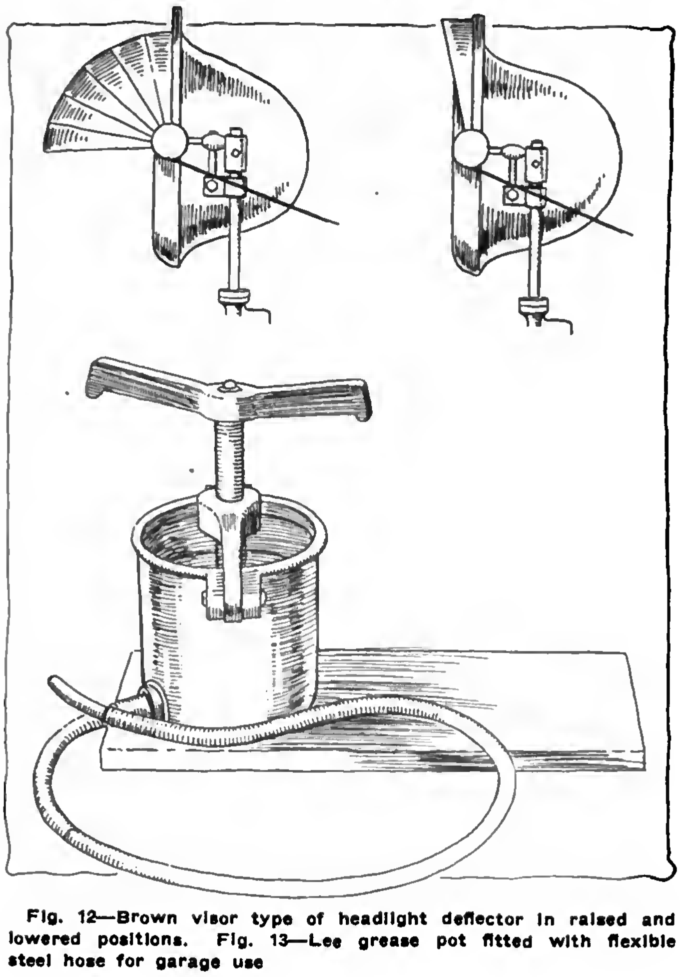

Fig. 12—Brown visor type of headlight deflector in raised and lowered positions. Fig. 13—Lee grease pot fitted with flexible steel hose for garage use

in cases where the drivers are in the habit of frequently testing the pressure in the tires. Nut M screws over the thread of S and inside of it, a short coiled spring R is in place. The latter may be depressed for the purpose of forcing the end of G out of or into the nut M, when desirous of measuring the air pressure, or after having done so. All these specialties are sold in the Metropolitan territory by Asch & Co., 1777 Broadway, New York City.

Connecticut Master Vibrator

To overcome the trouble of frequent adjustment that is associated with the use of an ignition system in which all four cylinders are provided with separate spark coil vibrators the Connecticut Telephone and Electric Co. have brought out a master vibrator. This device, in which is incorporated a throw-over switch, is primarily designed for use on Ford cars fitted with the flywheel type of magneto. This master vibrator is shown in Fig. 10. It is intended for mounting on the dash in such a position that the casing projects inside the hood, with the switch handle on the driver's side of the dash.

The wiring is simple, it being only necessary to connect the three terminals directly to the dash coil, magneto and battery respectively. The vibrators on the four-cylinder coil should be short-circuited by screwing down tightly and connecting the vibrator and bridge on each of the four units with a short length of copper wire. The switch lever is removable, having a locking ball for holding it in place. When removed the ignition is locked.

Prest-O-Primer

In order to facilitate the starting, in cold weather, of engines fitted with electric or compressed air cranking devices the Prest-O-Lite Co., Indianapolis, Ind., are marketing an acetylene primer for attachment to the Prest-O-Lite tank. This device, shown in Fig. 11, is called the Prest-O-Primer and consists essentially of a reducing valve R inserted in a pipe connection between the tank and the inlet manifold, permitting the introduction of small quantities of acetylene at a very low pressure—2 ounces—to cause the initial explosions. It is operated by means of a second valve V in the circuit, located on the dash and actuated by foot. Besides this push valve, which is of the spring-return type, there is a screw valve mounted alongside as a double insurance against gas leakage. The makers claim that this priming device does away with the necessity of gasoline priming when the engine is refractory and state that if the engine is allowed to run about 20 seconds on acetylene it will be found to be warmed sufficiently to obtain the desired response from the carbureter, however cold the weather. A special two-way union is furnished for attachment to the tank, where the latter also supplies the gas for lighting. By the use of a reducing valve the pressure of gas is such that under no circumstances can an explosion of greater force occur than is obtainable with gasoline in the ordinary way, so that no undue strains are imposed on the engine.

Brown Headlight Deflector

To moderate the luminant effect of the headlights without the use of a dimming agent the Brown Co., Syracuse, N. Y., has designed the headlight deflector, Fig. 12. It consists of a multiple unit visor pivoted at the ends of the horizontal diameter of the headlight lense rim. The sections are so fixed that by turning the pivoting member they are one by one lowered or raised, so that the upper half of the lamp is blinded and the rays are deflected downward, while the lower still affords sufficient light to illuminate the road. A cable from the dash operates the visor.

Lee Grease Pot

A substantial greaser for garage use is being manufactured by Henry B. Lee, New London, Conn. This design differs from the conventional grease gun in two respects. First, it is much larger, and, second, the lubricant is ejected through a flexible steel hose, thereby facilitating the lubrication of the more inaccessible points of the chassis. The pot is 7 inches diameter by 7 inches high and is capable of dealing with five pounds of grease. Pressure is applied by means of a 1-inch screw with a large lever handle. There are no loose parts, the top merely hinging for the operation of refilling. Some idea of its substantial construction may be gathered from the illustration, Fig. 13. The walls of the pot are .5 inch thick, and the total weight of the device is 25 pounds. It is stated that the contents of this grease pot can be discharged in 2 minutes. Two types are marketed, No. 1 being designed for use with light grease and heavy oil, and No. 2—not shown—being arranged with a geared top so as to be capable of dealing with the heavier greases. As supplied these grease pots are mounted on a floorboard 8 inches by 20.

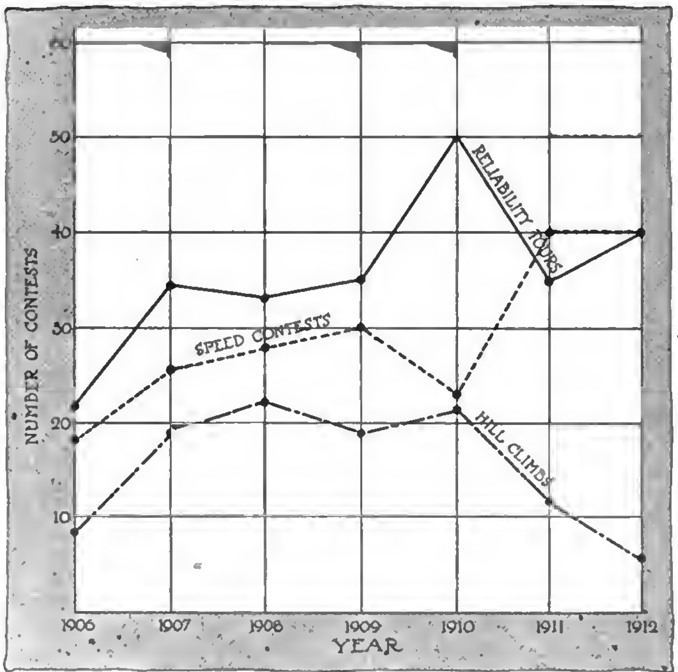
The Automobile

Makers Want Stock Car Contests

Find That the Performances of Specially-Constructed Machines, While Most Interesting from the Spectacular Viewpoint, Are of Little Practical Value to Either the Manufacturer or Buyer

SPEED has had a strange fascination on mankind ever since the history of the world began. Two thousand years ago chariot races attracted the Roman crowds to the circuses. Nowadays it is the automobile. The charioteer who held the reins in those early days and goaded his horses to victory now holds a driving wheel and coaxes a carbureter. Now conditions are different.

Today business has to be reckoned with; the advertising man of today has stepped in at such a splendid opportunity for a full-page display in animation and all the colors of nature before a huge and intensely interested audience. The cars were labelled and the money spent in entering the contests found to be a sound advertising investment. That is, it was until the entered cars bore so little resemblance to the product which the name represented that public interest in that side of the game waned. The prospective automobilist who wished to gain some idea of the relative capabilities of the various makes by following speed trials soon found that there were so many special features incorporated and stock features omitted in the cars raced that the name meant little or nothing. This is not to say that the contests themselves were any the less attractive from the spectacular point of view; rather the reverse, for the speeds attained were, of course, much higher. But there was a very evident decline in the commercial value of automobile racing.



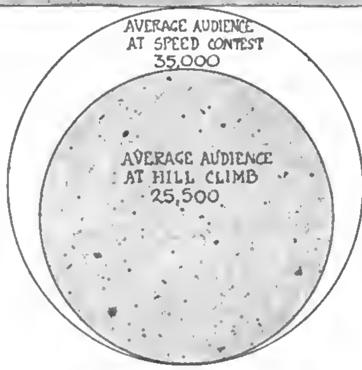


Fig. 1—Total number of speed contests, reliability tours and hill climbs since 1905, showing the trend in popularity. Fig. 2—Average audience at speed contests and hill climbs, respectively

This state of affairs brought about the framing of the stock-car rules a few years ago, so that automobile contests may be divided into two broad classes, the free-for-all and the so-called stock race. The first of these divisions, by its nature is easy and definite. It is the second classification with its elasticity and lack of definition, around which there has been so much contention and dissatisfaction.

Stock cars which were only such before they underwent extensive alteration calculated to bring them into a good position at the finishing line were entered in stock-car events. And the manufacturer who saw that another competitor's machine had undergone more alteration than seemed to him justifiable for such a race naturally felt that the conditions were unfair and the results not only valueless, but such as to detract seriously from the standing of his own product in the open field.

The difficulty of forming rules to govern stock car events is clearly indicated in the present A. A. A. contest rules, in which it is stated that:

It shall be the duty of the Technical Committee of the Contest Board to pass upon, establish and certify to the Contest Board the stock status of all manufacturers' models offered for registration with the Contest Board as stock cars and stock chassis.

In any case where it may be necessary to establish the status of any car alleged to be a stock car under the definition contained in these rules, the committee shall have the right

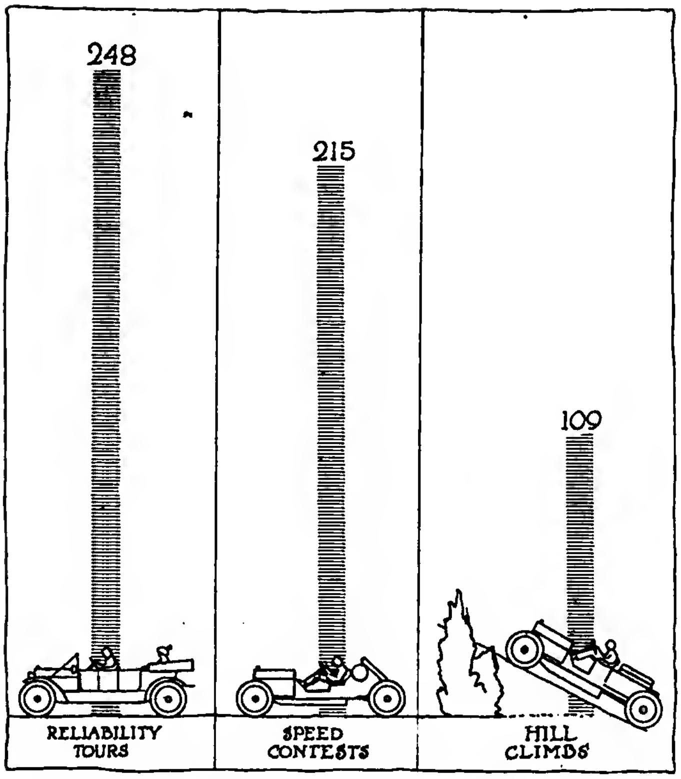

Fig. 3—Graphic representation of the total number of reliability runs, speed contests and hill climbs from 1906 to 1912, inclusive

to visit the factory of the manufacturer of such car, who shall be required to submit to the committee such evidence as it may require to verify the allegation on which the "stock" status of the car is based.

For some reason or other the manufacturers seem to have fought shy of registering with the Contest Board. Possibly the rules appear more stringent than is necessary.

The question of speed contests, reliability tours and hill-climbs is receiving a great deal of attention at the present moment, and in view of this fact the following opinions bearing on the comparative values, both from the commercial and spectacular points of view of stock-car and free-for-all contests is of great interest, coming, as they do, from makers who have been prominent supporters of contests in the past.

H. Butt, of the Mercer Automobile Co., believes that "if a commission could be formed to control stock car contests with powers to rigidly inspect all entrants and to reject all that were not abiding strictly by the rules, such inspection to go to an extent of an analysis of metals employed, providing the commission, in its judgment thought such drastic action necessary, it would be possible to hold stock car races on which the buying public could safely base its estimate of the cars engaged. Free-for-all contests are instructive to the manufacturer and indirectly benefit the public by developing weakness of construction, but are of little value to the prospective owner of an automobile when endeavoring to decide upon the type of car he wishes to buy. We are strongly in favor of stock car contests, and believe they are far more important to the industry than are the more spectacular races."

In the opinion of E. W. Bennett, of the Willys-Overland Co., which does not make racing cars, "automobile contests have outlived their usefulness and there has been so much elasticity in the rules of both special and stock contests and in reliability and other runs that they have ceased to interest the public."

That considerable help to the engineer can be derived from contests of any kind is the opinion of E. LeRoy Pelletier, of the Maxwell Motor Co., who says: "In the development of gas-engine chassis design, doubtless there is considerable value to engineers in these contests—even between extremely light stripped special racing machines. The engineer is able to make valuable deductions from these, but they are of value only to the engineer. As far as the public is really concerned with them, they are meaningless. This has been proven over and over again, from the fact that cars which have won the biggest free-for-all events have sometimes proven the greatest failures commercially and in the hands of users.

Webb Jay, of the Haynes company, "feels that unless the rules for stock cars were more clearly defined, the free-for-all race carries more value than what is termed stock car events and is certainly a great deal more attractive, and the number whose attention is attracted to these contests, as a rule, determines the advertising value."

Homer McKee, of the Cole Motor Car Co., divides automobile contests into two classes, namely, utility contests and sport contests, and says: "From a utilitarian standpoint, there is no question that the contest most worth while is the strictly stock car event. From a sport standpoint, it is equally evident that the free-for-all event offers vastly more opportunity. Personally, it appears to me that the public's general support of stock car events, while in some way increasing the efficiency of the average motor car product, would, on the other hand, work a decided disadvantage in races by inducing manufacturers to attempt to build cars with speed in mind rather than general endurance. There would be an inducement to use higher gear ratios than would be practicable for every-day usage on the country roads, and in the case of hill-climbs the tendency would also be to install gear ratios that would not be best for general road conditions. In other words, the type of motor car naturally evolved by general support of stock car contests would be over-developed in order to arrive at efficiency in the particular direction which the respective events would be intended to bring out. General endurance contests tending to prove the average efficiency of the average car are undoubtedly good. It should, however, be borne in mind that in all stock car events the main attempt should be to develop a better average car for the ordinary user. If hill-climbs and races in which only stock cars participate tend to this conclusion, such events are undoubtedly good."

Speed Contests Aid Designers

That the strictly speed contest is of great value to the designer by developing details that can be introduced advantageously in the stock product is the opinion of V. A. Longaker, of the American Motors Co., who states: "If stock cars only were to be used in speed contests, no manufacturer could place upon a track any new creation and get any benefit whatever from its performance. Instead of stock car principles being reconstructed for speed contests, cars should be designed strictly for speed and then modified and incorporated in the program of the manufacturer. If real stock cars were raced, it would be a help and might prove something to the buying public, who are the only ones interested in the matter of stock car competition. But it is well known that no stock car, strictly speaking, has ever been entered in a speed contest of note. Special material, special fits, special carbureters, special magnetos and various other things are incorporated into these cars and the word stock is therefore a misnomer."

Alvan Macauly, of the Packard Motor Car Co., does not favor contests generally, but believes that "the ideal contest should be limited to stock cars and run under the usual conditions of automobile usage, so as to wear out all except those cars best adapted to meet the conditions."

Although the National Motor Vehicle Co. retired from participation in contests at the close of the Indianapolis Speedway race of last year, it is still strongly in favor of stock car contests. G. M. Dickson, of that concern, writes: "We believe the present stock car rules are sufficiently concise to insure fair and honorable contests, if it were possible to maintain a salaried technical committee to enforce these rules to the letter, and if there

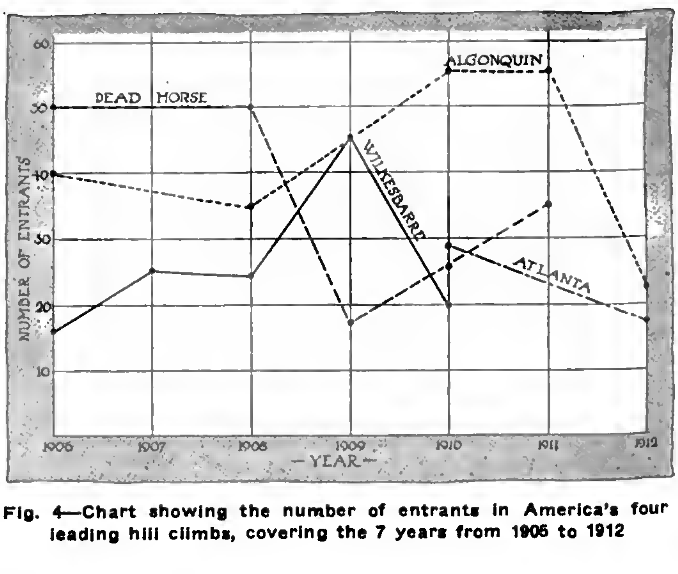

Fig. 4—Chart showing the number of entrants in America's four leading hill climbs, covering the 7 years from 1905 to 1912

is a feeling on the part of American manufacturers that stock car contests should be revived, we would be in favor of heartily supporting such a movement."

It is the opinion of the Henderson Motor Car Co. that all reliability or economy road contests should be limited to stock cars. C. P. Henderson, of that company states: "At one time we thought this should be the rule governing all racing contests, but we have since come to think that the public is more interested in speed than stock requirements, when it comes to a regular speedway event. It would therefore seem that free-for-all events should be encouraged on the speedway.

Chas. F. Barret, of the Knox Automobile Co. points out that the two chief purposes of entering competition of the kind in question are: "first, to make a thorough road test under official auspices of new models so as to correct any weakness which might develop, and second, to impress upon the automobile buying public the reliability and other desirable qualities which standard models could give." On the question of the relative value of racing stock and special cars Mr. Barret continues: "It has never seemed fair to us, or, in fact any help to the industry as a whole, to put specially built cars into contests of this sort, when the automobile public itself knows very well that no matter how well a car may perform under the requirements, they would never secure a car like it from the manufacturer for their personal use. In certain types of racing contests which are run largely for amusement it seems entirely consistent to use specially built models but in contests that are calculated to prove the actual ability of existing types of cars to negotiate certain road conditions, it is nothing short of a humbug to use any other than stock models."

Indications for the Future

The present month is the beginning of another racing season, and the time when those interested in the sport ask whether the prospects are as bright as in previous years or whether a decline in automobile speed contests is imminent. If the list of entries in the famous 500-mile struggle to be held at Indianapolis at the end of this month is any criterion, the followers of automobile sport are in for a good time. But this does not answer the question as to which direction motor racing is moving. The fact is that those who look pessimistically at this matter are inclined to base their views on the decline in popularity of particular events without considering the whole trend throughout the contest field.

With the idea of showing more definitely how the sport really stands the charts accompanying this article have been prepared. They represent graphically the varying popularity of the three principal kinds of automobile contests covering a period of the last 7 years. The diversions referred to are: speed contests, whether on road or track; reliability trials, including economy and endurance runs, and hill-climbs.

Fig. 1 shows by the number of important American contests held each year since 1906 the trend of public favor in reliability tours, speed contests and hill-climbs. It will be seen that with the single exception of 1911, when the speed events exceeded in number the reliability trials, the latter form of contest takes the lead, and, moreover, that the tendency of the curve as a whole

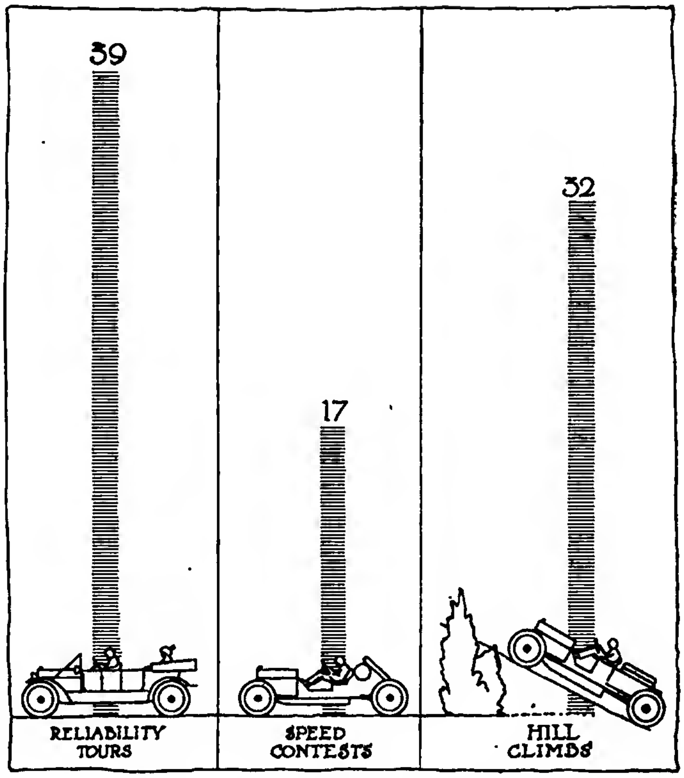

Fig. 5—Comparison of the average number of entries in the three great divisions of automobile contests since 1905

is favorable to increased interest in the future. The same can be said of the line which denotes the popularity of the purely speed contest. Although record speed achievements are now being made only on small margins there have been a sufficient number of these during the last year, or even the last few months, to warrant a keen public interest in any new car which is at all likely to go one better than the previous best in the way of making records.

The total number of events in the three divisions during the past 7 years shows the reliabilities lead with 248, as against 215 speed races and 109 hill-climbs, as charted in Fig. 3.

The hill-climb seems to make the least satisfactory showing, the general tendency being a falling away in favor, although the number of competitors who engaged in the Algonquin climb of 1910 and 1911 was as high as fifty-five. The chart, Fig. 4, dealing with the four most important hill-climbs shows that the average list of contestants varies between a range of twenty to fifty. The actual number of average entries in these contests is thirty-two, as shown in Fig. 5, which also gives the comparative length of the average entry list, obtained from figures extending over several years, of speed contests and hill-climbing events. It will be observed that in general the speed races favor the smallest field of competitors, with an average of seventeen cars.

It is true that the size of the entry list is not of itself a conclusive measure of value or popularity; the size of the audience is a factor that would furnish a truer perspective. Unfortunately these figures are not easily available and in the case of reliability trials on the open road are quite out of the question. However, it may be stated with a fair degree of accuracy that the average number of spectators who witnessed the important speed contests for the past few years is in the neighborhood of 35,000, while the audiences at hill-climbs averaged 25,500, as shown in Fig. 2.

One of the most interesting sets of figures, charted in Fig. 6, indicates the fluctuation in the cars entered from year to year in the four classic races. The rather sudden drop for 1912 in the Indianapolis curve of entrants is not continued, but takes a satisfactory upward turn for 1913, the list of entries just out numbering thirty-one.

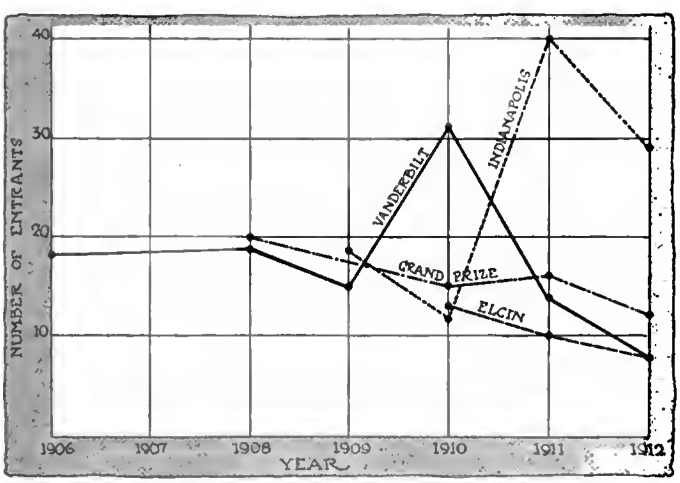

Fig. 6—Diagram of the number of entries in the four great speed classics of the United States during the past 7 years

A. C. of C. Holds Its First Business Meeting

A. B. of T. and N. A. A. M. Passed Out of Existence—Chamber's First General Meeting in Detroit May 19

NEW YORK CITY, May 7—The members of the N. A. A. M., Inc., and of the A. B. of T. have agreed unanimously to the plans adopted by their respective executive committees for the dissolution of the two associations and the consolidation of their interests in the newly-organized Automobile Chamber of Commerce. Meetings of the executive committees of the two bodies were held today. They were the last gatherings at which anything more than routine will be transacted. Tomorrow the members of the N. A. A. M., Inc., which is a Connecticut corporation, will meet at Hartford and vote to take the necessary legal steps to disband. It is intended that on the following day the Automobile Chamber of Commerce will commence active work.

The meeting of the A. C. of C. will be held at Detroit on Monday, May 19. At the meeting held today the following members of the executive committee of the A. C. of C. were present:

Charles Clifton, Charles C. Hanch, Samuel T. Davis, W. T. Leland, Windsor T. White, William E. Metzger, H. O. Smith, Albert L. Pope, L. H. Kittredge, H. H. Rice. Col. George Pope, the treasurer of the body, was also present.

Following is a short history of both the A. B. of T. and the N. A. A. M., which now have been merged into the A. C. of C.:

The Automobile Board of Trade was founded during May, 1911, and was originally composed of some fifty members of the dissolved Association of Licensed Automobile Manufacturers who had built motor cars under the Selden basic patent. This body had included a large number of automobile makers. The A. L. A. M. sought to enforce the Selden patent until early in 1911 when the principal suit of the A. L. A. M. against Henry Ford was lost by the decision of Judge Hough. Then the A. L. A. M. members began to plan a reorganization for the purpose of taking up other patents of general importance to the industry. The result of these considerations was the Automobile Board of Trade, with H. A. Bonnell as acting general manager.

The N. A. A. M. was organized November 10, 1900 at the first show held at New York. The first executive committee meeting was held on December 3, 1900. The association was incorporated on May 4, 1904.

As a partner of the Automobile Club of America, it governed the shows at Madison Square Garden. It remained until 1903 the *only* association of automobile manufacturers in this country. While so remaining it took upon itself the control of shows, the regulation of contests, the prosecution of good roads work, attention to legislative matters, the adoption of a warranty, the standardization of certain features of car construction and other interesting things. The control of shows was one of its first and most important undertakings.

The Selden patent and the formation of the Association of Licensed Automobile Manufacturers, popularly known as the Licensed Association, brought great changes. Following its formation the opposition organized the American Motor Car Manufacturers' Association, popularly known as the Unlicensed Association. The National Association, no longer the only one, became a house divided against itself, though it did not fall.

The licensed association took Madison Square Garden, where the National had formerly held sway, and conducted a show for the benefit of its members. The opposition took the Grand Central Palace for the unlicensed makers. The revenue of the National Association, as far as the New York show was concerned, was cut off. Meanwhile the association continued its control of the Chicago show, which gave it the necessary revenue to carry on its work.

The freight department of the association, backed by the numbers and influence of a united industry, became a real power and its value increased ten fold. The commercial vehicle committee became so active that its work is among the most important the association has done. The show committee jumped into the breach and headed off threatened opposition in New York. The membership committee became so active that it has added sixteen members to the roll, so that the association has now 105 upon the list, by far the greatest number in its history.

Early Metropolitan S. A. E. Meeting

NEW YORK CITY, May 7—The S. A. E. Metropolitan Section will hold its monthly meeting on May 27 instead of May 29, due to the visit of the British engineers, who will arrive on May 26 and will leave on the morning of May 28 for Pittsburgh. On the evening of May 26, an informal beefsteak dinner will be held in the Jungle room of Healy's restaurant, and on the following evening the monthly meeting in the ballroom of the McAlpin hotel. The problem of engine starting will be taken up, many starter manufacturers will have representatives at the meeting and a discussion will follow the reading of the papers.

Meteor Motor Car Co. Replaces Clark

SHELBYVILLE, IND., May 6—*Special Telegram*—The name of the Clark Motor Car Co., whose plant and other assets were purchased last week at a receiver's sale by interests headed by Maurice Wolf, of Chicago, has been changed to the Meteor Motor Car Co. The new company organized under this name will continue the manufacture of cars in Shelbyville, building two models, one of 30 horsepower and the other of 40 horsepower. Production of cars under the new regime is in progress, the first shipment leaving the factory today.

Regal Trebles Its Capital Stock

DETROIT, MICH., May 3—The capital stock of the Regal Motor Car Co. has been increased this week from $1,000,000, to $3,000,000. Of the latter amount, $2,600,000 has been subscribed for and paid in, while the remaining $400,000 of preferred has been set aside as a reserve for any future needs of the business.

The personnel of the Regal company has been altered somewhat, in that C. R. Lambert, John Lambert and Bert Lambert, who formerly held the positions of president, secretary and treasurer, respectively, have retired from active participation in the management. Fred W. Haines, former vice-president, has been made president, he at the same time retaining the general managership. H. H. Emmons has assumed the duties of secretary and treasurer. There is no vice-president under the new régime.

Although retiring from active capacities, the Lamberts will still remain on the Regal company's directorate, which includes Mr. Haines and Mr. Emmons in addition.

The concern's schedule calls for a production of about 7,500 cars this year, and with the present activity this figure will undoubtedly be reached. The Regal company has always enjoyed a healthy foreign trade.

Bostonians Settle 1914 Show Plans

BOSTON, MASS., May 5—A meeting of the Boston Commercial Motor Vehicle Association was held here on May 1, and the matter of holding a truck show for 1914 was fully discussed. It is planned to open the passenger car show on March 7 and close it on Saturday, March 14, and to open the truck show on the following Tuesday, March 17, and close it Saturday, March 21.

INDIANAPOLIS, IND., May 7—*Special Telegram*—C. B. Warren, who is leaving this state, resigned as president of the Indiana Automobile Manufacturers' Association last night. H. O. Smith, president of the Premier Motor Mfg. Co., was elected to succeed him. Carl G. Fisher was elected a director.

U. S. Rubber Earnings $91,000,000

NEW YORK CITY, May 7—The annual report of the U. S. Rubber Co., for the fiscal year ending March 31, 1913, which has been published here today, gives the total gross earnings during that period as $91,782,861.87, the net profit being $10,475,706.97 and the total income $10,559,830.46. The net profit, after deducting interest for funded indebtedness, etc., was $7,544,217.67.

The latter figure amounts to about 8 per cent. of the net sales, and from it $5,799,955 of dividends have been paid. The surplus after these payments is $1,744,262.67; together with moneys from the Rubber Goods Mfg. Co. common stock, etc., the surplus is $11,299,129.65, which together with previous surpluses, leaves the company a total surplus of $28,735,736.80, out of which a common stock dividend of $8,000,000 was paid. Net profits exceeded dividend payments by $1,730,755.36. Regular dividends of 8 per cent. on the first preferred and 6 per cent. on the second preferred stock were paid, as well as 4 per cent. payments on the common during the first quarter and 6 per cent. during the last, in addition to a 20 per cent. stock dividend declared in July.

During the year the first preferred issue has been increased from $40,000,000 to $70,000,000 and the common stock from $25,000,000 to $40,000,000, the second preferred having become convertible into first preferred. In addition to an enlargement of the company's plants, those of the Rubber Regenerating Co. have been acquired.

The report gives the company's assets as $185,770,827.52 of which $105,687,667.88 is credited to property and $7,456,804.28 to cash on hand.

Klaxon Company Increases Stock

NEW YORK CITY, May 5—The Lovell-McConnell Mfg. Co., of Newark, N. J., has just increased its capital to $2,000,000, half of which is common stock and half 7 per cent. preferred stock. The officers of the company remain the same. No stock will be offered in the open market, but the entire issue will go to people active in the company's factory.

Batavia-Seamless Suit to Court

NEW YORK CITY, May 6—The Seamless Rubber Co., of New Haven, Conn., has filed its answer to the complaint of the Batavia Rubber Co. which demands that the Seamless concern cease to manufacture tire treads resembling that of the Batavia company. The defendant has denied all the allegations made in the complaint, and the matter will come to trial. It is hardly probable that the suit will come up in court before the opening of the fall term.

Paige Company Plans Expansion

DETROIT, MICH., May 3—At the annual meeting of the board of directors of the Paige Motor Car Co., held recently, Alexander McPherson retired from the directorate and his place was taken by J. F. Bourquin, general manager of the company. No other changes were made in either the directors or the officials. The latter are H. M. Jewett, president; E. H. Jewett, vice-president; Gilbert Lee, treasurer; William B. Cady, secretary, and J. F. Bourquin, general manager. The directorate is composed of the following: H. M. Jewett, E. H. Jewett, E. D. Stair, S. L. Depew, W. E. Buhl, Gilbert Lee, J. F. Bourquin, C. H. Hodges and C. B. Warren.

The Paige company plans increased activity, and to this end H. M. Jewett has given up active participation in his other interests in order to devote more time to the affairs of the Paige concern. A new plant is contemplated to take care of the increasing business.

Maritime-Singer Six for Canada

LONG ISLAND CITY, N. Y., May 6.—The Palmer & Singer Mfg. Co. of this city has completed arrangements with the Maritime Motor Co. of St. John, N. B., Can., whereby the latter will assemble in its factory six-cylinder cars made from parts made by the Long Island company and known as Maritime-Singer Six, the cars to be practically identical with the sixes built in Long Island, having 45-horsepower, 128-inch wheelbase, and being fitted with two, four or five-passenger bodies. The price is to be about $3,000 Canadian money. The St. Johns factory operates now at the rate of seven cars a week.

Matheson Plant Sale on May 20

WILKES-BARRE, PA., May 5—The property of the Matheson Automobile Co., now in bankruptcy, will be sold here at auction on May 20. The sale will be under the control of receiver in bankruptcy W. C. Shepherd, formerly president of the company. The property will be offered for sale in separate parcels, although it is hoped by some parties that the sale will be preliminary to a resumption of manufacturing operations and not a dissolution sale.

DETROIT, MICH., May 3—Nothing definite as to the future plans of the Warren Motor Car Co., which went into the hands of a receiver recently, has yet been decided. A statement of the condition of the company and an inventory of its stock and equipment are now being prepared. The Detroit Trust Co. has been appointed receiver for the concern.

Automobile Securities Quotations

The amount of trading during the week was limited, although the market as a general proposition showed a fair amount of strength. Ajax-Grieb, Firestone, and Goodrich all scored advances, the last named rising 15 points over last week's closing figure. Miller Rubber, on the other hand, fell off as many points. General Motors, Lozier and Overland declined.

Market Changes of the Week

Tin had its usual change, this week rising $.50 per hundred pounds. An improved consuming demand was also noted, with a fair amount of speculative buying. The London market was steady. Lead experienced a drop of $.15, the market remaining quiet, following the reduction in prices by the leading interests. Dealers report a rather light demand for domestic scrap, and according to reports from some other cities the demand has latterly fallen off, notably at Boston, where little business has been transacted of late, and the tendency of prices there is reported to be downward. Automobile tire scrap is calling at $.10 per pound. After a fairly steady opening cottonseed oil dropped to $6.87 per barrel, at a loss of $.04. This was caused by the weaker tone to the provision markets and the indifference of the consuming demand. Both petroleums experienced no changes, the prices remaining constant. Reports given say that the wells in the West are working good. Gasoline remains at $.22 1-4 per gallon sold in 200-gallon lots. Electrolytic copper showed a slight gain of $.00 1-8 per pound due to more active trading conditions.

Packard motor in the A.C.A. testing laboratory undergoing its long endurance test which equals a trip across the continent

Packard Motor Steady

First Half of 200-Hour Heavy Duty Test Goes Off Smoothly

NEW YORK CITY, May 7—For more than 84 hours the Packard six-cylinder 4 by 5.5-inch motor now on test at the laboratory of the Automobile Club of America, has been steadily pounding away at the rate of 1,200 revolutions per minute. This is a model 38 motor taken from stock and driven in a touring car from Cleveland to New York. It arrived here Friday noon and at 10:43 Saturday night it was started on its long test.

For 200 hours the motor will be run at its maximum power at the rate of 1,200 revolutions per minute. The throttle is wired wide open, the magneto is wired so that the spark is fully advanced while the laboratory staff works night and day in 8-hour shifts, keeping a constant record of the performance of the motor. To all appearances the motor is running just as it did when it started.

A test of this kind uses 60 gallons of gasoline every 200 hours. In 1 hour the motor will have turned over 72,000 times or 1,730,000 revolutions per day. At the end of 200 hours the motor will have revolved 14,400,000 times. At 1200 revolutions per minute with the standard gear ratio of a touring car, the car will be traveling at the rate of 37 miles an hour. This is 888 miles per day or for the 200 hours amounts to 7,400 miles. Should the test be continued for 300 hours it will correspond to a traveled distance of 11,100 miles. At the end of 300 hours the crankshaft will have revolved 21,600,000 times.

Observations are made constantly according to the conditions printed in THE AUTOMOBILE for May 1 and no sign of weakness has as yet developed. A blast of air to parallel road conditions is used to cool the crankcase and the water is pumped to a cooling tank instead of through the radiator.

Ford Makes 1,000 Cars a Day

DETROIT, MICH., May 3—The making of 1,000 automobiles a day is no longer a press agent's dream, for on several days during the month of April just passed the production of Ford model T automobiles has equalled or exceeded that figure. Averaging the entire month of April, the daily output of the Ford plant has been 869 cars per each 24 hours. Of course, there were some days when the number turned out fell somewhat short of the 1,000 mark, while on others it was considerably overshadowed.

During May the Ford production department expects to average in the neighborhood of 900 completed machines each working day. This means that on some days the number leaving the works will have to be greatly in excess of 1,000 to make up for the days when it falls below.

Such figures are hard to realize when it is considered that many a prosperous factory does not make many over 1,000 automobiles a year, to say nothing of a quantity equal to a single month's Ford output. During April there were about 21,000 Fords offered to the world. For March there were exactly 17,364 produced, with a total value of $10,000,000, in round numbers. Thus, April showed an increase of manufacture of about 21 per cent. over March. At this rate it looks as if there will be no trouble in meeting the schedule of 200,000 machines as planned.

The company's records for the first half of the fiscal year ending with March and extending over the months of October, November, December, January, February and March, show that for this period a business of $47,000,000 was done, which establishes a new mark in the annals of automobiledom. The sale and delivery of 78,462 cars for the past 6 months is in excess of the entire number turned out by the company for the previous fiscal year by about 5,000 cars. The past half year's quota swells the total number of Fords produced from the beginning of manufacture up to April 1, 1913, to 234,753.

Licenses for New York Operators

ALBANY, N. Y., May 3—The McGrath bill was passed in the Legislature yesterday, after having been amended seven times. All automobile operators must be licensed. In its present form the law gives to the secretary of state the power to suspend or revoke any license after a hearing and 10 days' notice to the owner thereof, if he has been shown to be guilty of reckless driving.

The amendment reads in part as follows:

"Application for a license to operate motor vehicles as an operator or chauffeur may be made, by mail or otherwise, to the Secretary of State or his duly authorized agent upon blanks prepared under his authority.

"Special licenses shall be issued to chauffeurs, but before such license is granted the applicant shall pass such examination as to his qualifications as the Secretary of State shall require. The Secretary of State shall appoint examiners and cause examination to be held at convenient points throughout the state as often as may be necessary. Every application for a chauffeur's license shall be accompanied by two photographs of the applicant in such form as the Secretary of State shall prescribe, such photographs to be taken within 30 days prior to the filing of such application and to be accompanied by the fee provided therein.

"As regards to licensing chauffeurs, the bill provides for a more liberal license fee and a reduction of the renewal. The first license shall be $1.00 and no charge for a renewal; this is a change from $5.00 for new license and $2.00 for renewal.

"The Secretary of State is empowered to suspend or revoke any certificate of registration or any license for the following causes: Three violations of the speed provisions in one year, conviction of felony, physical or mental disability, intoxication or the use of drugs, negligence or reckless driving."

Makers Object to Tariff

Proposed Chassis Reduction Is a Joker, Says Manufacturers' Protest

TWENTY-SEVEN manufacturers of American-made passenger cars have protested to Congress against the new tariff on motor cars and motor car parts. The chief ground of protest is on the reduction of the duty on chassis from 45 to 30 per cent. and further on the reduction of duty on finished parts of cars, not including tires, from 45 to 20 per cent. These manufacturers take the view that the present Underwood tariff takes care of the foreign manufacturer and the foreign workman by opening the American market to them on the lowest possible terms. The protests further goes on to state that importers and representatives for foreign manufacturers were consulted and their advice taken, whereas the American manufacturer seeking to defend his business and his employees from foreign cheap labor products has been utterly ignored.

The protest goes on to show that not only a slight modification of the existing duty of 45 per cent. was necessary to be entirely satisfactory to European factory representatives in this country and that if the duty were reduced from 45 to 33 or 30 it would give the European makers entry to the American market at satisfactory rates of profit to them.

The protest further says: "It certainly is a joker to have finished automobiles in the tariff schedules at 45 per cent. and to have automobile chassis listed at 30 per cent. . . . Practically all of the imports of motor cars are in the form of chassis. The chassis is the thing the European manufacturer wants to bring in at the minimum rate of duty. European manufacturers do not manufacture bodies except to a very small extent, as bodies are too bulky and subject to damage in shipping and too expensive to ship by reason of their bulk in proportion to their value. Does it seem like a joker to have a Ways and Means Committee put its stamp of approval on the 45 per cent. rate of duty for finished automobiles exactly as it was done by the Payne-Aldrich bill and then place a rate of duty of 30 per cent. on the chassis?"

Further: "The chassis itself is really a completed automobile and it is the thing the European manufacturer wants to bring in at the minimum rate of duty. It is the part requiring the ingenuity, the invention, the expensive material, the elaborate work of skilled manufacture chiefly represented in expense by American labor at American wages and American material. There is practically no material now imported. It is all made in this country. Magneto factories, parts makers, etc., have been transplanted to America and motor car factories also under the present Payne-Aldrich tariff."

The second joker consists in admitting finished parts at 20 per cent. duty.

The protest goes on to show how it is the parts that make the car and that the chief cost of its chassis consist in the material in these parts and the labor bestowed on them, whereas the labor necessary to properly bring them together into a chassis is a minor one, and the negligible per cent. of the chassis cost.

The protest continues: "Is a European manufacturer going to import these products into America as chassis at 30 per cent. duty, when he can ship it at less cost of freight and enter it at 20 per cent. and have simply to assemble the various parts into a chassis at a cost of approximately 1 per cent.? It is clear that the foreign manufacturer will provide for uniting or assembling the imported parts in America. Chassis as such will only be imported by the foreign manufacturer who is without sufficient means to establish an assembling branch in America."

In conclusion: "The man in the grocery business who buys an American automobile sees his money distributed in payroll to the American workmen making that automobile, who, buying groceries or clothing, spend it in his store. With free trade or a tariff reduced to the point of ready admission of foreign automobiles or parts this same grocer or clothier sees his money going to Europe to pay foreign workmen and to be spent for foreign groceries and clothes. With the purchase of the American automobile, the buyer benefits the American manufacturer, the American workman and himself. With the tariff reduced to admit foreign automobiles, the purchasers of them take away the means of existence of the American motor car manufacturer, the American workman and himself to just that extent.

"The motor car industry is deserving of credit for the large export trade which has been built up as the result of great national prosperity at home, which has enabled it to adopt manufacturing methods, to reduce the cost of production, and enter into the war for the world's commerce with European concerns who are better located as to freight, fully equipped with American machinery and with cheap labor available at approximately half to two-thirds that paid American labor.

"The total American export trade of all kinds has grown to exceed the enormous sum of $2,000,000,000 annually. This could not have been done without a condition precedent to it of prosperity, first in America, which properly has given the ways and means and ability to engage in the fight for world-wide commerce. Prosperity at home is the first necessary factor for increase of export trade.

The protest is signed by the following, constituting a committee of five representing the 27 manufacturers mentioned below.

John N. Willys, vice-president, Willys-Overland Co.; W. S. Leland, general manager, Cadillac Motor Car Co.; Charles Clifton, treasurer, Pierce-Arrow Motor Car Co.; Hugh Chalmers, president, Chalmera Motor Car Co., and Henry B. Joy, president, Packard Motor Car Co.

The following are the manufacturers represented by the above committee:

John S. Clark, vice-president, Autocar Co.; Ardmore, Pa.
A. F. Benjamin, general sales manager, American Locomotive, New York, N. Y.
V. A. Longaker, general manager, American Motors Co., Indianapolis, Ind.
H. W. Ford, secretary, Chalmers Motor Co., Detroit, Mich.
W. C. Leland, vice-president, Cadillac Motor Car Co., Detroit, Mich.
J. J. Cole, president, Cole Motor Car Co., Indianapolis, Ind.
G. W. Bennett, vice-president, The Garford Co., Elyria, Ohio.
Elwood Haynes, president, Haynes Automobile Co., Kokomo, Ind.
Chas. D. Hastings, secretary, Hupp Motor Car Co., Detroit, Mich.
S. T. Davis, Jr., president, Locomobile Co. of America, Bridgeport, Conn.
G. A. Kissel, president, Kissel Motor Car Co., Hartford, Wis.
Joseph M. Gilbert, president, Lozier Motor Co., Detroit, Mich.
Leo A. Feif, general sales manager, Mitchell-Lewis Co., Racine, Wis.
Geo. M. Dickson, secretary, National Motor Vehicle Co., Indianapolis, Ind.
Geo. O. Daniels, vice-president, Oakland Motor Car Co., Pontiac, Mich.
O. C. Hutchinson, vice-president, Olds Motor Works, Lansing, Mich.
Henry B. Joy, president, Packard Motor Car Co., Detroit, Mich.
L. H. Kittredge, president, Peerless Motor Car Co., Cleveland, Ohio.
Charles Clifton, treasurer, Pierce-Arrow Motor Car Co., Buffalo, N. Y.
George Pope, treasurer, Pope Mfg. Co., Hartford, Conn.
H. M. Snyder, secretary, Reo Motor Car Co., Lansing, Mich.
H. B. Staver, Staver Carriage Co., Chicago, Ill.
W. H. Whiteside, president, Stevens-Duryea Co., Chicopee Falls, Mass.
Frederick F. Fish, president, Studebaker Corporation, South Bend, Ind.
Robert W. Allen, general manager, Warren Motor Car Co., Detroit, Mich.
Windsor T. White, president, White Co., Cleveland, Ohio.
John N. Willys, president, Willys-Overland Co., Toledo, Ohio.

Yosemite Park Open to Motorists

WASHINGTON, D. C., May 3—Secretary Lane today rescinded an order which bars automobilists from Yosemite Park, on the grounds that thereby a large proportion of the people will be enabled to enjoy the beauties of the National Park.

AUGUSTA, ME., May 5—The legislature has passed a law creating a state highway commission of three members and authorizing the issue of $2,000,000 bonds to be spent solely on highway construction.

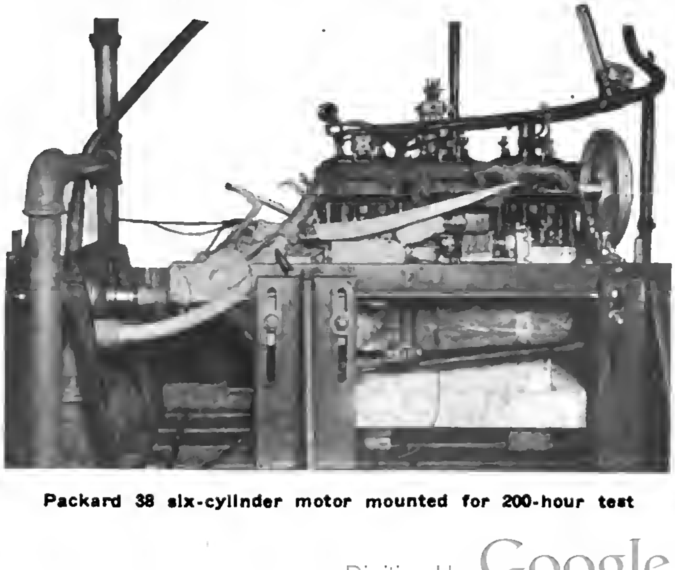
$3,000,000,000 Road Plan Proposed

WASHINGTON, D. C., May 1—National and state co-operation in a $3,000,000,000 expenditure for good roads—$1,000,000,000 being for construction and $2,000,000,000 for maintenance, and both extending over a period of 50 years—are proposed by a plan submitted this week by Jonathan Bourne, Jr., former Senator from Oregon, to the joint committee on federal aid in the construction of post roads.

His plan contemplates that the billion-dollar construction fund shall be apportioned among the states upon the basis of area, population, assessed valuation and road mileage, and that the several states shall deposit in the U. S. Treasury their 50-year 4 per cent. bonds for the amount due them, and the Government loan the states the par value thereof for road construction, the Government raising its fund by the sale of its 50-year non-taxable 3 per cent. bonds. By crediting each state every year with the excess 1 per cent. interest paid by the state to the Government over what the Government pays on its bonds and allowing 3 per cent. interest compounded annually on said excess 1 per cent., a sinking fund is established from which the Government pays off the bonds at the end of 50 years and the state is relieved of the payment of principal on its bonds.

The Government will also, under this plan, pay to each state annually for road maintenance an amount equal to 2 per cent. of the amount of bonds on deposit, provided the state expends a like amount.

NEW YORK CITY, May 7.—Under the provisions of the Pollock bill, which has just passed the legislature of New York state, it will be possible for bus companies operating in New York City to compete with the Fifth Avenue line, which has long held a monopoly. A new company, the Electric Coach Co., with a weighty financial backing is seeking a franchise and expects to have 1,000 electric four-wheel-drive buses operating on New York streets by the end of the season. The fare is to be 5 cents.



Packard 38 six-cylinder motor mounted for 200-hour test

Start of eighteen trucks which participated in the Washington Post commercial car run

Atterbury truck crossing the Hyarthtown bridge, Maryland

Trucks Do Well in Run

HARRISBURG, PA., May 6—With approximately one-half of its distance covered the Washington Post motor truck demonstration reached here early this afternoon, having all of its original eighteen contestants and three non-contestants in line, as well as all of the various passenger cars used by officials.

Eight of the eighteen contestants still have perfect road scores these being Mais, Wilcox. Hupmobile, McIntyre, Lauth-Juergens, two Whites and an International. The three non-contestants are ambulances entered by Major P. L. Halloran, of the United States army and two of these, a White, has still a clean sheet, the other carry slight penalties.

The total run, which will take in 4 days and cover 288.7 miles of country, will come to an end in Washington, D. C., Thursday evening after which the trucks will be given brake, clutch and transmission tests as well as a technical inspection. The daily itinerary has averaged 72 miles with night stops at Hagerstown, Md.; Harrisburg, Pa.; Hanover, Pa.; and Washington, D. C. The trucks carry their full load as catalogued. this in many cases being bags of gravel carefully weighed before the start of the run and in other cases merchandise. Each one carries in addition to its driver an official observer. During noon contols, which are from 1 to 2 hours in length to give citizens at the noon stops an opportunity of examining them, the trucks are parked under police protection so that no meddling can be done with them. At night they are similarly parked, so that any work done on them from start to finish will result in penalization.

The speeds on the roads vary from 9 to 12 miles per hour according to the truck loads, but on the first 2 days these have been entirely too slow, for the dry roads passed over, although if rain were encountered it is certain that all of the time afforded would be required.

The following are the loads carried: Under 1,500 pounds load 12 miles; 1,500 to 2,000 pounds 11 miles; 2,000 to 5,000 pounds, 10 miles; 5,000 to 8,000 pounds 9 miles per hour. The following are the entries, their official speeds, loads and penalties to date:

No.	Name	Entrant	Capacity	Sp'ds	Penalties
1	Vulcan	Commercial Garage	8000 lbs.	9	189
2	Mais	Mais Motor Truck Co	3000 lbs.	10	0
3	Little Giant	Motor Truck Corp	2000 lbs.	11	12
4	Witt-Will	Witt-Will Co	2240 lbs.	10	43
8	Rowe	Rowe Motor Mfg. Co	4000 lbs.	10	47
9	Hupmobile	Wash. Auto Service Co	800 lbs.	11	0
10	McIntyre	W. H. McIntyre Co	3000 lbs.	10	0
11	Autocar	Autocar Sales & Service Co.	3000 lbs.	10	23
12	Lauth-Juergens	Lauth-Juergens Motor Car Co	4000 lbs.	10	0
13	Atterbury	Atterbury Motor Car Co	1500 lbs.	12	3
14	Atterbury	Atterbury Motor Car Co	2000 lbs.	11	6
15	Atterbury	Atterbury Motor Car Co	3000 lbs.	10	101
16	Atterbury	Atterbury Motor Car Co	4000 lbs.	10	29
17	White	The White Co	1500 lbs.	12	0
18	White	The White Co	3000 lbs.	10	0
19	International	H. B. Leary, Jr	1000 lbs.	12	0
20	Atterbury	Atterbury Motor Car Co	1500 lbs.	12	128
100	Brown	Major P. L. Halloran	Ambul'ce	12	3
101	Four-Wheel-Drive	Major P. L. Halloran	"	12	15
102	White	Major P. L. Halloran	"	12	0

No 1912 Los Angeles-Phoenix Race

PHOENIX, ARIZ., May 1—It has been practically decided that there will be no Los Angeles-Phoenix race this year. Conditions are so unsettled on the coast that the members of the Maricopa Auto Club. who have promoted the race for 5 years, do not believe it will be possible to hold it with any satisfaction next fall. They hope to promote a race from El Paso, sanctioned by the A. A. A. instead.

Texans to Build Speedway

SAN ANTONIO, TEX., May 1—The San Antonio Automobile Club and the Texas State Highway Assn. have under consideration the construction of a 2-mile speedway here to take the place of the present short racing course. The proposition is being urged by Dr. W. A. Hering, president of the club, and John W. Warren, president of the association. It is meeting with enthusiastic endorsement.

PHILADELPHIA, PA., May 3—Preliminary plans and regulations that are to govern the interclub reliability run to Gettysburg, to be held on June 7, under the joint auspices of the Quaker City Motor Club, the Automobile Club of Philadelphia, the Automobile Club of Germantown and the Delaware County Automobile Club, have been completed.

The run is to be open to members of the four organizations mentioned, who are private owners and not connected with the automobile industry. Members of the trade are invited to accompany the run as non-contestants. The Interclub Road Run trophy will be awarded the club having the most teams finishing with a perfect score, the entrants being divided into teams of five for each club.

PHILADELPHIA, PA., May 4—Favored by ideal weather and road conditions, the local automobile contest season was opened yesterday when the Quaker City Motor Club conducted its sixth annual sociability run to Atlantic City, N. J. Forty-one cars were officially entered, of which thirty-one checked in at the Hotel Strand

Thirty-One Cars for Indianapolis Race

INDIANAPOLIS, IND., May 5—When the list of entries was closed for the 500-mile race to be held at the Indianapolis Motor Speedway, May 30, it was found thirty-one cars had been entered for the long grind. This is seven more entries than there were in the race last year. Two of the entries are unknown, and may not be announced until the elimination trials.

It is said that the race will present one of the most thorough representative international motor car races ever held. Most of the entries this year have been made by factories, both of the United States and abroad. This year will see several foreign drivers, whereas heretofore the foreign entries have been by American owners with American drivers.

The qualifications for the race are that cars must not exceed 450 cubic inches piston displacement, must have a minimum weight of 1,600 pounds and must be able to do 75 miles an hour.

The seat sale is proceeding in a most satisfactory manner. Preparations for the race are also making excellent progress. There will be better hotel accommodations than in the past, because two large hotels, one of seventeen stories and the other of twelve stories, have been built since the race last year. The complete list of entries follows, together with some of the mechanical details of the cars:

No.	Car	Cyls. In.	Bore In.	Stroke In.	Disp. Cu. In.	Driver
1	Nyberg	6	6	4	389	H. Endicott

CHICAGO, May 5—Additional improvements planned for the Kane County circuit by the Elgin Automobile Road Race Association promise to make the course one of the fastest in the country, and one that even will threaten the Santa Monica course's supremacy. If a speed of close to 80 miles an hour cannot be maintained in the Elgin National race next fall, it will be surprising. These contemplated improvements mean that the Kane County course will be in reality an 8.5-mile circular speedway, with no sharp right-angled turns.

At a meeting of the Elgin Automobile Road Race Association yesterday it was decided to build a new turn at the east end of the course.

The Elginites will again close with the Chicago Automobile Club to handle the meet. They also have contracted for a covered grandstand and several concessions have been let.

Motor Dealers Secret-Time Run

NEW YORK CITY, May 2—The recently organized Motor Dealers' Contest Association held its first contest of the season this evening, which took the form of a secret-time sociability run from Columbus Circle to Hotel Cedarcliff, New Rochelle, 17.5 miles. Fifty-four cars started in the gasoline and electric division. The secret time for the gasoline cars was 56 minutes and 21 seconds, and the winning car was J. T. Kelly's Overland, which took 56 minutes and 10 seconds; second prize, W. Cullem, DeDion, 56 minutes 50 seconds; and third prize, Miss Stella Mayhew, Regal, 55 minutes 21 seconds. Gold, silver and bronze medals were awarded.

Nearly a score of electrics contested for the W. C. Poertner Cup. Their running time was 80 minutes 17 seconds, a speed of 13 miles per hour. Mrs. A. E. Waxham, in a Waverley, was first, 84 minutes 49 seconds. P. S. Rogers, in a Waverley, was second, 72 minutes 36 seconds, and a Baker entered by the New York Edison Co. was third, 68 minutes 57 seconds.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

Testing Out the Motor Trucks

IT is generally conceded that the early reliability contests did much to quicken the devlopment of the passenger car. The 200-mile mountain climbs showed up weaknesses in brake construction, in cooling facilities, in running gear details and in not a few other lines. These same makers who learned their valuable passenger car lessons are today averse, in many cases, to entering in truck competitions. They claim that they are not needed. They claim that the passenger car trials taught them all that it was necessary to know.

The motor truck is more and more becoming a vehicle of inter-city work and the requirements for such service are often quite different from those in city service. This is chiefly so in hilly districts where severe strains are placed on the motors and brakes. The present truck demonstration through the states of Maryland and Pennsylvania is proving that in several cases brakes are not adequate for the long mountain descents, the same as was discovered in the touring car field 8 years ago. The long mountain climbs are showing the necessity for adequate radiator capacity.

Apart from the valuable lessons that truck demonstrations teach the maker direct, they play a big part by the enthusiasm they create along the route, which is particularly so when efforts are made to give the business people at noon and night stops an opportunity not only to look over the trucks but also to talk with the factory managers who accompany the demonstration.

Reducing the Automobile Tariff

THE announced reductions in the tariff on automobile chassis and parts from 45 to 30 and 20 per cent. respectively has, as tersely pointed out in a brief recently issued by twenty-seven leading American automobile makers, placed in the hands of the foreign maker a weapon that he can wield with danger to some of the American factories, in that the flat reduction of 15 per cent. on chassis coupled with his cheaper labor and modern machines will enable the foreign maker to readily compete in certain car fields with the home-made product on a much more favorable ground than formerly.

In manufacturing cars, the foreigner secures labor that often does not cost one-third the price of American labor, but today he has a still further advantage that he did not possess a few years ago, namely, he has fitted his factory up with the most approved machinery purchased in America.

Heretofore, the American maker has excelled the makers of all other countries in production. Automatic and multiple machines have so far outdistanced the old-fashioned foreign methods that the cheap labor question of Europe was offset. Today matters are changing. The foreigner is cutting his costs of manufacture and consequently will be a stiffer competitor in America than he has been. In the past conditions have been sufficiently favorable that where foreigners have been well represented on this side of the Atlantic they have been able to build up a very large market. True, only one or two have so taken advantage of the conditions, but they have existed, nevertheless, and if under the 45 per cent. rule they have made such progress what can be expected under a 30 per cent. regime?

The American manufacturers point out that in the reduction of duty on spare parts from 45 to 20 per cent. an opportunity will be offered to ship the separate parts in and assemble them and so place them on the market at an enormous price reduction as compared with today. There is little danger at present of this because it would call for a greater speculative investment than most of the foreign concerns would be willing to make. To build an assembly factory in this country would mean to produce 2,000 cars or over and few of the concerns would venture on such a risk. Practically all of the importation of parts will, as in the past, continue to be for replacement of cars now running.

It is, however, up to the American maker to look to his fences. He must cast the microscope around his engineering department, around his manufacturing methods, around his selling force and around his maintenance organization.

Letting down the bars, as the tariff proposes, pushes our makers out into world-wide competition burdened with a labor handicap, also handicapped in that the European maker is a more experienced exporter and has been developing his market in all parts of the world for the last 10 years, whereas the American builder has been engaged in that time filling home demands. Every economy in manufacture will have to be looked to. Motion study will have to be made a greater study in all production departments; and the designers will practically be compelled to design with a view to economy of manufacture.

Detroit S.A.E. on Kerosene and Aluminum Alloys

DETROIT, MICH., May 2—That kerosene carburetion and aluminum alloys are especially live subjects in the automobile industry just at present, was demonstrated by the large attendance at the meeting of the Detroit Section of the Society of Automobile Engineers on May 1. Vice-chairman Cornelius T. Myers called upon P. S. Tice for the first paper, under the title of "Some of the Difficulties of Kerosene Carburetion." Mr. Tice first gave a résumé of the characteristics of kerosene and their relation to gasoline under the following heads: (a) greater specific gravity, (b) higher viscosity, (c) less volatile, kerosene being practically non-volatile at the ordinary temperatures in this latitude, (d) about the same specific heat, (e) two and one-half times the latent heat of vaporization, or about 680 British thermal units per pound for kerosene, (f) more diverse composition with more and more widely assorted foreign matttr in suspension in the commercial product.

Difficulties with Kerosene

Of the difficulties encountered in kerosene carburetion, he said that the change of viscosity with change of temperature was especially hard to deal with, since the ratio between kerosene and gasoline of the rate of flow through a small orifice is 1.74 from 40 to 140 degrees Fahrenheit. This means that the motor has to be nursed until the whole system warms up, and to give flexibility and economy, it is necessary to supply the conventional type of carbureting device with additional heat. With the high boiling point and a latent heat of vaporization of about 680 British thermal units per pound it requires approximately 900 British thermal units to vaporize kerosene from an initial temperature of 40 degrees Fahrenheit. Prohibitive difficulties may easily arise from the very high temperatures necessary to furnish the fuel with the required heat units in the very short time available. The relative non-volatility of any of the constituents of kerosene, below 135 to 140 degrees Fahrenheit has proven the greatest trouble in producing a commercially successful kerosene carbureter, for it is practically impossible to start witht a cold motor and carbureter on this fuel.

The second part of Mr. Tice's paper dealt with the results of a preliminary investigation of kerosene fuel carried on by him in the laboratory of the Holley Brothers' Co. Tre results of this research were given graphically by curves shown by means of lantern slides. The runs were made on a Ford motor with the regular carbureter and manifold replaced by a T-manifold with short branch to which was attached a vertical copper tube. At the lower end of the tube a series of venturi-like throat pieces could be fitted. The flow of fuel was controlled by the relative position of the jet to the venturi neck. There was no throttle of the ordinary type. The copper tube was wound with resistance wire through which an electric current was passed, the amount of current being controlled by a rheostat. The kerosene used had a specific gravity of .817. One set of curves was plotted between pounds of kerosene per brake horsepower-hour and mixture temperature. These were for two conditions, that of minimum temperature for starting with a cold motor and that of minimum temperature for steady running. These curves showed that to start with a cold motor it was necessary to have a mixture temperature of from 170 to 250 degrees Fahrenheit, depending upon the richness of the mixture. The leaner the mixture, the higher the temperature necessary. The steady running temperatures varied with the richness of the gas from 76 to 120 degrees Fahrenheit. Normal conditions required temperatures of 220 and 100 degrees Fahrenheit, respectively.

Another set of curves showed the effect of mixture temperatures upon economy. The difference in economy for different temperatures was very marked and with conditions varying from very light to almost full load and at several speeds it was found that the greatest economy lay between mixture temperatures of 150 to 170 degrees Fahrenheit.

The last slide brought out the fact that with a kerosene mixture at 160 degrees Fahrenheit, the fuel consumption per brake-horsepower-hour at different speeds was much lower than that considered very good with a standard carbureter on the same motor under the same conditions of speed and load but without heating. These results were under close throttling of the motor.

In the discussion following the Tice paper, W. S. Hovey spoke of the progress of the Sheffield Car Co. in injecting kerosene and even lower grade oils in two-cycle railroad and marine motors.

Geo. A. Kliesrath then described a test trip with an Overland car equipped with the new Ray Harroun carbureter. This device uses kerosene which furnishes the required heat at the jet by passing all of the exhaust through it. Starting on a cold motor was accomplished by feeding gasoline to the inlet manifold during the time that the self-starter was cranking. The performance of the car was very satisfactory, tests being made for acceleration, sustained speed, idling, etc. The fuel economy was excellent considering the very bad roads encountered in the flood district of Indiana and Ohio.

It had been the experience of both Mr. Tice and Mr. Kliesrath that it is necessary to heat the fuel or the mixture when using kerosene and not to pre-heat the air as is now common practice in gasoline carburetion. Neither had intentionally used water with the mixture for the purpose of decreasing carbon deposits or preventing pre-ignition. The motors in both cases were of the same compression as used with gasoline. It was also brought out by several members that the pounding or bumping of the motor which has been noticed with kerosene and sometimes with gasoline, when starting, is probably due to a poor distribution of fuel between the different cylinders.

The second paper dealt with a comparison of aluminum alloys. Claude E. Cox showed several charts giving the possible alloys with aluminum and the results of a large series of tests of different alloys and under varying conditions. It is possible to alloy aluminum with many other elements, such as gold and silver, but those with which we are most familiar are the alloys with copper, zinc, and more recently, magnesium, as in duralumin and magnalium. The data presented pointed to quite a variation in the physical properties for the different kinds and proportions of the alloys, and also that the pouring temperatures made a great difference in the strength of the castings. Probably the most interesting chart indicated that the strength of an aluminum casting decreased markedly with an increase of the temperature of the piece.

Aluminum Casting Practice

Following the talk by Mr. Cox, J. P. Carritte read a paper dealing with the shop practice in casting aluminum with especial reference to what is known as McAdamite metal. This metal was perfected by William McAdams, and is an aluminum-zinc compound, handled by a special method in shop practice production. Mr. Carritte gave some foundry rules for obtaining especially good castings, among them being the use of graphite crucibles, the rubbing of pots and receptacles with graphite and the avoidance of iron skimmers. These precautions are advisable because of the great and detrimental affinity of aluminum for iron and silicon. For the same reason he recommended that no turnings be used in the scrap, because of the iron which comes from the tools. In the McAdamite castings, for which extra strength is claimed, the virtue seems to lie not only in the alloy, but more especially in the method of handling the casting and molding. A molding compound of carborundum, carbon, French clay, charcoal, etc., is used in the same manner as in ordinary sand practice, and by this means quick chilling is accomplished the same as if the metal were poured into iron molds. The latter practice, however, would be commercially impracticable. Tests by Prof. Henry Souther and other authorities showed some very interesting results as to its strength. Although in regular practice this metal does not run to extreme strength, it is possible to make special McAdamite castings which will average 33 1-3 per cent stronger in all directions than the No. 12 and other ordinary aluminum alloys. Mr. Carritte favors the zinc alloys, and also looks forward to the time when we shall produce aluminum from many other sources besides that of bauxite.

In the discussion which followed these papers questions were asked concerning a new fluxing material, of which about 6 ounces are used to 100 pounds of aluminum. It seems that some very favorable results have been obtained with it in a few Detroit foundries, but that just what it is still is more or less of a secret. It is said that a party of engineers has just left for the locality where deposits of this flux are found, and that it is soon to be brought forward commercially.

There will be no June meeting of the Detroit section, as the National body of the S. A. E. will leave this city with their English guests on the fourth of the month. The semi-annual meeting will be held upon the steamer City of Detroit III during the voyage to the Soo.

Upper—Two cloudbursts had changed this alkali road 4 miles east of Laramie into a swamp hole for a distance of 8,100 feet. Three distinct sets of wheel tracks may be seen where automobiles have tried to avoid the pitfalls of those who had gone before. This one bad spot in a distance of many miles conld be eliminated by using the earth on the sides to build np the center, with a cross-culvert to take care of the water that runs back and forth on the low ground at each side. It took a cor 1 hour with outside assistance to make this 100 feet. Vertical arrows indicate a board over a cross-nnder drain which was badly choked.

Lower—An overage example of the culvert type of bridge out in Wyoming in the plateau conntry. Owing to a bend in the channel of the occasional small stream, the far bank has been gradually washed away nntil it no longer protects the posts on which the end plates rest. These plates have now started to tip out of place. The length of the eorth rest when first built can be judged from the position of the bridge and at the right of the pictnre. There are three bridges in a distance of 200 yards. Circle shows end supports falling away from lack of protecting wings.

A Transcontinental Hodge-Podge

By Ernest L. Ferguson

Part III

From Denver to Salt Lake City

FROM Denver to Salt Lake City by the way the motorist travels is 600 miles. You traverse portions of three states: one-sixth of the trip is northward through Colorado, where you have an opportunity of enjoying all the scenic beauties and far-famed mountain scenery that is to be found west and north of Denver. Leaving Colorado you practically cross the lower end of Wyoming, in fact two-thirds of the Denver-Salt Lake leg is through this state. These 400 miles are monotonous being over plains with sage brush, and while you cross the Rockies in this distance, you are scarcely aware of them because you work your way through them instead of over them. If it were not for your route book you might miss knowing them.

From north of Denver to the Rockies, near Wamsutter the soil is alkali with only occasional outcroppings of rock. This alkali makes a most excellent road, excepting in very wet weather. It is not difficult for the tourist to average 18 miles per hour with equipment. This pace will be slowed down at a dozen places by dry washes which cross the road. They are gulches 3 to 5 feet deep. There used to be a section of road 30 miles long between Table Rock and Point of Rocks, through what is familiarly known as the Bitter Creek section that is filled with these gulches, but a new road is now built 10 to 15 miles further north. It is free from gulches, also 6 miles shorter between these points.

From the Rocky Mountains to the Wyoming-Utah state line, the same general character of roads continues; and from the state line to Salt Lake City there is that positive change of road mentioned. It is a natural highway, well cared for, and being rapidly improved with concrete culverts and grading. The last 10 miles into the Mormon Mecca, through what is known as Parley's Canyon, is a gorgeous trip. The road is narrow and winds through the heavily wooded canyon accompanied on one side by a running stream along the banks of which the local people spend much time in camping and fishing.

Although the Denver-Salt Lake City stage of the trip takes you through the mountains, there is really not a bad grade in the whole 600 miles.

From the eastern slope of the Rocky Mountains to the Great Salt Lake the most traveled trans-continental automobile route continues to follow the old-time trail of early Western history. This leads one across the

Upper—This shows a section of a 70-mile stretch that does not vary 2 per cent. in grode or character in its distance across the eastern Wyoming plains between Laromie and Medicine Bow, and over what is known as the Laramie plains. Because it is some miles away from the railroad, for more of which distance it is to be abandoned, and a new road is now being finished between the same points, near the railroad for antomobile travel. It is on alkali soil and noturally well drained.

Lower—This long, winding climb west of Hanna, Wyo., had a fairly good surface np to 1912 when a series of unprecedented heavy rains, locally known as cloudbnrsts, washed away so much that there is now a high center. Only one side ditch, on the right, had been provided. With the large area, sharp slope and freqnency of rainfall this ditch conld not take care of the surface drainage. The result is shown by the deep gulley on the left. A new roodway is now planned 2 miles to the right that will have a more gradnal rise ond that will not have to drain so great an area. In crossing Wyoming there are four such stretches, each 1 mile in length. Arrows indicate deep side ditches—road washed out by heavy rains.

Upper—One of Wyoming's broad expanses of alkali with but scant growth of any kind at Preston and Continental waterehed. It is 8 miles long. The dotted line in this particular expanse is the Continental watershed. The trail that shows is maintained in its distinct marking almost entirely by transcontinental and other automobile touring. Upper arrow is good bench for road bed. Lower arrow shows an alkali bottom.

Lower—One of the conditions that must be watched in touring acrose the plateau country is the dry wash west of middle of the State. These are in groupe of two or three and three such groups in a distance of 100 miles. These have very steep banks, are frequently 3 to 5 feet deep and rarely more than 2 feet wide at the bottom. The rise out of them is so sharp that more often than not the front wheels are at the top before the rear wheele come to the bottom. A car will run in and out of them on its own power. Circles show banks of earth thrown out to ease the approach.

entire State of Wyoming near its southern border for over 400 miles. Some there are who have accused that state of having the poorest roads in the United States. If this were true, then many a state east of the Mississippi River could boast of its roads whereas facts compel them to silence by any comparison.

There are many miles of bad stretches and there has been one other that was notoriously vicious, but as an example of what is being done in Wyoming to improve touring conditions particular attention is here called to that one, of over 30 miles. It followed the curve of the railroad through the Bitter Creek and Black Butte country, forming a large Indian bow, and was a succession of viciously deep gullies. It holds a record of many broken frames.

With the influence of a trans-continental route association, having its headquarters at Cheyenne, a new road line across a plateau has been established that may be likened to the string of the bow. This not merely shortens the distance by about 7 miles but more important that that it gives a roadway without gullies and with no climbs of moment. At the present time it is hardly more than a trail through the sage brush though clearly defined by a very considerable amount of automobile travel. In its making the sage brush was dug out to give a roadway of single track width.

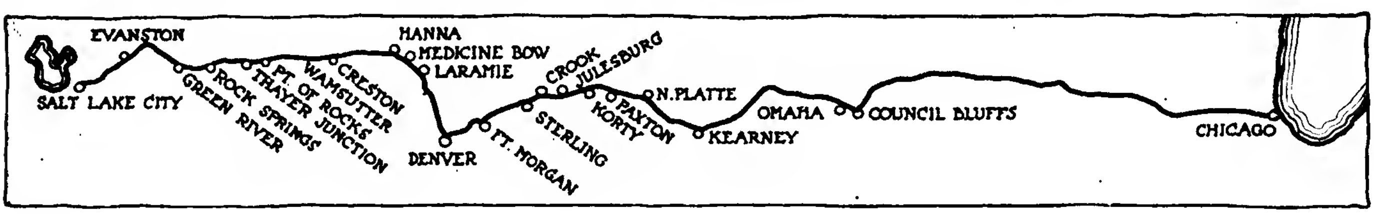
The state can also boast of as fine a piece of highway as is to be found in any traveling. This connects Rock Springs and Green River, a distance of 15 miles. The highway has been carefully engineered and keeps to only portions of the old roadway lines. It swings around hills instead of over them as did the old lines of travel; also it avoids the deeper hollows and greasewood bottoms either by a new line or by filling. The culverts are substantially made and protected by heavy rock work against the rush of waters from the nearby hills. The roadbed is of rock with a sort of shale surface and has all the delights of boulevard riding. The country between is wild in the extreme and taken all in all the contrasts between the highway and its surroundings never fail to mightily impress those who travel over its $40,000 surface.

In viewing the Wyoming roads the tourist in passing over them often pronounces judgment without being consciously aware of the effects of surroundings. The long distances between habitations and settlements, together with the monotony of sage brush growth ever present, and the weather-scarred cliffs and mountains without a vistage of tree growth, have an influence not always realized.

Another point not to be overlooked is that the lack of roads is not so much a lack of appreciation as it has been a lack of needs. The state has been one distinctly devoted to grazing, and roads were of no material importance in that industry. Now that farming is being taken up, particularly along the line of the transcontinental route, the needs for

Upper—The trail-like road that frequently for miles in Wyoming winds along one side or the other of the railroad between the latter and the mountain ranges in the central southern part of the State. These ranges are so broken in their lines that no real mountain climbing is encountered at any point. Grades are rarely over 8 per cent. One passes through rather than over the Rockies. It will be noted that in some places the road is along the lowest ground and again on the benches along the mountain side. White arrow shows a good road bench. Circle is a greasewood bottom.

Lower—It is not all alkali and sage brush. There are now and then bold croppings of rocks long distances from the mountain sides. Sometime these will become valuable as nearby road-making material. One-holf way across State and at approach to the Rocky Mountain section. Vertical arrow indicates red gronite rocks. Horizontal arrow is alkali soil.



Top—This bridge is amply strong and well designed to take care of any travel. However, it will be noticed that the support at the ends is such only as comes from resting on the natural soil. This is over a particularly deep gulley that drains a large area of mountain side. The rush of waters is washing away the soft earth bank as shown in the circle.

Upper Middle—Miles from any town, but paralleling the nearby railroad, the county authorities have filled in a roadway across an alkali flat the cracked surface of which can be partly seen on each side of a built-up section. The illustration shows the spot shortly after a series of rains that would have made impassable a road across the flat at Salt Wells in western Wyoming. Circles show alkali flats.

Lower Middle—An alkali flat after a few cloudbursts. This flat is only 2 miles from the one just described, having a built-up roadway. These flats have measurements varying from yards to miles in area. They are lower ground than their surroundings and are without a vestige of growth. While wet the soil varies from greasy slipperiness to a glue-like consistency thot clings to anything. Circles show alkali baking out into flakes. Vertical arrows show ruts made by cars.

Bottom—Nearing the Wyoming-Utah line west of Evanston, Wyo., the earth is not so clearly alkali. Thereby it more readily lends itself to keeping in some reasonable condition where only traffic does the work. By keeping this road to the higher ground on the left more natural road soil would be found and better drainage. There are 10 miles of such road in this particular stretch. Circle indicates higher rocky soil.

at least what might be called roadways is being felt and given attention.

Progressive thought in that line of progress is being devoted to the subject as evidenced in the recently passed law that places the convicts at the disposal of communities for road construction. A number of instances are already evident of work done in the past year and more is being planned. That a greater amount is not evident seems to come from the lack of a more general knowledge and understanding of the application of the law.

Fortunately for the tourist the average rainfall is from one-third to one-quarter that of Eastern states, because this immense elevated plateau, crossed by broken ranges of the Rocky Mountain system, is an alkali plain with occasional greasewood bottoms. And water-soaked alkali at all times surpasses the most energetic gumbo that ever was. There seems to be no limit to the depth that a car can sink in saturated alkali. Yet, when dried out by wind and sun it bakes to a surface that is as hard and smooth as the best asphalt road.

Materials Are at Hand

Whenever the time comes that stone-road construction takes place in that state nature has placed the material close at hand all along the route. More frequently than not this is in a natural disintegrated condition of varying sizes that will require only screening to produce all the accepted road building aggregate. While some of this is of the sand-stone variety there are mountains—millions of tons—of very proper quality.

A condition of circumstances that materially benefits the tourist is the many miles of old railroad grading that is utilized as a roadway. Some years back the railroad, from various causes, in many places changed its roadbed for greater or lesser distances. In the days of that old railroad bed the grading was not carried to the tops of the ties, so that with their removal the intermediate cross ridges were of little height and soon disappeared under weather and travel, leaving a smooth surface.

The result is a roadway that is cut through all hills it encounters as well as being filled in across low spots and ravines. One component of the old right of way that was not left when the grading was abandoned by the railroad company was the bridging across the dry washes that drain the country in its few rain periods. This means the travel is required to occasionally leave the grading and take to the side ground and obviously at the least desirable spots.

Care Greatly Needed

Now and then where the grading reaches across deep fills the rain has gradually washed off some of the sides so that the traveled surface is barely wider than the tread of the vehicle. In the growing use, from trans-continental touring and local traffic, these places well need to be taken care of. From the same cause will undoubtedly come the replacing of bridges or culverts at the now existing gaps. All told, this will give something like 100 miles of excellent highway at a minimum cost of construction.

Throughout much of the country just east and west of the Rocky Mountains there is an elemental weakness in the method of constructing the bridges and culverts, even where the superstructure is well taken care of. That weakness is in the lack of abutment wings.

Such rains as they have are generally heavy and as the country is one of steep slopes, at varying angles to the line of travel, the waters do not flow but rush along such courses as they form. The alkali soil is without

Top—A $40,000 shale and rock boulevard 15 miles long connecting Rock Springs and Green River, Wyo., winding its well-engineered way through one of the mountain ranges, west of the Rockies, in Wyoming. At each end is a town; between is not a habitation. The surrounding country is wild. Dotted line shows part of the old trail across the alkali bottom.

Upper Middle—West of Green River, at the west end of the boulevard, shown in (M), the road is bad only by comparison. The soil is of the same type, largely gravel, shale and rock. Arrow shows road across alkali bottom. Line shows good bench for a road.

Lower Middle—The importance of Salt Lake City and Ogden, ond the value of the land between has brought about definite road construction, connecting the two, on modern lines. In the meantime the roadway yet to be completed by the engineers is in a generally excellent condition, although in places liable to have standing water because of high sides at certain points. White arrow is wide irrigation ditch. Black arrows show ruts indicating true character of soil.

Bottom—The canyons that lead into Utah from the east are narrow winding valleys. The soil is oll thot could be desired for the construction of roads. Even now the little attention that hos been given has yielded a roadway that affords excellent touring, there being considerable rock and a lot of surface gravel that rapidly shape themselves under the minimum of attention. Circles indicate mountain sides of rock and gravel.

body, and rapidly wears away along the banks of the narrow, suddenly formed streams. In constructing a bridge or culvert a frequent method is to carry the ends well beyond each bank onto what is at the time solid ground.

By this method or even where post or plank abutments are built it is only a question of time when the banks wash away to points beyond the abutments or the natural soil on which rests the floor timber ends.

With the construction of wings the banks at the ends of the structure would be materially protected. Owing to the powder-like consistency of alkali soil this protection could not have the permanence that would obtain in more homogeneous soil. There would be sometimes come the need for filling at the wings to prevent back water getting at the bridge ends, but this work can be reduced to a negligible quantity compared with what is now necessary if serious attention was given to prevent the present condition of washed-away bank ends.

Choice of Two Branches

Going west from the Wyoming-Utah state line the trans-continentalist for the second time is given the choice of taking either branch of a huge Y. The right one goes direct to Ogden, but, as in the case at the Nebraska-Colorado line, going by way of the left well repays the choice. This leads to Salt Lake City with its many attractions for the tourist, where a turn north is made to Ogden. This routing adds but 34 miles to the journey.

The branching takes place at Echo, Utah, and each has picturesque canyons with roadways constantly being bettered. Each branch is about the same in mileage, the added difference being the distance from Salt Lake City to Ogden and this is over a newly improved modern road.

Of the two branches the left one to Salt Lake City is the more improved and passes through well-settled farming districts, principally dairying, that are rapidly rebuilding their roads to take care of the necessary hauling of products to the railroad shipping points. Two-thirds of the way along this branch is a valley with as picturesque scenery as can be found anywhere, with one view equaling anything to be found in Switzerland. Coming down from the low divide into the city by the inland salt sea the canyon is one vast camping-out ground for fishing and hunting. The right-hand branch from Echo has one of the country's natural scenic wonders, the Devil's Slide, which is well worth the 10-mile trip from Echo, even though one decides to go via Salt Lake City.

Fuel Situation in Australia

SYDNEY, AUSTRALIA, April 10.—The price of fuel in this commonwealth is having its effect on the type of car being purchased. Fully 80 per cent of the cars registered are of the type represented by Ford, Overland, Buick, Hupmobile and a few similar makes. Such cars as these practically control the whole Australian market. Fuel in any of the cities costs 42 cents per gallon for heavy benzine, and this is now becoming the generally-used fuel. Gasoline cost 60 cents per gallon today. Now as most of our automobiles go into the back country, anywhere outside a 50-mile radius of any of the cities, the cheapest you can get benzine is 50 cents, and any man living off the railway line will pay 5 to 10 cents more. Another item to bear in mind is the cost of tires. Thirty-six to 4-inch tires cost from $50 to $60 retail, according to make.

Detecting Resistance-Saving Fuel

PART IV

Accelerometer Readings Furnish Data for Plotting Close Approximation To Torque Curve of Motor—Maximum Grades for Each Speed Deduced

By Professor W. C. Marshall

¶ This is the last and concluding part of Professor Marshall's article on the accelerometer. In this issue some more uses to which the instrument may be put and the results obtained from actual tests are given. It is shown that the torque curve of the motor at all speeds may be plotted from the information derived from the accelerometer. The amount of grade the car should be able to mount on each speed may be determined and plotted in the form of curves which will stand a lasting record of what the car should be able to do and which will give immediate information to the owner of the car when the torque of the motor drops off owing to some decrease in compression through poor valve seating or from any one of the many other possible causes.

LET us examine the accelerating properties of the car, the resistance curve of which is shown in Fig. 1 by curve (A).

On this curve are plotted the torques exerted at the various gear reductions and the resistance exerted by hills of varying degrees of steepness, besides the resistance curve A.

From the motor torque curve obtained in the laboratory and published by the makers, we can construct the torque curve on direct drive when the wheels are 37 inches diameter and the gear ratio is 3 3-7 to 1.

The accelerating power at 20 miles per hour on direct drive is shown by the length of ordinate between curves A and 1 at 20 miles, which measures 157 pounds per ton.

This force acting on a mass weighing 1 ton will produce an acceleration of $F = \frac{121 \times 32}{2{,}000} = 2.5$ feet per second per second. At 40 miles per hour the force available for acceleration will be 121 pounds, which will produce an acceleration of $F = \frac{121 \times 32}{2{,}000} = 1.94$ feet per second.

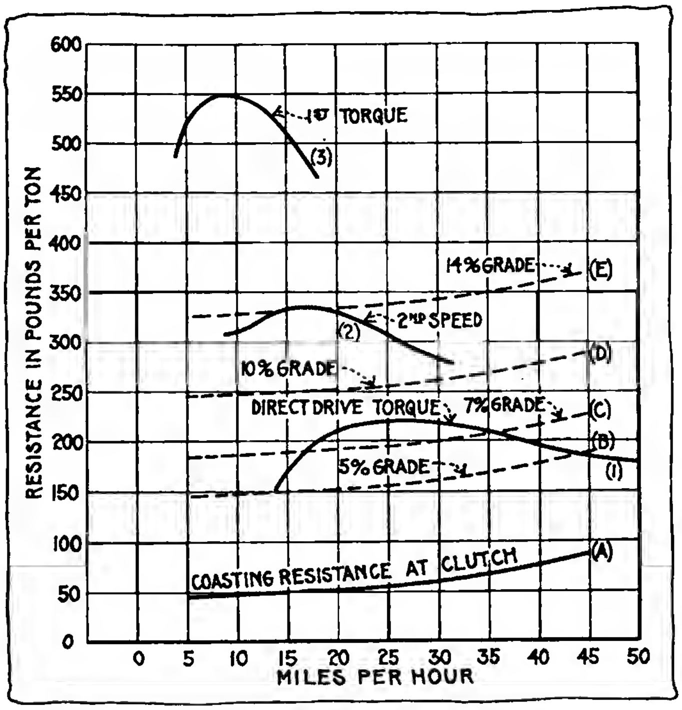


Fig. 1—Showing the torque curves plotted for each speed. The readings along the torque curves give the amount of effort produced by the motor at the speeds shown along the abscissæ. The amount of resistance interposed to climbing the grade at any speed is shown along the grade curves given by the dotted lines. It is obvious that the point at which the engine effort or torque curve falls below the effort required to ascend the hill at that particular speed, the car will no longer be able to climb the hill. Therefore where the curves intersect shows the maximum hill that can be climbed on any gear at any speed. For instance, on direct drive the car could not ascend a 5 per cent. grade faster than 44 miles an hour. It will be noticed that the curves intersect at this point and this value could be used as one point on a curve of maximums

The resistance curve of a 5 per cent. grade, with the coasting resistance, is shown by curve (B). The intersection of curves (B) and (1) shows the maximum speed obtainable on this grade, viz., 44 miles per hour.

A 7 per cent. grade could be mounted at 35 miles per hour. Above 7.5 per cent. it would be necessary to drop to second speed to mount the grade.

The acceleration produced on a 5 per cent. grade on direct drive at 20 miles per hour would be $F = \frac{55 \times 32}{2{,}000} = .88$ feet per second. At 15 miles per hour it would only be $F = \frac{18 \times 32}{2{,}000} = 0.288$ feet per second, which might prevent the car from mounting this grade at this speed.

If the speed was 20 miles when the car struck the grade it would probably go up without difficulty on the direct drive.

This of course is the usual policy employed by those driving through the country wherever they have a chance to rush a short steep hill and this often saves gear changing.

This shows the disadvantage some cars have when they can not increase their speed just before reaching a hill and in consequence must shift gears.

By inspection of the diagram in Fig. 1, one can see that this car could ascend a 13 per cent. grade, provided it started at a rate of 15 miles per hour on second speed. If the rate was 10 miles it would probably be necessary to shift gears and drop to first speed.

The maximum force which the motor of this car can exert is 550 pounds per ton to push the car at a speed of 9 miles per hour, whereas the motor of the car in Fig. 5, Part III, can exert 710 pounds per ton to push the car 5 miles per hour.

The 550-pound per ton force would enable the first car to ascend a 24 per cent. grade, but the second car could ascend a 31 per cent. grade.

As the latter car has a 4.5 by 5.5-inch motor and the other car a 4.25 by 5.5-inch, it seems quite probable that this is correct.

It the cases just treated it was assumed that the horsepower torque curve of the motor was known.

By means of the accelerometer we can determine the torque curve of the motor, approximately, in the following manner: Determine, first, the resistance curve at the clutch by declutching and reading the retardation at various speeds on the accelerometer. This test should include a run at the maximum speed of the car.

Plot this curve resistance.

Next make an acceleration test at 5 miles per hour intervals from 5 miles up to the maximum.

This consists in running at a constant speed in top gear at each interval, and reading the maximum acceleration in feet per second per second which it is possible to give the car by opening the throttle wide.

From these readings the torque curve of the motor can be plotted as curve (1) of Fig. 5 in Part III.

For example, suppose an average car running at a constant speed of approximately 20 miles per hour. The throttle is opened wide and the acceleration instantly given to the car is read on the dial of the accelerometer as 2.5 feet per second per second. This amount of acceleration by comparison with the opposite half of the graduated scale, is equivalent to a force of 158 pounds per ton. This is measured on the 20-mile ordinate above the resistance curve of the car and gives a point on the torque curve of top or highest gear.

After plotting the torque curve on the diagram of pounds resistance and miles per hour we can proceed to plot the motor torque curve on the basis of horsepower and revolutions per minute. The top speed gear ratio must be known as well as the driving wheel diameters to enable the revolutions per minute of motor to be determined from a given car speed in miles per hour.

Suppose the top speed gear ratio is 2.4 to 1. Taking a speed of 20 miles per hour with 36-inch wheels we find the motor is making 448 revolutions per minute.

The resistance overcome at the clutch is 158 pounds per ton plus 60 pounds for coasting resistance, a total of 218 pounds $\frac{218 \times 2 \times 20}{375} = 23.2$ horsepower which is laid off on a vertical ordinate erected at the 218 revolution per minute point of the horizontal base line.

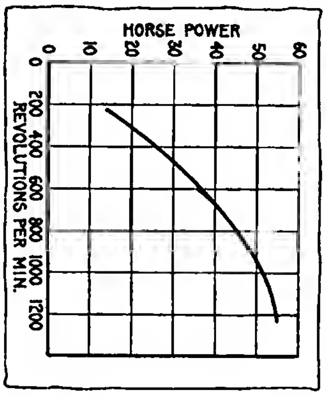

Fig. 2—Result of a test made by the author Nov. 6, 1912, on a 1908 chain-driven car weighing 2 tons. The car was not equipped with a windshield. The results shown in this curve were obtained solely by accelerometer readings and were plotted by taking the intersections of the torque and resistance curves on various degrees of gradient. This gave the maximum horsepower at these speeds

The motor torque curve once plotted can be used to calculate the torque curves on the resistance-miles diagram for third, second and low gear ratios, as previously shown in Fig. 5, Part III.

By drawing in the grade resistance curves we can determine the accelerating power and grade-climbing ability of the car in question.

The author made a test of this character on a 1908 chain-drive car, November 6, 1912. The car weighed 2 tons and did not have a windshield. The tires were 36-inch diameter; gear ratios: first, 9.25; second, 4.65; third, 3.08; fourth, 2.4. Motor, four-cylinder, 5.75 inches by 5.75 inches.

The resistance curve is shown in Fig. 2 (A). As maximum speed was 55 miles per hour, this point was taken on a point on the resistance curve where the torque curve, on fourth speed, crossed it. Another point was taken on the 10 per cent. grade resistance curve at its intersection with the 20-mile ordinate. As given in the curves, Fig. 3. This was determined from the performance of the car, which ascended a 10 per cent. grade at 20 miles per hour, on fourth speed, without being able to accelerate.

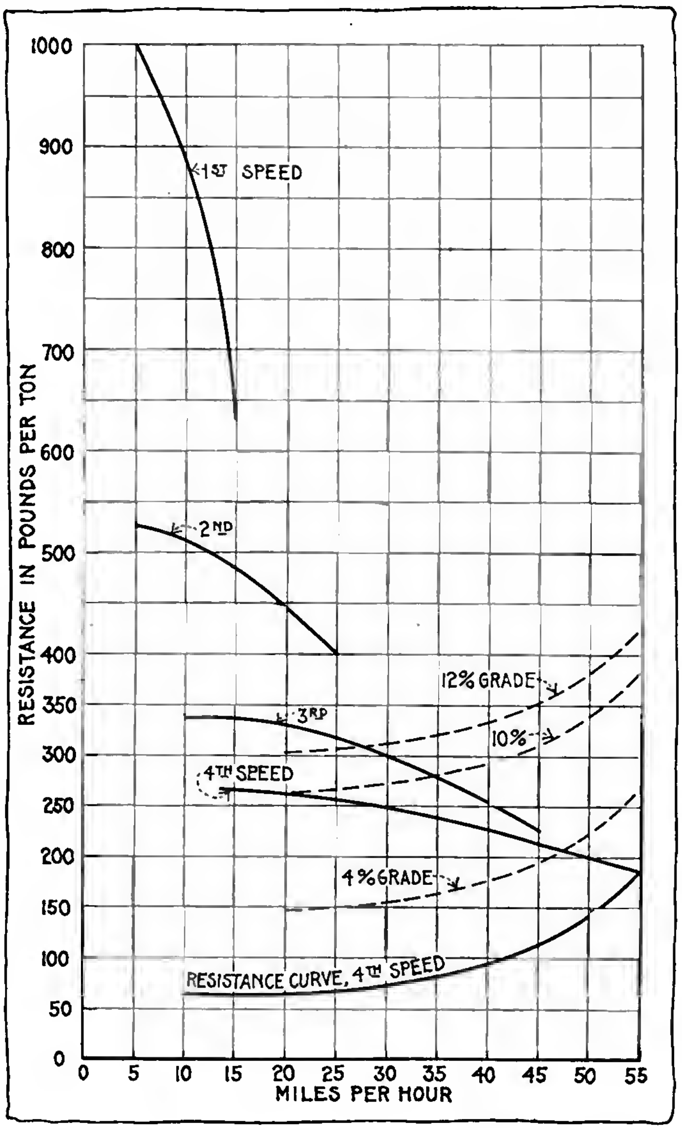

Fig. 3—This set of curves furnishes the data necessary in plotting the maximum horsepower curves for each speed. Such a curve has been plotted from the data given here and is shown in the curve above (Fig. 2)

Other points on the torque curve were found from the acceleration which could be given to the car at various velocities in miles per hour.

From this torque curve a motor torque curve was plotted, as shown in Fig. 3.

This curve was then used as a basis for obtaining the torque curves of third, second and first speeds, which are shown in Fig. 1.

These curves show the great power which this car has to accelerate when in low gears. The maximum power is 1,000 pounds per ton at 5 miles per hour on first speed.

In all these cases just cited, if the wind should be blowing against the car or if the road becomes rough the resistance, of course, would be increased and the speed shown by the diagram could not be realized.

The engine torque curve can be raised a small amount by opening the muffler, provided the speed is greater than 30 miles per hour.

Some of the possibilities of the accelerometer have been shown in the preceding lines. Now it remains for the car owner to make the above-mentioned experiments and by comparison judge whether his

The Engineering Digest

A Digest of Technical Information from the Engineering Journals

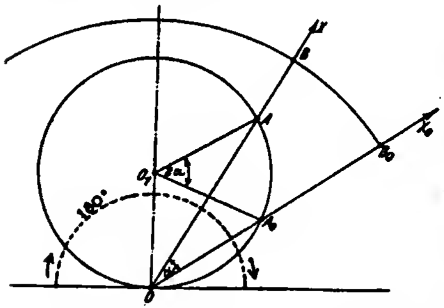

Fig. 1, Illustrating the geometrical principle of the Magg system for a graphic presentation of cam and valve action of any given requirements in four-cycle motors—the system enabling the designer to ascertain in advance the effect of any chosen valve-timing or cam shape on other factors of interest

ASSISTANCE for the Designing and Mounting of Camshafts.—A graphic method has been devised by Dr.-Engineer J. Magg of the Technical Highschool at Graz, Austria, for co-ordinating the position of the camshaft and the cams with the corresponding position of the crankshaft and piston in a four-cycle motor, the resulting diagrams enabling the designer to visualize requirements and effects with regard to any particular valve-timing or control mechanism which it may be his purpose to incorporate in the motor. Diagrams serving the same purpose have been in use for 50 years for steam engines and have been applicable to two-cycle internal-combustion motors as well, but the corresponding data for four-cycle motors have been in the form of tabulations, difficult to consult and giving no mental advance-image of the relations and shapes to be accomplished.

As the camshaft makes one revolution while the motor shaft makes two, the basis for a diagram system must be sought in a geometrical relation of the same nature. This is found in the fact that a peripheric angle is one-half of the center angle on the same arc. In Fig. 1 the center angle AO_1A_0 measures twice as many degrees as the peripheric angle AOA_0. Consequently, when the line OX turns to the position OX_0 describing the arc BB_0, it turns exactly one-half as many degrees as the line O_1A which at the same time turns to the position O_1A_0, describing the arc AA_0. [Those who have forgotten this geometrical theorem may easily realize the relation by turning a tangent at O around O, so as to intersect the circle successively at all points of its periphery until it points in the opposite direction, having turned 180 degrees, while a radius to the successive points of intersection, by following the movement, describes a full circle or 360 degrees].

A full revolution of OX thus corresponds to two full revolutions of O_1A, and there are therefore the same relations between OX and O_1A, as between the camshaft and the motor shaft in a four-cycle motor. But if only one circle is used to represent the motor shaft, no distinction will appear in the diagram between induction and power strokes or between compression and exhaust strokes. In the complete cam-action diagram, Fig. 2, the motor shaft and piston movement is therefore represented by two circles placed side by side. O_1 and O_2 are here the separated centers of the two revolutions of the motor shaft, the line O_1 O_2 is the piston displacement, and O is the center of the cam-action circle. It is practical to draw the crankshaft circles with a radius of 100 millimeters, as this facilitates all graphic dealing with factors in the valve-timing which are expressed as a percentage of the piston displacement. The radius of the circle representing the cam-action is best shown in a simple numerical relation to the actual eccentricity e of the cam [which in most cases is identical with the number of millimeters of valve-lift]. For the sake of uniformity, the movements expressed in the diagram should always be represented as taking place clockwise, and the exterior intersection Z between the crankshaft circle to the left and the line representing the piston displacement should be taken as the moment of ignition [on center; the retarding or advancement of the spark being a matter not entering for consideration]. The halves of the crankshaft circles will then represent successive strokes in the cycle of the motor in the order marked on Fig. 2. In this illustration there is constructed an opening Aa of the exhaust valve taking place when the expansion or power stroke lacks 15 per cent. of being finished and a closing Az of the same valve 5 per cent. after the end of the exhaust stroke. The arc between Aa and Az represents the angular travel of the exhaust cam while the exhaust valve is open, and the hatched area gives a relative value, as a gas channel, of the valve-lift effected (apart from the effects of a possible lever device with unequal arms for actuating the tappet rods or valve stem). The perpendicular

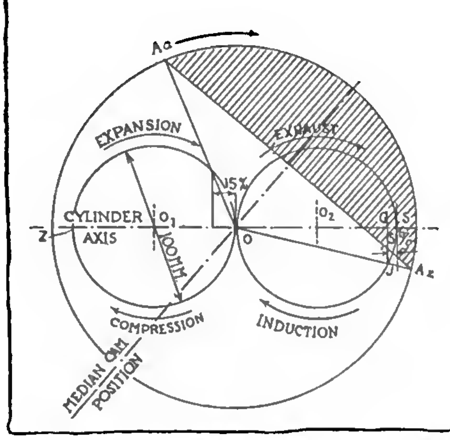

Fig. 2—The plan of cam action diagram

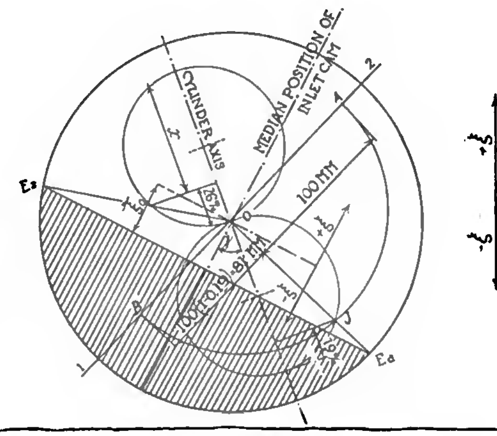

Fig. 3—An example of diagram construction

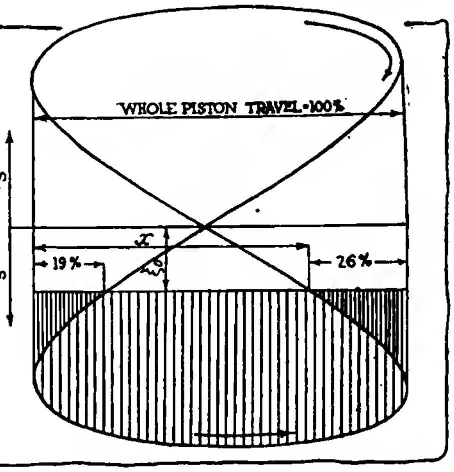

Fig. 4—Determining the valve lift

erected upon the middle of the line Aa-Az determines the median position of the cam during the exhaust.

Three examples of the numerous ways in which this diagram may be used are illustrated in Figs. 3, 4, 5 and 6.

Example 1, Fig. 3. Assumed to be known: The point Ea in the camshaft circle corresponding to the moment of opening the inlet valve; also the point in the piston stroke to which Ea corresponds, this being chosen as 19 per cent. before center, and the piston displacement before the closing, the moment of closing to come 26 per cent. after center. This moment is to be marked Ez on the camshaft circle. To be determined: The median position of the cam during the admission of gas and the relations to the piston travel.

The diagram can be completed from the given values of Ea and Ez by drawing crankshaft circles first and turning them by superposition within the camshaft circle till Ea is in the correct relation, but Fig. 3 shows a direct construction as follows: Draw the line 1-2 perpendicular on Ea-O and mark on it OA equal to the diameter of the crankshaft circle (100 millimeters) and OB equal to the piston travel from the center at O to Ea (in this case 100 millimeters minus 19 per cent., or 81 millimeters). The semi-circle over AB as diameter intersects the straight-line O-Ea at a point J which is now the second point known in the crankshaft circle which is sought. Having O and J, the center of the crankshaft circle can now be determined (being the intersection of a perpendicular on middle of OJ and an arc drawn with radius 50 millimeters from O) and therewith the line of piston travel. Thereafter the point Ez is determined as before, and the perpendicular on the middle of chord Ea-Ez gives the median cam position, while the arc Ea-Ez gives the duration of the admission.

The relation between the cam-lift ξ (xi), measured at the median position, and the corresponding piston displacement x, measured from the dead center, gives a value for ξ (xi) in which the length of the connecting-rod does not enter as a factor but in the form of an equation of the fourth degree:

$$\xi = \pm e \left[\sqrt{\frac{x}{2r}} \sin \gamma \pm \sqrt{1 - \frac{x}{2r}} \cos \gamma \right]$$

in which e is the eccentricity, r the crankarm length, γ (gamma) the angle between the line of piston displacement (cylinder axis) and the median cam position. To work this equation out is a tedious task, but the diagram shows directly the relations between x and ξ (xi), as indicated in the diagram for the point Ez. When the same relations are drawn in for a large number of points, there is obtained a picture of the open-period of the inlet valve, as in Fig. 4, in which the piston travel is drawn on twice as big a scale as in Fig. 3. If the dimensions of possible rocker-arms or tappet-lift levers are known, a curve designating the valve lift can be drawn directly from such a diagram.

Example 2, Fig. 5: The object being to operate inlet and exhaust valves by means of a single cam, the angle of rotation intervening between the actuating of the two valves is to be determined. Under the circumstances the two valves must remain open equally long, so that three points in the valve action determine the fourth. Thus, if it is given that the opening of the inlet valve is 7 per cent. early (Ea = 7 per cent.), its closing 11 per cent. late (Ez = 11 per cent.) and the opening of the exhaust valve 16 per cent. early (Aa = 16 per cent.), then the position Az for the closing of the exhaust, which is usually most variable, is fixed. In the diagram, Fig. 5, it is found practical to introduce the "inert circle" of the cam in the place of the cam circle. The angle between Ea and Ez, with the opening moments as assumed, measures 125 degrees and must be the same between Aa and Az, whereby Az is determined. From the points Ea and Ez and a chosen valve lift the shape of the cam portion can be constructed. The angle ϕ (phi) between the tappet-rod rollers is determined by radial perpendiculars on the chords Aa-Az and Ea-Ez.

Example 3, Fig. 6: [This relates to means for equalizing the action of two symmetrical cam systems in a double-acting four-

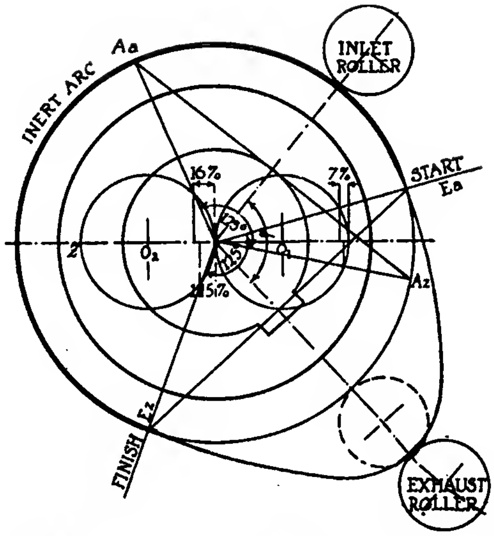

Fig. 5—Diagram for using one cam for inlet and exhaust

cycle motor, and as this case is even farther removed from automobile practice than example 2, the details are here omitted and only the diagram is presented. The author has under way a larger work on the valve control of internal-combustion motors, in which the style of diagram here exemplified is employed exclusively for elucidating the subject.]—From *Zeitschrift V. D. I.*, Feb. 15.

CONTINUOUS Gear Change.—The Bardet system for effecting infinitely graduated changes in the ratio of a power transmission depends upon the use of special beehive-shaped slidable gear teeth such as are shown marked *d* in Fig. 7. The system is at present interesting mainly as an example of pretty mechanics. The teeth *d* of the driving-wheel *a* are mounted on sliding-blocks *e* movable transversely of the wheel in grooves *ei*. The driven wheel *b*, on the other hand, has fixed teeth formed on planes radiating from its axis. The shaft *f* of this wheel is stationary, and the shaft *h* of wheel *a* can turn around a third shaft *i* which is perpendicular upon both shaft *f* and shaft *h*.

If wheel *a* is turned parallel with the shaft wheel *b*, as in both the sectional views of Fig. 7, its teeth *d* can all pass successively between two teeth *g* of wheel *b* without causing any rotation of the latter. But if the plane of wheel *a* is turned around shaft *i* into an oblique position, each tooth *d* of *a*, once engaged between two teeth *g* of *b*, will push one of these teeth laterally and will make the wheel *b* turn a certain angle, the size of which depends upon the angle of inclination of wheel *a*.

[It may be considered an objection that the highest gear is thus obtained in the most oblique position of *a*.]

In order to make the engagement possible, the teeth of the driving-wheel are mounted on sliding-blocks which remain movable so long as the tooth on each of them is not in mesh with *b*, and the teeth during that period follow a path determined by a toothed cone *w* which turns in unison with wheel *b* and by a curved guide-piece *c*. This hollow piece is flared at its entrance where it receives the tooth coming out of mesh

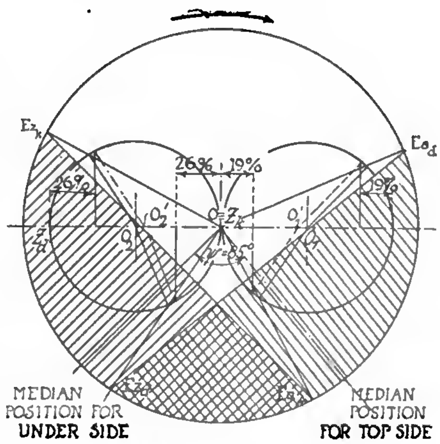

Fig. 6—Diagram for double-acting motor

and narrows down at its other end which is opposite to the apex of the toothed cone *w* whose base is tangent to one of the edges of wheel *b*. The bevel-gear pinions *k* and *y*, secured respectively to cone *w* and wheel *b*, assure the unity of movements by which the teeth of wheel *a* are sure to be guided into the space between two teeth of cone *w*—the sliding-blocks assisting—and thence into the space between two teeth of wheel *b*. The guide *c* is secured to the support *j* in which the spindles *h* of wheel *a* are journaled, so that the guide piece always remains in the median plane vertical upon wheel *a*.

Now, if the wheel *a* is turned a certain angle around the shaft *i*—by means of the worm *u*, the sector *v* and the two bevel pinions *l* and *m*—the guide piece *c* is turned with it, and the cone *w* oscillates around shaft *f*, while its apex remains at the exit of guide *c*; this by virtue of a special manner of mounting shaft *ji* of cone *w* permitting this oscillation.

Steel balls *x* are placed in nests *n* formed in driving-wheel *a* in line with each sliding-block. The bottoms of these nests are slightly inclined toward the middle. The balls, being pushed outwardly by springs *o*, are pinched between the bottoms of the nests and the sliding-blocks, blocking any movement of the latter in either direction. It is necessary to release the blocks in order to bring them back into the central plane of wheel *a* as soon as teeth *d* enter the guide piece *c*. For this purpose, the mechanism includes two plates *p* journaled upon shaft *h* with the intermediation of ball joints *q*. Upon the edges of these plates there are shoulders *r* extending laterally and engaging the entrances to nests *n*. By reason of the position of the plate, which is held inclined at an angle with shaft *h* by the action of the fixed fork *t* upon the lug *s*, in all position except that directly facing wheel *b*, the balls *x* are pushed by the shoulders *r* to the center of the nests, excepting at the moment when a tooth passes before wheel *b*.—From *Technique Automobile* and *Génie Civil*, January 18.

STEEL Better and Cheaper.—According to detailed reports in the metallurgical journals it costs about $1.50 less to produce 100 tons of steel by the Hadfield method than without making use of this improvement. By the Hadfield method the freshly poured ingot is forced to cool and solidify from below up, the top being kept hot longer by means of a layer of charcoal, separated from the molten steel only by a thin layer of non-conductive material, such as slag, and an airblast fomenting the combustion of the charcoal. The saving is materialized solely through the fact that from 15 to 30 per cent. must be cut from the top of the ingot cooled in the ordinary manner by reason of being faulty in structure and composition and must be melted over again, while the discard from the top-heated ingot amounts only to from 8 to 10 per cent. The flaws which are made to concentrate in this small percentage of the steel are checks ramifying from the "pipe," or empty space forming in that part of the ingot which cools last, and segregation. The latter is due to the flow of impurities toward the portion of the ingot which keeps fluid longest. By keeping the top hot, the "pipe" is partly filled from above—or, rather, prevented from forming—while the impurities, such as oxides, nitrides, sulphur and phosphorus, continue to rise.

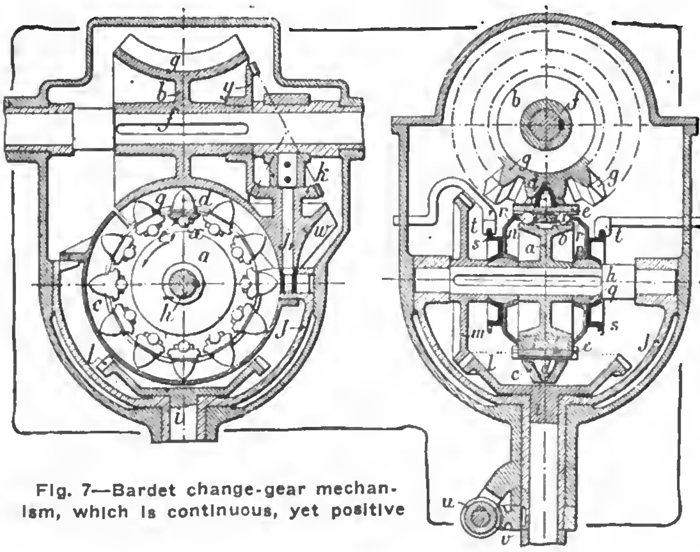

Fig. 7—Bardet change-gear mechanism, which is continuous, yet positive

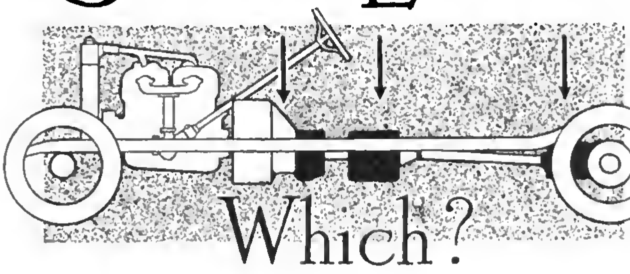
Of greater importance to the automobile industry than the saving in the cost of production of plain carbon steel is the much greater saving effected in the case of alloy steels, their value being higher and their discard being relatively of lower value for remelting purposes. But far beyond even this consideration comes another which has not yet become widely appreciated, although it is strongly emphasized by Hadfield. It is this, that the strong flow of impurities toward the top-heated portion, which is discarded in the end, leaves the usable portion of the ingot—the 90 to 92 per cent.—perfectly sound and uniform in structure, while the 70 to 80 per cent. which is used of ingots cooled in the ordinary manner still frequently contains faulty streaks of steel that pass undetected until taken into use. These minor flaws, which are after all far from negligible, especially for automobile purposes, are caused by irregularities in the process of the cooling and solidification, the steel in which they are found having remained hot while imprisoned in cooler and impervious surrounding portions of the whole mass, so that the flow of impurities toward the eventual discard-portion was barred and the steel in the hot pocket was compelled to contract separately in the final cooling under strains likely to cause a local "pipe" or a fissure.

From another source there comes a guarantee of better and cheaper steel than that which has been available in the past. The electric steel furnaces and melting-ovens are multiplying and offer industrial facilities for producing at a relatively low cost steels in which a desired chemical composition is maintained with an accuracy scarcely to be equalled by the much more expensive crucible-method of production. It is perhaps especially notable that the carbon content of electric-smelted steel can be warranted to come within 5 points (1 point being 1 per cent. of 1 per cent.) of that specified in advance, while a tolerance of 10 points, or even 15, has been considered unavoidable in the case of open-hearth steel. A still more far-reaching importance is attributed to the fact that steel can be maintained at a very high temperature and degree of fluidity in an electric oven or tip-furnace and, when poured from it directly into moulds, can be made to assume shapes so thin and intricate that similar ones never could have been contemplated heretofore for steel castings. And as the chemical composition of the electric steel is also under excellent control, as mentioned, the strength and toughness of such castings can be made highly creditable. In conjunction with recent progress in the art of producing and handling the moulds and cores by special machinery, the electric furnace renders a rapid expansion in the casting of automobile parts distinctly probable, the development in this direction being already well under way and limited in its immediate possibilities only by the necessary slowness in the installation of furnaces and in the acquirement of the new technical knowledge which must be brought to bear upon the work.—From *Revue de Métallurgie*, *Giesserei Zeitung*, *Järnkontorets Annaler* and other journals.

DIFFERENCE in Motoring Temperaments of Nations.—According to statistics presented by Prince Henry of Prussia, there are 88,279 motor vehicles in circulation in France with a population of about 38 millions, making 441 persons to each vehicle, while in Great Britain there are 175,245 vehicles for a population of 43,740,000, or one vehicle for 249 persons. Germany, on the other hand, with 75 million inhabitants, has only 70,000 motor vehicles, or one for 927 persons. The figures include motorcycles. Whether the explanation of the disproportion for Germany is to be sought in the lesser popular wealth, in prejudices not yet overcome or in the too-high taxation of the German automobiles, seems difficult to decide.—From *Z. V. D. I.*

The Engineers' Forum

Gearbox Location



Part II

Amidship Location Is Favorite with Three Engineers—Two Prefer Unit with Motor Construction

Keeton Prefers Location Amidship
Maraini Also Likes Amidship Type
Crane Finds Conditions Determine
Porter Approves a Unit with Motor
Gilliard Leans Toward Amidship Idea
Lee Likes the Unit with the Motor

HEREWITH appears the second installment of the views expressed by leading automobile engineers on the subject of gearbox location, the discussion of which was caused by the article by S. D. Waldon, "The Rear Axle Gearbox," in THE AUTOMOBILE for April 17. The ideas of several men prominent in the automobile field follow:

¶ *Weight Distribution Is Most Important—Keeton*

DETROIT, MICH.—Editor THE AUTOMOBILE:—With reference to location of gearbox, in the first place, the question of distribution of weight is a most important factor. After considerable experimenting and observation, we found that locating the gearbox amidship in a car of the weight of 3,400 pounds, completely equipped and all tanks full, makes for easier riding than when located as a unit with the motor or with the rear axle. And, by this practice, we distribute the weight as evenly as is possible in an automobile so that an undue proportion is not put on the front axle or on the rear axle. **Further, the distribution of weight, as in our car, to some extent lessens the liability of skidding,** which, as you will agree, is a most important point to carefully consider. Then there is the question of accessibility. It takes but a fraction of a minute to remove the footboards in the car, and the gearbox complete is exposed, ready for oiling, adjustment, or, in fact, whatever work is necessary to be done. If the gearbox was located as an integral unit with the rear axle. it would mean removing the body entirely in order to make simple adjustments, or else assuming a very uncomfortable position beneath the car in order to put oil into the transmission. And if located as an integral unit with the motor, it would be necessary to remove at least the front footboards for oiling, and if adjustments were necessary, the body and radiator as well. **The location of the gearbox as an integral unit with the motor, in our type of car especially, would make the clutch practically inaccessible even for the ordinary oiling.**

The demand of the critical motor-buying public of today is for simplicity with the greatest possible efficiency, and in locating the gearbox as we do, with left-hand steering and center control, changes from first to fourth speed and to reverse being made by one lever extending directly upwards from the gearbox, we completely eliminate pull-rods with their adjustments, etc., which gives us a clean chassis and at the same time makes for easier gear changing. Just one more vital fact—locating the gearbox as we do makes it serve as a cross-member, strengthening the frame and eliminating the two cross-members ordinarily used when other methods of locating the transmission are followed.—F. M. KEETON, Vice-president and Manager, Keeton Motor Co.

¶ *Best Type Depends on Size of the Car—Maraini*

POUGHKEEPSIE, N. Y.—Editor THE AUTOMOBILE:—Gearset as a unit with the rear axle: Differential and main driving bevel or worm gears, and occasionally brake control, are enough for a rear axle to carry. Any other mechanism added to these, besides spoiling its simplicity and neat appearance, increases its weight; and the rear axle better than any other part of the car should be as light as possible. For this simple reason I believe there is no advantage in making the gearbox a unit with the rear axle.

Gearset as a unit with the motor: For a car not high-powered a neat unit with a short three-speed gearset is preferable under every point of view, say, lightness, rigidity and simplicity, and this especially if combined with a well-designed three-point suspension, so as to relieve the system from any stress or distortion. I am very favorable to this style of construction limited to a certain limit of power.

Gearset mounted amidship: For a big motor with a large clutch, four-speed gearset, the unit system, though not absolutely objectionable, is apt to lose the main qualities of lightness and neatness above mentioned, so that in a high-powered heavy car I prefer to have the gearbox mounted amidship. This allowing also the discharge directly on the frame. through the cross-bar, the heavy stress and distortion transmitted by the rear system.—B. MARAINI, Engineer, Fiat Automobile Co.

¶ *Roads Too Rough for Axle Type—Crane*

BAYONNE, N. J.—Editor THE AUTOMOBILE:—The proper position of the gearbox whether it should be combined with the rear axle or with the engine, or mounted separately in the center of the car is a complicated one involving many opposing considerations. **So long as the roads in this country are no better than they are, I do not think that the extra weight below the springs on the rear axle caused by placing the gearbox there can be justified.** This is a serious matter with a three-speed gearbox and naturally much more serious with a four-speed gearbox. I believe that it is admitted by all engineers that the axles both front and rear of a car, as well as the wheels should be as light as they can possibly be made if the easiest riding car over all kinds of roads is to be obtained and if the tire wear is to be reduced to a minimum.

The chief advantage of the gearbox on the rear axle is its power first cost and the possibly slightly lower cost of upkeep of the propeller shaft and joints. In view of the fact that most cars are driven 99 per cent. of the time on the high gears the latter advantage cannot be expected to be noticeable, and would never compare except in a case of cars driven at very low speeds with the excess tire wear and consequent expense due to the extra weight below the springs. **This form of mounting also prevents the use of a propeller shaft brake, which, when properly designed, is far more powerful, equally smooth in operation, easier to adjust and less liable to need adjustment due to its being completely protected against dirt, as well as much more efficient on slippery roads, presenting as it does an equal retarding effect on both wheels than the brakes mounted directly on the rear wheels.**

As to whether the gearbox should be combined with the engine or mounted separately in the center of the car depends somewhat on the size of the power plant. The combination system is simpler from a manufacturing point of view and affords better protection against dirt, although it frequently makes certain parts somewhat inaccessible.

As the design and construction of clutches especially and of other parts becomes more reliable, the relative importance of accessibility becomes less, and the advantages of the unit power plant more marked.

In our own cars combining a six-cylinder engine of rather large size and a four-speed gearbox with gearbox brake the size and weight of the parts and the element of accessibility decided in favor of the separate gearbox.—H. M. Crane, President, Crane Motor Car Co.

¶ *Unit with Motor for Small Cars—Porter*

Trenton, N. J.—Editor The Automobile:—The discussion opened in the April 17 issue of your paper in reference to the mounting of gearchange set is one that will present many varied and opposite opinions. The position taken in this issue by S. D. Waldon, of the Packard company, to my mind, evades the paramount issues concerned in the relative values of the different methods used. He seems to have neglected the fact that **the suspended part of a car's weight is to the car as a whole under speed conditions, the same as the flywheel is to the motor. This coupled with the fact that unnecessary weight is undesirable is the one never-failing fact that faces every designer who attempts the rear-axle gearbox.**

These are things that are not the question of different men's opinions or judgment, or the interpretation of the laws governing these things, but are facts that have been illustrated from time to time by tests and conceded, I believe, by nearly every one. Mr. Waldon had ignored this entirely and seems to lay great stress on the easy-riding qualities of inclosed cars with this type of construction. The easy-riding qualities mentioned cannot be disputed, but the realization of this condition is not the rear axle unit. I merely take sides with Mr. Waldon on these points to illustrate why I believe the rear axle unit to be out of the question in so far as a fast-moving vehicle is concerned.

The unit construction I believe to be without question the only thing for cars developing less than 30 horsepower, owing to the length of the unit usually involved with motors developing greater horsepower in order to take care of the increased torque makes necessary such a cumbersome and rigid construction that the practice resolves itself into a very roundabout way of reaching the desired object. Since three-point construction is almost necessary with this type of unit, this then leads to the sub-frame construction for the medium and heavy-weight cars. The theoretical ideal, of course, points to unit construction with three-point suspension, but in practice the obstacles are many. The success of subframe construction depends largely on the placing of the gusset and the section of the subframe member. The subframe must necessarily be as narrow as possible and so placed that the result of the main frame warping is not conveyed to the subframe members in an exaggerated proportion. The misalignment under these conditions occasioned at the point between the gearset and the motor, due to the twisting of the main frame, becomes so very slight that it is easily taken care of in a permanent manner by the compensating joint at this point.

It Is Up to the Designer

Since this is about the only argument against subframe construction it behooves the designer using this type to so locate the compensating joint in relation to the feet of the motor and gearset that any possible misalignment of the subframe is transmitted to the two separate units in a very nearly like ratio, which will reduce the misalignment between the two units to a minimum. Subframe construction also lends itself to economical production and the compensating joint proves of considerable value in taking care of the variation in frame dimensions as well as relieves the necessity of being too accurate on the feet of the different units.

The question of excess weight with this construction can be neglected inasmuch as cases often cited in arguments are not the result of subframe construction, but more often lack of thorough understanding exhibited by the designer of different units. This construction also lends itself readily to the perfect alignment of driveshaft, universals, torque rods and radius rods. Without resorting to unduly heavy construction, it practically eliminates all end movement of the universal joint excepting in the case of one wheel being raised and the other stationary. This point alone proves of wonderful value in the maintenance of these parts and relieves to a great extent the usual shock transmitted by a hard jolt often experienced in the other types of construction.

Summing up briefly the subframe construction in the hands of one thoroughly conversant with the desirable points to be attained develops many of the ideal values sought after and more nearly approaches them as a whole than any other class of construction.

Mr. Waldon's reference to class of material and workmanship used in the rear construction permitting of lightness, together with his remarks in reference to accessibility of the clutch, are also points that have no bearing on the type of construction. The same argument holds good for all types and becomes merely a matter of the designer's ability and the standard set for attainment.—Finley R. Porter, Engineer, Mercer Automobile Co.

¶ *Amidship Is Very Advantageous—Gilliard*

York, Pa.—Editor The Automobile:—In looking over the different ways of mounting the motor, gearset and rear axle in motor cars, it will be found that the size of the car itself is of predominating importance, and one system, although successful with a small car, could not be very well applied with the same results to a larger car.

Readers of The Automobile will find outlined below our criticisms of the three principal modes of construction, with their qualities and defects, which 15 years of experience in the automobile field in America and abroad have allowed us to learn.

The writer will incidentally state that he was connected from 1895 to 1902 with the Motobloc Co. of France, which was the first abroad to introduce a unit power plant system, motor and gearset combined, with the clutch running in oil. This was in 1895.

Gearset as unit with motor: Good points: neat in appearance, cheap as a manufacturing proposition.

Bad points: weight of gearbox carried on front axle too much, this system necessarily being of the inclosed type, the disadvantage of inaccessibility presents ieself. Unit systems of this design are heavy, meaning unnecessary weight to be carried by tires and less hill-climbing ability; driveshaft of gearset and crankshaft of engine being constructed in a rigid line, and the bearings of the crankshaft being generally split babbitt, while the gearset bearings are ball bearings, the wear of the crankshaft bearings being mostly in a direction perpendicular to the axis of the shaft, and the radial wear of ball bearings is practically nil, it will be clearly seen that undue stresses resulting from disalignment will be created even under the most normal conditions of wear.

Unless power plants below 25 horsepower and three speeds forward are produced, the problem of attaching the unit to the frame becomes difficult on account of its length and weight.

Gearset as unit with rear axle: Good points: Minimum strains on rear universal joints; saving in manufacturing; gearset not rigidly fastened to frame, minimizing gear noise.

Bad points: Too much unsprung weight on rear wheels, giving bad riding conditions and excessive wear on tires; abnormal length of change-speed control rods; position of gears in gear case affected by the accidental change of position of rear axle in relation to rear springs.

Gearset amidship: Bad points: More expensive as a manufacturing proposition and one more set of universal joints.

Good points: Access of parts maximum; repair and replacements facilitated and cars not in repair shops long; no side strains on engine or transmission; small units to handle in shop; direct-acting gear-shifting rods, as gearbox comes under floor, naturally in the right position, and weight uniformly distributed on frame.—E. T. Gilliard, General Manager, Pullman Motor Car Co.

¶ *Unit with Motor Is Most Simple—Lee*

Detroit, Mich.—Editor The Automobile:—Since the inception of the motor car, opinions as to the locations of its different components have been various. In the past the motor and gearbox were located anywhere between the front and rear axle, and it is safe to say that the present predominating locations have been more the result of public opinion than from engineers carrying out what they frankly believed to be the more practical. However, as engineers are more or less adaptable they accomplish a great deal even though they are not privileged to carry out their own pet ideas.

Not long ago there was a car made with the motor and gearbox located very close to the rear axle. This left the front end of the car lighter and gave it the advantages of being able to climb obstructions in the road and contributed to easier steering, not to mention the added traction to the rear wheels. On account of this construction it is safe to say, and there are those who can bear witness, that for ability to get around over any kind of roads there was nothing, that could compare with it, having the same amount of power.

However, in the meantime there were many other cars designed with the motor under a hood in front which, while it occupied much valuable space, proved to be more accessible and pleasing to the general public. It also has its advantages which are well known, such as being more accessible for carbureter adjustments and minor troubles. The gearbox was still a matter of opinion as to its location and is to this time. However, at present it has three principal locations; that of the rear axle, mounted separately between the motor and rear axle, and the unit construction now employed by many makers of well-known ability.

The writer, being an advocate of the unit construction, will, therefore, pass up the others, and while the arguments will be drawn from our own car it is for the purpose of illustration only. As before mentioned, the advantage in placing the motor in front under a hood was to make it more accessible for correcting troubles, and in order that they may be more readily detected. This being the case, it is evident that the gearbox and clutch could be incorporated with the motor as a unit for the same purpose. No doubt this was the intention of the designer of the first unit constructed power plant, but which, however, does not cover all of the advantages. By this construction it is possible to design the motor, gearbox and clutch so that they cannot be distorted by road conditions. Once they are right there is nothing aside from completely demolishing a car that can disturb them and even then they have been found to be as good as ever. They are there to stay. Especially is this the case when the three units are suspended at three points. It also lends itself very readily to the new and popular center control as the mechanisms can be incorporated in the gearbox cover and directly connected without the necessary linkage and reach rods that are usually found on the cars of other designs. There are few possibilities for oil leaks and dirt may be more readily excluded, as the only moving parts which project outside of the case are protected by the sod pan beneath the motor.

Engineers Working Toward Simplicity

Up-to-date engineers are continually working to make cars simpler of construction and operation. In some cases it is necessary for an owner to keep a couple of barrels of oil and from 50 to 100 or more pounds of different kinds of grease, and a chauffeur who must be an expert mechanic. This may suit the man who can afford this extra expense, but for the average owner who drives and looks after his own car, the simpler and fewer the duties he has to perform before the car may be operated the better he likes it. This is where the unit construction again has its advantages.

In the case of our car it is only necessary to pour the oil through the breather pipe, which is made especially large for this purpose, until it shows the proper level on the gauge and the motor, clutch and gearbox are oiled. After the motor has run long enough to collect cuttings all that is necessary to remove them is to drain the oil out at the point lowest in the oil receptacle, pour in a gallon of kerosene, and run the motor 5 seconds, after which the kerosene may be drained off, and the oil receptacle refilled with clean oil. As far as accessibility goes it is possible to take the motor out of the frame, gearbox and all, and replace in an hour's time. Again the gearbox and clutch can be detached from the motor and disassembled, put back and reattached in 30 minutes, all without removing anything but the hood and the floor boards in front. In our construction there is absolutely no end thrust taken by the motor or gearset. The driving of the car is not transmitted from the rear axle to the gearbox as in some cases, but is accomplished by means of specially designed cross-member to which the axle torque arm is attached by means of a ball-and-socket joint, which leaves the gearbox and motor free from any duties save imparting the rotary motion to the rear axle. This construction also permits of supporting the gearbox high enough to clear all obstructions in the road and it cannot be affected by vibrations due to the rear wheels, or subjected to any driving strain or torque from the rear axle. In motor cars as well as in all other progressive lines of business, evolution is a factor always to be considered, and in using the unit constructed motor and gearbox we are only taking advantage of what long well-founded experiences have proved to be most desirable.—W. S. Lee, Engineer Briggs Detroiter Co.

—

Boston, Mass.—Editor The Automobile:—The point that seems uppermost in my mind is in regard to the power developed at the various speeds allowed by law, which, as you state, is, of course, a great deal below the maximum horsepower of the motor. It seems as though if the automobiles were allowed only 25 miles per hour as a maximum speed, the horsepower developed at that speed being approximately 12-15 horsepower, that it would most certainly be unfair to tax the owner for something that he had but was not allowed to use. If the owner is allowed to drive his car at its full rated power, then, of course, it would be no more than right that he should be obliged to pay in proportion.

At the present writing this is the only point that the writer could see that would have any effect on stalling this new legislation.—C. T. Bates, Lenox Motor Car Co., Inc.

Inspection Report Blanks

Truck Form, Passenger Car Test Card and File Index Key Card Used in New York Service Plants

New Type of Requisition Designed for Work Shops on the Card and Punch-Tag Scheme

IN ADDITION to the several series of automobile inspection blanks which have been illustrated and the use of which has been described in previous issues of THE AUTOMOBILE, a few additional blanks in use with several companies of New York are shown below.

The first of these forms, Fig. 1, is a report which is made out by the truck inspectors of the General Motors Truck Co., of New York. This company arranges with GMC trucks operating in the Metropolitan territory for monthly calls at the service department garage, during which inspectors look over the exterior parts of the trucks which are apt to get out of adjustment. Once every 3 months, the inspectors open the crankcase and gearbox of every truck to see if the internal parts are in good condition, whether or not the bearings need taking up, if the gears are properly lubricated, etc. In this way, a thorough inspection is made of the whole truck and by applying the principle of a stitch in time saving nine, the life of the truck is lengthened and the cost of maintenance per year and mile reduced. In such cases where it is impossible for a truck to call at the department, the latter sends inspectors to meet the truck at a pre-arranged time and place, to make as thorough an inspection as possible.

After the inspection has been completed, the inspector fills out a report, Fig. 1. The paper on which this report blank is printed, is 8.5 inches wide, 22 inches high and folded across to form two pages of half that height. On the first, spaces are provided for the name of the truck owner, the place and time of the inspection as well as three sets of smaller spaces for reporting on the condition of the chassis, the tires and the body. The parts named on the sheet are inspected one by one, and in each case a note is made, if there is anything wrong with it. On the second page is a space for owner's or driver's remarks or complaints.

Fig. 2—Cadillac service department history card

The Cadillac Motor Car Co.'s New York branch does not send inspectors periodically after the cars operating in the territory, but instead any Cadillac car driving up before the service department is readily looked over by the three testers whom the company employs for this purpose. If an inspection is made, the tester goes over the motor, its parts and conjointly operating systems such as lubrication, ignition and carburetion, and then looks over the running gear, etc. As his inspection progresses, he either checks the names of the parts on the blank, Fig. 4, if they are in good order, or states whatever troubles there are. This form is 4.75 by 10.75 inches and is made out with an original on white and a duplicate on yellow paper. After this form has been filled out, it is marked with the name of the car owner, the date of the test, the model name or number of the car and the number of the motor. The report is shown to the owner or driver, and if repairs are ordered by him, the order of the shop or job number is also noted on the form. The original remains in the office of the service department superintendent, while the duplicate is sent to the shop with the job order. All test reports are filed under the engine numbers, the salesroom being in possession of a cross index giving these and the owners' names.

The service department also keeps an exact history of the life of each Cadillac car sold and serving in the New York territory. This work is done by means of file cards, Fig. 2, which are 5 by 8 inches and printed black on thin white cardboard. When the car is sold, the upper half of the card is filled out, giving all possible information about the purchaser and the car itself. Then, whenever the car is brought in for a test or repair job, the date, the eventual repair number and the amounts of paid-for and guarantee work are noted on the card. These cards are filed under the names of the car owners and serve as a key to the inspection and repair record system which latter is too elaborate to be described here at this time.

Handy Stockroom Requisition

A requisition form used for drawing material from the stockroom which is used by a New York service department is shown in Fig. 3. This form is quite original in the following respect. Ordinarily, requisitions are printed on thin paper in form of

pads and are made out with duplicates and sometimes triplicates, one copy going to the stockroom, a duplicate to the main office and the eventual triplicate to the accountant of the company. A handier system is obtained by the use of the requisition, Fig. 3. This form is of the size here shown and printed on medium-heavy tan or green cardboard. The right-hand fourth of the card forms a section being divided from the rest of the card by a perforation so that it can be torn off easily; it is punched with a hole so that it can be tied to the steering wheel. The main section which fills three-fourths of the card, is divided into spaces for making a note of the number and quantity of the parts to be drawn from stock, the list price per unit, the total list price which is to be charged to the customer as well as the total cost appearing on the company's books. Sometimes, when material has to be bought outside, the price paid for it is noted under cost. By checking each item under either C or F, the bookkeeper is informed whether the job is to be charged or is done free of charge under the guarantee. Each form is of course numbered on both sections.

In filling out, the workman requiring the card takes one of the cards which are kept on the desk of the foreman and fills out on it the job number, the date, the number and name of the part and the quantity required. The foreman then O.K.'s the requisition by signing it, not until after he has marked each item for charge or free work. Then the workman takes the card to the stockroom, or sends it in by a boy. The latter receives from the stockroom clerk the required material and signs for it on the main section; then the clerk fills out the small section at the right of the card and signs it, as does the recipient of the material. The clerk also marks the items free or charge and if any of the materials are not in stock, he corrects the amount on the requisition. The materials delivered, the clerk retains the main section of the card, while the person who takes the materials to the shop attaches the small section of the card to the steering wheel of the car. When the repair job is completed, the requisitions found on the steering wheel, together with the time-distribution cards of the workers, give full information regarding the cost of a repair job and what should be charged for it.

Practical Value of Service Systems

Many a dealer, especially if his business is small, is of the opinion that service systems, which include car inspection and repairs done at the lowest possible price and without profit, are work that does not pay and consequently cannot be done to any purpose. The fallacy of this idea, however, is shown by the fact that large firms with whom economy of practice has become a byword are more and more introducing such apparently unprofitable systems; and that the moral effect on an automobile buyer is greater than one might think. Heretofore, salesmen have sold cars and made not unfrequently statements and claims for their wares and the guarantee these bore, which could not be borne out by practical work. The public has begun to understand, now, however, that expectations of service by automobile makers and dealers must be reasonable and that a guarantee must necessarily be a flexible matter. This brings up the great desirability of keeping the car out of the repair shop as much as possible; but not by running along until it breaks down for good, but to have it inspected frequently and by making small repairs when trouble is still embryonic anticipate bigger ones thereby save in maintenance cost and depreciation of the car.

Knock Develops After Overhauling—Lubrication of the Jackson 59—How To Wire Up a Splitdorf Coil—Repairing a Leaky Radiator—Air Pressure on Account of Car Weight—Derivation of S.A.E. Horsepower

Knocks After Overhauling Job

EDITOR THE AUTOMOBILE:—I am driving a car having a four-cylinder motor, 4.5 by 5 inches, rated at 40 horsepower. The motor has lately been overhauled, all slack taken out, carbon cleaned out, and is apparently in good order, yet the motor knocks badly when accelerated, will not stand a quick opening of the throttle without knocking at any speed it may be running, but will attain maximum speed exceeding 50 miles an hour. The compression is good. In fact, it is difficult or rather impossible to spin the motor when cranking and yet it turns easy with petcocks open. I have tried all degrees of spark advance. Has Zenith carbureter, which, as you know, is not adjustable.

New York City. W. M. WEBB.

—There are two possible causes for this trouble. One is that the compression has been increased an undue amount owing to the reboring of the cylinders and the other, and most probable, is that a piston slap has developed. Twice in every revolution the thrust of the piston against the cylinder wall is transferred to the opposite side. When looseness exists between the piston and the cylinder the skirt of the piston has a tendency to strike the cylinder and give rise to a knock which has come to be known as the piston slap. The only cure for this is the re-boring of the cylinder or the fitting of an oversized piston. The piston has a tendency to swing about the wristpin as a pivot. This produces the condition of affairs which is shown in an exaggerated form in Fig. 1. Before taking steps to prevent the piston slap, which will be a costly operation, be sure that the connecting-rod bearing caps have been tightly fitted, that there is no play in the crankshaft bearings or at the wristpin, that the ignition is properly timed and not advanced too far, that the motor is free of all carbon, and that the valves seat correctly.

Shoe Has Been Made Too Large

Editor THE AUTOMOBILE:—I have a Ford touring car, and am having trouble with the rear shoe, which is a 30 by 3.5. It keeps slipping off the rim. It has run about 500 miles, and I have been unable to find a remedy up to the present time. Do you know a remedy for such a difficulty?

Lawrence, Mass. GEORGE W. LEDUKE.

—The fault is in the shoe, which has been made too large. The 30 by 3.5-inch size is the correct tire to put on the rear wheels. The best course to pursue would be to take the tire back where you bought it and complain of its oversize. There is a possibility that they have given you a 30 by 4-inch tire by mistake.

You may remember when the tire was last put on whether it slipped on more readily than is usual with tires of the correct size. If this was the case it is proof of the fact that the tire is too large and should be exchanged for one of the correct size.

Resurfacing a Scored Crankshaft

Editor THE AUTOMOBILE:—Where can I secure a tool for truing up scored crankshafts? I have been doing this on a lathe, but find that it is hard, sometimes, on marine engine shafts when the flywheel has become firmly rusted to the shaft and it is not desired that the time be taken to remove it.

I understand that a tool is made to do this work and that it is adjustable and works on the same principle as a common pipe-cutter, only with the blade running the other way and acting as a scraper or cutter. Can you enlighten me on the subject?

Edgartown, Mass. WILLIAM S. NEVIN.

—THE AUTOMOBILE has no record of any instrument for turning down a scored crankshaft other than a lathe. In practice it would seldom happen that the time required in removing a stubborn flywheel would ever be so great that it would counterbalance that required for turning down the shaft in some other manner. An expert mechanic could, if necessary, take off the extra material by means of a light file and get the work accurate by means of the frequent use of a micrometer. This would be very delicate work and would naturally require a long time on account of the necessity of proceeding carefully and of avoiding the possibility of getting the shaft out of round. After doing this work independently for each bearing it would be necessary to fit each bearing liner very carefully. The bearings would vary in size to a much greater extent than they do when a lathe is used. Even in the latter case there is a variation which sometimes amounts to as much as .005 inch. This amount is made up by scraping in the bearing, or in other instances by shimming. Should the shaft be somewhat out of round or dented it is put in a lathe and a tool which contains an aperture for the shaft lined with very fine emery is put on and the shaft brought back to round. The shaft is never touched by a file where good work is done.

Lubrication of the Jackson Car

Editor THE AUTOMOBILE:—Will you kindly give me an outline of the oiling system used in the 1912 Jackson 50? Is it a force or splash system?

Bridgeport, Conn. G. C. B.

—The oiling system on the Jackson car is a circulating splash system. The circulation of the oil is maintained by means of the flywheel and by gravity. The oil reservoir is contained in the clutch or flywheel housing, the main oil supply resting in the bottom of this housing. The oil is picked up by the flywheel and carried up to a device known as a skimmer which catches up the oil carried up by the flywheel. This skimmer forms a small vessel which constantly holds a supply of oil.

The oil from the skimmer flows by gravity to a splash trough located beneath each of the connecting-rods and also flows by the same means through another pipe to the gearset. Thus, there are two oil leads from the skimmer vessel, one a large pipe which takes the oil to the crankcase and the other a smaller one which takes the oil to the gearset. The pipe which leads to the crankcase is pierced by four smaller pipes which grade in size from the rear cylinder to the foremost. The reason for this is the fact that there will be less oil left in the large pipe after each cylinder is passed and therefore, to make the supply of oil even to each one of the cylinders, the oil is divided correctly by the various sizes of pipe. The areas of these pipes have been obtained by calculations and subsequent experiment.

The splash troughs are divided off from one another by walls which are pierced by overflow holes. The holes are of such a height that the oil level is maintained at the right point. Before it can become high enough to cause an over-supply of oil to be thrown up to the cylinders, it will flow down through the overflow holes. The walls between the splash compartments are put there to prevent the oil from leaving the compartments when the car is ascending or descending a steep hill. This would starve either the rear or front cylinders of their oil supply.

As there is constantly much more than the necessary quantity of oil being fed to the skimmer there is always an overflow at this point as well as at the splash troughs and in the gearset housing. All the overflow oil goes back to the well beneath the flywheel, from which it is again picked up and distributed through the system. All the bearings are lubricated by this system without the aid of an oil pump.

Some Electric Ignition Queries

Editor THE AUTOMOBILE:—Kindly answer the following questions:

1—How to wire master vibrator using a five-unit of an ordinary Splitdorf coil for the purpose on a four-cylinder car?

2—How to tell polarity of current in old-style Apple igniter dynamo, so as to charge storage battery?

3—What voltage should dynamo read?

4—Will it be a success to charge in this manner and ignite and light the car with storage battery?

5—Can I successfully construct an automatic switch on the dynamo from an ordinary bell magnet so that same will throw dynamo in and out to prevent bother of throwing dynamo on and off storage circuit?

6—Instruct me how to fit cylinder rings.

Atlantic City, N. J. J. W. TAYLOR.

—1—Splitdorf never made a five-unit induction coil. There is, however, a coil known as the four-cylinder synchronized coil made by the Splitdorf Co. in which a vibrator unit acts for the entire coil besides the regulation for induction units. The synchronized coil has been made by the Splitdorf Co. to do away with the individual vibrator adjustment. When this one vibrator is adjusted all the cylinders will fire in synchronism as far as the vibrator is concerned. This is no doubt the coil to which you refer in speaking of the five-unit type. The method of wiring up this coil is given in Fig. 2. The instrument consists of a vibrator which forms the fifth unit. The only duty of this unit is to operate for each coil in the series as the primary circuit is grounded by the commutator. The speed of this vibrator is very high, which is one of the recommending features of this system. The unit consists of a double-pole magnet applied under the base which actuates the vibrator spring and hammer. The magnet is excited by the current from the battery through the grounding of the commutator on the engine. The vibrator is fitted with a regular condenser for the suppression of the spark at the vibrator points, thereby avoiding burning these out rapidly. All the units of the coil are equipped with auxiliary condensers having a ground connection of their own to form a protective system to the commutator points on the motor.

2—In the old-style Apple igniter dynamo the top of the pulley turns towards the plus pole. As the amperage of the dynamo only amounts to 2 it will charge the battery very slowly.

3—The voltage of the dynamo is about 7 or 8.

4—The system would operate with this dynamo, but it would be rather slow on account of the low output. It would be better to get one of the new dynamos for $27.50 and get an allowance for your old one. The allowance would probably amount to $5 or $6 and would thereby cut down the cost of the new one to a large extent. The new machine includes within it a governor and automatic switch.

5—Such a switch as you suggest would hardly work well enough to be depended upon. A new automatic switch which is positive in its action can be bought from the Apple Co. for $10. It would be better all around to install the modern system as stated under answer No. 4.

6—Piston rings are bought to size and are slipped down over the piston head into the grooves by placing thin strips of metal around the piston. About four of these strips of sheet metal a half inch wide will be sufficient to prevent the ring from slipping into any but the correct groove. After the rings have been placed in the piston the pistons can be pushed into the cylinder by compressing the ring by means of a cord wound around the lower part of the ring, leaving just sufficient space to be able to slip the upper edge of the ring into the cylinder.

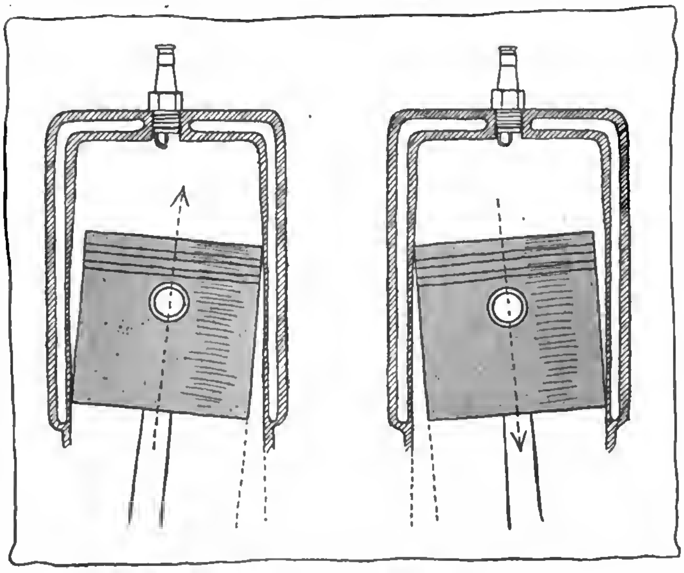

Fig. 1—Exaggerated sketch to show cause of piston slap. Piston rocks about wristpin

Repairing Radiator Tube Leak

Editor THE AUTOMOBILE:—I have an Elmore automobile, model 25, which has a McCord Mfg. Co. radiator on it, and one of the small radiator tubes about the center of the radiator has a split about an inch long in it. I see different kinds of radiator compounds advertised to repair such leaks, but hardly think such would make a permanent repair. So, if you can tell me of anything that would repair it without going to the expense of having new tubes put in, I would appreciate it very much.

Metz, W. Va. L. C. SHIELDS.

—To solder a leak in the tube of a radiator necessitates some delicate work unless you are somewhat familiar with the work. In fact, were you to take the radiator to your local plumber you would probably have to buy a new one after he got through with it. The amount of skill that is required depends largely upon the position of the leak. Assuming that it is in such a place that you can reach with a little care the method of procedure is as follows: Set the radiator in some position where you can work at it readily in a good light. Put a small piece of emery cloth on the end of a thin stick or rod and work down into the space between the tubes rubbing the metal along the leak until it becomes bright and clean. This must be done thoroughly if you wish the ultimate work to be a success. This will take some time if done right, and can be handled best if the radiator is tilted up in some such position as shown in Fig. 3. Immediately after the metal has been cleaned and be-

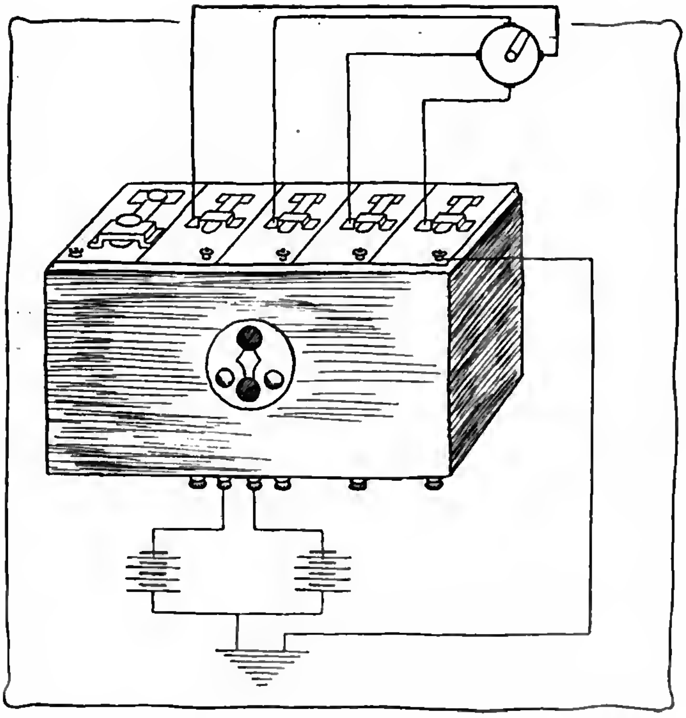

Fig. 2—Wiring diagram of Splitdorf coil with single vibrator

fore it has a chance to oxidize and become dull apply the flux, which should be zinc chloride. With a thin soldering bit heated to a cherry-red color, heat the metal to be soldered and which has been coated with the zinc chloride. While using the heated rod have another rod heating in the flame so that before the metal will have a chance to become cool the solder can be applied. The solder should be in the form of a narrow strip or else you will not be able to get it into the small aperture within which you have to work. To make the strip solder it is only necessary to heat a bar of solder and pour it into a vessel containing a small hole, as the solder is poured in it will leak through the hole in a fine stream and by running this stream along a metal surface a thin strip of solder will be produced. This should, of course, be ready before the work is commenced.

The solder is applied by means of the red-hot bit and is carefully moved along the surface of the metal which has been prepared by the flux. After the solder is applied the work should be cleaned up by the aid of a fine file.

The probabilities are that for the first two or three attempts you make at this you will have the pleasure of seeing the solder

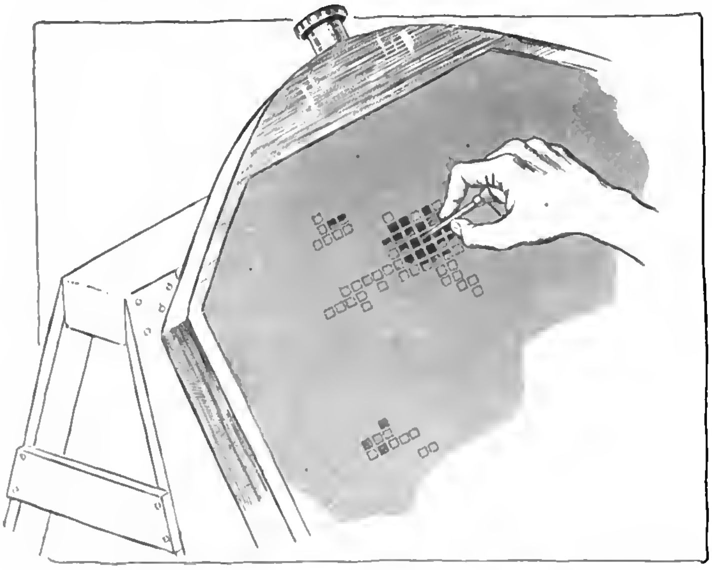

Fig. 3—Emery on the end of a fine rod will clean tube rupture

that you apply drop gently from the surface of the metal and leave the leak in very much the same state as it was at first, but with the use of considerable amount of patience you should be able to make a permanent job of it. The main part of the work is the preparation of the surface by means of the emery and flux. Some flux should remain on the surface when the solder is applied. The flux may be applied by the use of a fine paint brush. If you find that the leak is in such a place that it is absolutely inaccessible for this work, the best thing would be to send it at once to the factory and have the work done there, because this would be cheaper in the long run owing to the fact that it is very easy to spoil a large section of the radiator by means of a little clumsy workmanship. The solder to be used is the ordinary medium sōlder to be obtained in any plumber's shop. You can make it yourself by melting together one part of lead to two parts of tin.

Car Weight Increases Air Pressure

Editor The Automobile:—A claims that a tire pumps up harder if the weight of the car is on the tire, B claims that there is no difference, as the air pressure is inside the tubes. Who is correct?

Bernardsville, N. J. C. B.

—This question has been argued for hours by chauffeurs and others and there appears to be no reason why it should not be clear. Perhaps you have stepped, at some time, on a partially-inflated rubber ball. The ball was round before you stepped upon it, but when you did this it flattened out. When you stood upon the ball the pressure within the ball became greater than before because the internal volume of the ball was decreased. In other words, the same amount of air occupied a smaller volume. The air was compressed and therefore its pressure increased.

Air is a perfect gas. Perfect gases follow Mariotte's law, which states that the volume of a gas diminishes at the same ratio that the pressure upon the gas is increased, or conversely. When the ball was stepped upon its internal volume was decreased. If there had been no air in the ball it would have been actually flattened out. As it was, however, the ball reached a point at which the pressure within was enough to hold it against further compression.

The same thing happens with a partially inflated tire. When the car is jacked up the tires are round and the internal volume of the tire is at a maximum. The inner tube is round. When the jacks are removed the inner tubes become elliptical in section and the internal volume is smaller. According to Mariotte's law the pressure in these tubes has increased in the same ratio that the volume has been decreased. It is harder to pump against a tire that has a pressure of 1 ounce more than another. Although the difference is minute, it is nevertheless there. A is right.

Wants Automobile Engineering Course

Editor The Automobile:—I should like to know if a boy of 18 years of age with 2 1-2 years in a high school of good standing can enter any automobile course or mechanical engineering course in any of our state universities.

Frankfort, Ind. L. C.

—The mechanical engineering course in a state university requires a standing equivalent to that of high school graduation. You may take college entrance examinations and if you pass with the required percentage you may enter. The probabilities are, however, that if you have just managed to pass the entrance examination and your foundation work is weak, you will be bothered during your entire university course by this insufficient groundwork. It would be wiser all around to complete your high school course before entering the university.

Automobile courses are just being considered by universities, and those which have adopted them use them as a sort of post-graduate course to their mechanical engineering studies or have a course which is very much like the ordinary automobile schools.

To make a proper study of automobile engineering you need the same training that you do before taking up mechanical engineering because the same principles are involved in each study and, in fact, automobile engineering requires a more extended course in thermodynamics. In order to study thermodynamics a knowledge of the calculus is necessary. To lead up to the calculus requires all the mathematics that you will get in your high school course.

Derivation of S. A. E. Horsepower

Editor THE AUTOMOBILE:—Under the section Letters Answered and Discussed of your issue of April 10, 1913, the explanation of the derivation of the S. A. E. horsepower formula should be taken up differently.

First, the mean effective pressure assumed was 75 pounds per square inch. This should have been 90. No doubt, this was a typographical error as the final result $\frac{D^2N}{2.5}$ is correct.

The number of working strokes of a four-cycle and presumably a single-cylinder motor is $\frac{N}{2}$ in which N = revolutions per minute. (We must bear in mind that there are two strokes per revolution.)

The speed of the piston in feet per minute is given as L N, in which L = stroke in feet; N = revolutions per minute. This should be: Piston speed in feet per minute is 2 L N. This, of course, is due to the fact that there are two strokes to a revolution.

I would like to submit a derivation of the S. A. E. formula which, I believe, will be much easier comprehended. Let us take the formula for indicated horsepower:

$$\text{I horsepower} = \frac{PLAn}{33{,}000}$$

P = mean effective explosion press in pounds per square inch
L = length of stroke in feet
A = area of piston in square inches
n = number of explosions per minute.

It is clear that this formula is good for motors of any number of cycles and cylinders. Let us now apply it to a four-cycle single motor.

Let R = number of revolutions per minute. Now we know that there will be one explosion for every two revolutions, therefore

$$n = \frac{R}{2}$$

Putting this value for n in the formula for I horsepower it will look like this:

$$\text{I horsepower} = \frac{PLAR}{2 \times 33{,}000}$$

Now let us convert this into the A. L. A. M. formula. Only a certain part of this power can be utilized.

Tests which the A. L. A. M. made showed this to be .75.

The formula then becomes

$$\text{A. L. A. M. horsepower} = \frac{.75\ PLAR}{2 \times 33{,}000}$$

A. L. A. M. tests showed that motors gave their maximum power at a piston speed of 1,000 feet per minute.

Piston speed in feet per minute = 2 L R.

Then, piston speed in feet per minute divided by 2 = L R.

If the piston speed is 1,000 feet per minute we get

$$\frac{1{,}000}{2} = 500 - L\ R.$$

For every revolution the piston travels the length of its stroke twice, therefore the 2 in the above.

Now we can write the formula

$$\text{A. L. A. M. horsepower} = \frac{.75\ P\ A\ 500}{2 \times 33{,}000}$$

Further tests of the A. L. A. M. showed that the average mean effective pressure of the motor was 90 pounds per square inch. This was adopted as the average mean effective pressure.

Then the formula becomes

$$\text{A. L. A. M. horsepower} = \frac{.75 \times 90 \times 500\ A}{2 \times 33{,}000}$$

If D = bore of cylinder in inches
A = $D^2 \times .7854$

This gives us

$$\text{A. L. A. M. horsepower} = \frac{.75 \times 90 \times 500 \times .7854 \times D^2}{2 \times 33{,}000}$$

Working this out gives us

$$\text{A. L. A. M. horsepower} = \frac{D^2}{2.49}$$

or in round numbers

$$\text{A. L. A. M. horsepower} = \frac{D^2N}{2.5}$$

This is the A. L. A. M. rating for a single cylinder. To get the A. L. A. M. horsepower for a motor of any number of cylinders you have simply to multiply by the number. Let N be the number of cylinders, then for any number of cylinders the

$$\text{A. L. A. M. horsepower} = \frac{D^2N}{2.5}$$

This explanation, I believe, is much easier followed out than one at which the conclusions are jumped at, even though the reasoning were right.

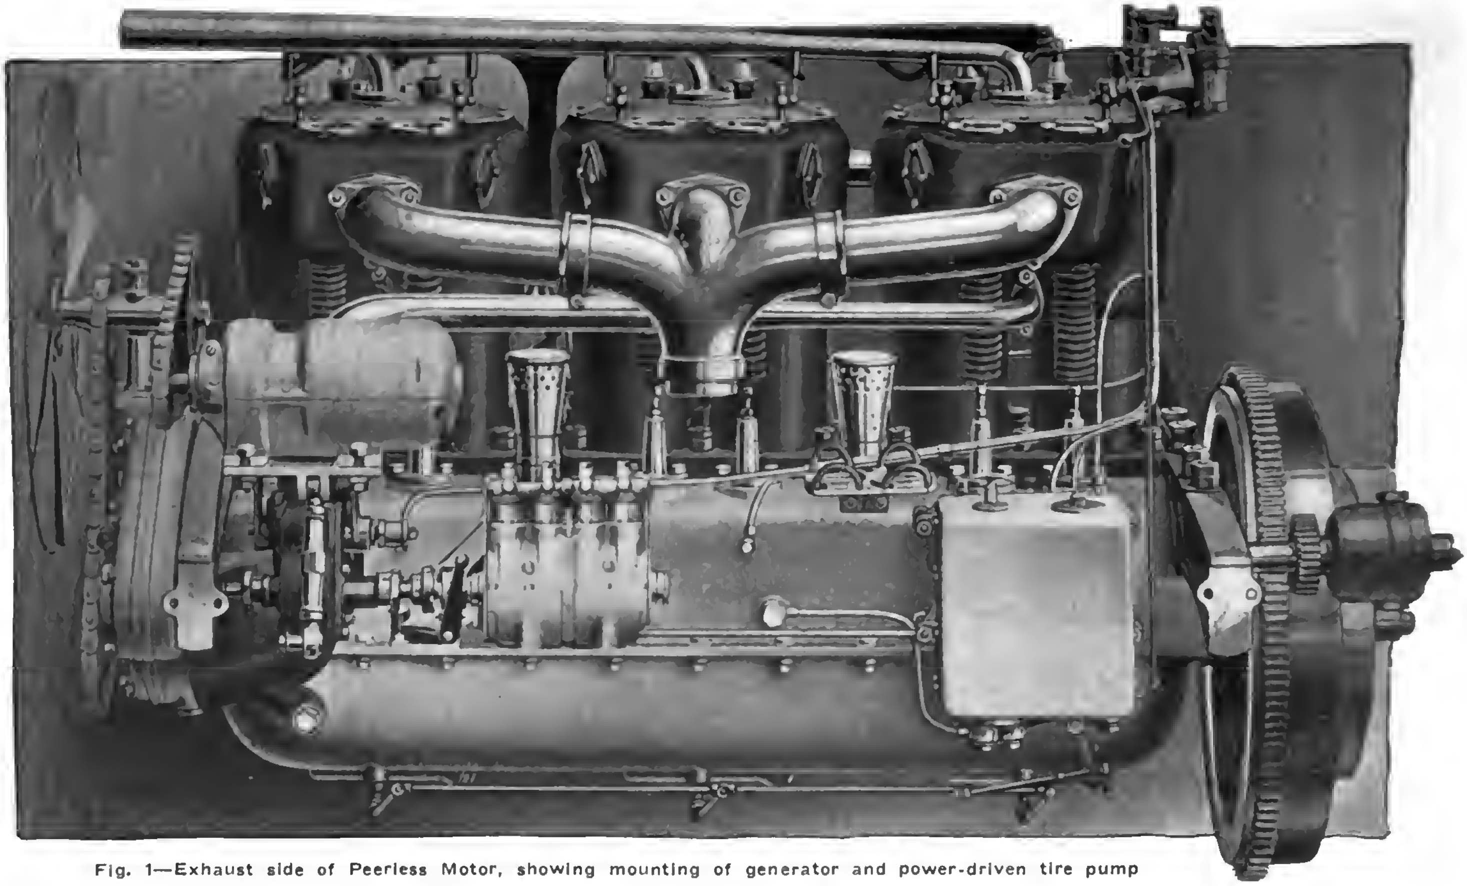

Fig. 1—Exhaust side of Peerless Motor, showing mounting of generator and power-driven tire pump

Peerless Continues the Three Sixes

THREE models of Peerless cars will comprise the line of this company for the coming season. These are all sixes and are known as the 38-Six, 48-Six, and 60-Six. They are all identical in principle and construction, merely varying in the weights and sizes of the parts. The most important changes have been made in the direction of improving the riding qualities of the car and the changes made in this direction have resulted in a lower center of gravity. The gasoline tank has been placed under the rear of the body and is slung between the two side members of the frame while the tirs are now carried on a rack at the rear of the car instead of at the side on the running board. The springs have been made thinner by decreasing the thickness of the leaves and the front and rear axles are now fitted with shock absorber. The upholstery of the rear seat has been increased in thickness to 10 inches which insures increased comfort for the passengers.

The equipment of the car has been made more complete. It includes a speedometer in combination with a clock, a combination bulb and electric horn, an electric starting and lighting system, and the same type of power driven tire pump as used last year.

The motor sizes of the three new car models are as follows:

38-Six,	bore 4	inches,	stroke 5.5	inches.
48-Six,	bore 4.5	inches,	stroke 6	inches.
60-Six,	bore 5	inches,	stroke 7	inches.

The new pistons are different than the pistons used in the past. There are now three piston rings used instead of four. All three of these rings are located at the top of the piston. A cross section of the piston is given in Fig. 2 and also a plan view. It will be noticed that a very strong system of cross bracing is employed to stiffen the walls of the piston which have been made somewhat lighter. The cylinders are T-head cast in pairs.

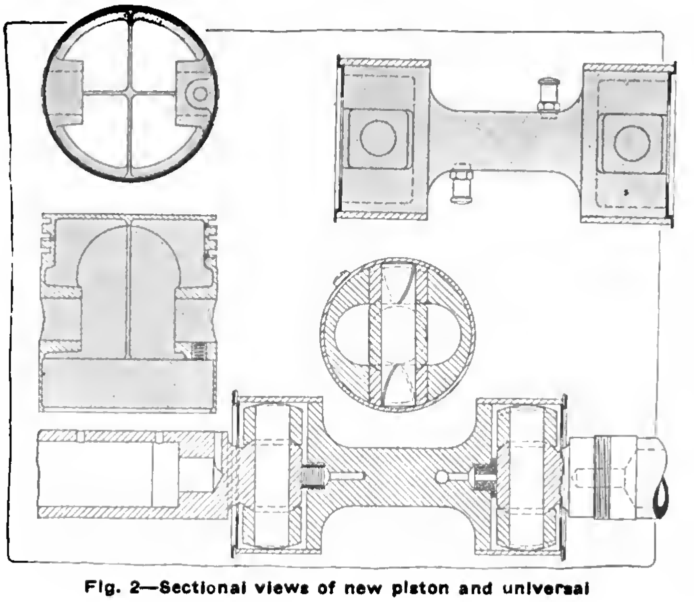

Fig. 2—Sectional views of new piston and universal

Crankshafts are drop forgings tested for both static and running balance. The material is of chrome metal steel. Seven main bearings are used and they are all carried in the upper half of the crankcase. No shimming is used in the main bearings these being all scraped in by hand. All the bearing surfaces are ground and all the bushings have bronze backs lined with babbit.

The valves are of nickel steel and are operated by an eight-bearing camshaft. The camshaft, magneto and water pump shaft are all driven through spiral gears of semi-steel running in oil. The crankcase is contained in two horizontal sections and is made of a special aluminum alloy.

The gasoline feed is by pressure from a copper tank suspended at the rear of the frame. This tank is a new departure for the Peerless company and is illustrated in detail in Fig. 4. As will be seen it is substantially braced by angle-iron cross members. A two-way gasoline valve connects either main supply 5-gallon reserve or shut off. The tank has a 22-gallon capacity and is supplied with an automatic gauge. The pressure is automatically supplied by a reciprocating pump on the engine and the air line contains a relief valve to limit the pressure in the tank. About 2 pounds is generally carried. There is a dirt trap in the gasoline line. The Peerless carbureter remains unchanged.

Ignition is by the Bosch Dual system as in the former models. When the magneto is not in use the current is suplied by the storage battery of the starting and lighting system which is kept charged by the dynamo.

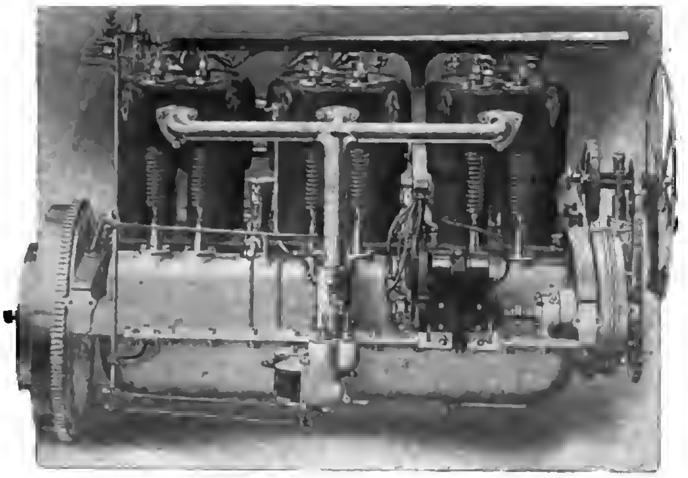

Fig. 3—Intake side of motor with magneto mounting

The Peerless type of expanding band clutch operating through a worm and screw is maintained. The frictional surface is composed of chrome leather with round cork inserts forming about 33 per cent. of the frictional surface. In the new model the action of the clutch has been somewhat improved by the introduction of a double swivel joint in the shifter fork support. The power is transmitted through a four-speed gearset which has been improved by the addition of a universal in place of the flexible coupling formerly used between the gearset and clutch. This new universal is illustrated in Fig. 2. Another improved part of the car is the muffler. This has perforated baffle plates and an interior that may be removed for cleaning. It is placed lengthwise on the left side of the chassis instead of transversely at the rear as on all previous Peerless models. The spring suspension has been improved on all three models by using thinner leaves of high quality.

Detecting Resistance—Saving Fuel

(*Continued from page 979*)

car is up to the standard of easy running or not, if, indeed, his gasoline bills have not already given him this information.

The question of grade can be solved by it instantly to the satisfaction of any doubtful ones.

Fitted to a neat bracket, so placed on the dash as to be easily read by the driver, one has always ready a sure detector of hard running.

An enterprising owner interested in engineering research can plot the torque curve of his motor by taking acceleration readings at different speeds and with varying gear combinations.

Perhaps the future car owner may require the torque curve of the motor to be produced by the makers, and before purchasing ask to make the accelerometer tests to verify it.

The instrument is not expensive ($52.50) and it is not difficult to use. Why then should it not be more widely used?

Partly perhaps because it is made in England and is not especially well known in this country.

(*Concluded*)

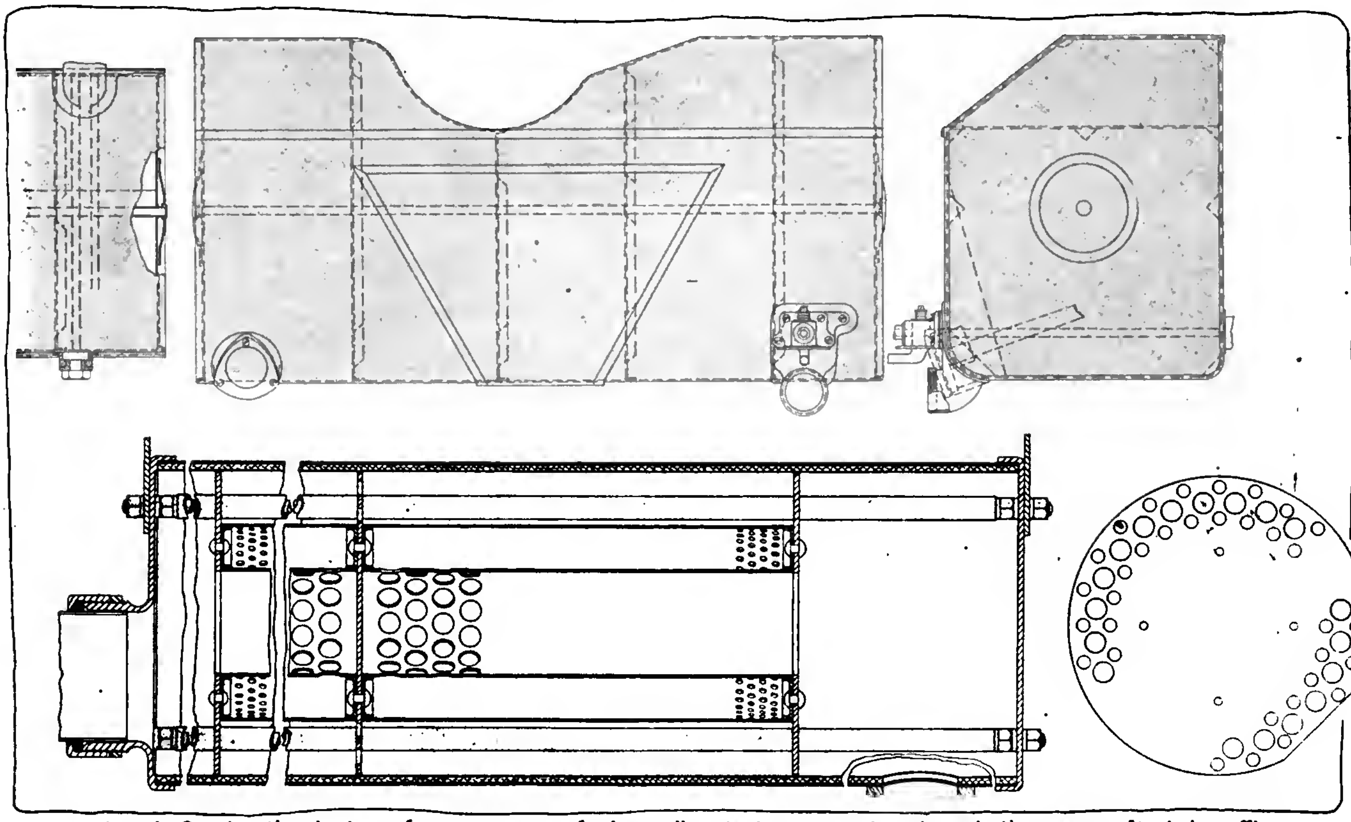

Fig. 4—Constructional view of new pressure feed gasoline tank and section through the new perforated muffler

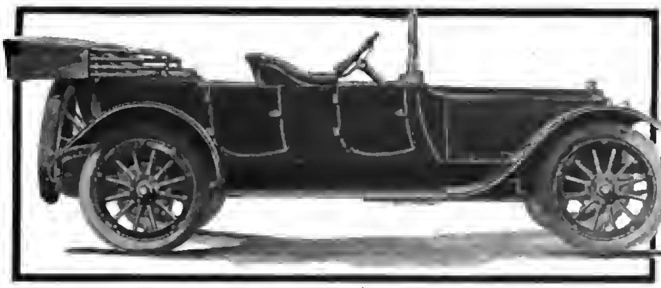
Chandler Six of Light Construction

THE new Chandler is strictly in line with the policy of the time in constructing light six-cylinder cars. Weighing less than 3,000 pounds and having a motor which develops 35 horsepower, the car is distinctive even in that field.



New Chandler light six, which weighs under 3,000 pounds

The motor has its cylinders cast in three blocks of two. The bore is 3.375 inches and the stroke is 5 inches. This gives an A. L. A. M. rating of 27.3 horsepower and a stroke-bore ratio of 1.33. Ignition is by Bosch high-tension magneto and starting is by the 6-volt Westinghouse system.

Coventry silent chains are used for driving the magneto, pump shaft and camshaft. The arrangement of the magneto, generator, cranking motor and pump may be noted from the illustrations of the motor at the foot of this page. The water pump and magneto are operated from the same shaft on the left side of the motor, while the generator and cranking motor form independent units and are located on the right side. The cranking motor in this installation carries a gear wheel on the end of the armature shaft. This gear meshes with the gears in the flywheel. The generator is driven from the timing gear set and is located at the front of the motor on the right side.

The lubrication system is a combination of the force feed and splash. Oil is forced from the crankcase oil reservoir to each of the main crankshaft bearings. From this point the oil overflows into a series of splash troughs located beneath the crank throws. The splash takes place in the customary manner. All the oil leads are contained within the crankcase. There are no exterior oil pipes.

The clutch is of the multiple-disk type with the alternate plates lined with Raybestos. The clutch and gearset form a unit with the motor and an aluminum housing, which is a continuation of the crankcase, encloses both the clutch and the three-speed selective sliding gearset. The gearshift lever and the brake lever are both connected to the gearset housing, giving center control.

The driveshaft has two universal joints and terminates in a ball-bearing rear axle of the floating type. The differential is of the bevel type and is also mounted on ball bearings. No torque strains are taken by the springs, these being absorbed by a triangular member of pressed steel.

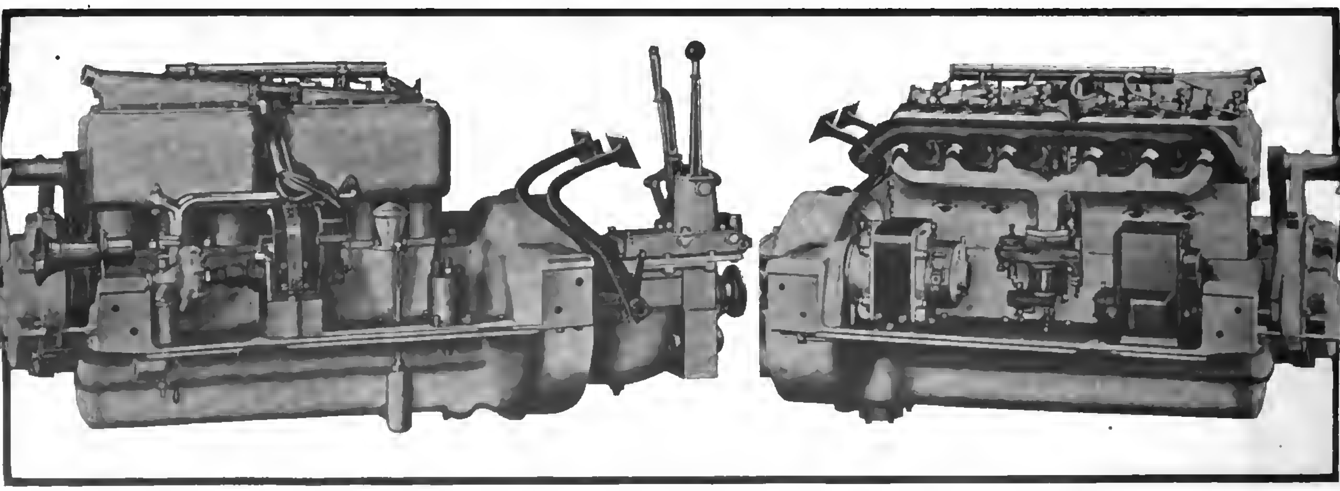
The channel side members of the frame are toed-in in front to decrease the turning radius of the car. This works out to 37 feet which is low for a car of 120 inches wheelbase.

The gasoline system consists of a 20-gallon tank swung between the members of the frame at the rear of the car. The gasoline is fed to the carbureter by pressure secured from a small reciprocating pump. The pressure maintained is in the neighborhood of 2 pounds. An air gauge is located on the dash to tell the pressure in the gasoline tank at any time. The makers claim a mileage of 13 to the gallon for this car.

The steering gear is a worm and sector. The column extends straight through the sloping footboard and terminates at the worm and gear housing. The column is raked back at a racy angle to coincide with the low driving seat given by the straight-line construction. The body side line is raised just slightly above the line of the hood, giving a pleasing appearance.

Throughout the entire construction of the car modern practice has been followed. An example of this is in the windshield, which is built directly into the cowl and does not require the long brace rods which are necessary in many types. This gives an air of simplicity to the body and does away with some of the lines that would cross the straight-line construction and destroy the simple and clean appearance that straight-line body work is supposed to give. The dash equipment is carried on a cowl board and the body line is kept smooth by mounting the lamps within the dash instead of allowing them to project.

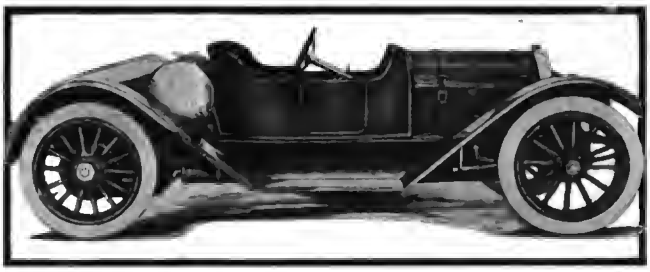
Complete equipment is furnished with the car. The accessories are stowed in a neat manner, leaving the streamline touring body lines unbroken at the sides. The extra tire is carried on the spare demountable rim at the rear of the car and the electric horn is mounted firmly on the motor itself, beneath the hood. The sound is projected through the radiator. The fenders are long and flat with a quick arch over the 34 by 4-inch wheels. Jiffy curtains, robe rail, speedometer, illuminated cowl dash, 12-inch Turkish upholstery and a full tool equipment fit the car for immediate use on the road in any weather.



The Chandler motor has its cylinders cast in two blocks of three and develops 35 horsepower on the block

Multiplex—A New Car with Racy Lines

A NEW concern which was made known to the automobile world by the recent sealed bonnet endurance run of the Automobile Club of Philadelphia has brought out a car known as the Multiplex. It is made by the Multiplex Manufacturing Co., of Berwick, Pa. The car is made in touring and roadster bodies on the same chassis.



Multiplex roadster manufactured by new Pennsylvania concern

The motor is a four-cylinder Waukesha having a bore of 5 inches and a stroke of 6 inches. The A. L. A. M. rating of this motor is 40 horsepower. The makers' rating is 50. The cylinders are of the L-head type with inclosed valves.

Modern practice has been followed in the motor arrangement and the latest features for silence have been included. The crankshaft is suspended from the upper half of the crankcase the lower half being a separate casting and used for an oil reservoir. The gears are of the skew type and the valve action is reached by the removal of a cover plate.

Lubrication system employed is a combination force feed and splash. A gear pump driven off the camshaft lifts the oil from the crankcase reservoir and forces it to the three main bearings supplying these with copious lubrication. After leaving the main bearings the oil runs into the splash troughs which are located beneath each crank throw. Scoops are placed on the connecting-rod caps which throw the oil into the cylinders and also take care of the lubrication of the wristpins. A separate lead runs from the gear pump to the timing gearcase, causing the spiral gears to operate in a constant oil bath. The oil drains back to the crankcase after overflowing from the troughs and since the oil supplied is constantly in excess of the demands of the lubricating system, there is a continuous circulation maintained throughout the lubricating system.

Ignition is by Bosch dual system with a single set of sparkplugs. The systems are independent of each other except for the plugs. The carbureter is a Stromberg and draws its air supply from a heater surrounding the exhaust pipe.

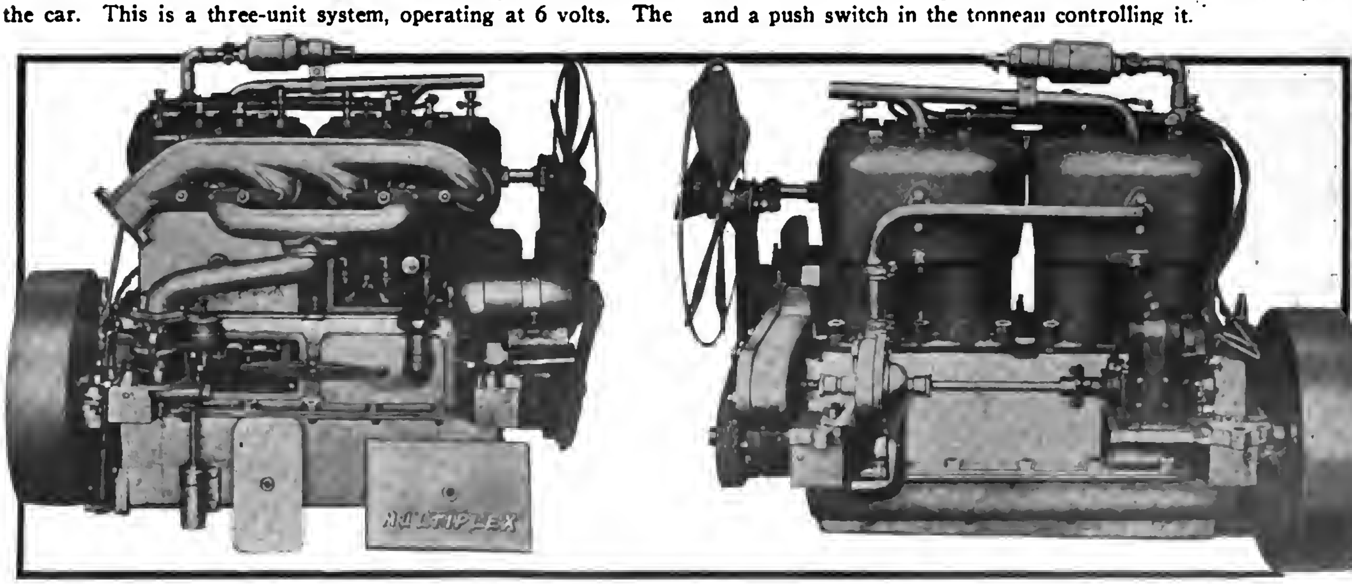
The Rushmore electric lighting and starting system is used on the car. This is a three-unit system, operating at 6 volts. The Rushmore generator has been on the market for some time and is of the iron-clad bi-pole type. The noteworthy feature of the Rushmore system is the regulation of the current by the utilization of a peculiar property of iron wire of greatly increasing its resistance when heated. The resistance of the wire is practically constant up to a certain point allowing the current in amperes to be proportional to the voltage applied. At a certain point, however, the wire reaches a dull red heat and at this point the resistance increases enormously, a very large voltage being required to force another ampere through the line.

The clutch is of the dry-plate multiple-disk type with alternate disks faced with asbestos material. The power is transmitted by a four-speed Warner selective gearset having the levers placed in the center to permit access from the right side of the car. Right steering is used, however, with center control. The fourth gear is higher than direct while the third gear is direct drive.

The steering gear consists of a worm and complete gear, the gear wheel being mounted on a square shaft which renders it possible to remove the wheel and give it a quarter turn when wear begins to appear.

Both the roadster and touring car bodies are swung long and in connection with the long wheelbase, 134 inches, and large wheels, a very racy appearance is given. The rear tires of the touring car are 39 by 5 inches and the front wheels of the touring and all the wheels of the roadster and race-abouts are 38 by 4.5. Firestone demountable rims are used all around. The tread is 56 inches and the floorspace of the tonneau is 45 inches wide.

The body is of steel panels on wood and iron framing, extra tonneau seats being supplied on the touring model which fold up very compactly and fit in floor sockets. They can be lifted out if desired to leave the floor clear. A refinement not always found on touring cars is the use of the step light which lights automatically when the door is opened. Another convenience is a light fastened in the folding top with a flexible cable leading to it and a push switch in the tonneau controlling it.



The four-cylinder Waukesha motor used in the Multiplex car has a bore of 5 inches and a stroke of 6 inches

Making Motor Spirit

Standard Oil Manager Outlines Process—Two Refineries Now Supplying Trade with New Fuel

WHEN, on the advent of motor spirit, came the statement that it would be sold at practically 3 cents per gallon less than gasoline, many were skeptical, feeling that the news was too good to be true, and naturally felt that even if the information were correct as to price there must be something wrong with the quality. To clear up this point it may as well be stated at the outset that the information as to price is correct, and with the exception of a slight odor, and the fact that the color is not quite water white, there need be no misgivings as to the quality either.

Gasoline is made, as everyone knows, by distilling the crude oil and taking off the lighter products. Other products then are made by further distillation, until finally there is a residue left that heretofore has been marketed only for fuel purposes at a price in competition with coal. For a great many years the chemists have known that this residue, or fuel oil, contained a large amount of material similar in composition to gasoline, but of a much higher boiling point. Notwithstanding the vast amount of experimental work that has been done, the problem of converting high boiling-point products into low boiling-point products by a practical method baffled every effort.

It is true that the necessity for a greater production of gasoline has become imperative only within the past year. Prior to that the refineries were able by the ordinary methods to produce enough gasoline to meet all requirements, but with the constant increase in the number of gasoline engines and the growth of the automobile industry, coupled with the decrease in the production of crude oil, an acute condition has been brought about within the last year. Necessity is ever the mother of invention; with the urgent necessity of an increased yield of a fuel for internal-combustion engines came a solution of the vexing problem, and the discovery of the process by which motor spirit is made.

Total Fuel Production Doubled

As stated above, motor spirit is made from what was formerly known as fuel oil. It is extracted by the process of pressure distillation. Under this process it is possible to secure about as many gallons of motor spirit from a given amount of crude run as now are obtained of gasoline. Thus the total production of fuel suitable for gasoline engines can be practically doubled. Of course, this takes time. The process requires an extremely expensive plant installation—several times as expensive as is necessary in the ordinary refining process.

The operation likewise is expensive, but as rapidly as the stills can be built they are being erected at the huge refineries at Whiting, Ind., and Alton, Ill., owned by the Standard Oil Company of Indiana.

It will take several years to reach a point where a maximum amount of production can be secured, but the progress that has been made and is being made in the erection of these stills seems to give assurance that the supply of fuel will keep pace with the demand.

Motor spirit could be refined further, deodorized and a product could be obtained therefrom that would be identical in every way with gasoline, but to do this would bring up the cost of the product to the present price of gasoline. This would accomplish no good purpose. The odor, whilst pungent, is not necessarily disagreeable; it is simply a distinctive odor that is noticeable only when handling the liquid. The exhaust from an engine is not as offensive as is the exhaust from gasoline. You can ride in an automobile using motor spirit and not detect it. The color is of but little moment. We have learned to expect gasoline to be water white. The fact that the new fuel is slightly yellow has no bearing on its efficiency for power purposes, any more than if it were green or blue. There are other disadvantages in further refining this product.

There are certain inherent properties in motor spirit that are desirable for power purposes that would be taken out in refining, principally the low boiling points which make the starting of the car easy, for it is a fact that in cold weather a car can be started easier with this fuel than with gasoline. There is also more power in it than there is in gasoline, and further refining would destroy this advantage, so that there is everything to be lost and nothing gained in seeking a product that would look a little prettier and smell a little sweeter. As is the case with gasoline, it is desirable to use a chamois filter for filling to avoid the presence of moisture.

It is not necessary to use a different carbureter, but it will be found best to make a slight adjustment of the carbureter, either by reducing the amount of fuel or increasing the amount of air admitted to the carbureter.

Provision for storing motor spirit is being made through the entire section in which the Standard Oil Co. of Indiana operates. This in itself is a huge problem, but every effort is being made to supply the trade as rapidly as possible. The trade can now be supplied, even in the most remote sections by making shipments in iron barrels from distributing points. Of course, this will make some little reduction in the saving where local freight has to be paid, but there is still sufficient saving to warrant the consumer in using motor spirit.—P. C. CRENSHAW, general manager sales department, Standard Oil Co. of Indiana.

English Fuel Situation More Acute

LONDON, ENGLAND, April 24—The fuel situation is growing more acute every week in this country. There is a strong feeling here that a combine controls the supply of motor fuels in England. It is a rather significant fact that almost simultaneously with the publication in America of facts concerning the new fuel, Motor Spirit, that the Shell interests here announced that they would in future furnish two grades of fuel. They always have supplied a heavy spirit named Crown which was not used by private car owners to any great extent, but by buses and cabs. Then they announced Shell I and Shell II, taking the opportunity to put Shell I up 4 cents a gallon, making it 43, and Shell II at 39. The Anglo-American people followed exactly 1 week afterwards taking the same course and putting up the price.

Motorists on this side feel very strongly that they are in the grip of a trust and that there will be no relief until there is a strong and determined competition up against them.

Our imports of motor fuel are rising enormously. During the 3 months ending March 31, we imported no fewer than 23,171,471 gallons, as against 14,903,951 gallons for the period last year.

There are campaigns on here for home-produced fuel, and the joint committee representing two of our institutions, the Royal Automobile Club, the Automobile Association, and our Trade Society is now investigating the whole question.

Every effort is being made at present to create a big demand for benzol, which is giving excellent results. It gives more miles to the gallon than gasoline, and has no deleterious effect on the engine. England is producing millions of gallons of benzol annually, but the irony of the situation is that the bulk of it is exported and used in France as a motor fuel. The home demand should be great enough to kep the stuff for use here, but even so, the supply is infinitesimal compared with the growing demand. The coke oven plants at the mines only produce 1½ to 2 gallons of benzol to each ton of coal treated, plus the various by-products, but investigations show that with a Del Monte system, this can be increased from 6 to 7 gallons per ton of ordinary coal, and to as high as 20 gallons per ton from channel coal. It is further claimed by this process that the residue after treatment is a thoroughly efficient smokeless fuel.

Acetylene Tank Makers Protest Against Undue Emphasis Placed on Electric Light Systems for Automobiles

INDIANAPOLIS, IND.—Editor THE AUTOMOBILE:—Inasmuch as the columns of the automobile press seem to be constantly filled with matter which discusses the value of lighting systems for automobiles, and which dwells largely on the use of electricity as an illuminating agent, we should like very much to suggest a thought or two which possibly may have escaped your attention.

We acknowledge the novelty of electricity, its undoubted convenience while in working order and the unquestioned widespread demand.

The other side of electric lights seems to be ignored, probably on the theory that the weakness will be eliminated in time. The fact that only the highest class of electric equipment, carefully installed and expertly cared for, is competent to give satisfaction seems to be having little or no publicity. It is well known that the makers of medium-priced cars cannot afford, at present prices, to install the grade of electrical equipment which will hold up and give service under practical road conditions. The manufacturers themselves admit it, and yet thousands of these outfits are being hastily put on, and incorrectly put on, in order that automobile factories may advertise "electrically lighted and started." Literally thousands of these systems have been torn out by the purchasers of such cars and gas lighting substituted.

Gas lighting yields nothing to electricity in point of convenience, cost of installation, cost of up-keep and service, quality and character of light or dependability. As a plain matter of fact, gas lamps, electrically lit, are as convenient as electricity. With the gas automatically regulated to give the proper height of flame in all the lamps at all times, the user has only to turn on the gas at the dash, press a button and the lamps are lit. True, an automatic electric lighter for gas lamps will occasionally get out of order—probably not as often as electric lights get out of order. But there is this important difference: When you push the button and your gas lamps don't light you can use a match; when you push the button and your electric lights don't light—suppose you tell your readers what to do.

Misinformation on Cost of Service

Perhaps the largest single amount of misinformation on this whole lighting subject is on the point of cost of service. The expression "Electric light costs nothing—the engine generates the light," is a common one in the news columns, in electric light advertisements and in the mouths and minds of automobile dealers and owners. Coupled with this statement one usually finds the sapient remark, "you save the money you used to pay for gas." This is perhaps the largest factor today in the sale and use of electric lights, even greater than the convenience of electric lights, and yet it is an absurd untruth. The average user of gas for lighting pays not to exceed $10 per year. Can you figure out for the benefit of your readers how they can use electric lights at the minimum cost of $10 per year? In computing this take into consideration something more than is usually considered, namely, the cost of electric-light globes. Go also into the cost of repairs on electric lighting systems, cost of gasoline used for current generation, the cost of new batteries to replace those ruined by amateur abuse, and many other phases of electric lighting troubles.

Does an electric light company create its current and maintain its equipment for nothing? Will any well-posted electrician contend that the maintenance of electric equipment, particularly when operated by someone who is not an electrician, costs nothing?

The unreliability of electric lights is proverbial—the whole trade knows it. The stories of people who have suddenly found themselves without light on a country road, without the slightest knowledge of how to effect a repair, are not uncommon. Even officials of automobile factories have been compelled to spend the night at some small town, 50 miles from home, because they were powerless to repair their electric lighting system, and because dealers are likewise unable to render this service. And yet some of these manufacturers who, in private conversation have no hesitancy in admitting the need of an auxiliary lighting system on any electrically lighted car, are even proceeding to omit the oil founts from their lamps, thereby compelling their customers to rely wholly on electric lights.

The reason for this is not hard to find. People know that their houses are electrically lighted with almost no trouble. They therefore rush to the conclusion that electric lighting of automobiles is equally simple and equally dependable. Then, spurred on by misstatements of certain manufacturers that "electric light costs nothing" and encouraged by the dealer who spreads this same erroneous message, either because he does not know better or because he has electrically lighted cars for sale, the prospective automobile buyer has no reason for believing that electric lights are anything but ideal in every way. Hence the demand.

Influence of Unprincipled Dealers

Another angle of the situation is the eagerness of a great many automobile makers to take prompt advantage of the unthinking demand which a few of the automobile makers originally created by spectacular announcements of electrical features. The dealer, instead of frankly telling his customers the disadvantages as well as the advantages of electric lights, and winning their gratitude for letting them see both sides of the question, realizes that he might make sales more easily if he could hand the public what they ask for regardless of its merits and so presses the factory for electric lighting equipment. The factory yields to this pressure, when it becomes sufficient, and thereupon promptly rushes into print with the announcement "electric lights."

Some dealers have already paid an excessive penalty for their part in this peculiar sort of sales logic by being compelled to perform gratis considerable expensive labor on lighting systems which they recommended and sold as "absolutely reliable."

That the reaction has commenced and will increase admits of no doubt, but the remarkable part of the situation is that the trade press itself, which should be the most reliable guide to public opinion, is reticently tagging along in the wake of the procession instead of attempting to lead it.

The gas lighting industry is showing today the largest per cent. of increase in its entire history. The only thing that could possibly change the situation, with any permanence, would be the perfection of an electric lighting system, cheap enough to be accessible to the maker of medium-priced cars and reliable enough to give satisfaction. That such a combination will ever come to pass defies imagination.

All the foregoing has been said with a view to encourage a calm, unprejudiced discussion of the lighting problem and in the hope that you may ultimately present the whole subject, uncolored by the imagination, unbiased even by the hope of future perfection of any system, and undaunted by any consideration of what people will say.—S. M. COOLEY, Prest-O-Lite Co.

Test E.C.B. Carbureter on Many Fuels

New Device Has Interconnected Throttle and Jet—External Adjustment of Fuel Level Provided

A CARBURETER which it is claimed will give correct fuel mixture at all running speeds, thus making for considerable fuel economy, bas been developed by the Detroit Carbureter Co., and carries the trade name E.C.B.

The E.C.B. carbureter, a sectional view of wbich is sbown in Fig. 1, possesses a number of unique features and on account of its peculiar design it really is equivalent to a small carbureter at low speed, and as the demand increases due to the greater engine speed the greater opening of the throttle and its interconnected fuel needle valve and air valve causes it to become virtually equivalent to a larger instrument.

The carbureter is of the concentric float type, the float surrounding the mixing tube and regulating the flow of fuel from the supply tank through a needle valve in the usual way.

Referring to the figure, the float is shown at F. The mounting of this float is one of the patented features of tbe instrument. It is wbat is termed a gimballed arrangement and really amounts to a universal connection to the arm F_1, allowing the float to remain stationary in any position. This is, no matter what the position of the engine on which the carbureter is placed and not actually upset, the float will maintain a constant level of fuel at the spray nozzle N. The primary air intake is at the bottom of the carbureter, allowing the air to pass vertically upwards around the nozzle where it mixes with the fuel. The auxiliary air enters at A and combines with the mixture at B, the whole passing on to the manifold through the diffusing screen at the outlet O.

The carbureter has no automatic features whatever, all variable quantities except primary air intake being controlled by their interconnection with the throttle. The throttle control lever is shown at T. This clamps the cylindrical throttle valve V, which has openings in its opposite sides. When these openings register with the passages O and A, air is admitted through A and fuel allowed to escape through O in proportion to the amount of register. The manifold opening in the throttle valve V bas a certain lead on the air opening so that for slow running and for priming, the auxiliary air inlet is entirely closed.

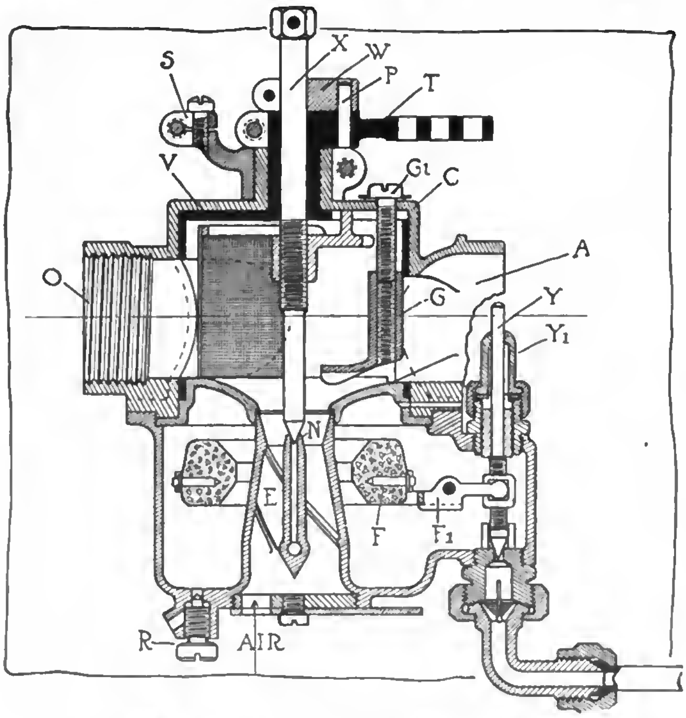


Fig. 1—E. C. B. carbureter with sleeve type of throttle

Referring to the figure, it will be seen that the needle X is screwed into a part of the carbureter casing. Through its clamp W and the pin P it is also fastened to the throttle lever T so that when the latter is turned it also raises or lowers needle from its seat.

The stop S is provided to prevent the opening of the throttle beyond a certain point. Thus when T is turned it opens the throttle, the auxiliary air and the needle valve all at the same time. The relation of these various openings must, of course, be adjusted after the carbureter is installed, so as to furnish the best results with a given engine.

It will perhaps be observed that without any apportioning feature, the amount of air admitted through the auxiliary intake would be in direct relation to the throttle opening through O. To take care of the greater proportionate amount of auxiliary air necessary with the increased engine speeds, an adjustable gate G is provided in the air intake passage. A clearer view of this gate is shown in Fig. 2. The lower edge of this gate G is inclined. Thus the more the valve V is opened the greater the proportion of air, since the valve opens from the left. The gate G may be raised or lowered in its guides through the adjusting screw G_1, allowing for the correct proportioning of the auxiliary air.

Adjustment of Fuel Level

There are several special minor features of the carbureter which are of note. For instance, the adjustment of the level of the fuel in the float chamber may be very simply and correctly made for 1-64-inch increments. The upper end Y of the inlet valve is flattened on two sides, while the lower portion is threaded to fit the float controlling nut to whicb the float lever F_1 is connected. The needle guide Y_1 is broached at its upper end to fit the flattened part of Y, while at its lower end Y_1 is provided with two lugs or keys wbich fit in slots in the carbureter bowl. The thread of the needle is of such a pitch that when the guide Y_1 is turned so that these lugs fit the second set of slots beyond any given position they have either raised or lowered the fuel level by 1-64 inch. The clamping nut around the guide Y_1 prevents Y_1 from turning until the nut has been unscrewed sufficiently to allow the lugs to clear their slots so that accidental alteration cannot take place.

Another feature is the provision made so that the upper and lower halves of the carbureter may be placed in six different positions relative to each other. That is, the holes for the connecting screws in the lower half allow the register of the upper holes in six combinations. This permits the location of the carbureter on either side of the motor and allows for the accommodation of any position of the manifold and of the gasoline connection.

Tbe venturi tube E is provided with spiral inner flanges to assist in the directing of the air rapidly to the nozzle. Another good feature is the placing of a drain plug at R.

The E.C.B. carbureter has been tested rather strenuously of late and is said to have come through with flying colors. In fact, the tests show that with a fixed adjustment it has worked satisfactorily on gasoline, mixtures of gasoline and kerosene, kerosene and lubricating oil, alcohol alone, and alcohol and water. A test of the carbureter was recently made by the Superior Motor Co., Detroit, with one of its stock two-cylinder, two-cycle motors, 3 1-2-inch bore and 4 1-2-inch stroke. A non-stop run lasting for 96 hours was made, the engine driving an 8-kilowatt generator and delivering approximately 9 brake horsepower at the flywheel.

The fuel used in this test was 50 per cent. gasoline .740 specific gravity and 50 per cent. kerosene with specific gravity of .807.

For the 1st 24 hrs. 1,344,770 revolutions were made averaging 934 R.P.M.
For the 2d 24 hrs. 2,292,430 revolutions were made averaging 900 R.P.M.
For the 3d 24 hrs. 1,355,170 revolutions were made averaging 927 R.P.M.
For the 4th 24 hrs. 1,291,580 revolutions were made averaging 900 R.P.M.

The above variations were caused by moving the position of the throttle.

After this run the cylinders and all parts in general were examined. The pistons were free from carbon.

The engine was then re-erected for further tests on different fuels and different grades of the different fuels. Kerosene .807 specific gravity, or 44 degrees Beaumé, was next tried and worked as satisfactorily as the mixture of half kerosene and half gasoline combined. The following mixtures of kerosene and lubricating oil were next used:

	S. G.	Beaumé
7 parts of kerosene to 1 part of lubricating oil........	.815	42.5
13 parts of kerosene to 3 parts of lubricating oil.......	.820	41
3 parts of kerosene to 1 part of lubricating oil........	.825	40.5

The above mixtures held the load as steadily as the mixture of half gasoline and half kerosene did. With the last-mentioned heavy mixtures the exhaust was very smoky and would undoubtedly have fouled the engine in time, but with all of the previous tests as well as the following the exhaust was odorless, showing proper consumption of fuel.

A run with denatured alcohol purchased at a local drug store at 60 cents per gallon followed. The specific gravity of same was .835, or 38.5 Beaumé. This fuel was easily handled by the carbureter and engine and instantly showed an increase of power over the other fuels. It held the electrical load as steadily as any other fuel. The next test made was purely out of curiosity and for experiment:

Alcohol 90 per cent., water 10 per cent., specific gravity..........	.850
Alcohol 85 per cent., water 15 per cent., specific gravity..........	.860
Alcohol 80 per cent., water 20 per cent., specific gravity..........	.975
Alcohol 75 per cent., water 25 per cent., specific gravity..........	.890
Alcohol 70 per cent., water 30 per cent., specific gravity..........	.905
Alcohol 65 per cent., water 35 per cent., specific gravity..........	.920
Alcohol 60 per cent., water 40 per cent., specific gravity..........	.935
Alcohol 50 per cent., water 50 per cent., specific gravity..........	.960

After all of the above tests, a continuous run of 10 hours was made on pure kerosene, after which the cylinders were again removed for examination. The piston heads and all other parts were found to be as clean as when previously examined. The carbureter adjustment was the same throughout the entire tests and experiments. During the above tests no heat whatever was supplied to the carbureter either in the shape of hot water or hot air, the carbureter being made without hot-water jackets. The water used for cooling entered the cylinders cold just as it was pumped from the city supply or under the same working conditions that would occur with a marine engine. The only adjustments made were when the different viscosities of the various fuels demanded, it is said.

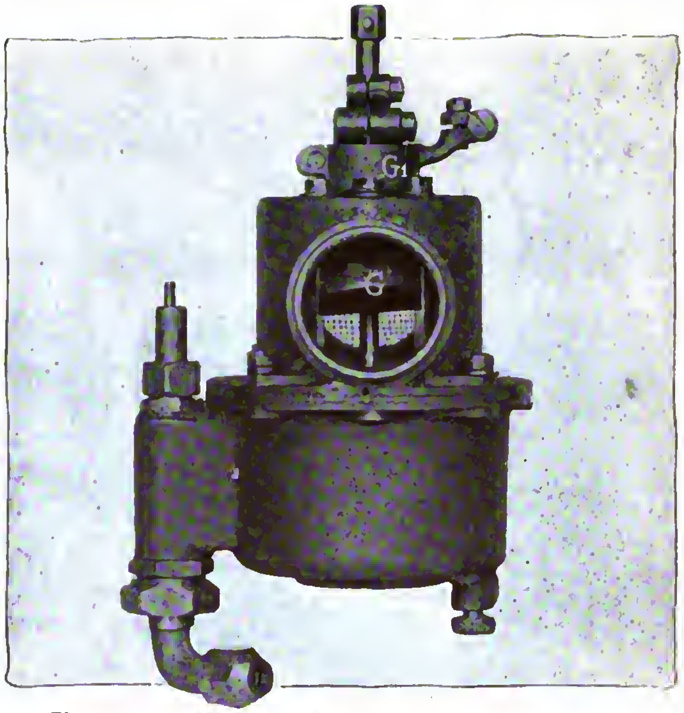

Fig. 2—E. C. B. carbureter, showing auxiliary air intake

Fisher 8-Ampere Generator

With the coming of electric lighting for automobiles, makers of electric apparatus have all striven for utmost efficiency and simplicity of generating units, so that they will be impervious to the shocks and jars to which motor vehicles are subjected.

One of the makers which claims to meet such conditions as those imposed by the automobile is the Fisher Electrical Works, Detroit, Mich., which has brought out the lighting generator shown in Fig. 3. This unit is of the inverted "U" type, which permits the minimum distance between the center of the armature shaft and the base of the generator. In the machine shown, this distance is 1.75 inches, including the non-magnetic baseplate. The generator is designed to be driven at crankshaft speed and comes up to its full rated voltage at about 300 revolutions per minute. It is so designed that the current produced does not exceed 8 amperes at any speed. The machine weighs 24.5 pounds.

The pole pieces and the fields are constructed of drop-forged steel, while the armature shaft, which is carried on ball bearings, is also of steel ground to size. The armature is of the drum wound type, the slots being partially closed by the overhanging tops of the segments. The field coils are wound in the usual way and the commutator is constructed of hard drawn copper segments with mica insulation.

The cut-in switch is mounted directly above the commutator casing, as shown at A, Fig. 3. The function of this device is to close the platinum iridium points at its base, when the generated energy reaches 7 volts, thus sending it to the storage battery. When the generating speed is too low to furnish the minimum voltage, the cut-in automatically disconnects the generator from the battery by opening the contact points. Thus, regulation is obtained automatically and there are no hand-operated switches used with the apparatus, with the exception of that for controlling the current to the various lamps.

The full potential is delivered at about 300 revolutions per minute and at about 400 revolutions per minute it is sending current to the battery at the rate of about 1 ampere. At a speed of 900 revolutions per minute it is delivering 6 amperes, coming up to its maximum of about 8 amperes at about 2,000 revolutions per minute. It is claimed that it is more desirable for a generator not to deliver over 8 amperes at any speed, thus charging the battery continuously at a moderate rate, than it is to race the generator at high speed, flooding the battery with successive charges for short periods; then operating at others without sending any current to the storage battery.

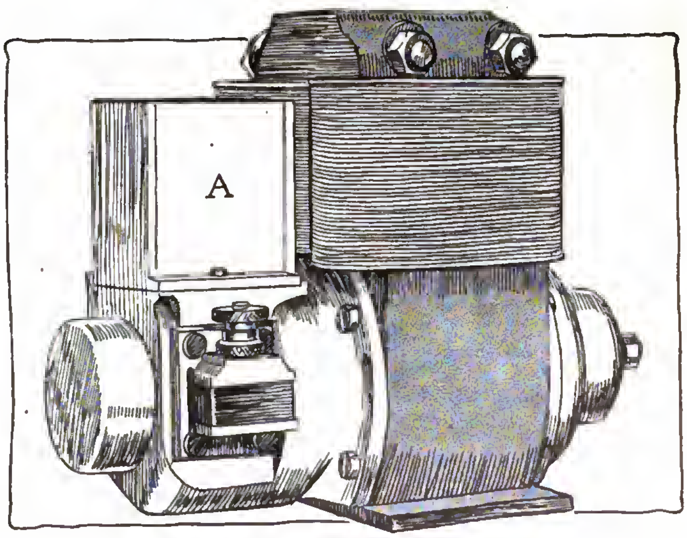

Fig. 3—External view of Fisher generator

Factory Miscellany

Bank of drills and reamers which performs four separate operations on motor castings in one of the plants of the Studebaker Corp.

QUANTITY production means to a large extent keeping things moving. The machine shown in the accompanying illustration helps to do this in the Studebaker plant. The bank of drills and reamers is a special machine which performs four separate and distinct boring and reaming operations on the motor castings. The first operation is the boring of the holes for the bolts which fasten the cylinder block to the crankcase. The second operation is the boring of the push rod guide holes. The third operation is concentric with the second and is the boring for the valve stem guide. The fourth operation is really two in one and consists of reaming both the valve stem guide holes and the push roll guide holes with a two-step reaming tool.

CHANDLER'S New Plant—The Chandler Motor Car Co., Cleveland, O., is making rapid progress in the erection of the new steel and concrete plant near St. Clair avenue. The factory will have more than 50,000 square feet of floor space. The site which has been acquired consists of 6 acres. It is expected to have the factory completed by June 1 at the latest.

Huselton Motor Company Working—The Huselton Motor Co., Butler, Pa., recently organized, will commence work in the near future on the manufacture of motor trucks.

Leases Prest-O-Lite Plant—The Miami Cycle & Mfg. Co., motorcycle manufacturers of Middletown, O., has leased half of the old plant of the Prest-O-Lite Co., in East South street in Indianapolis, Ind.

To Manufacture Electrics—Volney S. Beardsley, president and manager of the California Automobile Co., Los Angeles, Cal., states that plans have been completed to manufacture electric cars on the Coast with a factory located in that city.

Hewitt Rubber's Factory—The Hewitt Rubber Co., Buffalo, N. Y., has filed plans in Buffalo for the construction of a new three-story brick factory at 240 Kensington avenue, to cost $175,000. Work will be started on the new building within the next 3 weeks.

Moves Offices to Factory—The E. B. Van Wagner Mfg. Co., Syracuse, N. Y., has moved its general offices to the factory at Fayettesville, N. Y. Extensive improvements have been made to the factory buildings, increasing office and manufacturing facilities.

New Lord Baltimore Buildings—It is stated that J. H. Powers, Gaither Bldg., Baltimore, Md., has plans in preparation for a group of buildings to be erected for the Lord Baltimore Motor Co., that city. The buildings are to be of steel and concrete. Details are not yet available.

Erects New Deaco Plant—The Detroit Electric Appliance Co., manufacturer of the Deaco electric lighting and starting system, is building a new plant on East Grand boulevard, Detroit. The new structure will be three stories high, of brick and concrete construction, and will cover 25,000 square feet.

New Detroit Factory—The latest recruit in Detroit, Mich., automobile manufacturing army is the Detroit Electric Appliance Co., maker of the Deaco apparatus for lighting, ignition and cranking. The new plant is being erected on East Boulevard and has a floor space of 25,000 square feet. It is to be of brick and concrete and three stories high.

Wallis Tractor Rents Factory—The Wallis Tractor Co., an $800,000 corporation formed in Milwaukee, Wis., will begin the manufacture of traction engines on a large scale in Cleveland, O., and has rented the factory buildings on East Seventy-second street near Clair avenue, formerly occupied by theRoyal automobile company. H. M. Wallis, Sr., and H. M. Wallis, Jr., are the main stockholders in the concern.

Tracy Moves Testing Plant—Joseph Tracy has again moved his testing plant and laboratory, Rutherford, N. J., to larger quarters. At the new plant, six to eight motors may be tested simultaneously, and there are special facilities for making investigations on motor fuels. The equipment includes torsion, reaction, fan, electric, and hydraulic dynamometers, one of the latter having a maximum capacity of 500 horsepower.

Bosch Makes Record—The Bosch Magneto factory at Springfield, Mass., established a record for magneto shipments last month. There were shipped nearly 25,000 magnetos.

Beaver Company's Plant—The Beaver Automobile Co., Portland, Ore., recently incorporated with a capital of $150,000, will erect a plant in Vancouver, B. C., for the manufacture of automobiles.

Ravenna Working on Plant—The Ravenna Auto Truck Co., Ravenna, O., has started work on the erection of its proposed factory. It will be 50 by 150 feet. The company makes automobile trucks.

Erects $100,000 Chicago Plant—The W. J. Hughey & Son Co., Chicago, Ill., will erect a factory at Prairie avenue and Thirty-third street for the manufacture of automobile bodies. The estimated cost is $100,000.

Pope's Production Increasing—Production at the factory of the Pope Mfg. Co., Hartford, Conn., has been at a satisfactory rate and without interruptions such as have occurred in former years. To date the company has built approximately 1,100 automobiles as against 531 in the same period in 1912 season and 820 for all the 12 months to July 31 last.

Davies-Bach to Add—The Davies-Bach Mfg. Co., Cleveland, O., with a plant at Alliance, O., for the manufacture of automobile parts, has increased its capital stock from $300,000 to $600,000, in order to provide additional working capital. The company is about to place a contract for a large addition to its plant to be used for assembly purposes and a pickling department. Still further enlargement will be made in the summer, when the company will set about the construction of a sheet metal and enameling plant.

Peerless Factory Pushed—E. J. Kulas, general manager of sales for the Peerless Motor Car Co., Cleveland, O., has issued a bulletin to the company's dealers and branches throughout the country offering customers whose orders are on the books for delivery before July 1, $100 for delaying the delivery of the car till after that date if the delay amounts to 30 days and $200 if it amounts to 60 days. This unusual situation is due to the fact that the spring rush of orders is pushing the factory in an unprecedented manner in spite of the additional facilities provided at the plant.

New motor-testing plant of Joseph Tracy at Rutherford, N. J.

The Automobile Calendar

Shows, Conventions, Etc.

May 20-21.........Boston, Mass., Convention of Electric Vehicle Makers.
May 20-23.........Baltimore, Md., Spring Meeting, American Society of Mechanical Engineering.
June 2-7...........Racine, Wis., "Made in Racine Exposition," J. I. Case Co.'s foundry.
June 5, 6, 7.......Detroit, Mich., Midsummer Meeting of Society of Automobile Engineers.
October ....Paris, France, Automobile Show, Grand Palais; 10 days.
November ....London, Eng., Annual Automobile Exhibition, Olympia.

Race Meets, Runs, Hill Climbs, Etc.

May 5-8...........Washington, D. C., Motor Truck Reliability, *Washington Post.*
May 14-15.........New York City, Start of 2-Day Hudson and Catskill Scenic Tour.
May 17............Atlanta, Ga., Automobile and Accessory Assn. Annual Hill Climb.
May 29-30.........Chicago, Ill., Inter-Club Reliability to Indianapolis, Ind., Chicago Motor Club vs. Illinois Athletic Club.
May 30............Indianapolis, Ind., 500-Mile Race, Speedway.
June 5............New York City, Orphans' Day Picnic at Glen Island, Orphans' Automobile Day Assn.
June 7.............Philadelphia, Pa., Inter-Club Reliability, Quaker City Motor Club, Automobile Clubs of Delaware County, Philadelphia and Germantown.
June 14..........Cincinnati, O., Hill Climb, Cincinnati Auto Dealers.
June 16, 17, 18....Columbus, O., Reliability Contest, *Ohio State Journal.*
June 19............Chicago, Ill., Algonquin Hill Climb, Chicago Motor Club.
June 25-28.........Chicago, Ill., Non-Motor-Stop Reliability, Chicago to Boston, Chicago Automobile Club.
July 1.............Indianapolis, Ind., Tour of Indiana Automobile Manufacturers' Assn. to the Pacific Coast.
July 1-16..........Winnipeg, Man., Motor Plow Competition, Dr. A. W. Bell, Manager.
July 4.............Taylor, Tex., Track Meeting, Taylor Auto Club.
July 4-5...........Sioux City, S. Dak., Track Meetings, Sioux City Automobile Club and Speedway Assn.
July 5-6...........Tacoma, Wash., Road Race, Montemara Festa Automobile Committee.
July 8-16..........Winnipeg, Man., Midsummer Exhibition, A. C. Emmett, Manager.
July 11............Twin City, Minn., National Reliability Tour, A. A. A.
July 27...........Grand Rapids, Mich., Tour, Grand Rapids Auto Club.
July 27-28.........Tacoma, Wash., Tacoma Road Races.
August 5...........Kansas City, Mo., Sociability and Endurance Run from Kansas City to Colorado Springs, Col., Kansas State Automobile Assn.
Aug. 29-30........Elgin, Ill., Elgin Road Races, Elgin Road Race Assn.
Aug. 30-Sept. 6....Chicago, Ill., Reliability Run, Chicago Motor Club.
Sept. 1............Columbus, O., 200-Mile Track Race, Columbus Auto Club.
Sept. 9............Corona, Cal., Track Race, Corona Auto Assn.
Oct. 4-11..........Chicago, Ill., Around Lake Michigan Run, Chicago Motor Co.
Nov. 24...........Savannah, Ga., Vanderbilt Cup Race, Motor Cups, Holding Company.
Nov. 27...........Savannah, Ga., Grand Prize Race, Automobile Club of America.

Laying the foundations for the new steel and concrete plant of the Chandler Motor Car Co., Cleveland, O.

The Week in the Industry

Engineer Dealer Repairman Garage

An Indian driver on one of the White trucks used in building an oil pipe line from the Midway fields in California to San Pedro

How the pipe lines were distributed along the road

WHITES BEAT 500 MULES—The Auto Delivery Co., San Francisco, Cal., recently undertook a hauling contract in building an oil pipe-line from the Midway oil fields in California to tidewater at San Pedre. Eighteen White motor trucks were used, supplanting 500 mules. A journey of 40 miles through desert sand and other hindrances had to be made. Before great progress could be made it became necessary to build bridges and put on full-blooded Indian drivers to stand the heat. The average time made by the trucks was about 8 miles an hour.

WILBUR ASSISTANT GENERAL MANAGER—L. R. Wilbur has been made assistant general manager of the Empire Automobile Co., Indianapolis, Ind.

GERAGHTY GENERAL MANAGER—F. D. Geraghty has been appointed general manager and president of of the Imperial Motor Tire Co., Washington. D. C., recently incorporated for $100,000. The principal offices will be at 1112 Connecticut Avenue.

TO HAVE ITS OWN BUILDING—The Grafton & Knight Mfg. Co., of Worcester, Mass., has decided to house its motor cars in a building of its own on Franklin street that will be 95 feet by 25 feet, one story in height and take care of a dozen cars.

WILL HANDLE ACCESSORIES—H. P. Thompson, formerly with the Houston, Tex., branch of the Goodrich Co., has accepted a position with the Houston Motor Car Co., Cadillac distributors. Mr. Thompson will have charge of the tire and accessory department.

WADE GENERAL PURCHASING AGENT—F. A. Wade, formerly purchasing agent of the Flanders Motor Co., has been made general purchasing agent of the Maxwell Motor Co., Inc., with headquarters at the executive offices, Woodward avenue and Warren, Detroit, Mich.

TIMES SQUARE COMPANY'S ADDITION—Immediate work will be started on the construction of two additional stories to the rear building of the Times Square Automobile Co., New York City, extending from 56th street to 55th street. When completed there will be over 100,000 square feet of floor space.

INTO NEW QUARTERS—The salesrooms formerly occupied by the R-C-H Co. at 911 Boylston street, Boston, Mass., have been secured by the Michigan Motor Car Co., that was further down town in showrooms that were not so attractive because of their being several feet up in the air. The R-C-H Co. retains a part of the floor space.

ACCESSORY CENTER IN INDIANAPOLIS—Agents for manufacturers of automobile accessories in Indianapolis, Ind., are considering the feasibility of establishing an accessory center for the purpose of decreasing overhead expense. In Indianapolis each agent would have supervision over the business of the company he represents.

WITH ABBOTT-DETROIT—A. L. Bennett has become sales manager for the Abbott-Detroit Co. in New York City.

ADDS VULCANIZING SHOP—The E. S. Youse Co., Reading, Pa., is adding a tire vulcanizing shop to its automobile establishment.

SECURES FISK TIRE AGENCY—Rudolf & West, automobile accessory dealers in Washington, D. C., have secured the Fisk tire agency.

PITCHER COLUMBUS BUGGY MANAGER—L. W. Pitcher has been made manager of the Columbus Buggy Co. branch at Minneapolis, Minn.

NEW FIRESTONE FRISCO HOME—The new home of the Firestone Rubber Co., San Francisco, Cal., was recently opened on upper Van Ness avenue.

PORTLAND ADDS TRUCK—Portland, Ore., has recently added another Federal truck to its string, this being the eighth truck in service of that city.

POLLOCK KISSELKAR MANAGER—The KisselKar sales and service building at Wabash and 26th street, Chicago, Ill., has been put in charge of P. J. Pollock.

GIBNEY'S BOSTON BRANCH—Manager Albert L. Greene of the Gibney Tire & Rubber Co. has opened his salesrooms at 245 Columbus avenue, Boston, Mass.

COLLARD NEW GOODYEAR MANAGER—C. E. Collard has been appointed manager of the motor truck department of the Goodyear Tire & Rubber Co., New York City.

LAND PURCHASED FOR AGENCY—Land was purchased recently for the new home of the Michigan Motor Sales Co., Los Angeles, Cal. It will be completed by July 1.

THORNTON MANAGER—J. M. Thornton has again returned to the Seattle, Wash., field, this time as manager of the McKenna-Marmon Co., selling the Interstate cars.

TAKES MCNAULL TIRE AGENCY—The Rogers Supply & Tire Co., Columbus, O., has taken the central Ohio agency for the McNaull electric tires, manufactured in Akron, O.

BASLE WITH SOWERS TRUCK—A. H. Sowers has secured the services of Charlie Basle, the racing driver, who will assume charge of the assembling plant of the Sowers Motor Truck Co., Boston, Mass.

TRADE CONGRESS IN GENEVA—The Syndicate of Swiss Motor and Cycle Manufacturers and Agents has invited the International Union of European Motor Car Builders to hold a congress in Geneva during 1914.

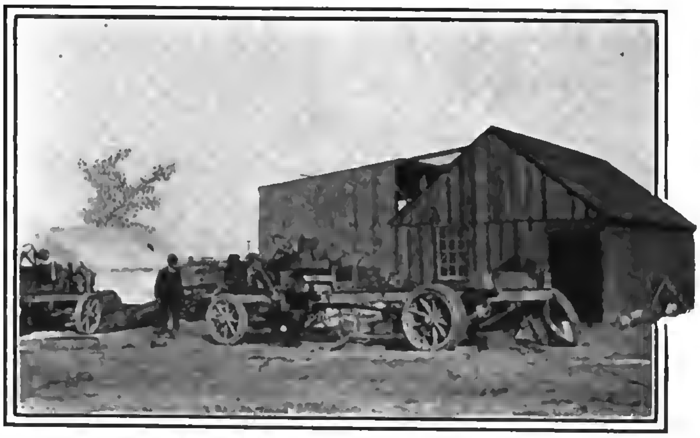
DE DION MOVES—The De Dion Bouton Selling Branch, New York City, announces the removal of its showroom to 1672 Broadway, northeast corner of 52d street. The garage and repair department is on 110 West 54th street

LOCOMOBILE TRUCKS FOR VANCOUVER—Two 5-ton Locomobile trucks have recently been purchased by the city of Vancouver, B. C. The cars will be used as street flushers and each will transport a tank carrying 12,000 gallons of water.

WILSON WITH MARATHON—F. E. Wilson has severed his connections with the Tone Car Corp., Indianapolis, Ind., and joined the sales organization of the Marathon Motor Works, Nashville, Tenn. His headquarters will be in Dallas, Tex.

NEW HARTFORD SALESROOM—Edward S. Clark, Paige-Detroit and Modern representative at Hartford, Conn., has acquired the whole salesroom at 183 Allyn street, one-half of it having been formerly occupied by T. E. Oakes. Richard C. Skinner, state representative of the Shawmut tire and tube department of the Hood Rubber Company, will conduct a tire branch at the same address. Alterations are now in progress.

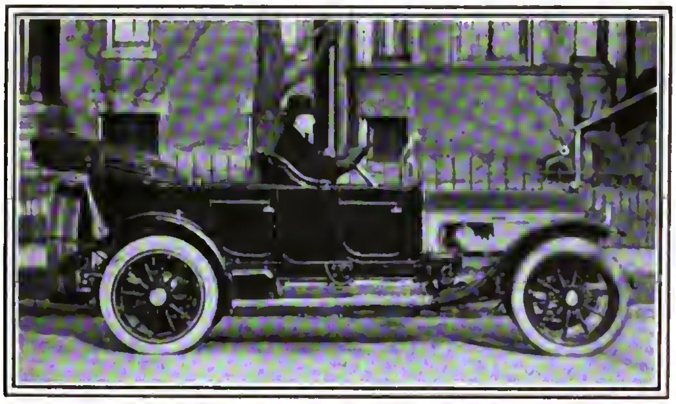
DRAWBACK ON ANNULAR BEARINGS—A ruling has been made by the treasury department at Washington, D. C., that drawback shall be allowed under section 25 of the existing tariff act on motor cars and motor car engines manufactured by the Briggs-Detroiter Co., of Detroit, Mich., with the use of imported annular bearings. The allowance is not to exceed two imported annular bearings to each motor car or engine exported.



Rough-and-ready garage at Lancaster, Cal., for the trucks

How the pipes were carried, ready to drop at the roadside

Hauling sheet metal and supplies through the sand hills. Blankets, food and water were carried with every load



New model Peerless 38-six with touring body

Automobile Incorporations

AUTOMOBILES AND PARTS

BRITTON, OKLA.—Darling Automobile Mfg. Co.; capital, $25,000; to manufacture automobiles. Incorporators: C. P. Stealey, A. W. Hedge, H. O. Crum, G. R. Crawford, S. D. Shintaffer, D. L. Sellers, W. C. Settle, H. S. Emmerson, O. L. Stealey.

BROOKLYN, N. Y.—S. & K. Mfg. Co.; capital, $10,000; to manufacture and deal in motors, engines, etc. Incorporators: Harry Stander, F. J. Hill, Stephen Koetler.

BUFFALO, N. Y.—Selleck & Co.; capital, $40,000; to deal in automobiles. Incorporators: G. K. Selleck, M. L. Selleck, W. M. Selleck.

CHICAGO, ILL.—Falk Sales Co.; capital, $25,000; to deal in automobiles and accessories. Incorporators: L. W. Mack, W. J. Dixon, L. L. Falk.

GALVESTON, TEX.—American Motor Co.; capital, $2,000; to deal in automobiles. Incorporators: John Christensen, Johann Rasmussen, Geston Weigel.

MEMPHIS, TENN.—Michigan Motor Car Co. of Memphis; capital, $5,000; to deal in automobiles. Incorporators: R. Kupferschmidt, C. V. York, Irby Bennett, J. J. Carrigan, H. L. Combs.

MOLINE, ILL.—Borg & Beck Co.; capital, $80,000; to manufacture machinery and motors. Incorporators: O. W. Borg, M. Beck, G. W. Borg.

NEWARK, N. J.—Ingle Motors Co.; capital, $25,000; to manufacture motors, engines, etc. Incorporators: J. E. Ingle, Jr., C. L. Riess, C. M. Maurling.

NEW YORK CITY.—Still's Automobile & Accessories Co.; capital, $10,000; to deal in automobiles and accessories. Incorporators: G. M. Still, G. E. Still, J. H. Still.

NEW YORK CITY.—Tarrytown Motor Car Co.; capital, $250,000; to deal in automobiles. Incorporators: B. J. Knerr, A. M. Levy.

SACRED HEART, MINN.—Sacred Heart Automobile Co.; capital, $10,000; to deal in automobiles. Incorporators: J. H. Sagnes, P. Melaness, Torlief Arestad, W. A. Day, E. O. Dosseth.

SLAYTON, MINN.—Murray County Automobile Co.; capital, $10,000; to deal in automobiles. Incorporators: A. Pelck, F. F. Young, O. L. Young, O. H. Harrington, LeRoy Triplet, W. E. Richardson, Oliver Duchene, Cornelius Casey, Charles Carlson.

SOUTH BOSTON, VA.—Auto Co.; capital, $15,000; to deal in automobiles. Incorporators: J. A. Mebane, Frank Mebane, W. W. Ballou.

UTICA, N. Y.—H. D. Grim Auto Co.; capital, $20,000; to deal in automobiles. Incorporators: C. W. Grim, Fred Crain.

GARAGES AND ACCESSORIES

AKRON, O.—Diamond Rubber Co.; capital, $10,000; to deal in rubber and rubber goods of all kinds including automobile tires. Incorporators: A. H. Marks, O. C. Barber, Guy E. Norwood, A. B. Jones, N. S. Noble.

BROOKLYN, N. Y.—Self-Generating Motor Co.; capital, $250,000; to manufacture machines for generating steam, etc. Incorporators: O. G. Holahausen, R. T. Maul, H. B. Wood.

BUFFALO, N. Y.—Fedders Mfg. Co.; capital, $400,000; to manufacture automobile accessories and supplies. Incorporators: T. Fedders, C. W. Fedders, J. M. Fedders.

CANTON, O.—Canton Tire Saver Co.; capital, $25,000; to manufacture a liquid preparation to be used in automobile tires to prevent and stop punctures and deal in other automobile and motorcycle accessories. Incorporators: J. A. Calhoun, H. H. Calhoun, A. H. Wilson, A. E. Gordon, W. E. Romy.

CHICAGO, ILL.—Costello Seat Co.; capital, $10,000; to manufacture automobile accessories. Incorporators: G. W. Costello, Deward J. Hennessy, W. R. Swissler.

CLEVELAND, O.—Puncturemend Co.; capital, $1,000; to manufacture and deal in articles to be used in connection with automobiles and any part thereof. Incorporators: H. C. Wharfield, M. A. Wharfield, T. L. Felber, Florence Cook, W. B. Wood.

CINCINNATI, O.—Heeb Auto Service Co.; capital, $10,000; to deal in automobile accessories. Incorporators: Charles Estep, J. E. Reese, J. E. Marget, W. W. Weaver, R. E. Anderson.

CINCINNATI, O.—Neeb Auto Service Co.; capital, $10,000; to carry on an automobile service. Incorporators: P. B. Davidson, H. C. Armstrong, J. Trumbull, Victor Heintz, C. M. Neeb.

CLEVELAND, O.—Auto Garage Co.; capital, $5,000; dealing and renting automobiles. Incorporators: J. M. Bucheider, W. M. Dilkes, B. Klikes, G. W. Gumney, Horace Neff.

CLEVELAND, O.—Harris Carbureter Co.; capital, $15,000; to deal in carbureters and other automobile accessories, machinery and appliances. Incorporators: H. C. Cummins, F. B. Fishman, J. W. Camp, L. A. Black, Harry Pott.

HEMPSTEAD, N. Y.—James Street Garage; capital, $5,000; to carry on a garage business. Incorporators: T. A. McWhinney, F. W. Russell.

HARTFORD, CONN.—Automobile Insurance Co. of Hartford; capital, $300,000; to engage in automobile insurance. Incorporators: M. G. Bulkeley, M. B. Brainard, J. S. Rowe, C. H. Remington, H. R. Clough.

MONTREAL, QUE.—Montreal Autobus Co.; capital, $10,000,000; to carry on an automobile bus business. Incorporators: H. S. Holt, U. H. Dandurand, F. L. Wanklyn, D. McDonald, J. S. Norris, Tancrede Bienvenue, D. Lorne McGibbon, Paul Galibert, J. E. Wilder.

NEW YORK CITY.—Gerlelt Auto Spring Wheel Co.; capital, $200,000; to manufacture an automobile spring wheel. Incorporators: August Gerlelt, Martin Vath, Henry Hell.

NEW YORK CITY.—National Spark Plug Co.; capital, $10,000; to deal in automobile supplies, etc. Incorporators: R. L. Cherburg, C. B. Bennett, Agnes Boselman.

NEW YORK CITY.—Universal Liquid Register Co.; capital, $25,000; to manufacture and deal in gasoline gauges, etc. Incorporators: A. D. Dickerson, C. F. Brown, H. M. Moorhead.

PAINESVILLE, O.—Vulcan Mfg. Co.; capital, $200,000; to manufacture automobile accessories.

PITTSFIELD, N. Y.—City Garage and Sales Co.; capital, $50,000; garage business. Incorporators: W. G. Venn, M. H. Ward, H. N. Stackpole.

RICHMOND HILL, MASS.—Richmond Hill Garage & Machine Co.; capital, $8,000; to manufacture machinery, etc. Incorporators: O. H. Ryan, A. F. Ryan, M. E. Tunon.

SYRACUSE, N. Y.—Bendring Mfg. Co.; capital, $50,000; to manufacture piston rings and other engine parts. Incorporators: H. C. Cowles, W. R. Walker, A. L. Jones.

SEDALIA, MO.—Shaffer Motor Co.; capital, $35,000; to manufacture and repair the Shaffer revolving valve internal combustion gas engine and motor machinery. Incorporators: F. K. Shaffer, J. H. Remington, O. S. Gray.

SPRINGFIELD, O.—National Jack & Mfg. Co.; capital, $6,000; to manufacture automobile accessories. Incorporators: G. Wallace, J. L. Glaze, C. Kraft.

SHERIDAN, IND.—Sheridan Motor Bus Co.; capital, $5,000; to operate a bus line from Sheridan to Noblesville. Incorporators: J. W. Ridge, Emma Ridge, Haley Hutchens.

WASHINGTON, D. C.—Imperial Motor Tire Co.; capital, $100,000; to deal in automobile tires.

CHANGES OF NAME AND CAPITAL

CLEVELAND, O.—Davies-Bach Mfg. Co.; capital increase from $300,000 to $600,000.

CLEVELAND, O.—R. H. Allen Motor Sales Co.; change of name to the Velie-Paige Motor Car Co.

ELMWOOD PLACE, O.—Highland Body Co.; capital reduced from $50,000 to $5,000.

SANDUSKY, O.—Suspension Roller Bearings Co.; capital increase from $250,000 to $350,000.

RICHMOND, IND.—George W. Davis Carriage Co.; change of name to the Geo. W. Davis Motor Car Co.

Peerless new model 38-six roadster type

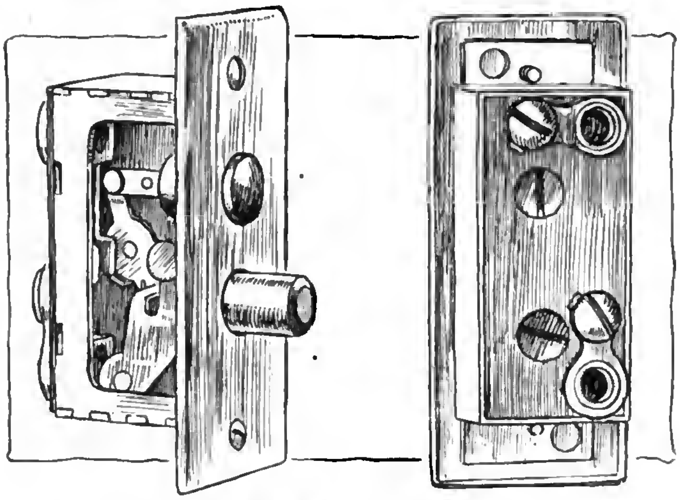

Fig. 1—Hart & Hegeman push switch

A PUSH SWITCH specially constructed for automobile lighting systems, is made by the Hart & Hegeman Mfg. Co., Hartford, Conn. This switch, Fig. 1, is constructed along the same lines as the ordinary house switch, and consists of two push-buttons which bear upon a pivoted lever, so that by depressing one the other button is raised above the plane of the metal face of the switch. The face of one button is finished in white and that of the other in black, and linked to the white button is a short lever which is raised or depressed by raising or depressing the button. If the latter is pressed in, the end of the short lever contacts with a plate inside the back of the switch. This plate is connected to one of the terminals on the back of the switch—which are seen in the illustration to the right—the other terminal is connected to the short lever.

Benson Self-Adjusting Worm Drive

The worm drive, Fg. 2. which is made by the Benson Car Co., Chicago, Ill., is so constructed as to do away with the necessity of adjusting the relation between worm and gear so as to prevent localized wear of the operating members. This end is obtained by the relative arrangement of worm gear as here shown. The point X of the worm is the fulcrum on which the gear works, and being central the wear is equally distributed toward both sides A and B. In order to permit the upper worm, however, to move sideways relatively to the lower gear, the trunnion T on the flange F is used.

Simple Ventilator for Coupe Bodies

A simple and neat ventilator for closed cars which would seem to be very practical is being made by Morrissey's Shop, Chicago, Ill. As shown in Fig. 3, it consists of a vertical pipe or neck B to which a horizontal top plate carrying a flange F is fastened. A cover C fits over the plate, which former is shaped with two holes, one cut into each end. On one of its longer sides, however, the cover does not reach down fully to the plate, but leaves a slot through which air enters if it is turned forward in the direction of the moving car. The device is installed at the roof of the body, the neck projecting into the coupé. As the car moves, the air entering through the slot is led down through B and forced into the interior of the body, supplying the passengers with fresh air.

Fabric Tester for Interlock Liners

The Double-Fabric Tire Co.. Auburn, Ind., tests the fabric used for its inner liners in a hydraulic machine, Fig. 4. The special laminated fabric used for the liners is made from high-grade Egyptian cotton, the threads of which are composed of three times the number ordinarily used, according to the manufacturer, and woven so that all of them are under even tension. The testing machine consists of a hydraulic press, which moves a hammer against the fabric, the blow amounting to 1,500 pounds per square inch. This is approximately the breaking strength of the fabric used for the inner liners.

Liquid Tire Tonic

The Liquid Tire Tonic Co., Kansas City, Mo., is manufacturing a tire tonic to stop punctures. This company claims that it will not only cure punctures instantly, automatically and permanently, but will increase the life of the tire at least 30 per cent. It is a free-flowing liquid or semi-liquid sealing agent of cement, so that upon puncture in a tire the escaping air will force said agent or cement into the aperture or wound, thereby closing or healing the same, preventing the further escape of air confined therein. The liquid is employed as a self-healing agent designed to automatically close or heal a leak. This liquid is injected in the inner tube and by centrifugal force it is evenly distributed around the inner surface of the air-containing tube. It has the consistency of molasses and has the property of remaining fluid when exposed to the air contained in the tube, but will harden upon exposure in small quantities to the outer air. The basis of the tonic is a fiber and when a puncture occurs the suction of air through the hole instantly pulls the fibre into it, automatically plugging the puncture, and as the compound hardens in the hole a permanent cork is formed. This tonic is so made chemically that it has a preservative effect upon the rubber in the tire and prolongs its life. Automobile owners who treat their tires with this solution do not sacrifice any of the advantages of riding on air. Only about a quart of the tonic is needed for each tire. It is poured through the valve and requires only 6 per cent. of the space inside of an inflated tire, the remaining 94 per cent. being air. As soon as the wheel is in motion this fluid forms a thin coating over the walls of the inner tube.

New Scott Side-Curtain Fixtures

The Star Storm Front Co., Troy, O., manufactures the ingenious side curtains which are illustrated in Fig. 5. These consist of celluloid panes secured to pressed sheet metal frames, the

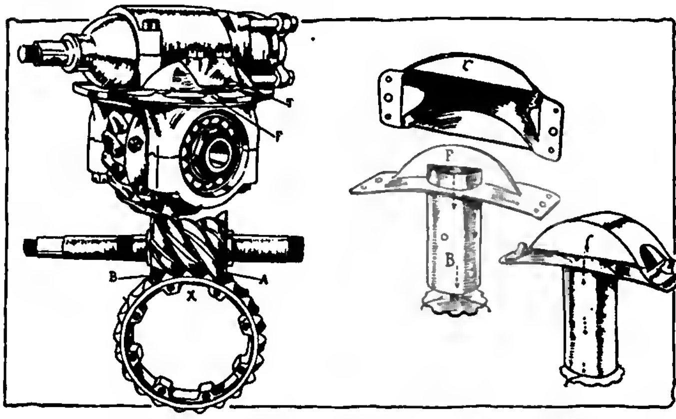

Fig. 2—Benson drive. Fig. 3—Morrissey ventilator

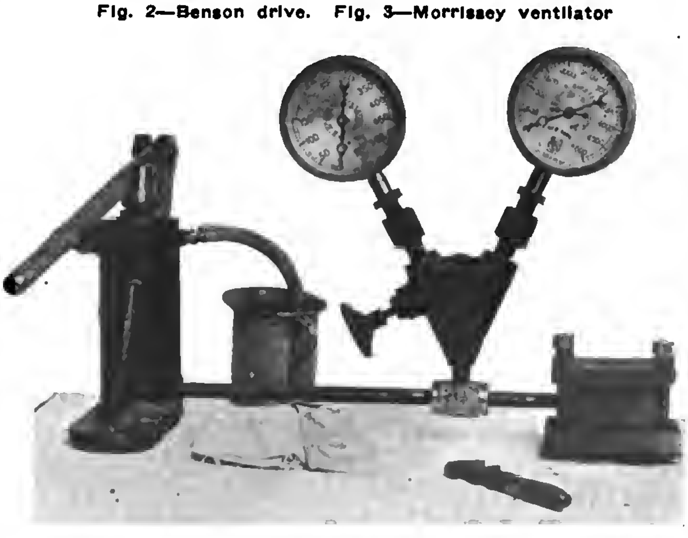

Fig. 4—Innerlock fabric tire strength tester

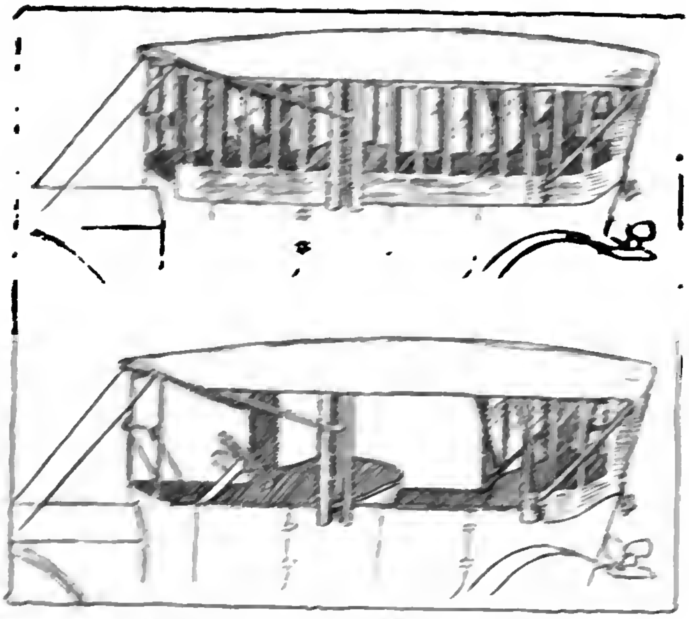

Fig. 5—New Scott automatic side curtains

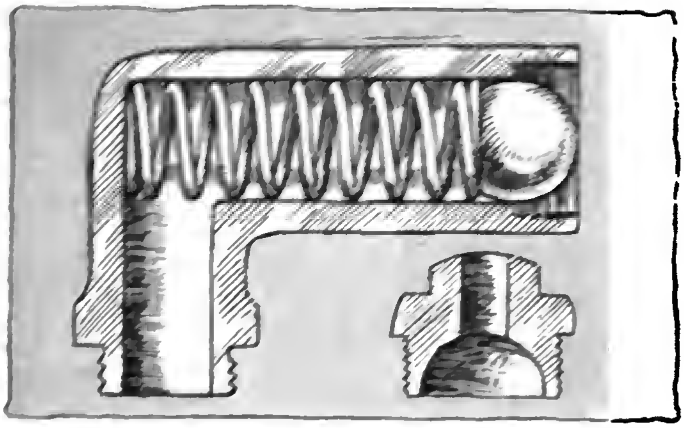

Fig. 6—Automatic gasoline saving device

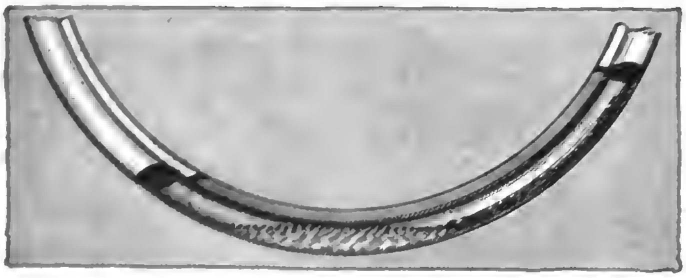

Fig. 7—Duryea self-healing inner tube

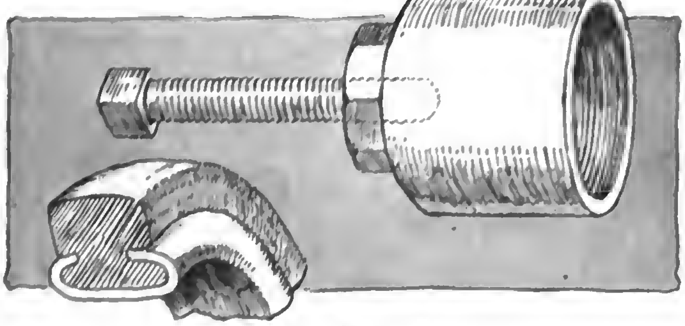

Fig. 8—Divine tire. Fig. 9—Grossman wheel puller

whole curtain being capable of rolling around a rod. How this property of the material is utilized in the construction is seen by referring to the illustration. The curtain on each side consists really of three sections, front, middle and rear. The latter is permanently open, that is, visible, being mounted on the side edge of the rear of the top and to the rear upright of the top frame. The front and middle sections are secured at their relative rear and fore edges to revolving rods or bars encased in a metal housing. These bars are held under spring tension somewhat similar to that applied to window-shade mechanisms. The free edges of front and middle sections are temporarily secured to the windshield frame and the front edge of the rear section. By this construction it is easy to open or close all or any of the six curtain sections promptly and with hardly an effort. The use of the materials above named warrant the longevity and strength of the device.

Automatic Gasoline Saving Device

An auxiliary air intake device is being made by the Automatic Gasoline Saver Co., [illegible] Broadway, New York City. This accessory is shown in Fig. 6. It consists of a brass angle pipe with polished surface, which screws into the intake pipe of the motor with the end shown as the lower in Fig. 6. The horizontal, in the illustration, shank of the pipe contains a coiled spring which presses against a ball fitted into the screw-threaded end of the pipe. Into this end fits also a plug threaded externally, the interior of which is shaped as a hollow sphere with a diametral outlet pipe through the surrounding plug metal. The plug is also made of brass. As it is screwed into the end of the pipe, it presses the ball against the spring, the tension of the latter holding the former tight against the plug and closing the outlet opening tapped into the latter. The operation of the device is automatic, as follows: If the motor is started and run at low speed, the saver is not influenced at all and all its parts remain in the same condition and relation as when the motor is at rest, being those described before. When, however, the motor is speeded up by wide opening of the throttle, the motor developing more suction than can be satisfied by the air passing through the carbureter intake—which is of limited capacity—draws the air out of the pipe and the atmospheric pressure outside of the latter works upon the ball pressing it against the spring, compressing the latter and opening an inlet for auxiliary air. The capacity of this inlet varies with the throttle opening, being maximum with the largest opening of the same. By screwing the plug in more or less, it takes a higher or lower speed to bring the instrument into action and to compress the spring.

Grossman Wheel Puller for Fords

The Emil Grossman Co., 250 West Fifty-fourth Street, New York City, manufactures a wheel puller for Ford cars, Fig. 9. The device consists of a bobtail hubcap through which screws a bolt. To apply the device, the original hubcap is taken off the wheel, and the bobtail cap is screwed on in its place. After it is tightened on the end of the axle, the screw which is threaded through the center of the end plate of the cap is screwed in, thereby pressing upon the end of the axle and forcing the wheel off the axle of the car. The only tool required in the use of this device is an ordinary spanner or wrench for engaging the square head of the screw bolt.

Divine All-Fabric Tire

The Divine Tire Co., Utica, N. Y., makes the tire shown in Fig. 8, which is composed entirely of cotton fabric, containing no rubber or binding material of any nature. The tire consists, in other words, of a number of canvas blocks, held together under the great rim pressure. The threads of the fabric are placed diagonally so that the wear comes on the thread ends. The coefficient of traction of this tire is claimed to be very high and it is said to be non-skidding. While it has not as much resiliency as rubber, it is stated by the manufacturer that the tire is very well capable of absorbing road shocks. One of the principal advantages of this tire is its long life. This is easily explained as due to the high pressure of the fabric in the rim, which evens up all inequalities of the tread after any objects picked up while traveling have been removed.

J. H. Tonneau Shield

The J. H. Tonneau Shield Co., 229 West Forty-sixth Street, New York City, is manufacturing a small windshield which is designed to protect the passenger in a tonneau from the wind. The shield consists of a mahogany frame made in three sections and fitted with glass panes. The sections are joined with the main frame by means of brass joints. The two side sections may be folded over the central section and the latter may be turned from a vertical into a horizontal plane, in which position it may be used as a table. A waterproof curtain depends from the lower edge of the central section.

Vulcan Wins Washington Contest

Carries 1 Ton 1 Mile at a Cost of 1.22 Cents—Great Reliability of Commercial Car Shown by Fact That Every Car Starting Finished Run — Six Out of Eighteen Have Perfect Road Scores

All Six Trucks Finishing with Perfect Score Were Put Through Rigid Technical Test and Came Out With Clean Slate—Result Depended on Fuel Economy

WASHINGTON, D. C., May 9—The announcement of the final results of the 4-day motor truck demonstration conducted by the *Washington Post* was made tonight and the 4-ton Vulcan, which was No. 1 in the contest, was declared the sweepstake winner on the ton-mile basis used in determining the results. This truck carried 1 ton 1 mile at a rate of 1.22 cents. In dollars its figure is, ton-mile cost $.0122. This truck was the only one in its division. Each of the other divisions had its winner, as set forth in the tabulation herewith. Thus, Division 5 K, No. 16, Atterbury, ton-mile cost, 1.72 cents; Division 4 K, No. 18 White, ton-mile cost, 1.40 cents; Division 3 K, No. 5 Wilcox, ton-mile cost, 2.6 cents; Division 2 K, No. 17 White, ton-mile cost, 2.38 cents; Division 1 K, No. 19 International, ton-mile cost, 3.47 cents, and Non-Contesting Division, No. 102 White, ton-mile cost, 2.76 cents. In Division 6 K there was only one contestant, namely, No. 8 Rowe, which had a ton-mile cost of 2.62 cents.

Final Results

			Ton-Mile Cost
SWEEPSTAKES WINNER

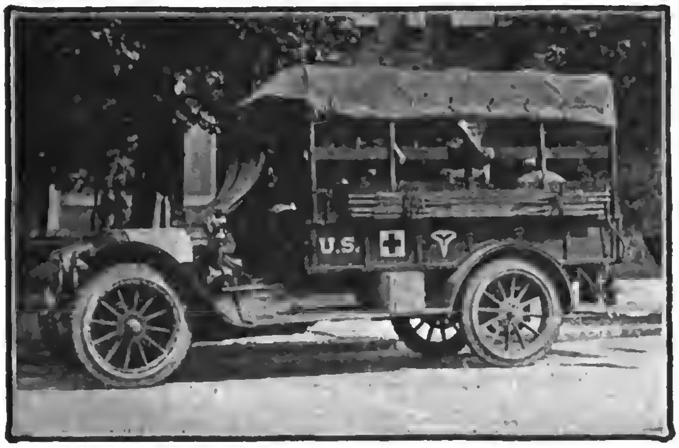
No. 101 Brown	8 Persons	12 M.P.H.	$.0442
No. 101 Four-Wheel-Drive	8 Persons	12 M.P.H.	$.0525

Eighteen contesting trucks of various capacities started on the run and all eighteen finished under their own power. Three non-contesting United States Government ambulances carrying eight passengers each made the complete trip.

The run proved a strenuous test for all of the trucks, which carried their rated load capacities throughout the trip. The run each day was short, but bad roads were encountered in many places and a great many penalties were assessed. Six trucks, however, were able to complete the road circuit with perfect road scores, these being Mais, Wilcox, McIntyre and three Whites. After the road work was over the cars were given outdoor tests of brakes, clutches, gearboxes and a final examination and all of these six took these tests and passed the examination with a clean score. This done, the final result depended upon the amount of gasoline and the number of gallons of oil used. Gasoline was charged for at

Vulcan contestant and two of the Whites, one 3000 and the other a 1500-pound capacity as they appeared on the road



U. S. Army Ambulance which participated in the Washington run

20	Atterbury	3160	1400	1750	4680	1400	3250

a rate of 20 cents a gallon and the oil at 45 cents per gallon. These costs, together with the loads carried, were used as a basis of computing the ton-mile cost. Where points penalty were assessed the costs were also charged.

One of the interesting features of the run was the government representation, the army having three ambulances and a carload of officials, who followed every detail of the trip, noted the performances of the competing vehicles and made measurements on the majority of the contestants.

The trucks showed up remarkably well throughout the contest, and, although thirteen of the eighteen contesting vehicles received road penalties against them, the majority of these penalties were for minor troubles. Many of them were for adjusting carbureters and cleaning out gasoline feed lines. A number of the trucks had to take on water outside of controls and were penalized therefor. Others had to replenish oil between the starting and finishing points of each forenoon or afternoon run. Others received penalties for broken driving chains, leaky radiators, etc.

No. 1 Vulcan, the sweepstake winner, had 217 points against it for road work and 20 points in the technical examination, but it won out on its gasoline and fuel cost. It used but 5 quarts of oil on the run, which was remarkable for so large a truck. This truck had particularly great difficulty on the first day out due to getting stuck on the Middlebrook hill and making it necessary to unload part of its 4 tons, ascend the hill with one-half a load, unload it at the top and return for the second half. This caused heavy time penalties against the truck. During the remainder of the trip it did not have any similar difficulties. On the Middlebrook hill a dozen of the other contestants had to be assisted.

Four-Wheel Drive Ambulance Does Well

The performance of the three White trucks stands out conspicuously. Two of them had clean scores throughout, but the third lost on both road work and in technical examination.

The Four-Wheel-Drive government ambulance was one of the interesting vehicles of the trip. On the first day it demonstrated the superiority of driving through all four wheels when ascending Middlebrook hill. It pulled to the side of the road and moved up past the stalled vehicles without any difficulty. A difficulty befell this truck on the last day's run when the differential between the gearbox and the front axle broke so that the truck had to complete its trip driving through the rear wheels only.

The lowest consumption of gasoline on the trip was made by No. 17 White with 1,500-pound load. It required but 22.125 gallons. The next lowest was No. 19 International, 1,000-pound load, 24.19 gallons, and third was No. 9 Hupmobile, 800 pounds, with 25.125 gallons. Fourth place was taken by No. 102 White ambulance, which consumed 26.5 gallons.

The consumption of oil was estimated by quarts. The lowest consumption was 1.5 quarts by No. 19 International, 1,000 pounds load, the cost being 17 cents. Next came No. 16 Atterbury, 4,000 pounds, 2 quarts, cost 23 cents. No. 14 Atterbury was third, with an oil cost of 34 cents. The highest oil cost of the trip was No. 20 Atterbury, 1,500 pounds, using 18 quarts at a cost of $2.03. The winning Vulcan used 5 quarts, its cost for oil being 56 cents. The amount of gasoline and oil used and the cost of each are given in the general tabulation.

During the test or demonstration every precaution was taken to prevent tampering with the vehicles. An observer rode on each truck and he did not leave it from the time it was checked out in the morning until it reached the noon control, where it was kept under watch by the officials. The same program was followed during the afternoon runs. Each night the cars were parked in a roped-off space and police watched them. The gasoline and oil were carefully checked at each filling, an official watching the measuring. At the end of the run the gasoline and oil measurements were made to correspond with those at the start of the run so that the utmost accuracy was obtained.

Upper: One thousand pound International motor truck
Lower: One ton Wilcox car entered by the Columbia Coal and Brick Co., which made a good showing

Interest Aroused Along the Route

Throughout the run much interest was shown in every town and city passed through and also along the country roads. The parking space at noon and night was crowded outside the ropes with business men who wanted to see the trucks and who talked business with the representatives in not a few cases. The only way in which the run might have been improved so far as making it a greater merchandising proposition is concerned would have been to have spent 1 day in Harrisburg, Pa., where the contestants could have been witnessed in their all-day work by the citizens and business men.

The trucks carried throughout the run their full rated capacity. The majority of the loads were bags of gravel, but a few carried merchandise consisting of barrels or boxes. The speeds

Lauth-Juergens, Autocar, Atterbury and Hupmobile entrants as seen along the line of the route

NOTE.—Under columns for each of the first four days are the penalty assessed for day with a total road penalties in the following column. Br.—Penalties for brake test. Cl.—Penalties for clutch test. Tr.—Penalties for transmission test. Tech.—Penalties imposed in technical examination.

The Mais truck was one of the heavier contestants and went through the run without penalization

The Little Giant truck was penalized 12 points on the road the first day, but went through with that total

The Witt-Will truck was entered by the only builder of motor trucks in Washington, D. C.

The trucks followed each other closely into the checking-in stations, at which points there was always a crowd of spectators

averaged were varied according to the loads carried and were as follows: 1,500 pounds and under, 12 miles per hour; 1,501 to 2,000 pounds, 11 miles per hour; 2,001 to 5,000 pounds, 10 miles per hour; 5,001 to 8,000 pounds, 9 miles per hour. These speeds were too slow for average country touring as the trucks were invariably well ahead of schedule.

The route was divided into eight divisions, one for each forenoon and one for each afternoon. These were as follows:

Monday, May 5: forenoon, Washington to Frederick, Md., 43 miles; afternoon, Frederick to Hagerstown, 25.9 miles.

Tuesday, May 6: forenoon, Hagerstown, Md., to Shippensburg, Pa., 32 miles; afternoon, Shippensburg to Harrisburg, 38.7 miles.

Wednesday, May 7: forenoon, Harrisburg to Columbia, 31.5 miles; afternoon, Columbia to Hanover, 33.8 miles.

Thursday, May 8: forenoon, Hanover to Baltimore, Md., 43 miles; afternoon, Baltimore to Washington, 40.8 miles.

In determining the winner the following factors were considered: Number of gallons of gasoline at 20 cents per gallon; number of gallons of oil at 45 cents per gallon; penalties on road for doing work on car or being late at controls, 10 points, penalty being equivalent to 1 cent; an outdoor test at the end of the run of brakes, clutch and gearset; and a technical inspection at the end of the run for broken parts, all penalties in this being on a basis of 1 cent for every 10 points. In arriving at the final result the grand total of cost from these various sources was obtained. The ton-miles work done by each truck during the run was computed by multiplying the total mileage 288.7 by the rated load of the truck in tons. This product was divided into the total cost. The results show that the winner carried 1 ton 1 mile at 1.22 cents cost. In the tabulation the cost is given in dollars.

Gasoline Measured at 20 Cents a Gallon

Considerable criticism was heard relative to the method of calculating total cost in that the gasoline and oil consumed were in too great proportion to the cost assessed for work done on latest in arrival in control. To explain: A gallon of gasoline amounted to 20 cents in the final calculation. Two hundred points penalty at the rate of 1 cent per point equaled the same cost as a gallon of fuel. Thus a car could be 200 minutes late and this penalty would amount to but 20 cents or the same as a gallon of fuel. A truck being 3 hours late on schedule should have a greater cost debited against it than this. In other words the real winner was determined on a fuel economy basis rather than on a reliability basis. The final result showed six cars to make perfect scores on the road; perfect scores in the brake, clutch and transmission test and perfect scores in the technical examination. Yet none of these six was adjudged the sweepstake winner and, in fact, several of them were not winners in their own divisions because of the amount of fuel they consumed.

The work of the Vulcan, the sweepstake winner, was conspicuous from start to finish, because it was the largest capacity truck in the contest, carrying a useful load of 4 tons, the next largest truck to it being one with a capacity of 2.5 tons. The results would tend to show that there was a satisfactory ratio between the motor size and the load carried in this truck.

The history of the Vulcan throughout the run shows that it suffered penalties each day on the road. On the first day, due to an accident of some rope getting entangled with the driving chain on one side the chain was broken and a 100-point penalty assessed. The truck was also 29 minutes late because of its trouble on Middlebrook hill. On the second day the fan belt bracket loosened and the fan blades cut into the radiator, penalty being 31 points. On the third day there was more fan bracket and radiator trouble, resulting in an assessment of 13 points. On the fourth day there were more similar troubles and 15 points penalty annexed. In the final examination 20 points more were added for the leaky radiator.

The greatest competition of the demonstration occurred in Division 4K with trucks of loading capacity from 2,001 to 3,000 pounds. There were six contestants, namely, White, McIntyre, Autocar, Atterbury, Mais and Witt-Will. All had 1.5-ton capacity except the Witt-Will, which is 1.25 ton. The White proved the winner and its ton-mileage cost in the entire classification of the run was next to the Vulcan. Its figure was 1.4 cents per ton-mile. It had a perfect road and technical test. There were other close contests in this trial as McIntyre, Autocar and Atterbury were very close. The final ton-mile figures showed how close was the fight. Here are the figures; McIntyre cost 1.81 cents; Autocar ton-mile cost, 1.83 cents; and Atterbury ton-mile cost 1.85 cents.

The contest for the Divisional prize in Division 3K, 1,501 to 2,000 pounds was equally close, but the Wilcox proved winner. The ton-mile figures are: Wilcox, 2.6 cents; Atterbury, 2.70 cents; and Little Giant, 2.77 cents. The ton-mile cost of this class is considerably higher than that for the 4K Division or 2,001 to 3,000-pound trucks. No. 5 Wilcox, winner of this division, had a clean road and technical score. It used $6 worth of gasoline and $1.52 worth of oil at a total cost of $7.52. The cost of the Atterbury was $7.81 and the Little Giant $8.

In the 1,001 to 1,500-pound trucks, of which there were three contesting, the ton-mile cost was less than in the 1,501-2,000 division, the figure being 2.38 cents for the winning White. Atterbury, finishing second, had a cost of 2.79 cents per ton-mile and the Atterbury finishing third was much higher.

The winning International in the class of 1,000 pounds and under had a clean road and technical score and the total cost of gasoline and oil for the 288.7 miles was $5.01. The Hupmobile, the other contestant in this division, would have had a clean road and technical score had it not been for a gasoline leak when 11 miles out of control on the third day which caused the penalty of 8 points being imposed.

Atterbury Wins 3,000-Pound Class Contest

There were only two contestants in the class 3,001 to 4,000 pounds, both being 2-ton trucks. The winning Atterbury had a ton-mile cost of 1.72 cents per mile. This car received road and technical penalties. The first day out it took on water; the second day its score was clean and the third day clean, fourth day water and in the technical examination it received 1 point for a water leak. The Lauth-Juergens was second in this division. It had a clean score on the first 2 days; had to take oil on the third and had engine bearing trouble on the fourth day. In the technical examination it received 1 point penalty for the end, being off the shutter-valve operating rod.

Of trucks of 4,001-5,000 pound capacity the Rowe was the only contestant. Its ton-mileage figure was 2.62 cents. On the road it had to repair the fan belt the first day; had trouble with the gasoline line the second; had trouble with the gasoline line the third day and received penalties the fourth day. In the technical examination it was assessed 8 points.

The following tire report was issued by the Technical Committee at the completion of the run of 288.7 miles. Some of the tires were abnormally cut for so short a run. There was one case of a tire blowing out during the first half day of the trip. There was one example of block tires which were practically used up from the distance. The following are the reports as issued:

No. 1 Vulcan, gross load, 15,370 pounds, Goodrich demountables, front 36 by 5, rears 36 by 5 dual. "Inside left rear cut badly in one place, slight cuts in others. Tires stood up well owing to the overload and speed."

No. 2 Mais, gross load, 9,050 pounds, Polack, fronts 36 by 3.5, rears 37 by 5.5. "Right rear slightly cut on the inside on account of sharp obstacle. All others in fine shape."

No. 3 Little Giant, gross load, 5,200 pounds, Goodrich wireless pressed on, fronts 36 by 3.5, rears 40 by 4. "A few slight cuts on the right rear inside. Others slightly cut."

No. 4 Witt-Will, gross load, 6,685 pounds, Firestone side wire, fronts 36 by 2, rears 36 by 2.5. "Right rear a few slight cuts. Right front slightly worn on outside edge."

(*Continued on page* 1038)

The U. S. Army vehicles made good showing in the run under the close inspection of government officers

McIntyre 3,000-pound truck escaped penalization on the road for the entire 4 days and also in the technical test

Atterbury No. 16 and Atterbury No. 13 made the best records of the Atterbury team of four

Some of the roads through which the contestants had to work their way were not of hard surface

The new Automobile Chamber of Commerce. From left to right the members are: Standing—L. H. Kittredge, H. H. Rice, W. C. White, H. O. Smith, A. L. Pope, W. C. Leland, Alvan Macauley, S. A. Miles, J. S. Marvin, H. A. Bonnell. Sitting—A. L. Prindle, W. E. Metzger, Charles Clifton, George Pope, C. C. Hanch

N. A. A. M. Now Formally Dissolved

Indianapolis Company Announces Cyclecar—Will Be Ready in May—Fletcher Sells to Roebling

NEW YORK CITY, May 13—The Automobile Chamber of Commerce was incorporated on March 18 by the fourteen who had comprised the executive committee of the N. A. A. M. and C. C. Hanch, the only director of the Board of Trade who was not also a member of the executive committee of the N. A. A. M.

The N. A. A. M. was formally dissolved at a meeting held in Hartford, Conn., last week, as the law of that state, under which the N. A. A. M was incorporated, demands a two-third vote of the membership in case of dissolution The meeting was held at the offices of the Pope Mfg. Co. and the vote was unanimous.

All of the departments of the old associations will be continued under the same management. S. A. Miles, for 10 years general manager of the N. A. A. M., retains that position with the new organization with H. A. Bonnell as assistant general manager. The traffic department remains in charge of J. S. Marvin and the commercial vehicle work in charge of H. W. Perry, to whose department will probably be added a bureau of publicity, with particular reference to the interests of good roads.

The officers of the Chamber of Commerce are:

Charles Clifton, president; Wilfred C. Leland, vice-president; Hugh Chalmers, vice-president, in charge of the gasoline vehicle department; W. T. White, vice-president, in charge of the commercial vehhicle committee; H. H. Rice, vice-president, in charge of the electric vehicle department; George Pope, treasurer; R. D. Chapin, secretary.

The committees so far appointed are as follows:

Patents Committee—C. C. Hanch, W. H. Van Dervoort, L. H. Kittredge, Alvin Macaulay and L. E. Latta.

Show Committee—George Pope, H. C. Smith and W. C. Leland.

Traffic Committee—A. L. Pope, W. E. Metzger and H. H. Rice.

Legislative Committee—J. N. Gunn, G. H. Stilwell and J. I. Farley.

The next meeting of the Board of Directors will be held at the association's offices on Wednesday, June 4.

Indianapolis Cyclecar Out Soon

INDIANAPOLIS, IND., May 12—Local capitalists and motor car men are behind the Economy-car Co. which is being organized to manufacture cyclecars. Details of the company and the names of the men behind it will not be made public for several days. A sample car is being built and will be exhibited the week of the 500-mile race to be held at the Indianapolis Motor Speedway, May 30. It is probable the company will enter a car in the Indiana to the Pacific tour which starts from Indianapolis, July 1.

The car to be built will have a two-cylinder, 8-10 horsepower, air-cooled motor, a wheelbase of 106 inches and a tread of 36 inches. Wire wheels will be employed and two models will be built, one a tandem.

Flechter Sells Out to Roebling

NEW YORK CITY, May 12—The manufacturers of the Flechter carbureter, L. V. Flechter & Co., have assigned their business and the entire manufacturing and selling rights of the above-named carbureter to the Trenton Brass & Machine Co., of Trenton, N. J. The latter concern is under the control of C. G.

Automobile Securities Quotations

Trading this week was limited and stock prices fluctuated, the quotations at the closing of the week being given below. Rubber Goods was almost the only issue which gained.

Packard Motor Will Run for 300 Hours

Roebling and F. W. Roebling and employs 200 men; the manufacturing equipment of the Flechter concern will immediately be shipped to Trenton, where manufacturing will be continued. There will be a New York sales and distributing branch, with L. V. Flechter as general sales manager. At present the Trenton company manufactures plumber and hardware articles, but the intention is to gradually apply all the manufacturing force to the making of carbureters.

Paige-Detroit Builds Huge Addition

DETROIT, May 10—The Paige Motor Car Company has completed the plans for the erection of new buildings which will have an aggregate area of 225,000 square feet and will be large enough to house the entire organization, both manufacturing department and executive offices. The new plant will be situated on McKinstry street, between Fort street and the tracks of the Wabash and Pere Marquette railroads, on a plot of ground 900 feet in length by 170 feet in width.

Location in proximity to the railroads will afford ideal shipping facilities. The architect is the John Scott Co., who has planned a most modern factory in every particular. Ground is to be broken at once for this latest of Detroit's factories. The buildings will be in the shape of an H and they will be of fireproof reinforced concrete construction, having a complete sprinkling system. The wall surface of the plant will be practically entirely of glass, the front, facing the west, being of ribbed glass to lessen the sun's glare, while the east side will be of plain glass.

The main building will be 406 feet long by 60 feet wide and three stories in height, giving a total working space of 107,000 square feet, or nearly 2.5 acres.

It is stated by H. M. Jewett, head of the Paige concern, that the imperative need for a new plant is evidenced by the fact that the company is now 22 weeks behind with its orders although working to utmost capacity with existing facilities. It is planned to make the first year's output at the new factory 15,000 machines, while during the year following 25,000 cars are to be made, it is said.

The new plant will provide facilities for the manufacture of more of the parts of the Paige-Detroit cars than has heretofore been possible. Motors and transmissions will continue to be made under the plant's supervision.

Market Changes of the Week

Few changes occurred this week in the markets and those which did take place were immaterial with the exception of tin which was affected by a slump of $.73, due to the lower London cables which put somewhat of a damper on speculative operations. The lack of disposition to trade on the part of operators, together with the dull consuming demand, presented a rather inactive market. Prices receded from $50.63 on Wednesday to $49.90 on Tuesday. The lead market is dull. Buying is very light, with prices somewhat easier. Lead on call at the Metal Exchange $4.35 was bid and $4.40 was asked for all deliveries. Both coppers experienced slight raises in prices, electrolytic copper, $00 3-4, and Lake, $.00 1-8. Antimony rose $.00 1-8 on Monday. Cottonseed oil was very dull, prices fluctuating, but to no great degree, remaining around $6.90 and $6.91 a barrel. A lack of demand seems to be the cause.

Change of Spark Plugs and Two Adjustments on One Tappet Only Attention Given to the Motor Adjustment

NEW YORK, May 14—At 10:43 a. m. today the Packard Motor on test had finished 10.5 days of continuous running. In this time the car would have covered about 1350 miles at a rate of 37 miles an hour against a resistance equivalent to a grade of 6.5 per cent.

NEW YORK, May 13, 7 P. M.—The Packard motor on test at the A. C. A. laboratory in this city had run 236 hours at 6:43 this evening. It passed the 200-hour mark on its continuous run at 6:43 a. m. Monday. Running at 1,200 revolutions per minute steadily the motor would have pulled the Packard 38 car 7,492 miles in 200 hours. The fuel consumption averages just above 100 gallons per day, and at this figure would carry the car at a rate of 9 miles to the gallon. The only adjustments made have been the substitution of two new spark-plugs and two adjustments of the exhaust valve tappet on the No. 1 cylinder. A valve cover was also tightened during the run.

The test will be continued for 300 hours, ending at 10:43 a. m. Friday. During this time the horsepower is not allowed to drop below 70 per cent. of the maximum of 45. No important mishaps have occurred, a slight breakage of the gasoline line which did not damage being the nearest approached. The motor has been averaging in the neighborhood of 35 horsepower since shortly after the beginning of the run.

NEW YORK, May 14, 9 A. M.—The adjustment of the exhaust valve tappet on No. 1 cylinder at the 147th and again at the 152d hour of the test has aroused criticism in that it is construed as a violation of rule 5 under which the tests are being made. The part of this rule in question is "No adjustments of the motor or its accessories, which directly affect the quantities being measured, will be permitted after the first official test run has been started, except as provided in rule ...." The view expressed by the critics is that adjusting the tappets is an adjustment which would affect the power, which is one of the quantities being measured in the test. Professor Hutton who has charge of the A. C. A. laboratory and Herbert Chase, laboratory engineer, held a conference on the subject yesterday and decided that under rule No. 5, as quoted, the adjustment of the tappet was permissible.

S. A. E. Getting Ready for Detroit

NEW YORK CITY, May 13—The entertainment committee of the Metropolitan Section of the S. A. E. held a meeting yesterday to confer on the welcome and the details of the entertainments to be extended to the British engineers who will arrive in town on May 26, to leave for Detroit two days later.

Ideal Changes Name to Stutz

INDIANAPOLIS, IND., May 12—Announcement is made that the name of the Ideal Motor Car Co., maker of the Stutz car, has been changed to the Stutz Motor Car Co.

Batavia Annual Meeting Held

BATAVIA, N. Y., May 14.—The stockholders of the Batavia Rubber Co. held their annual meeting here yesterday, at which Vice-President A. W. Caney was elected president for the ensuing year, and Geo. E. Perrin vice-president. The stockholders voted that the company proceed legally against any competitors infringing on any of the rights of the Batavia concern and that the plant of the company be extended during next year. The present capacity of the factory is from 125 to 150 tires a day.

CHICAGO, May 13.—Three garage fires, all taking place within 30 hours on the south side of the city and destroying 132 cars at an estimated loss of $420,000 has resulted in an investigation by the fire attorney's office.

Texas Discourages Clubs

Motor Spirits Patent Right Disputed—Standard Oil Defends It

AUSTIN, TEX., May 10—The State Supreme Court has been called upon to decide the question of whether automobile clubs and kindred organizations may legally be incorporated in Texas. Acting on an opinion given from the attorney general's department that such organizations could not be chartered under the statute granting charters to bicycle clubs and such other innocent sports, Secretary of State John L. Wortham has refused to grant a charter to the Dallas Automobile Club Building Association of Dallas. This latter organization has filed a mandamus petition in the supreme court to compel Mr. Wortham to grant it a charter.

Motor Spirits Patent Questioned

CHICAGO, ILL., May 12—An article appearing in the April issue of one of the oil trade journals under the heading "Is Standard Using Old-Time Process?" questions the priority of the Burton patents for the manufacture of the Standard Oil Co.'s new motor fuel called Stanolind Motor Spirits. It seems that as early as 1890 Sir Boverton Redwood and James Dewar, both of England, patented in the United States a process for the production of light oils by pressure distillation. The Dewar-Redwood patent was obtained at a time when burning oil was the chief product wanted and gasoline practically was thrown away. The article referred to expresses the opinion that the United States patent granted to W. M. Burton for manufacturing gasoline and asphalt from fuel oil presents nothing of patentable novelty over the work of Sir Boverton Redwood and the Dewar-Redwood patent.

It is claimed by the Standard Oil Co. of Indiana that its patent attorneys, who prepared and prosecuted the applications for the Burton patents, fully acquainted themselves before filing them, with the prior art including the Dewar-Redwood patent. It is a significant fact that the examiners in the Patent Office, as shown by the records of the Burton applications, cited and fully considered that patent with reference to them, but found nothing in it anticipatory of the claims made by Burton.

One of the chief differences between the processes as outlined in the Dewar-Redwood patent and that of the Burton patent is, as pointed out by Burton, that in the former, carbonic acid gas. etc., was introduced to produce the pressure for the pressure distillation, whereas in the Burton process such means of pressure production is not made use of. Another point made is that the earlier patent did not consider the production of gasoline as it was not of value, whereas the gasoline substitute is the chief object of Burton's process.

The Standard Oil Co. of Indiana, owns and attaches great value to the Burton patents, and says it will undertake to maintain its rights under them against any infringements.

Municipal Repair Trucks Immune

MILWAUKEE, WIS., May 13—That repair trucks belonging to the fire and police departments have the same privileges on the streets as fire-fighting apparatus or police patrols, was the decision of Judge Halsey in the Circuit Court at Milwaukee in dismissing the damage suit of Rudolph Engel against the city of Milwaukee. Engel was struck by a fire and police alarm system truck as he was boarding a street car and sued for $5,000. The city demurred and Judge Halsey sustained it, saying that the city cannot be held liable for an accident occasioned by a police and fire alarm truck any more than by an accident caused by the fire department.

Fletcher Carbureter No Infringer

CHICAGO, ILL., May 10—The Flechter carbureter, made by L. V. Flechter & Co., of New York City, is no infringement of the Perkins patent No. 731,218, owned by the Stromberg Motor Devices Co. This is the decision rendered by Judge Sanborn in the United States District Court, Northern District of Illinois; the opinion is founded on the statement that the claims are vaguely formulated, that the Perkins carbureter never influenced automobile carbureter design.

No Decision on Victor vs. Mechanics

BUFFALO, N. Y., May 14—*Special Telegram*—Justice Marcus of this city has reserved decision on the motion for change of venue in the case of the Victor Motor Truck Co. vs. the Mechanics Bank of New York City and W. F. McGill. These parties were sued by the truck company to recover the face value of notes totalling $250. It is desired to shift the place of trial from Erie to New York county.

Motor Wagon Co. a Bankrupt

DETROIT, MICH., May 13.—The Motor Wagon Co. filed a voluntary petition in bankruptcy in the United States District Court here on May 12. The Union Trust Co. of this city was made the trustee by Lee E. Joslyn, referee in bankruptcy.

It is probable that this company will be made receiver for the Motor Wagon concern by the court. Nothing definite has yet been decided as to whether the business will be continued under the receivership or sold out immediately.

The concern's filed statement shows its liabilities to be $131,196.83, while the assets are set at $85,339.75. This includes stock on hand, machinery, buildings and other equipment.

Railroads Demand 5 Per Cent Increase

WASHINGTON, D. C., May 12—While members of the Interstate Commerce Commission do not know anything, officially, about the proposed railroads freight rate increase, it is being consistently rumored that the railroads of the East will demand an increase of 5 per cent. of the present freight rates. At present first-class freight between New York and Chicago is 75 cents per 100 pounds, and if a 5 per cent. increase were granted by the Commission, this rate would be increased to 75¼ cents.

A. A. A. to Test Double Taxation

NEW YORK CITY, May 13—The Supreme Court of the United States will be asked to pass upon the constitutionality of the double taxation of automobiles as enforced by many states. It was as a result of the growing inclination on the part of many states to increase the registration tax, while at the same time taxing automobiles as personal property, and thus compelling motorists to pay an unjust proportion of roads construction and maintenance money, that this action was taken at the Baltimore meeting of the executive board of the A. A. A.

From time to time there have accumulated protests from automobilists in various parts of the country against holding them mainly responsible because a greater use of the highways has made necessary improved construction and systematic maintenance.

The double taxation question is the main issue at stake. By double taxation is meant where the motorist pays an annual registration on his car and also a personal property tax. There are at present forty-eight states in the Union and of this number there are but five in which the personal property tax has been set aside and only the annual car registration tax imposed. These states are: New York, Pennsylvania, Iowa, Alabama and Idaho. This means that in practically all of the other forty-three states, and nearly all of them have state laws governing registration, the motorist is discriminated against and pays double taxation on his car, the registration fee and also the personal property tax.

The case which will be carried to the highest court in the land has been adversely passed upon by the New Jersey courts, and it involves both the question of double taxation and discrimination against one class of road users. The subject occupied the thorough attention of the Baltimore meeting, held last week, which had representatives from 10 states, with President Laurens Enos presiding and Ex-Presidents Robert P. Hooper, of Pennsylvania, and L. R. Speare, of Massachusetts, included in the board members present.

The New Brunswick Automobile Association of St. John, N. B., asked the executive board if it would be eligible for membership. A favorable reply has been sent to the Canadian body, and it will undoubtedly result in the growing interchange of visitors across the border.

Aldermen Graft Held Up Taxi Ordinance

NEW YORK CITY, May 12—The Mason-Seaman, as well as the Yellow Taxicab Company, have forwarded to Assistant District Attorney Du Vivier evidence to the extent that many members of the New York Board of Aldermen have been using taxicabs for a long time without paying for them. The Grand Jury is now investigating the situation.

Maxwell Indiana Receiver Paid

INDIANAPOLIS, IND., May 12—After hearing several witnesses and taking the matter under advisement for several days, Judge Joseph Collier of the Superior Court has allowed a fee of $7,500 to Frank E. Smith. The allowance is for Smith's services as ancillary receiver in Indiana for the United States Motor Co.

Western Crops in Promising Condition

MINNEAPOLIS, MINN., May 10—Spring wheat seeding is fully completed in the lower half of the wheat belt and 80 per cent. in the upper. Reports coming in from the Soo line are also very favorable.

The secretary of the Oklahoma Grain Dealers' Association has estimated the state's wheat crop at 30,000,000 bushels. Ohio crops are being placed at 35,000,000 bushels.

Illinois State Aid Sought

Governor Urges Convict Labor—To Number All French Roads

SPRINGFIELD, ILL., May 13—*Special Telegram*—At the meeting of the Illinois State Highway Improvement Association held at Hotel Leland in this city today, Governor Dunne announced that he is strongly in favor of employing convict labor on honor system in building state roads. Up to the present convict labor in Illinois has to an extent, been used indirectly in road construction in that the convicts at Joliet have been used in preparing stone for road purposes which has been sold at the lowest possible rate for construction purposes. The governor tonight held a reception which marked the closing of the annual meeting of this association, which, although little more than a year old, has secured more for good roads in the State of Illinois than any other movement.

The main object of the meeting here today was to urge upon the Legislature the necessity of passing the Tice Good Roads bill, which provides for state aid in road building, the state to furnish one-half and the county the remainder. The state, under the law, will supervise construction and maintenance of the roads. The bill also provides for the use of motor car registration fees for road building.

This bill has been endorsed by over 100 motoring and business men's organizations in the convention here today, all of these organizations being represented by delegates.

The Tice bill is at present before the joint committee of the House and Senate. It is expected it will be reported from committee at once, or before the end of the week at the latest.

President W. G. Edens, and all the other major officers of the association were re-elected.

French Roads to Be Numbered

PARIS, May 3—France has adopted a reform which has the double advantage of costing the nation nothing and of being invaluable to the tourist. Every highway throughout the land is to be given a name and number, and these denominations are to be immediately painted on all kilometre stones and government road-direction posts. It appears but a slight reform, but in reality it is one of immense importance to automobilists. All the roads in France are divided into classes: national highways, departmental highways, *chemins de grand communication*, etc., and each road bears a number. This classification is made use of by the authorities, who never speak of a highway as the road between Dieppe and Rouen, but as "National Highway No. —." To indicate the position more accurately, they have only got to add "Kilometre stone No. —" or "Hundred metre stone No. —" to make it possible for any person to find a desired spot as easily as he would pick out a numbered house in a numbered street.

Good Roads Committee of Congress

WASHINGTON, D. C., May 12—*Special Telegram*—Chairman Henry of the Rules Committee of the House of Representatives reintroduced to-day his resolution to create a House committee on roads to handle all legislation relating to the good roads movement. The amended resolution provides that the new committee shall not have appropriative powers.

Transcontinental Movement Progressing

INDIANAPOLIS, IND., May 12—The present scope of the transcontinental rock highway movement and the Indiana to Pacific automobile tour, which will leave Indianapolis on July 1, both of which ideas were born in this state, are becoming wider each day. Letters from state officials, commercial bodies, Governors of states and private individuals are pouring in each day. Cities on various routes which the tour might travel are making all kinds of preparations for the visitors and are begging that they be allowed to act as hosts.

Throughout the entire West the tour plans have been received with open arms. Every city of any importance has written concerning it, and within the week messages were received from the Governor of California and the chief executives of all the states through which the tour will pass and the San Francisco and many other Chambers of Commerce telling of the preparations of welcome which are being made.

The State of Wyoming, through its Legislature, has sent an invitation to so arrange this midsummer tour to the Pacific Coast that advantage may be taken of the excellent roads of Wyoming. The resolutions were signed by the Speaker of the House, the President of the Senate and approved by Governor Carey. A copy was sent to John Guy Monihan, also of the Premier company of Indianapolis, who conceived and put over the Premier Ocean-to-Ocean tour and to whom is largely responsible the development of across country automobile literature and the tremendously increasing number of private motor car owners who see the great vacation possibilities of the now famous trail to the sunset.

The Governor of Nevada has advised that he with his official staff, will meet the tour and accompany it to the California state line, where the Governor of the latter state and his staff will welcome the party, and all will accompany the tourists to the Golden Gate.

Various communities are ready to repair the roads which the tourists will travel, and it is known definitely that the $218,000 which will be spent on the transcontinental highways can be attributed directly to the Indiana tour and assures the American public another means of reaching the coming great Panama Exposition in San Francisco in 1915.

Colorado Roads Get $200,000

DENVER, COLO., May 9—The new state highway commissioner and advisory board held their second meeting this week and planned an apportionment of $200,000 more among the several counties for road building this year. This makes a total of $518,000 furnished from the state road fund thus far to aid the counties in this year's work of improving the principal highways in Colorado. In nearly all cases the counties will be required to put up as much as the state offers, in order to get the help from the state fund.

The highway commission has also ruled that every county must secure and present a clear title to the roads to be improved, and also have the work planned and supervised by a civil engineer.

This new apportionment makes special provision for improving roads over five or six mountain passes, as well as for putting into good condition several long stretches of important lines of travel.

The first improvement work is planned largely for the benefit of motorists wishing to cross the state, and will take in many pieces of road through Colorado's most attractive scenery.

H. O. Smith Heads Hoosier Makes

INDIANAPOLIS, IND., May 12—The resignation of C. B. Warren, president of the Indiana Automobile Manufacturers' Association, has been accepted by the board of directors, and H. O. Smith, of Indianapolis, president of the Premier Motor Mfg. Co. Carl G. Fisher, of the Prest-O-Lite Co., was chosen as a member of the board of directors, and R. P. Henderson, builder of Henderson cars, was selected as tour treasurer.

Wisconsin Makers Dislike Compensation

MILWAUKEE, WIS., May 13—Wisconsin manufacturers, among whom there are many identified with the motor car industry, are protesting vigorously against the passage of amendments to the Wisconsin Workmen's Compensation law, or industrial insurance act.

Bad Eggs Among Milwaukee Roads

MILWAUKEE, WIS., May 13—Nearly 1 of the 9 miles of concrete highway built in Milwaukee County during 1912 must be replaced because of incompetent inspection during construction. The mile of poor paving is distributed over 3 of the 5 stretches of county highway improved last year. County Highway Commissioner H. J. Kuelling takes the blame for the mistake and says that the poor paving was due to unwise selection of gravel, which may cost the county $75,000 to $90,000.

Hudson-Catskill Starts with Seventeen

NEW YORK CITY, May 14.—The West Hudson & Catskill reliability hill-climbing and fuel test started here at noon today with seventeen participants. The cars were entered by members of the New York trade. The night stop will be made at Newburgh, N. Y., where a smoker will be held and the tourists will be addressed by various speakers. They are to return to this city tomorrow night.

L. I. A. C. Will Have Century Run

BROOKLYN, N. Y., May 13—The L. I. A. C. has announced that it will hold a 100-mile run on May 18. This run will be a non-stop, fixed-time event, held under the A. A. A. rules. The average pace will be 20 miles an hour, and cars will be checked at five points, being penalized 1 point for a deviation of 15 seconds from the speed scheduled.

Proportioning Motor to Load

OFFICIAL tests of the *Washington Post* motortruck demonstration published in this issue bring out forcibly the marked differences of cost per ton-mile with different makes of trucks. The reports show where the ton-mile cost is quite often double that of other makes of trucks and there are a few cases where one truck has nearly three times as great a ton-mile cost as another make. The lowest ton-mile cost was with the truck carrying the heaviest load and generally speaking the ton-mile cost increased in proportion as the amount of useful load was reduced; thus a 3000-pound truck showed a lower ton-mile cost than a 2000-pound vehicle, and a 2000-pound truck lower cost than one with a load capacity of 1000 or 1500 pounds.
